IV. The other species of compound propositions are those called **DISJUNCTIVES**; in which, comparing several predicates with the same subject; we affirm that one of them necessarily belongs to it, but leave the particular predicate undetermined. If any one, for example, says, "*This world either exists of itself, or is the work of some all-wise and powerful cause,*" it is evident that one of the two predicates must belong to the world; but as the proposition determines not which, it is therefore of the kind we call *disjunctive*. Such too are the following; "*The sun either moves round the earth, or is the centre about which the earth revolves.*"—"Friendship finds men equal, or makes them so." It is the nature of all propositions of this class, supposing them to be exact in point of form, that, upon determining the particular predicate, the rest are of course to be removed; or if all the predicates but one are removed, that one necessarily takes place. Thus, in the example given above; if we allow the world to be the work of some wise and powerful cause, we of course deny it to be self-existent; or if we deny it to be self-existent, we must necessarily admit that it was produced by some wise and powerful cause. Now this particular manner of linking the predicates together, so that the establishing one displaces all the rest; or the excluding all but one necessarily establishes that one; cannot otherwise be effected than by means of *disjunctive* particles. And hence propositions of this class take their names from these particles which make so necessary a part of them, and indeed constitute their very nature considered as a distinct species.

#### SECT. VI. Of the DIVISION of PROPOSITIONS into SELF-EVIDENT and DEMONSTRABLE.

I. WHEN any proposition is offered to the view of the mind, if the terms in which it is expressed be understood; upon comparing the ideas together, the agreement or disagreement asserted is either immediately perceived, or found to lie beyond the present reach of the understanding. In the first case the proposition is said to be **SELF-EVIDENT**, and admits not of any proof, because a bare attention to the ideas themselves produces full conviction and certainty; nor is it possible to call any thing more evident by way of confirmation. But where the connection or repugnance comes not so readily under the inspection of the mind, there we must have recourse to reasoning; and if by a clear series of proofs we can make out the truth proposed, inasmuch that self-evidence shall accompany every step of the procedure, we are then able to demonstrate what we assert, and the proposition itself is said to be **DEMONSTRABLE**. When we affirm, for instance, that "*it is impossible*"

ible for the same thing to be and not to be;" whoever understands the terms made use of perceives at first glance the truth of what is asserted, nor can he by any efforts bring himself to believe the contrary. The proposition therefore is *self-evident*, and such that it is impossible by reasoning to make it plainer; because there is no truth more obvious or better known, from which as a consequence it may be deduced. But if we say, *This world had a beginning*; the assertion is indeed equally true, but shines not forth with the same degree of evidence. We find great difficulty in conceiving how the world could be made out of nothing; and are not brought to a free and full assent, until by reasoning we arrive at a clear view of the absurdity involved in the contrary supposition. Hence this proposition is of the kind we call *demonstrable*, inasmuch as its truth is not immediately perceived by the mind, but yet may be made appear by means of others more plain and obvious, whence it follows as an undeniable consequence.

II. From what has been said, it appears, that demonstration is employed only about demonstrable propositions, and that our intuitive and self-evident perceptions are the ultimate foundation on which it rests.

III. Self-evident propositions furnish the first principles of reasoning; and it is certain, that in our researches we employ only such principles as possess this character of self-evidence, and apply them according to the rules to be afterwards explained. We shall be in no danger of error in advancing from one discovery to another. For this we may appeal to the writings of the mathematicians, each being conducted by the express model here mentioned, are an incontestable proof of the firmness and stability of human knowledge, when it is upon so sure a foundation. For not only are the propositions of this science stood the test of ages, but are found attended with that invincible evidence, as forces the assent of all who consider the proofs upon which they are established. Since the mathematicians are universally allowed to have hit upon the right method of arriving at unknown truths, since they have the happiest in the choice as well as the application of their principles, it may not be amiss to explain here their method of stating self-evident propositions, and applying them to the purpose of demonstration.

First then it is to be observed, that they have been very careful in ascertaining their ideas, fixing the signification of their terms. For this purpose they begin with DEFINITIONS, in which the meaning of their words is so distinctly explained, that they cannot fail to excite in the mind of an attentive reader the very same ideas as are annexed to them by the writer. And indeed the clearness and irresistible evidence of mathematical knowledge is owing to nothing so much as to their care in laying the foundation. Where the relation between any two ideas is accurately and precisely traced, it will not be difficult for another to apprehend that relation, if in setting himself to explain it he brings the very same ideas into comparison. But if, on the contrary, he affixes to the same words ideas different from those that were

in the mind of him who first advanced the demonstration; it is evident, that as the same ideas are not compared, the same relation cannot subsist, inasmuch that a proposition will be rejected as false, which, had the terms been rightly understood, must have appeared incontestably true. A square, for instance, is a figure bounded by four equal right lines, joined together at right angles. Here the nature of the angles makes no less a part of the idea than the equality of the sides; and many properties demonstrated of the square flow entirely from its being a rectangular figure. If therefore we suppose a man, who has formed a partial notion of a square, comprehending only the equality of its sides, without regard to the angles, reading some demonstration that implies also this latter consideration; it is plain he would reject it as not universally true, inasmuch as it could not be applied where the sides were joined together at equal angles. For this last figure, answering still to his idea of a square, would be yet found without the property assigned to it in the proposition. But if he comes afterwards to correct his notion, and render his idea complete, he will then readily own the truth and justness of the demonstration.

V. We see, therefore, that nothing contributes so much to the improvement and certainty of human knowledge, as the having determinate ideas, and keeping them steady and invariable in all our discourses and reasonings about them. On this account mathematicians always begin by defining their terms, and distinctly unfolding the notions they are intended to express. Hence such as apply themselves to these studies have exactly the same views of things; and, bringing always the very same ideas into comparison, readily discern the relation between them. It is likewise of importance, in every demonstration, to express the same idea invariably by the same word. From this practice mathematicians never deviate; and if it be necessary in their demonstrations, where the reader's comprehension is aided by a diagram, it is much more so in all reasonings about moral or intellectual truths where the ideas cannot be represented by a diagram. The observation of this rule may sometimes be productive of ill-founding periods; but when *truth* is the object, *soundness* ought to be disregarded.

VI. When the mathematicians have taken this first step, and made known the ideas whose relations they intend to investigate; their next care is, to lay down some self-evident truths, which may serve as a foundation for their future reasonings. And here indeed they proceed with remarkable circumspection, admitting no principles but what flow immediately from their definitions, and necessarily force themselves upon a mind in any degree attentive to its ideas. Thus a *circle* is a figure formed by a right line moving round some fixed point in the same plane. The fixed point round which the line is supposed to move, and where one of its extremities terminates, is called the *centre* of the circle. The other extremity, which is conceived to be carried round until it returns to the point whence it first set out, describes a curve running into itself, and termed the *circumference*. All right lines drawn from the centre

to the circumference are called *radii*. From these definitions compared, geometricians derive this self-evident truth; "that the radii of the same circle are all equal to one another."

VII. We now observe, that, in all propositions, we either affirm or deny some property of the idea, that constitutes the subject of our judgment, or we maintain that something may be done or effected. The first sort are called *speculative* propositions, as in the example mentioned above, "the radii of the same circle are all equal one to another." The others are called *practical*, for a reason quite obvious; thus, *that a right line may be drawn from one point to another* is a practical proposition, inasmuch as it expresses that something may be done.

VIII. From this twofold consideration of propositions arises the twofold division of mathematical principles into axioms and postulates. By an *axiom* they understand any self-evident speculative truth; as, "That the whole is greater than its parts;" "That things equal to one and the same thing are equal to one another." But a self-evident practical proposition is what they call a *postulate*. Such are those of Euclid; "That a finite right line may be continued directly forwards;" "That a circle may be described about any centre with any distance." And here we are to observe, that as in an axiom the agreement or disagreement between the subject and predicate must come under the immediate inspection of the mind; so in a postulate, not only the possibility of the thing asserted must be evident at first view, but also the manner in which it may be effected. For where this manner is not of itself apparent, the proposition comes under the notion of the demonstrable kind, and is treated as such by geometrical writers. Thus, "to draw a right line from one point to another," is assumed by Euclid as a postulate, because the manner of doing it is so obvious, as to require no previous teaching. But then it is not equally evident, how we are to construct an equilateral triangle. For this reason he advances it as a demonstrable proposition, lays down rules for the exact performance, and at the same time proves, that if these rules are followed, the figure will be justly described.

IX. This leads us to take notice, that as self-evident truths are distinguished into different kinds, according as they are speculative or practical; so is it also with demonstrable propositions. A demonstrable speculative proposition is by mathematicians called a *THEOREM*. Such is the famous 47th proposition of the first book of the elements, known by the name of the *Pythagoric theorem*, from its supposed inventor Pythagoras, viz. "that in every right-angled triangle, the square described upon the side subtending the right-angle is equal to both the squares described upon the sides containing the right-angle." On the other hand, a demonstrable practical proposition is called a *problem*; as where Euclid teaches us to describe a square upon a given right-line.

X. Besides the 4 kinds of propositions already mentioned, mathematicians have also a 5th known by the name of *corollaries*. These are usually subjoined to theorems or problems, and differ from them only in this; that they flow from what is

there demonstrated in so obvious a manner as to discover their dependence upon the proposition whence they are deduced, almost as soon as proposed. Thus Euclid having demonstrated, "that in every right-lined triangle all the three angles taken together are equal to two right-angles;" adds by way of corollary, "that all the three angles of any one triangle taken together are equal to all the three angles of any other triangle taken together;" which is evident at first sight; because in all cases they are equal to two right ones, and things equal to one and the same thing are equal to one another.

XI. The *SCHOLIA* of mathematicians are indifferently annexed to definitions, propositions, or corollaries; and answer the same purposes as annotations upon a classic author. For in them occasion is taken to explain whatever may appear intricate and obscure in a train of reasoning; to answer objections; to teach the application and uses of propositions; to lay open the original and history of the several discoveries made in the science; and, in a word, to acquaint us with all such particulars as deserve to be known, whether considered as points of curiosity or profit.

## PART III.

### OF REASONING.

#### SECT. I. Of REASONING in GENERAL, and PARTS of which it CONSISTS.

IT often happens in comparing ideas together that their agreement or disagreement cannot discerned at first view, especially if they are of a nature as not to admit of an exact application one to another. When, for instance, we compare two figures of a different make, in order to judge of their equality or inequality, it is plain, that barely considering the figures themselves, we do not arrive at an exact determination; because reason of their disagreeing forms, it is impossible so to put them together, as that their several parts shall mutually coincide. Here then it becomes necessary to look out for some third idea to which we will admit of such an application as the precise case requires; wherein if we succeed, all difficulties vanish, and the relation we are in quest may be traced with ease. Thus right-lined figures are all reduced to squares, by means of which we can measure their areas, and determine exactly their agreement or disagreement in point of magnitude.

II. But how can any third idea serve to discover a relation between two others? The answer is, By being compared severally with these others; for such a comparison enables us to see how the ideas with which this third is compared are connected or disjoined between themselves. In the example mentioned above of two right-lined figures, if we compare each of them with a square whose area is known, and find the one exactly equal to it, and the other less by a square inch, we immediately conclude that the area of the first figure is a square inch greater than that of the second. This manner of determining the relation between any two ideas, by the intervention of some third with which they may be compared,

angicauda.

BELLOWS for inflating the LUNGS.

J. De la Haye

rd, is that which we call *reasoning*; and is in-  
l the chief instrument by which we push on  
discoveries, and enlarge our knowledge. The  
t art lies in finding out such intermediate ideas,  
when compared with the others in the ques-  
tion, will furnish evident and known truths; be-  
cause, as will afterwards appear, it is only by  
means of them that we arrive at the knowledge of  
what is hidden and remote.

I. Hence it appears, that every act of reason-  
ing necessarily includes three distinct judgments;  
wherein the ideas whose relation we want to  
discover are severally compared with the middle  
idea, and a third wherein they are themselves con-  
sidered or disjoined, according to the result of  
the comparison. Now, as in the second part of  
our judgments, when put into words were  
called *propositions*, so here in the third part the ex-  
pressions of our reasonings are termed *sylogisms*.  
Hence it follows, that as every act of reasoning im-  
plies three several judgments, so every syllogism  
must include three distinct propositions. When  
reasoning is thus put into words, and appears  
in form of a syllogism, the intermediate idea made  
use of, to discover the agreement or disagreement  
in search for, is called the *middle term*; and the  
ideas themselves, with which this third is  
compared, go by the name of the *extremes*.

V. But as these things are best illustrated by  
examples; let us, for instance, set ourselves to  
enquire *whether men are accountable for their actions*.  
The relation between the ideas of *men* and *ac-  
countableness* comes not within the immediate view  
of the mind, our first care must be to find out  
a third idea that will enable us the more easily  
to discover and trace it. A very small measure  
of reflection is sufficient to inform us, that no  
man can be accountable for his actions, unless  
we suppose him capable of distinguishing the good  
from the bad; that is, unless we suppose him  
possessed of reason. Nor is this alone sufficient.  
What would it avail him to know good from  
bad actions, if he had no freedom of choice, nor  
could avoid the one and pursue the other? Hence  
it becomes necessary to take in both considera-  
tions in the present case. It is at the same time  
obviously apparent, that wherever there is this abi-  
lity of distinguishing good from bad actions, and  
of pursuing the one and avoiding the other, there  
a creature is accountable. We have then got  
our third idea, with which *accountableness* is insepar-  
ably connected, *viz. reason and liberty*; which are  
to be considered as making up one complex  
middle term. Let us now take this middle idea,  
and compare it with the other term in the ques-  
tion, *viz. man*, and we all know by experience  
it may be affirmed of him. Having thus by  
means of the intermediate idea formed two several  
judgments, *viz. that man is possessed of reason and  
liberty; and that reason and liberty imply accountableness*;  
a third obviously and necessarily follows,  
*that man is accountable for his actions*. Here  
we have a complete act of reasoning, in-  
deed, according to what has been already observ-  
ed: there are three distinct judgments; two that  
may be styled previous, inasmuch as they lead to  
the third, and arise from comparing the middle  
term with the two ideas in the question; the third

is XIII. PART I.

is a consequence of these previous acts, and flows  
from combining the extreme ideas between them-  
selves. If now we put this reasoning into words;  
it exhibits what logicians term a syllogism; and,  
when proposed in due form runs thus:—"Every  
creature possessed of reason and liberty is account-  
able for his actions.—Man is a creature possessed  
of reason and liberty:—Therefore man is ac-  
countable for his actions."

V. In this syllogism we may observe, that there  
are three several propositions expressing the three  
judgments implied in the act of reasoning; and  
so disposed, as to represent distinctly what passes  
within the mind in tracing the more distant rela-  
tions of its ideas. The two first propositions an-  
swer the two previous judgments in reasoning, and  
are called the *premises*, because they are placed be-  
fore the other. The third is termed the *conclusion*,  
as being gained in consequence of what was assert-  
ed in the premises. We are also to remember;  
that the terms expressing the two ideas whose rela-  
tions we enquire after, as here *man* and *account-  
ableness*, are in general called the *extremes*; and  
that the intermediate idea, by means of which the  
relation is traced, *viz. a creature possessed of reason  
and liberty*, takes the name of the *middle term*.  
Hence it follows, that by the premises of a syllo-  
gism we are always to understand the two propo-  
sitions where the middle term is severally compared  
with the extremes; for these constitute the previ-  
ous judgments, whence the truth we are in quest  
of is by reasoning deduced. The *conclusion* is that  
other proposition, in which the extremes them-  
selves are joined or separated agreeably to what  
appears upon the above comparison.

VI. The conclusion is made up of the extreme  
terms of the syllogism; and the extreme, which  
serves as the predicate of the conclusion,  
goes by the name of the *major term*: the other  
extreme, which makes the subject in the same  
proposition, is called the *minor term*. From this  
distinction of the extremes arises also a distinc-  
tion between the premises, where these extremes  
severally compared with the middle term. That  
proposition which compares the greater extreme,  
or the predicate of the conclusion, with the mid-  
dle term, is called the *major proposition*: the oth-  
er, wherein the same middle term is compared  
with the subject of the conclusion or lesser extreme,  
is called the *minor proposition*. All this is obvi-  
ous from the syllogism already given, where the  
conclusion is, *Man is accountable for his actions*.  
For here the predicate *accountable for his actions*,  
being connected with the middle term in the first  
of the two premises, *every creature possessed of rea-  
son and liberty is accountable for his actions*, gives  
what we call the *major proposition*. In the se-  
cond of the premises, *man is a creature possessed of  
reason and liberty*, we find the lesser extreme, or sub-  
ject of the conclusion, *viz. man*, connected with  
the same middle term, whence it is known to be  
the *minor proposition*. When a syllogism is pro-  
posed in due form, the major proposition is al-  
ways placed first, the minor next, and the con-  
clusion last.

VII. These things premised, we may in the ge-  
neral define reasoning to be an act or operation of  
the mind, deducing some unknown proposition  
from

and other previous ones that are evident and known. These previous propositions, in a simple act of reasoning are only two in number; and it is always required that they be of themselves apparent to the understanding, inasmuch that we assent to and perceive the truth of them as soon as proposed. In the syllogism given above, the premises are supposed to be self-evident truths; otherwise the conclusion could not be inferred by a single act of reasoning. If, for instance, in the major, "every creature possessed of reason and liberty is accountable for his actions," the connection between the subject and predicate could not be perceived by a bare attention to the ideas themselves; it is evident that this proposition would no less require a proof than the conclusion deduced from it. In this case a new middle term must be sought for, to trace the connection here supposed; and this of course furnishes another syllogism, by which having established the proposition in question, we are then, and not before, at liberty to use it in any succeeding train of reasoning. And should it so happen, that in this ad essay there was still some previous proposition whose truth did not appear at first sight, we must then have recourse to a third syllogism, to lay open that truth to the mind: because so long as the premises remain uncertain, the conclusion built upon them must be so too. When, by conducting our thoughts in this manner, we at last arrive at some syllogism where the previous propositions are intuitive truths; the mind then rests in full security; as perceiving that the several conclusions it has passed through stand upon the immovable foundations of self-evidence, and when traced to their source terminate in it.

VIII. We see, therefore, that, to infer a conclusion by a single act of reasoning, the premises must be intuitive propositions. Where they are not, previous syllogisms are required; in which case reasoning becomes a complicated act, taking in a variety of successive steps. This frequently happens in tracing the more remote relation of our ideas; where, many middle terms being called in, the conclusion cannot be made out but in consequence of a series of syllogisms following one another in train. But although in this concatenation of propositions, those that form the premises of the last syllogism are often considerably removed from self-evidence; yet if we trace the reasoning backwards, we shall find them the conclusions of previous syllogisms, whose premises approach nearer and nearer to intuition in proportion as we advance, and are found at last to terminate in it. And if, after having thus unravelled a demonstration, we take it the contrary way; and observe how the mind, sitting out with intuitive perceptions, couples them together to form a conclusion; how by introducing this conclusion into another syllogism, it still advances one step farther; and so proceeds, making every new discovery subservient to its future progress; we shall then perceive clearly, that reasoning, in the highest sense of that faculty, is no more than an orderly combination of those simple acts which we have already so fully explained.

IX. Thus we see, that reasoning, beginning with *first principles*, rises gradually from one judgment

to another, and connects them in such that every stage of the progression brings certainty along with it. And now at may clearly understand the definition of this distinguishing faculty of the human Reason we have said, is the ability of unknown truths from principles or parts that are already known. This evidence by the foregoing account, where every proposition is admitted into a syllogism as one of the previous judgments on which the conclusion rests, unless it is itself a known established truth, whose connection with the principles has been already traced.

SECT. II. *Of the SEVERAL KINDS of REASONING; and FIRST of THAT by which we DISCOVER and DETERMINE the GENERA and SPECIES of THINGS.*

I. ALL the aims of human reasoning may be reduced to these two: 1. To ascertain under those universal ideas to which they belong; and, 2. To ascribe to them their proper attributes and properties in consequence of their distribution.

II. One great aim of human reasoning is to determine the genera and species of things. This is seen in the 1st Part of this treatise, how it proceeds in framing general ideas. We see in the 2d Part, how by means of particular ideas we come by universal propositions. Now as in these universal propositions we find some property of a genus or species, which that we cannot apply this property to particular objects till we have first determined what objects are comprehended under that general name, which the property is affirmed. These certain properties belonging to all *even* numbers, which nevertheless cannot be applied to any particular number, until we have first discerned the species expressed by that name. Hence reasoning begins with referring our ideas to their several divisions and classes in consequence of our ideas; and as these divisions are distinguished by particular names, we here apply the terms expressing general concepts to such particular objects as come under the scope of direct observation.

III. Now, to arrive at these concepts which the several objects of perception are distinguished under general names, two things are necessary. First, that we take a view of the object itself denoted by that general name, and attend to the distinguishing marks which characterize it. 2dly, that we compare the object with the object under consideration, or diligently wherein they agree or differ. If the object is found to correspond with the particular name, we then without hesitation apply to it that name; but if no such correspondence is found, the conclusion must necessarily take another turn. Let us, for instance, take the number *seven* and consider by what steps we are led to pronounce it an *even* number. First then the mind the idea signified by the expression *number*, viz. that it is a number divisible into equal parts. We then compare this idea with the number *eight*, and, finding them to agree, we once the necessity of admitting the

al judgments therefore transferred into and reduced into the form of a syllogism thus:—"Every number that may into two equal parts is an *even* number EIGHT may be divided into parts;—Therefore the number *eight* is *even* number."

It may be observed, that where the names, to which particular objects are referred, are familiar to the mind, and frequently used, this reference, and the application of the name, seem to be made without any effort of reasoning. When we see a horse in the street, or a dog in the street, we readily apply the name of the species; habit, and a familiar acquaintance with the general idea, suggesting it inly to the mind. We are not however to be misled on this account that the understanding is not the usual rules of just thinking. A repetition of acts begets a habit; and attended with a certain promptness of mind that prevents our observing the several gradations by which any course of reasoning is accomplished. But in other instances, we judge not by precontracted habits, as when the general idea is very complex, or less familiar to the mind, we always proceed according to the usual rules of reasoning established above. A man for instance, who is in doubt as to any particular action, whether it be of the species called murder, examines its properties, and then compares it with the general idea signified by that name, and finds a perfect correspondence, no longer states under what *class* of metals to

it be imagined that our researches are confined in appearance bounded to the images of general names upon particular objects, and are of little consequence. The most considerable debates among philosophers, and such too as nearly regard their interests, and happiness, turn wholly upon the question, Is it not the chief employment of the courts of judicature to determine in various instances, what is law, justice, and of what importance is it in many cases to determine whether an action shall be termed *manslaughter*? We see then that no less the interests and fortunes of men often depend on the decisions. The reason is plain. As soon as an action is referred to a general idea, draw all that may be affirmed of that idea; that the determining the species of action is one with determining what proportion of praise or dispraise, commendation or punishment ought to follow them. For as it is that an action of murder deserves death; by bringing that particular action under the head of murder, the course decide the punishment due

to the great importance of this branch of logic and the necessity of care and circumspection in particular objects to general ideas, is evident from the practice of the mathematicians. Every one who has read Euclid will find that he frequently requires us to draw out certain points, and according to these directions. The figures thence re-

sulting are often squares, parallelograms, or rectangles. Yet Euclid never supposes this from their bare appearance, but always demonstrates it upon the strictest principles of geometry. Nor is the method he takes in any thing different from that described above. Thus, for instance, having defined a square to be a figure bounded by four equal sides joined together at right angles; when such a figure arises in any construction previous to the demonstration of a proposition, yet he never calls it by that name until he has shown that its sides are equal, and all its angles right ones. Now this is apparently the same form of reasoning we have before exhibited in proving *eight* to be an even number.

VII. Having thus explained the rules by which we are to conduct ourselves in ranking particular objects under general ideas, and shown their conformity to the practice and manner of the mathematicians; it remains only to observe, that the true way of rendering this part of knowledge both easy and certain, is, by habituating ourselves to clear and determinate ideas, and keeping them steadily annexed to their respective names. For as all our aim is to apply general words aright, if these words stand for invariable ideas that are perfectly known to the mind, and can be readily distinguished upon occasion, there will be little danger of mistake or error in our reasonings. Let us suppose that, by examining any object, and carrying our attention successively from one part to another, we have acquainted ourselves with the several particulars observable in it. If among these we find such as constitute some general idea, framed and settled before-hand by the understanding, and distinguished by a particular name, the resemblance thus known and perceived necessarily determines the species of the object, and thereby gives it a right to the name by which that species is called. Thus four equal sides, joined together at right angles, make up the notion of a *square*. As this is a fixed and invariable idea, without which the general name cannot be applied; we never call any particular figure a *square* until it appears to have these several conditions; and contrarily, wherever a figure is found with these conditions, it necessarily takes the name of a *square*. The same will be found to hold in all our other reasonings of this kind, where nothing can create any difficulty but the want of settled ideas. If, for instance, we have not determined with ourselves the precise notion denoted by the word *manslaughter*, it will be impossible for us to decide whether any particular action ought to bear that name: because, however nicely we examine the action itself, yet, being strangers to the general idea with which it is to be compared, we are utterly unable to judge of their agreement or disagreement. But if we take care to remove this obstacle, and distinctly trace the two ideas under consideration, all difficulties vanish, and the resolution becomes both easy and certain.

VIII. Thus we see of what importance it is towards the improvement and certainty of human knowledge, that we accustom ourselves to clear and determinate ideas, and a steady application of words.

SECT. III. OF REASONING, as it regards the POWERS and PROPERTIES of THINGS, and the RELATIONS of our GENERAL IDEAS.

I. WE now come to the 2d great end which men have in view in their reasonings; namely, the discovering and ascribing to things their several attributes and properties. And here it will be necessary to distinguish between reasoning, as it regards the sciences, and as it concerns common life. In the sciences, our reason is employed chiefly about universal truths, it being by them alone that the bounds of human knowledge are enlarged. Hence the division of things into various classes, called otherwise *genera* and *species*. For these universal ideas being set up as the representatives of many particular things, whatever is affirmed of them may be also affirmed of all the individuals to which they belong. *Murder*, for instance, is a general idea, representing a certain species of human actions. Reason tells us that the punishment due to it is *death*. Hence every particular action, coming under the notion of murder, has the punishment of death allotted to it. Here then we apply the general truth to some obvious instance; and this is what properly constitutes the reasoning of common life. For men, in their ordinary transactions and intercourse one with another, have, for the most part, to do only with particular objects. Our friends and relations, their characters and behaviour, the constitution of the several bodies that surround us, and the uses to which they may be applied, are what chiefly engage our attention. In all these, we reason about particular things; and the whole result of our reasoning is, the applying the general truths of the sciences in the ordinary transactions of human life. When we see a viper, we avoid it. Wherever we have occasion for the forcible action of water to move a body that makes considerable resistance, we take care to convey it in such a manner that it shall fall upon the object with impetuosity. Now all this happens in consequence of our familiar and ready application of these two general truths. "The bite of a viper is mortal." "Water, falling upon a body with impetuosity, acts very forcibly towards setting it in motion." In like manner, if we set ourselves to consider any particular character, in order to determine the share of praise or dispraise that belongs to it, our great concern is to ascertain exactly the proportion of virtue and vice. The reason is obvious. A just determination, in all cases of this kind, depends entirely upon an application of these general maxims of morality: *Virtuous actions deserve praise; vicious actions deserve blame.*

II. Hence it appears that reasoning, as it regards common life, is no more than the ascribing the general properties of things to those several objects with which we are more immediately concerned, according as they are found to be of that particular division or class to which the properties belong. The steps then by which we proceed are manifestly these. First, we refer the object under consideration to some general idea or class of things. We then recollect the several attributes of that general idea. And, lastly, ascribe

all those attributes to the present object in considering the character of Sempronius find it to be of the kind called *virtuous* at the same time reflect that a *virtuous* is deserving of esteem, it naturally follows that Sempronius is so too. The put into a *sylogism*, in order to exhibit reasoning here required, run thus:—*virtuous man is worthy of esteem.— is a virtuous man:—Therefore Sempronius is worthy of esteem.*"

III. By this *sylogism* it appears, we affirm any thing of a particular object must be referred to some general notion is pronounced worthy of esteem consequence of his being a virtuous man ing under that general notion. Hence necessary connection of the various parts, and the dependence they have on another. The determining the general of things is one exercise of human reason; here we find that this exercise is the first and previous to the other, which consists in ascribing to them their powers, properties, and relations. But when we have taken this first step, and brought particular objects under general names; as the properties we ascribe to them other than those of the general ideas, that, in order to a successful progress of knowledge, we must thoroughly acquaint ourselves with the several relations and dependencies of these our general ideas. When this is done, the other part will be easy, and requires no more labour or thought, as being no more than a simple application of the general form of reasoning presented in the foregoing *sylogism*. We have already sufficiently shown how we proceed in determining the general attributes of things, which, as we have said, is the first step to this second branch of human knowledge. All that is farther wanting towards a full comprehension of it is, to offer some consideration of the manner of investigating the general properties of our ideas. This is the highest exercise of the powers of the understanding, and the end whereof we arrive at the discovery of the general truths; inasmuch that our deductions constitute that particular species of reasoning which regards principally the sciences.

IV. But that we may conduct our reasoning with some order and method, we shall observe, that the relations of our general ideas are of two kinds: either such as immediately concern themselves, upon comparing them with another; or such as, being more remote and distant, require art and contrivance to bring them into view. The relations of the first kind furnish us with intuitive and self-evident truths; those of the second are traced by the gradual application of intermediate ideas: this last kind that we are to speak of is the more difficult the other in the 2d Part. As in tracing the more distant relations of our ideas, we must always have recourse to intermediate ideas, and are more or less successful in our reasoning according to our acquaintance with the nature and ability of applying them; it is evident that to make a good reasoner, two things

required. 1st, An extensive knowledge of intermediate ideas, by means of which things are compared one with another. 2d, The talent of applying them happily in all particular instances that come under considera-

In order to our successful progress in reasoning, we must have an extensive knowledge of intermediate ideas by means of which things are compared one with another. For as it is every idea that will answer the purpose of our reasoning, but such only as are peculiarly related to the objects about which we reason, so as, by a union with them, to furnish evident and simple truths; nothing is more apparent than that the greater variety of conceptions we can bring to view, the more likely we are to find some that will help us to the truths here intended. And, indeed, it holds in experience, that the proportion as we enlarge our views of objects, and grow acquainted with a multitude of different objects, the reasoning faculty gathers strength: for by extending our sphere of knowledge, the mind acquires a certain force and precision, as being accustomed to examine the appearances of its ideas, and observe what they cast one upon another.

This is the reason why, in order to excel in any one branch of learning, it is necessary to have at least a general acquaintance with the whole circle of arts and sciences. All the various divisions of human knowledge are very near to each other, and, in innumerable instances, serve to illustrate and set off each other. And although it is not to be denied that, by obstinate application to one branch of study, a man may make considerable progress, and acquire some degree of eminence in it; yet his knowledge will be always narrow and contracted, and he will want that masterly discernment which not only enables us to pursue our discoveries with success, but also, in laying them open to others, to give them a certain brightness around them. But our reasoning regards a particular science, rather than a general one; and it is necessary that we more nearly acquaint ourselves with whatever relates to that science.

A general knowledge is a good preparation, and enables us to proceed with ease and expedition in whatever branch of learning we apply ourselves to; but, in the minute and intricate questions of any science, we are by no means qualified to reason with advantage until we have perfectly mastered the science to which they belong.

We come now to the second thing required in order to a successful progress in reasoning, namely, the skill and talent of applying intermediate ideas happily in all particular instances that come under consideration. And here, precepts are of little service. Use and practice are the best instructors. For, whatever philosophers may boast of being able to form perfect reasoners by book and rule, we find by experience, that the study of their precepts does not add any great degree of strength to the understanding. In short, it is the habit alone that makes a reasoner. And therefore the true way to acquire this talent is, by being conversant in those sciences where the

art of reasoning is allowed to reign in the greatest perfection. Hence it was that the ancients, who so well understood the manner of forming the mind, always began with MATHEMATICS, as the foundation of their philosophical studies. Here the understanding is by degrees habituated to truth, contracts insensibly a certain fondness for it, and learns never to yield its assent to any proposition, but where the evidence is sufficient to produce full conviction. For this reason PLATO has called mathematical demonstrations the *catartics* or purgatives of the soul, as being the proper means to cleanse it from error, and restore that natural exercise of its faculties in which just thinking consists.

VIII. If therefore we would form our minds to a habit of reasoning closely and in train, we cannot take any more certain method than the exercising ourselves in mathematical demonstrations, so as to contract a kind of familiarity with them. Not that we look upon it as necessary that all men should be deep mathematicians; but that, having got the way of reasoning which that study necessarily brings the mind to, they may be able to transfer it to other parts of knowledge, as they shall have occasion.

IX. But although the study of mathematics be of all others the most useful to form the mind and give it an early relish of truth, yet ought not other parts of philosophy to be neglected. For there also we meet with many opportunities of exercising the powers of the understanding; and the variety of subjects naturally leads us to observe all those different turns of thinking that are peculiarly adapted to the several ideas we examine, and the truth we search after. A mind thus trained acquires a certain mastery over its own thoughts, insomuch that it can range and model them at pleasure, and call such into view as best suit its present designs. Now in this the whole art of reasoning consists; from among a great variety of different ideas to single out those that are most proper for the business in hand, and to lay them together in such order, that from plain and easy beginnings, by gentle degrees, and a continued train of evident truths, we may be insensibly led on to such discoveries, as at our first setting out appeared beyond the reach of human understanding. For this purpose, besides the study of mathematics before recommended, we ought to apply ourselves diligently to the reading of such authors as have distinguished themselves for strength of reasoning, and a just and accurate manner of thinking. For it is observable, that a mind exercised and seasoned to truth, seldom rests satisfied in a bare contemplation of the arguments offered by others; but will be frequently assaying its own strength, and pursuing its discoveries upon the plan it is most accustomed to. Thus we insensibly contract a habit of tracing truth from one stage to another, and of investigating those general relations and properties which we afterwards ascribe to particular things, according as we find them comprehended under the abstract ideas to which the properties belong.

#### SECT. IV. Of the FORMS of SYLLOGISMS.

I. HAVING thus given a general notion of syllogisms,

and their parts, we shall now enter more fully into the subject; examine their various, and lay open the rules of argumentation proper to each. In the syllogisms above mentioned, the *middle term* is the subject of the *major* proposition, and the predicate of the *minor*. This disposition, though the most natural and obvious, is not however necessary; as it often happens, that the middle term is the subject in both the premises, or the predicate in both; and sometimes, directly contrary to its disposition in the preceding sections, the predicate in the major, and the subject in the minor. Hence the distinction of syllogisms into various kinds, called *figures* by logicians. For figure, according to their use of the word, is nothing else but the order and disposition of the middle term in any syllogism. And as this disposition is fourfold, so the figures of syllogisms thence arising are 4 in number. When the middle term is the subject of the major proposition, and the predicate of the minor, we have what is called the *first figure*: As, "No work of God is bad:—The natural passions and appetites of men are the work of God:—Therefore none of them is bad." If, on the other hand, it is the predicate of both the premises, the syllogism is said to be the *second figure*: As, "Whatever is bad is not the work of God:—All the natural passions and appetites of men are the work of God:—Therefore the natural passions and appetites of men are not bad." Again, in the *third figure*, the middle term is the subject of the two premises: As, "All Africans are black:—All Africans are men:—Therefore some men are black." And lastly, by making it the predicate of the major, and subject of the minor, we obtain syllogisms in the *fourth figure*: As, "The only being who ought to be worshipped is the Creator and Governor of the world:—The Creator and Governor of the world is God:—Therefore God is the only being who ought to be worshipped."

II. But, besides this fourfold distinction of syllogisms, there is a farther subdivision of them in every figure, arising from the *quantity* and *quality*, as they are called, of the propositions. By *quantity* we mean the consideration of *propositions*, as universal or particular; by *quality*, as affirmative or negative.

Now as, in all the several dispositions of the *middle term*, the propositions of which a syllogism consists may be either universal or particular affirmative or negative; the due determination of these, and so putting them together as the laws of argumentation require, constitute what logicians call the *moods* of syllogisms. Of these moods there is a determinate number to every figure, including all the possible ways in which propositions differing in quantity or quality can be combined, according to any disposition of the middle term, in order to arrive at a just conclusion.

The first figure has only four legitimate moods. The major proposition in this figure must be universal, and the minor affirmative; and it has this property, that it yields conclusions of all kinds, affirmative and negative, universal and particular.

The 2d figure has also 4 legitimate moods. Its major proposition must be universal, and one of

the premises must be negative. It yields conclusions both universal and particular, but not negative.

The 3d figure has six legitimate moods; the minor must always be affirmative; and its conclusions both affirmative and negative, universal and particular. These are all the figures which are admitted by the inventor of syllogisms; which, so far as we know, the number of legitimate moods has been ascertained, and is demonstrated. In every figure it will be upon trial, that there are *sixty-four* different conclusions of syllogism; and he who thinks it worth to construct so many in the *fourth figure*, remembering that the *middle term* in each be the *predicate* of the *major* and the *subject* of the *minor* proposition, will easily discern what number of these moods are *legitimate*, and give conclusions.

Besides the rules that are proper to each figure, ARISTOTLE has given some that are common to all, by which the legitimacy of syllogisms is tried. These may be reduced to five:—1. There must be only *three terms* in a syllogism: A fourth term occurs in two of the propositions, it is precisely the *same in both*; if it be *not*, the syllogism is said to have *four terms*, which makes it an *illicit* syllogism. 2. The *middle term* must be *universal* in one of the premises. 3. Both premises must *not* be *particular* propositions both *negative*. 4. The *conclusion* must be *particular*, if either of the *premises* be *particular*; *negative*, if either of the *premises* be *negative*. 5. A *term* can be taken *universally* in the *conclusion* if it be *not* taken *universally* in the *premises*.

For understanding the 2d and 5th of these rules it is necessary to observe, that a term is said to be taken *universally*, not only when it is the *subject* of a *universal* proposition, but also when it is the *predicate* of a *negative* proposition. On the other hand, a term is said to be taken *particularly*, if it is either the *subject* of a *particular* or the *predicate* of an *affirmative* proposition.

III. The division of syllogisms according to mood and figure respects those especially which are known by the name of plain simple syllogisms; that is, which are bound to three propositions all simple, and where the extremes and the middle term are connected, according to the above rules. But as the mind is not tied down to any one form of reasoning, but sometimes makes use of more, sometimes of fewer premises, and sometimes takes in compound and conditional propositions, it may not be amiss to take notice of the several forms derived from this source, and express rules by which the mind conducts itself in the use of them.

IV. When in any syllogism the major is a conditional proposition, the syllogism itself is called *conditional*. Thus: "If there is a God, he ought to be worshipped:—But there is a God:—Therefore he ought to be worshipped." In this example, the major, or first proposition, is conditional, and therefore the syllogism itself is of the kind. And here we must observe, that conditional propositions are made of two parts: one expressing the condition upon which the predicate agrees or disagrees with

3, as in this now before us, *if there is a God*; the other joining or disjoining the said predicate to the subject, as here, *be ought to be worshipped*. The first of these parts, or that which implies the condition, is called the *antecedent*; the second, here we join or disjoin the predicate and subject, has the name of the *consequent*.

V. In all propositions of this kind, supposing them to be exact in point of form, the relation between the antecedent and consequent must ever be true and real; that is, the antecedent must always contain some certain and genuine condition, which necessarily implies the consequent; for otherwise the proposition itself will be false, and therefore ought not to be admitted into our reasonings. Hence it follows, that when any conditional proposition is assumed, if we admit the antecedent of that proposition, we must at the same time necessarily admit the consequent; but if we reject the consequent, we are in like manner bound to reject the antecedent. For as the antecedent always expresses some condition which necessarily implies the truth of the consequent; by admitting the antecedent, we allow of that condition, and therefore ought also to admit the consequent. In like manner, if it appears that the consequent ought to be rejected, the antecedent evidently must be so too; because as was just now demonstrated, the admitting of the antecedent would necessarily imply the admission also of the consequent.

VI. There are two ways of arguing in *hypothetical* syllogisms, which lead to a certain and unavoidable conclusion. For as the major is always a conditional proposition, consisting of an antecedent and a consequent; if the minor admits the antecedent, it is plain that the conclusion must admit the consequent. This is called arguing on the admission of the antecedent to the admission of the consequent, and constitutes that sort or species of hypothetical syllogisms which is distinguished in the schools by the name of the *modus ponens*, inasmuch as by it the whole conditional proposition, both antecedent and consequent, is established. "Thus: If God is infinitely good, and acts with perfect freedom, he does nothing but what is best:—But God is infinitely good, and acts with perfect freedom:—Therefore he does nothing but what is best." Here we see the antecedent or first part of the conditional proposition is established in the minor, and the consequent or second part in the conclusion; whence the syllogism itself is an example of the *modus ponens*. If now we on the contrary suppose that the minor rejects the consequent, then it is apparent that the conclusion must also reject the antecedent. In this case we are said to argue from the removal of the consequent to the removal of the antecedent, and the particular mood or species of syllogisms thence arising is called by logicians the *modus tollens*; because in it both antecedent and consequent are rejected or taken away, as appears by the following example. "If God were not a Being of infinite goodness, neither would he consult the happiness of his creatures:—But he does consult the happiness of his creature:—Therefore he is a Being of infinite goodness."

VII. These two species take in the whole class

of conditional syllogisms, and include all the possible ways of arguing that lead to a legitimate conclusion; because we cannot here proceed by a contrary process of reasoning, that is, from the removal of the antecedent to the removal of the consequent, or from the establishing of the consequent to the establishing of the antecedent. For although the antecedent always expresses some real condition, which, once admitted, necessarily implies the consequent, yet it does not follow that there is therefore no other condition; and if so, then, after removing the antecedent, the consequent may still hold, because of some other determination that infers it. When we say, *If a stone is exposed some time to the rays of the sun, it will contract a certain degree of heat*; the proposition is certainly true; and, admitting the antecedent, we must also admit the consequent. But as there are other ways by which a stone may gather heat, it will not follow, from the ceasing of the before-mentioned condition, that therefore the consequent cannot take place. We cannot argue: *But the stone has not been exposed to the rays of the sun; therefore neither has it any degree of heat*: Inasmuch as there are many other ways by which heat might be communicated to it. And if we cannot argue from the removal of the antecedent to the removal of the consequent, no more can we from the admission of the consequent to the admission of the antecedent: because, as the consequent may flow from a great variety of different suppositions, the allowing of it does not determine the precise supposition, but only that some one of them must take place. Thus in the foregoing proposition, "If a stone is exposed some time to the rays of the sun, it will contract a certain degree of heat;" admitting the consequent, viz. that it has contracted a certain degree of heat, we are not therefore bound to admit the antecedent, that it has been some time exposed to the rays of the sun; because there are many other causes whence that heat may have proceeded. These two ways of arguing, therefore, hold not in conditional syllogisms.

VIII. As, from the major being a conditional proposition, we obtain the species of conditional syllogisms; so, where it is a disjunctive proposition, the syllogism to which it belongs is also called *disjunctive*, as in the following example:—"The world is either self-existent, or the work of some finite, or of some infinite Being:—But it is not self-existent, nor the work of a finite being:—Therefore it is the work of an infinite Being."

Now, a disjunctive proposition is that, in which, of several predicates, we affirm one necessarily to belong to the subject, to the exclusion of all the rest, but leave that particular one undetermined. Hence it follows, that as soon as we determine the particular predicate, all the rest are of course to be rejected; or if we reject all the predicates but one, that one necessarily takes place. When, therefore, in a disjunctive syllogism, the several predicates are enumerated in the major; if the minor establishes any one of these predicates, the conclusion ought to remove all the rest; or if, in the minor, all the predicates but one are removed, the conclusion must necessarily establish that one. Thus, in the disjunctive syllogism given above,

the major affirms one of the three predicates to belong to the earth, viz. *self-existence*, or that it is *the work of a finite*, or that it is *the work of an infinite Being*. Two of these predicates are removed in the minor, viz. *self-existence*, and *the work of a finite being*. Hence the conclusion necessarily ascribes to it the 3d predicate, and affirms that it is *the work of an infinite Being*. If now we give the syllogism another turn, inasmuch that the minor may establish one of the predicates, by affirming the earth to be *the production of an infinite Being*: then the conclusion must remove the other two, asserting it to be neither *self-existent*, nor *the work of a finite being*. These are the forms of reasoning in these species of syllogisms, the justness of which appears at first sight: and that there can be no other, is evident from the very nature of a disjunctive proposition.

IX. In the several kinds of syllogisms hitherto mentioned, we may observe, that the parts are complete; that is, the three propositions of which they consist are represented in form. But it often happens, that some one of the premises is not only an evident truth, but also familiar and in the minds of all men; in which case it is usually omitted, whereby we have an imperfect syllogism, that seems to be made up of only two propositions. Should we, for instance, argue in this manner:—"Every man is mortal:—Therefore every king is mortal:"—the syllogism appears to be imperfect, as consisting but of two propositions. Yet it is really complete; only the minor [*every king is a man*] is omitted: and left to the reader to supply, as being a proposition so familiar and evident that it cannot escape him.

X. These seemingly imperfect syllogisms are called *enthymemes*; and occur very frequently in reasoning, especially where it makes a part of common conversation. Nay, there is a particular elegance in them, because, not displaying the argument in all its parts, they leave somewhat to the exercise and invention of the mind. We are thus put upon exerting ourselves, and seem to share in the discovery of what is proposed to us. Now this is the great secret of fine writing, so to frame and put together our thoughts, as to give full play to the reader's imagination, and draw him insensibly into our views and course of reasoning. This gives a pleasure not unlike to that which the author himself feels in composing. It besides shortens discourse, and adds a certain force and liveliness to our arguments, when the words in which they are conveyed favour the natural quickness of the mind in its operations, and a single expression is left to exhibit a whole train of thoughts.

XI. But there is another species of reasoning with two propositions, which seems to be complete in itself, and where we admit the conclusion without supposing any tacit or suppressed judgement in the mind, from which it follows syllogistically. This happens between propositions, where the connection is such, that the admission of the one necessarily and at the first sight implies the admission also of the other. For if it so falls out, that the proposition on which the other depends is self-evident, we content ourselves with *barely affirming it*, and infer that other by a direct

conclusion. Thus, by admitting an universal proposition, we are forced also to admit of all the particular propositions comprehended under it, this being the very condition that constitutes a proposition universal. If then that universal proposition be self-evident, the particular ones follow of course, without any farther train of reasoning. Whoever allows, for instance, "that things equal to one and the same thing are equal to one another," must at the same time allow, "that two triangles, each equal to a square whose side is three inches, are also equal between themselves." This argument therefore,—*"Things equal to one and the same thing, are equal to one another:—Therefore these two triangles, each equal to the square of a line of three inches, are equal between themselves:—"*—is complete in its kind, and contains all that is necessary towards a just and legitimate conclusion. For the first or universal proposition is self-evident, and therefore requires no farther proof. And as the truth of the particular is inseparably connected with that of the universal, it follows from it by an obvious and unavoidable consequence.

XII. Now, in all cases of this kind, where propositions are deduced one from another, on account of a known and evident connection, we are said to reason by immediate consequence. Such a coherence of propositions manifest at first sight, and forcing itself upon the mind, frequently occurs in reasoning. Logicians have explained some length the several suppositions upon which takes place, and allow of all immediate consequences that follow in conformity to them. It is however observable, that these arguments, though seemingly complete, because the conclusion follows necessarily from the single proposition that goes before, may yet be considered as real enthymemes, whose major, which is a conditional proposition, is wanting. The syllogism just mentioned, when represented according to this view, will run as follows:—"If things equal to one and the same thing, are equal to one another; these two triangles, each equal to a square whose side is three inches, are also equal between themselves.—But things equal to one and the same thing, are equal to one another:—Therefore also these two triangles, &c. are equal between themselves." The observation will be found to hold in all immediate consequences whatsoever, inasmuch that they are in fact no more than enthymemes of hypothetical syllogisms. But then it is particular to them, that the ground on which the conclusion rests, namely its coherence with the minor, is of itself apparent and seen immediately to flow from the rules and reasons of logic.

XIII. The next species of reasoning we shall take notice of here is what is commonly known by the name of *SORITES*. This is a way of arguing, in which a great number of propositions are so linked together, that the predicate of one becomes continually the subject of the next following, until at last a conclusion is formed, bringing together the subject of the first proposition, and the predicate of the last. Of this is the following argument:—"God is omnipotent:—An omnipotent being can do every thing possible:—He that can do every thing possible

whatever involves not a contradiction: one God can do whatever involves not a lion."—This particular combination of ours may be continued to any length without in the least weakening the ground which the conclusion rests. The reason is, the sorites itself may be resolved into as many syllogisms as there are middle terms here this is found universally to hold, when such a resolution is made, and the terms are placed in train; the conclusion of the series is also the conclusion of the whole. This kind of argument, therefore, as it unites several syllogisms into one, must rest on the same foundation with the syllogism which it consists, and is indeed, properly, no other than a compendious way of syllogistically.

What is here said of plain simple propositions may be as well applied to those that are compound; that is, any number of them may be together in a series, that the consequent shall become continually the antecedent of following; in which case, by establishing the antecedent of the first proposition, we establish the consequent of the last, or by removing the consequent remove also the first antecedent.

This way of reasoning is exemplified in the following argument:—"If we love any man, our emotions of hatred towards him cease; if we love any man, our notions of hatred towards a person cease, and we rejoice in his misfortunes:—If we rejoice in his misfortunes, we certainly wish him no injury:—Therefore, if we love a person, we wish him no injury."—It is evident that this is no other than a series of syllogisms, with this only difference, that here the syllogisms are all conditional. The last species of syllogism we shall take notice of in this section is that commonly distinguished by the name of a DILEMMA. A dilemma is an argument by which we endeavour to prove the truth or falsehood of some assertion. In this, we assume a conditional proposition antecedent of which is the assertion to be proved, and the consequent a disjunctive proposition, enumerating all the possible suppositions which that assertion can take place. If it appears, that all these several suppositions to be rejected, it is plain, that the antecedent or assertion itself must be so too. Therefore such a proposition as that before mentioned is made the major of any syllogism; if it is rejected, all the suppositions contained in the consequent, it necessarily follows, that the antecedent ought to be rejected, which is the assertion to be disproved. This particular way of arguing is that which logicians call a dilemma; and from the account here given of it, we may in the general define it to be a hypothetical syllogism, where the consequent of the major is a disjunctive proposition, wholly taken away or removed in the minor. Of this kind is the following:—"If God create the world perfect in its kind, it will proceed from want of inclination, or from want of power:—But it could not proceed from want of inclination, or from want of

power:—Therefore, he created the world perfect in its kind." Or, which is the same thing: "It is absurd to say that he did not create the world perfect in its kind."

XVI. The nature then of a dilemma is universally this. The major is a conditional proposition, whose consequent contains all the several suppositions upon which the antecedent can take place. As therefore these suppositions are wholly removed in the minor, it is evident that the antecedent must be so too; inasmuch that we here always argue from the removal of the consequent to the removal of the antecedent. That is, a dilemma is an argument in the *modus tollens* of hypothetical syllogisms, as logicians speak. Hence it is plain, that if the antecedent of the major is an affirmative proposition, the conclusion of the dilemma will be negative; but if it is a negative proposition, the conclusion will be affirmative.

#### SECT. V. Of INDUCTION.

I. ALL reasoning proceeds ultimately from first truths, either self-evident or taken for granted; and the first truths of syllogistic reasonings are general propositions. But except in the mathematics, and such other sciences as, being conversant about mere ideas, have no immediate relation to things without the mind, we cannot assume as truths propositions which are general. The mathematician indeed may be considered as taking his ideas from the beginning in their general form. Every proposition composed of such ideas is therefore general; and those which are theoretic are reducible to two parts or terms, a *predicate* and a *subject*, with a *copula* generally affirmative. If the agreement or the relation between the two terms be not immediate and self-evident, he has recourse to an *axiom*, which is a proposition still more general, and which supplies him with a third or middle term. Thus he compares first with the *predicate*, and then with the *subject* or *vice versa*. These two comparisons, when drawn out in form, make two propositions, which are called the *premises*; and if they be immediate and self-evident, the *conclusion*, consisting of the terms of the question proposed, is said to be demonstrated. This method of reasoning is conducted exactly in the syllogistic form explained in the preceding section.

II. But in sciences which treat of things external to the mind, we cannot assume as first principles the most general propositions, and from them infer others less and less general till we descend to particulars. The reason is obvious. Every thing in the universe, whether of mind or body, presents itself to our observation in its individual state; so that perception and judgment employed in the investigation of truth, whether physical, metaphysical, moral, or historical, have in the first place to encounter with PARTICULARS. With these reasons begins, or should begin, its operations. It observes, tries, canvasses, examines, and compares them together, and judges of them by some of those native evidences and original lights which, as they are the first and indispensable inlets of knowledge to the mind, have been called the *primary principles of truth*. See METAPHYSICS.

III. "By such acts of observation and judgment,

this process REASON advances from *particulars to generals*, from *less general to more general*, till by a series of slow progression, and by regular degrees, it arrive at the *most general* notions, called FORMS or FORMAL CAUSES. And by *affirming* or *denying* a genus of a species, or an accident of a substance or class of substances, through all the stages of the gradation, we form *conclusions*, which, if logically drawn, are AXIOMS, or general propositions ranged one above another, till they terminate in those that are UNIVERSAL.

IV. "Thus, for instance, *the evidence of the external senses* is obviously the PRIMARY PRINCIPLE from which all physical knowledge is derived. But, whereas nature begins with *causes*, which, after a variety of changes, produce *effects*, the senses open upon the *effects*, and from them, through the slow and painful road of experiment and observation, ascend to *causes*. By *experiments* and *observations* skillfully chosen, artfully conducted, and judiciously applied, the philosopher advances from one stage of inquiry to another, in the rational investigation of the *general causes* of physical truth. From different experiments and observations made on the same individual subject, and from the same experiments and observations made on different subjects of the same kind, by comparing and judging, he discovers some *qualities*, *causes*, or *phenomena*, which, after carefully distinguishing and rejecting all contradictory instances that occur, he finds common to *many*. Thus, by many collateral comparisons and judgments made upon *particulars*, he ascends to *generals*; by a repetition of the same industrious process, and laborious investigation, he advances from *particular to more general*, till at last he is enabled to form a few of the *most general*, with their attributes and operations into AXIOMS or *secondary principles*, which are the well-founded bases enacted and endorsed by the God of nature.—This is the just and indubitable method of reasoning

in a single branch of science; he was brought to the temple of truth an offering more valuable than he has done by the aggregate of his logical and philosophical productions.

VII. "In all sciences, except the mathematics, it is only after the INDUCTIVE process industriously pursued and successfully completed, that DEFINITION may be logically and advantageously introduced, by beginning with the *general* through all the graduate and subordinate stages, and marking the *specific difference* as it till it arrive at the *individual*, which is the subject of the question. And by adding an *affirmation* or *negation* of the attribute of the *genus* or *individual*, or of a general *accident* of a particular *substance* so defined, making the whole a proposition, the truth of the question is logically solved without any farther process, that instead of being the *first*, as empiric logic in common use, *definition* may be the *last* of reason in the search of truth in general.

VIII. "These AXIOMS or general principles thus *inductively* established, become the primary PRINCIPLES, which may be proceeded SECONDARY, and which lay the foundation for the syllogistic method of reasoning. As they are formed, but not before, we may find the maxim with which logicians set out the exercise of their art, as the great hinge of their reasoning and disputation turns upon *truths* that are *already known*, to determine *truths* which are *not known*." Or, to state it more comprehensively, so as to apply to probability and to scientific reasoning—"From *truths* which are *better known*, to derive *others* which are *less known*." Philosophically speaking, syllogistic reasoning is under *general propositions* to reduce *others* which are *less general*, or which are *particulars* which are known to be true, and to trace their connection with the *generals* by speaking, it is, 'To predicate a *genus*

X. "Till general truths are ascertained by induction, the *third or middle terms* by which syllogisms are made are no where safely to be found. So that other position of the Stagyrice, that "*syllogism naturally prior in order to induction,*" is equally founded; for *induction* does not only naturally necessarily precede *syllogism*; and, except in mathematics, is in every respect indispensable to existence; since, till generals are established, we can be neither *definition, proposition, nor axiom*, and of course no *syllogism*. And as induction the first, so is it the more *essential* and *fundamental* instrument of reasoning: for as *syllogism* cannot produce its own *principles*, it must have them from induction; and if the general proposition or secondary principles be imperfectly or initially established, and much more if they be taken *axiomatically*, upon authority, or by arbitrary assumption like those of Aristotle, all the *syllogizing* in the world is a vain and useless *logomachy*, only instrumental to the multiplication of false learnings and to the invention and confirmation of errors.

The truth of syllogisms depends ultimately on the truth of axioms, and the truth of axioms on the soundness of inductions." (*Tatham's Chart Scale of Truth.*) But though induction is prior in order, as well as superior in utility, to syllogism, we have thought it expedient to treat of it; both because syllogism is an easier exercise of the reasoning faculty than induction, and because it is the method of mathematics, the first use of reason in which the student is communitiated.

#### SECT. VI. Of DEMONSTRATION.

HAVING dispatched what seemed necessary in regard to *induction* and *syllogism*; we now need to consider the laws of demonstration. Here it must be confessed, that in strict demonstration, which removes from the mind all possibility of doubt or error, the inductive method of reasoning can have no place. When the experiments or observations from which the general conclusions are drawn are numerous and extensive, the result of his mode of reasoning is moral certainty; and when the induction be made complete, it would be absolute certainty, equally convincing with mathematical demonstration. But however numerous and extensive, the observations and experiments are, upon which an inductive conclusion is established, they must of necessity come short of the number and extent of nature; which, in some cases, its immensity, defeat all possibility of their comprehension; and in others, by its distance, lie out of the reach of their immediate application. Though truth does not appear in all other departments of learning with that bold and resistless conviction with which it presides in mathematical science, it shines through them all, if not intercepted by prejudice or perverted by error, with a clear and useful, though inferior strength. And it is not necessary for the general safety or convenience of a traveller, that he should always enjoy the heat and splendor of a mid-day sun, whilst he may with more ease pursue his journey under the cooler influence of a morning or an evening ray; it is not requisite, for the various concerns and purposes of life, that men should be led by truth

of the more redundant brightness. Such truth is to be had only in those sciences which are conversant about ideas and their various relations; where every thing being certainly what it appears to be, definitions and axioms arise from mere intuition. Here *syllogism* takes up the process from the beginning; and by a sublime intellectual motion advances from the simplest axioms to the most complicated speculations, and exhibits truth springing out of its first and purest elements, and spreading on all sides into a system of science. As each step in the progress is syllogistic, we shall endeavour to explain the use and application of syllogisms in this species of reasoning.

We have seen, that in all the different appearances they put on, we still arrive at a just and legitimate conclusion; now it often happens, that the conclusion of one syllogism becomes a previous proposition in another; by which means great numbers of them are sometimes linked together in a series, and truths are made to follow one another in train. And as in such a concatenation of syllogisms all the various ways of reasoning that are truly conclusive may be with safety introduced; hence it is plain, that in deducing any truth from its first principles, especially where it lies at a considerable distance from them, we are at liberty to combine all the several kinds of syllogisms above explained, according as they are found best to suit the end and purpose of our inquiries. When a proposition is thus, by means of syllogisms, collected from others more evident and known, it is said to be *proved*; so that we may, in general, define the proof of a proposition to be a syllogism, or series of syllogisms, collecting that proposition from known and evident truths. But more particularly, if the syllogisms of which the proofs consist admit of no premises but definitions, self-evident truths, and propositions already established, then is the argument so constituted called a *demonstration*; whereby it appears that demonstrations are ultimately founded on definitions and self-evident propositions.

II. All syllogisms whatsoever, whether compound, multiform, or defective, are reducible to plain simple syllogisms in some one of the four figures. But this is not all. Syllogisms of the first figure, in particular, admit of all possible conclusions: that is, any propositions whatsoever, whether an universal affirmative or universal negative, a particular affirmative or particular negative, which fourfold division embraces all their varieties; any one of these may be inferred by virtue of some syllogism in the first figure. By these means it happens, that the syllogisms of all the other figures are reducible also to syllogisms of the first figure, and may be considered as standing on the same foundation with them. To demonstrate and explain the manner of this reduction, would too much swell this treatise. It is enough to notice that the thing is universally known and allowed among logicians, to whose writings we refer such as desire farther satisfaction in this matter. This then being laid down, it is plain that any demonstration whatsoever may be considered as composed of a series of syllogisms, all in the first figure—since all the syllogisms that enter the demonstration are reducible to syllogisms of the first figure.

to any idea; the same must needs agree or any number of individuals comprehend that idea." And thus at length, according to our first design, reduced into demonstration to one simple and principle; which carries its own evidence with it, and which is indeed the foundation of all syllogistic reasoning.

monstration therefore serving as an infallible to truth, and standing on so sure and stable a basis, we may now venture to affirm that the rules of logic furnish a sufficient criterion the distinguishing between truth and falsehood. For since every proposition that can be demonstrated is necessarily true, he is able to distinguish truth from falsehood, who can with confidence judge when a proposition is truly demonstrated. Now, a demonstration is nothing more than a concatenation of syllogisms, all whose premises are definitions, self-evident truths, or propositions previously established. To judge of the validity of a demonstration, we enquire whether the definitions that engage are genuine, and truly descriptive of the things they are meant to exhibit: whether the propositions assumed without proofs as intuitive truths are really that self-evidence to which they lay claim; whether the syllogisms are drawn up in a just and agreeable to the laws of argumentation, and whether they are combined together in a just and orderly manner, so that no single proposition serves any where as a premiss which is a conclusion of previous syllogisms.

Now, it is the business of logic, in executing the several operations of the mind, fully to direct us in all these points. It teaches the method and end of definitions, and lays down the rules which they ought to be framed. It distinguishes the several species of propositions, and describes the self-evident from the demonstrable. It states also the different forms of syllogisms, and assigns the laws of argumentation proper to each; and describes the manner of combining them, so as that they may form a train of reasoning, and lead to the successive discovery of truth. The precepts of logic, therefore, as they direct us to judge with certainty when a proposition is demonstrated, furnish a sure criterion the distinguishing between truth and falsehood.

Perhaps it may be objected, that demonstration is a thing very rare and uncommon, as the prerogative of but a few sciences, and that the criterion here given can be of no use. But wherever, by the bare contemplation of our ideas, truth is discoverable, there demonstration may be attained. Now that is an instantly sufficient criterion which enables us to judge with certainty in all cases where the degree of truth comes within our reach; for those sciences, that lie beyond the limits of the human mind, we have, properly, no business. A proposition is demonstrated, we are certain it is truth. When, on the contrary, our ideas are such as have no visible connection or resemblance, and therefore furnish not the proper materials for tracing their agreement or disagreement, we are sure that scientific knowledge is

not attainable. But where there is some foundation of reasoning, which yet amounts not to the full evidence of demonstration, there the precepts of logic, by teaching us to determine aright of the degree of proof, and of what is still wanting to render it full and complete, enable us to make a due estimate of the measures of probability, and to proportion our assent to the grounds on which the proposition stands. And this is all we can possibly arrive at, or even so much as hope for, in the exercise of faculties so imperfect and limited as ours.

VII. Before we conclude this section it is proper to take notice of the distinction of demonstration into DIRECT and INDIRECT. A *direct* demonstration is, when, beginning with definitions, self-evident propositions, or known and allowed truths, we form a train of syllogisms, and combine them in an orderly manner, continuing the series through a variety of successive steps, until at last we arrive at a syllogism whose conclusion is the proposition to be demonstrated. Proofs of this kind leave no doubt or uncertainty behind them; because, all the several premises being true, the conclusion must be so too, and of course the very last conclusion or proposition to be proved. The other species of demonstration is the *indirect*, or, as it is sometimes called, the *apagogical*. The manner of proceeding here is, by assuming a proposition which directly contradicts that we mean to demonstrate; and thence, by a continued train of reasoning, in the way of a direct demonstration, deducing some absurdity or manifest untruth. For hereupon we conclude, that the proposition assumed was false; and thence again, by an immediate consequence, that the proposition to be demonstrated is true. Thus Euclid, in his third book, being to demonstrate that circles which touch one another inwardly have not the same centre, assumes the direct contrary to this, viz. that they have the same centre; and thence, by an evident train of reasoning, proves that a part is equal to the whole. The supposition therefore leading to this absurdity he concludes to be false, and thence immediately infers, that they have not the same centre.

VIII. Now, because this manner of demonstration is accounted by some not altogether so clear and satisfactory; we shall therefore endeavour to show that it leads to truth and certainty equally with the other. Two propositions are said to be *contradictory* one of another, when that which is asserted to be in the one is asserted not to be in the other. Thus the propositions, "Circles that touch one another inwardly have the same centre," and "Circles that touch one another inwardly have not the same centre," are *contradictories*, because the second asserts the direct contrary of what is asserted in the first. Now, in all contradictory propositions, this holds universally, that one of them is necessarily true, and the other necessarily false. For if it be true, that circles which touch one another inwardly have not the same centre; it is unavoidably false, that they have the same centre. On the other hand, if it be false that they have the same centre, it is necessarily true that they have not the same centre. Since therefore it is impossible for them to be both true or both false at the same

same time; it unavoidably follows, that one is necessarily true, and the other necessarily false. This then being allowed, which is indeed self-evident, if any two contradictory propositions are assumed, and one of them can by a clear train of reasoning be demonstrated to be false, it necessarily follows, that the other is true. For as the one is necessarily true, and the other necessarily false; when we come to discover which is the false proposition, we thereby also know the other to be true.

IX. Now this is precisely the manner of an indirect demonstration, as is evident from the account given of it above. For there we assume a proposition which directly contradicts that we mean to demonstrate; and, having by a continued series of proofs shown it to be false, thence infer that its contradictory, or the proposition to be demonstrated is true. As, therefore, this last conclusion is certain and unavoidable; let us next inquire after what manner we come to be satisfied of the falsehood of the assumed proposition, that so no possible doubt may remain as to the force and validity of demonstrations of this kind. The manner then is plainly this: Beginning with the assumed proposition, we, by the help of definitions, self-evident truths, or propositions already established, continue a series of reasoning, in the way of a direct demonstration, until at length we arrive at some absurdity or known falsehood. Thus Euclid, in the example before-mentioned, from the supposition that circles touching one another inwardly have the same centre, deduces, that a part is equal to the whole. Since, therefore, by a due and orderly process of reasoning, we come at last to a false conclusion; it is manifest, that all the premises cannot be true: for, were all the premises true, the last conclusion must be so too, by what has been before demonstrated. Now, as to all the other premises made use of in the course of reasoning, they are manifest and known truths by supposition, as being either definitions, self-evident propositions, or truths previously established. The assumed proposition is that only as to which any doubt or uncertainty remains. That alone, therefore, can be false; and indeed, from what has been already shown, must unavoidably be so. And thus we see, that in indirect demonstrations, two contradictory propositions being laid down, one of which is demonstrated to be false, the other, which is always the proposition to be proved, must necessarily be true; so that here, as well as in the direct way of proof we arrive at a clear and satisfactory knowledge of truth.

X. This is universally the method of reasoning in all apogical or indirect demonstrations. But if any proposition is assumed, from which, in a direct train of reasoning, we can deduce its contradictory; the proposition so assumed is false and the contradictory one true. For if we suppose the assumed proposition to be true, then, since all the other premises that enter the demonstration are also true, we shall have a series of reasoning consisting wholly of true premises; whence the last conclusion or contradictory of the assumed proposition must be true likewise: so that we should thus have two contradictory propositions both true at

the same time, which is manifestly impossible. The assumed proposition, therefore, whence the absurdity flows, must necessarily be false; and consequently its contradictory, which is here the proposition deduced from it, must be true. If the any proposition is proposed to be demonstrated and we assume the contradictory of that proposition and thence directly infer the proposition to be demonstrated; by these very means we know, that the proposition so inferred, is true. For, since from an assumed proposition we have deduced it contradictory, we are thereby certain that the assumed proposition is false; and if so, then its contradictory, or that deduced from it, which in this case is the same with the proposition to be demonstrated, must be true.

XI. We have a curious instance of this in the 12th proposition of the 9th book of the Elements. Euclid there proposes to demonstrate, that "in any series of numbers, rising from unity in geometrical progression, all the prime numbers that measure the last term in the series will also measure the next after unity." In order to this, he assumes the contradictory of the proposition to be demonstrated; namely, that "some prime number measuring the last term in the series does not measure the next after unity," and thence, by a continued train of reasoning, proves that it actually does measure it. Hereupon he concludes the assumed proposition to be false; and that which is deduced from it, or its contradictory, which is the very proposition he proposed to demonstrate, to be true. Now that this is a just and conclusive way of reasoning, is abundantly manifest from what we have so clearly established above. Whence it appears, how necessary some knowledge of the rules of logic is, to enable us to judge of the force, justness, and validity, of demonstrations. For, though it is readily allowed, that by the mere strength of our natural faculties we can at once discern, that of two contradictory propositions, the one is necessarily true and the other necessarily false; yet when they are so linked together in a demonstration, as that the one serves as a previous proposition whence the other is deduced, it does not so immediately appear, without some knowledge of the principles of logic, why that alone, which is collected by reasoning, ought to be embraced as true, and the other, whence it is collected, to be rejected as false.

XII. Having thus sufficiently evinced the certainty of demonstration in all its branches, and shown the rules by which we ought to proceed, in order to arrive at a just conclusion, according to the various ways of arguing made use of; it is needless to enter upon a particular consideration of those several species of false reasoning which logicians distinguish by the name of *SOPHISMS*. He that thoroughly understands the form and structure of a good argument, will of himself readily discern every deviation from it. And although *sophisms* have been divided into many classes, which are all called by founding names, that therefore carry in them much appearance of learning; yet are the errors themselves so very palpable and obvious, that it would be lost labour to write for a man capable of being misled by

Here, therefore, we choose to con-  
 art of logic; and shall in the next give  
 nt of METHOD, which, though infer-  
 m reasoning, is nevertheless always  
 y logicians as a distinct operation of  
 because its influence is not confined  
 exercise of the reasoning faculty, but  
 some degree to all the transactions of  
 inding.

PART IV.  
 OF METHOD.

*f* the DIFFERENT SPECIES of METHOD.

ave now done with the three first ope-  
 the mind, whose office it is to search  
 , and enlarge the bounds of human  
 . There is yet a fourth, which regards  
 l and arrangement of our thoughts,  
 endeavour so to put them together as  
 mutual connection and dependence  
 arly seen. This is what logicians call  
 d place always the last in order in ex-  
 e powers of the understanding; be-  
 cessarily supposes a previous exercise  
 er faculties, and some progress made  
 ge before we can exert it in any exten-

s view, it is plain that we must be be-  
 vell acquainted with the truths we are  
 together; otherwise, how could we  
 ir several connections and relations, or  
 of them as their mutual dependence  
 e? But it often happens, that the un-  
 is employed, not in the arrangement  
 sition of known truths, but in the  
 discovery of such as are unknown.  
 he manner of proceeding is very diffic-  
 assemble at once our whole stock of  
 relating to any subject, and, after a  
 vey of things, begin with examining  
 ately and by parts. Hence it comes  
 at whereas, at our first setting out, we  
 ainted only with some of the grand  
 outlines of truth; by thus pursuing  
 h her several windings and recesses, we  
 discover those more inward and finer  
 ence she derives all her strength, sym-  
 l beauty. And here it is, that when,  
 w scrutiny into things, we have un-  
 y part of knowledge, and traced it  
 nd original principles, inasmuch that  
 frame and contexture of it lies open to  
 f the mind; here it is, that, taking it  
 y way, and beginning with these prin-  
 cau so adjust and put together the  
 e order and method of science requires.

as these things are best understood  
 rated by examples; let us suppose any  
 or instance a watch, presented to us,  
 clure and composition we are as yet  
 ed with, but want, if possible, to dis-  
 e manner of proceeding, in this case,  
 ng the whole to pieces, and examining  
 parately, one after another. When,  
 crutiny, we have thoroughly informed  
 f the frame and contexture of each, we

then compare them together, in order to judge  
 of their mutual action and influence. Thus we  
 gradually trace out the inward make and com-  
 position of the whole, and come at length to dis-  
 cern how parts of such a form, and so put to-  
 gether, as we found in unravelling and taking them  
 asunder, constitute that particular machine called  
 a watch, and contribute to all the several motions  
 and phenomena observable in it. This discovery  
 being made, we can take things the contrary way,  
 and, beginning with the parts, so dispose and  
 connect them as their several uses and structures  
 require, until at length we arrive at the whole  
 itself, from the unravelling of which those parts  
 resulted.

IV. And as it is in tracing and examining the  
 works of art; so is it, in a great measure, in un-  
 folding any part of human knowledge: for the  
 relations and mutual habitudes of things do not  
 always immediately appear upon comparing them  
 one with another. Hence we have recourse to  
 intermediate ideas; and by means of them, are  
 furnished with those previous propositions that  
 lead to the conclusion we are in quest of. And  
 if it so happen that the previous propositions  
 themselves are not sufficiently evident, we endeav-  
 our, by new middle terms, to ascertain their  
 truth; still tracing things backward, in a conti-  
 nual series, until we arrive at some syllogism where  
 the premises are first and self-evident principles.  
 This done, we become perfectly satisfied as to  
 the truth of all the conclusions we have passed  
 through, inasmuch as they are now seen to stand  
 upon the firm and immovable foundation of our  
 intuitive perceptions. And as we arrived at this  
 certainty by tracing things backward to the ori-  
 ginal principles whence they flow; so may we at  
 any time renew it by a direct contrary process, if,  
 beginning with these principles, we carry the train  
 of our thoughts forward until they lead us, by a  
 connected chain of proofs, to the very last conclu-  
 sion of the series.

V. Hence it appears, that, in disposing and  
 putting together our thoughts, either for our  
 own use, that the discoveries we have made may  
 at all times lie open to the review of the mind,  
 or where we mean to communicate and unfold  
 the discoveries to others, there are two ways of  
 proceeding equally within our choice: for we  
 may so propose the truth relating to any part of  
 knowledge, as they presented themselves to the  
 mind in the manner of investigation; carrying on  
 the series of proofs, in a reverse order, until they  
 at last terminate in first principles: or, beginning  
 with these principles, we may take the contrary  
 way, and from them deduce, by a direct train of  
 reasoning, all the several propositions we want to  
 establish. The diversity in the manner of arrang-  
 ing our thoughts gives rise to the twofold division  
 of method established among logicians: for meth-  
 od, according to their use of the word, is noth-  
 ing else but the order and disposition of our  
 thoughts relating to any subject. When truths  
 are so proposed and put together as they were or  
 might have been discovered, this is called the  
*analytic method*, or the *method of resolution*; inas-  
 much as it traces things backward to their source,  
 and resolves knowledge into its first and original  
 principles.

principles. When, on the other hand, they are deduced from these principles, and connected according to their mutual dependence, inasmuch that the truths first in order tend always to the demonstration of those that follow; this constitutes what we call the *synthetic method*, or *method of composition*. For here we proceed by gathering together the several scattered parts of knowledge, and combining them into one whole or system, in such a manner that the understanding is enabled distinctly to follow truth through all her different stages and gradations.

VI. The first of these two species of method has also obtained the name of the *method of invention*, because it observes the order in which our thoughts succeed one another in the invention or discovery of truth. The other again, is often denominated the *method of doctrine* or *instruction*; inasmuch as, in laying our thoughts before others, we generally choose to proceed in the synthetic manner, deducing them from their first principles. For although there is great pleasure in pursuing truth in the method of investigation, because it places us in the condition of the inventor, and shows the particular train and process of thinking by which he arrived at his discoveries; yet it is not so well accommodated to the purposes of evidence and conviction. For, at our first setting out, we are commonly unable to divine where the analysis will lead us; inasmuch that our researches are for some time little better than a mere groping in the dark. And even after light begins to break in upon us, we are still obliged to make many reviews, and a frequent comparison of the several steps of the investigation among themselves. Nay, when we have unravelled the whole, and reached the very foundation on which our discoveries stand, all our certainty, in regard to their truth, will be found in a great measure to arise from that connection we are now able to discern between them and first principles, taken in the order of composition. But in the synthetic manner of disposing our thoughts, the case is quite different: for as we here begin with the intuitive truths, and advance by regular deductions from them, every step of the procedure brings evidence and conviction along with it; so that, in our progress from one part of knowledge to another, we have always a clear perception of the ground on which our assent rests. In communicating therefore our discoveries to others, this method is apparently to be chosen, as it wonderfully improves and enlightens the understanding, and leads to an immediate perception of truth.

#### SECT. II. *Of the UTILITY of LOGIC.*

THE logic which for so many ages kept possession of the schools, and was deemed the most important of the sciences, has long been condemned as a mere art of wrangling, of very little use in the pursuit of truth. Attempts have been made to restore it to credit, but without success; and of late years little or no attention whatever has been paid to the *art of reasoning* in the course of what is called a liberal education. As both extremes are faulty, we cannot conclude this short treatise more properly than with the following reflections on the utility of this science.

IF ARISTOTLE was not the inventor of what was certainly the prince of logicians. The theory of syllogisms he claims as his own the fruit of much time and labour; and universally known, that the later writers have borrowed their materials almost entirely his *Organon* and Porphyry's Introduction after men had laboured near 2000 years of truth by the help of syllogisms, Logic proposed the method of induction, as a factual engine for that purpose; and since the art of logic has gradually fallen into

To this consequence many causes concur. The art of syllogism is admirably calculated for wrangling; and by the schoolmen it was used with too much success, to keep in countenance the absurdities of the Romish church. Its management it produced numberless dissenting sects, who fought against each other with much animosity without gaining any ground; but it did nothing considerable for the benefit of human life, whilst the method of induction has improved arts and increased knowledge. It is no wonder, therefore, that the estimation of Aristotle, which continued for many ages, should end in an undervaluation. The high esteem of logic, as the grand key of science, should at last make way for a more favourable an opinion, which seems now of its being unworthy of a place in a liberal education. Men rarely leave one extreme running into the contrary: Those who were formerly so fond of the fashion, will be as prone to the present extreme as their grandfathers were to the former; and even they who think for themselves, when they are sensible of the abuse of any thing, are too apt to be prejudiced against the *thing itself*. "I have said" (says the learned WARBURTON in his *Letter to Julian*, &c.), logic is more a *trick* than an art, formed rather to amuse than to instruct. In some sort we may apply to the art of logic what a man of wit says of rhetoric, that it tells us how to *name* those tools which are before put into our hands. In the service of the cane, indeed, it is a meer juggler's knot now loose; and the schools where the main was exercised in great perfection: the stories of its wonders." The authority of Warburton is great; but it may be counterbalanced by another which, on subjects of this kind, is confessedly greater.

"Laying aside prejudice, whether it be in vogue or unfashionable, let us consider (says I in his *Appendix to Lord Kames's Sketch on the People and Progress of Reason*) whether logic can be made subservient to any good purpose. The professed end is, to teach men to think and to reason, with precision and accuracy. A man will say that this is a matter of little consequence: the only thing therefore that can be doubted is, whether it can be taught?"

"To resolve this doubt, it may be said that our rational faculty is the gift of God to men in very different measures: Some have a large portion, some a less; and where there is a remarkable defect of the natural power, it may be supplied by any culture. But this na-

even where it is the strongest, may lie dead or want of the means of improvement. Many a sage may have been born with as good faculties as NEWTON, a BACON, or an ARISTOTLE; but their talents were buried by having never been put to use, whilst those of the philosophers were cultivated to the best advantage. It may likewise be served, that the chief mean of improving our rational power, is the vigorous exercise of it in various ways and on different subjects, by which the art is acquired of exercising it properly. Without such exercise, and good sense over and above, man who has studied logic all his life may be by a petulant wrangler, without true judgment or skill of reasoning in any science."

"This must have been LOCKE'S meaning, when, in his *Thoughts on Education*, he says, "If you would have your son to reason well, let him read MILLINGWORTH." The state of things is much altered since Locke wrote: Logic has been much improved chiefly by his writings; and yet much stress is laid upon it, and less time consumed in its study. His counsel, therefore, was judicious and reasonable; to wit, That the improvement of our reasoning power is to be expected much more from an intimate acquaintance with the authors who reason best, than from studying voluminous systems of school logic. But if he had meant, that the study of logic was of no use, nor deserved any attention, he surely would not have taken the pains to make so considerable an addition to it, by his *Essay on the Human Understanding*; and by his *Thoughts on the Conduct of the Understanding*; nor would he have remitted his notice to *Chillingworth*, the acutest logician as well as the best reasoner of his age."

There is no study better fitted to exercise and strengthen the reasoning powers than that of the mathematical sciences; because there is no other branch of science which gives such scope to long and intricate trains of reasoning, or in which there is so much room for authority or prejudice of any kind to cast a false bias to the judgment. When a youth of moderate parts begins to study Euclid, every thing is new to him: His apprehension is unsteady; his judgment is feeble; and rests partly upon the evidence of the thing, and partly upon the authority of the teacher. But every time he goes over the demonstrations, the axioms, the elementary propositions, more light breaks in upon him; and as he advances, the road of demonstration becomes more and more easy: he can walk in it firmly, and take wider steps, till at last he acquires the habit not only of understanding a demonstration, but of discovering and demonstrating mathematical truths.

It must indeed be confessed, that a man without the rules of logic may acquire a habit of reasoning in mathematics, and perhaps in any other science. Good sense, good examples, and assiduous exercise, may bring a man to reason justly and clearly in his own profession without rules. But never think, that from this conclusion he may infer the utility of logic, or that he may regret the want of that art; for he might as well infer, because a man may go from Edinburgh to London by the way of Paris, that therefore any road is useless.

OL. XIII. PART. II.

There is perhaps no art which may not be acquired, in a very considerable degree, by example and practice, without reducing it to rules. But practice joined with rules may carry a man forward in his art farther and more quickly than practice without rules.—Every ingenious artist knows the utility of having his art reduced to rules, and thereby made a science. By rules he is enlightened in his practice, and works with more assurance. They enable him sometimes to correct his own errors, and often to detect the errors of others; and he finds them of great use to confirm his judgment, to justify what is right, and to condemn what is wrong. Now mathematics are the noblest *praxis* of logic. Through them we may perceive how the stated forms of syllogism are exemplified in one subject, namely the predicament of quantity; and by marking the force of these forms, as they are there applied, we may be enabled to apply them of ourselves elsewhere. Whoever, therefore, will study mathematics with this view, will become not only by mathematics a more expert *logician*, and by logic a more rational *mathematician*, but a wiser philosopher, and an acuter reasoner, in all the possible subjects either of science or deliberation. But when mathematics, instead of being applied to this excellent purpose, are used not to exemplify logic, but to supply its place; no wonder if logic fall into contempt, and if mathematics, instead of furthering science, become in fact an obstacle. For when men, knowing nothing of that reasoning which is UNIVERSAL, come to attach themselves for years to a *single species*, a species wholly involved in *lines and numbers*, the mind becomes incapacitated for reasoning at large, and especially in the search of MORAL TRUTH. The object of mathematics is *demonstration*; and whatever in that science is not demonstration, is nothing, or at least below the sublime inquirer's regard. PROBABILITY, through its almost infinite degrees, from simple ignorance up to absolute certainty, is the *terra incognita* of the mathematician. And yet here it is that the great *business* of the human mind is carried on, in the search and discovery of all the important truths which concern us as reasonable beings. And here too it is, that all its *vigour* is exerted: for to proportion the assent to the probability accompanying every varying degree of moral evidence, requires the most enlarged and sovereign exercise of reason.

In reasonings of this kind, will any man pretend that it is of no use to be well acquainted with the various powers of the mind by which we reason? Is it of no use to resolve the various kinds of reasoning into their simple elements; and to discover, as far as we are able, the rules by which these elements are combined in judging and in reasoning? Is it of no use to mark the various fallacies in reasoning, by which even the most ingenious men have been led into error? It must surely betray great want of understanding, to think these things useless or unimportant. Now these are the things which logicians have attempted; and which they have executed—not indeed so completely as to leave no room for improvement, but in such a manner as to give very considerable aid to our reasoning powers. That the principles

they have laid down with regard to definition and division, with regard to the conversion and opposition of propositions, and the general rules of reasoning, are not without use, is sufficiently apparent from the blunders committed daily by those who disdain any acquaintance with them.

Although the art of categorical syllogism is confessedly little fitted for the discovery of unknown truth, it may yet be employed to excellent purposes, as it is perhaps the most compendious method of detecting a fallacy. A man in quest of unknown truths must generally proceed by the way of induction, from effects to causes; but he, who as a teacher is to inculcate any system upon others, begins with one or more self-evident truths, and proceeds in the way of demonstration, to the conclusion which he wishes to establish. Now every demonstration, may be resolved into a series of syllogisms, of which the conclusion of the preceding always enters into the premises of that which follows: and if the first principles be clear and evident, and every syllogism in some legitimate mode and figure, the conclusion of the whole must infallibly be admitted. But when the demonstration is thus broken into parts; if we find that the conclusion of one syllogism will not, without altering the meaning of the terms, enter legitimately into the premises of that which should

immediately follow; or, supposing it to be of the premises of a *new* syllogism, if we the conclusion resulting from the whole is obtained, is different from that of the deduction; we may, in either of these cases, rest that the author's reasoning is fallacious, or to error; and that if it carried an apparent conviction before it was thus resolved into elementary parts, it must have been owing to the inability of the mind to comprehend an *long* train of arguments. Whoever wishes to employ the syllogistic art for this purpose, he will be convinced of the truth of what we have respecting its utility, may consult the writer recommended by Locke, who, in his innumerable of his incomparable book, has set out pedantry, even in that pedantic age, the happiest application of the rules of logic, unravelling the sophistry of his Jesuitical

On the whole, then, though we acknowledge that much time was wasted by our forefathers in syllogistic wrangling, which may be termed *mechanical* part of logic, yet the art of reasoning and examining arguments is certainly a most valuable and worthy the ambition of the philosopher whose highest honour is, to be endued with wisdom.

## L O G

## L O G

\* LOGICAL. *adj.* [from *logick*.] 1. Pertaining to logic; taught in logic.—The heretick complained greatly of St Augustine, as being too full of logical subtleties. *Hooker*.—Those who in a logical dispute keep in general terms, would hide a fallacy. *Dryden*.—We ought not to value ourselves upon our ability, in giving subtle rules, and finding out logical arguments, since it would be more perfection not to want them. *Baker*. 2. Skilled in logic; furnished with logic.—A man who sets up for a judge in criticism, should have a clear and logical head. *Addison*.

\* LOGICALLY. *adv.* [from *logical*.] According to the laws of logic.—

How can her old good man  
With honour take her back again?  
From whence I logically gather

The woman cannot live with either. *Prior*.  
\* LOGICIAN. *n. s.* [*logicien*, French; *logicus*, Latin.] A teacher or professor of logic; a man versed in logic.—If a man can play the true logician, and have as well judgment as invention, he may do great matters. *Bacon*.—If we may believe our logicians, man is distinguished from all other creatures by the faculty of laughter. *Addison*.—

Each fierce logician still expelling Locke,  
Came whip and spur. *Pope's Dunciad*.  
—A logician might put a case that would serve for an exception. *Swift*.—The Arabian physicians were subtle men, and most of them logicians; accordingly they have given method, and shed subtilty upon their author. *Baker*.

(1.) LOGIE, (Gael. *Lagie*, i. e. a hollow or low place.) a parish of Fifeshire, 2½ miles long, and one broad, between Cupar and the Ferry. The climate is dry, and the soil fertile, producing

plentiful crops of all kinds. The population was 425; increase 12, since 1755. There are about 70 horses, and 2 flocks of sheep.

(2.) LOGIE, a village in the above parish in a hollow near a marsh, 3 miles from Cupar and 5 from Dundee.

(3.) LOGIE, a parish of Forfarshire, called LOGIE-MONTROSE, united with PERT, about A. D. 1610. The two are 4 miles long, from E. to W. and 3 broad; 1 on the N. and E. by the North Esk, and 1 on the S. by the South Esk. There are 14 miles from Montrose and Brechin. The soil is sharp, but salubrious; the soil various. 1850 acres were under oats, barley, pease, flax, potatoes, turnips, and hay, in 1720 in pasture, wood, and moorlands. The population, in 1791, was 999; increase, since 1703. The number of horses was 185, and black cattle 940. There are 2 bleas which employ about 50 hands; and few quarries, which produce above 16,000 shells, or 48,000 bolls of fine lime, annually are 12 mills for grain, flax, thread, and Thirlages are not wholly abolished.

(4.) LOGIE, a parish of Scotland, in the county of Perth, Stirling, and Clackmannan, 4 miles square. One half of it is a stony clay ground, producing excellent crops of wheat on the dry hilly ground, affording good pasture. The population, in 1761, was 1500; about 1750 in each county; decrease 485, since 1750. In the short period of 6 years, which is not accounted for in the *Statistical Account*, and seems very unaccountable. There are silver a

ance. The former was wrought during the  
1761—4.

) LOGIE. See LIPP, N° 1.

) LOGIE BUCHAN, a parish of Aberdeenshire,  
les long, and from 1 to 2 broad; intersect-  
y the Ythan. The soil is fertile in general,  
(what is singular) is most barren on the banks  
e river through its whole course. Oats and  
y are almost the only produce. The popu-  
4, in 1791, was 538; decrease 37 since 1755.  
97, there was a still farther decrease of 29;  
66.

) LOGIE COLDSTONE, a parish of Aberdeen-  
6 miles long from N. to S. 3½ broad, and  
om Aberdeen; surrounded by a large ridge  
ls. It consists of the united parishes of *Lo-  
nd Coldstone*. The climate is cold but salu-  
s; the soil various; oats, barley, and pota-  
are the chief produce. The population, in  
was 1182; the decrease 61, since 1755. The  
abounds with game, and there are several  
ical temples.

) LOGIE EASTER. See LOGGIE.

) LOGIE MONTROSE. See N° 3.

) LOGIERAIT, [*Gael.* from *Logan*, a hollow,  
*ait*, the ending of differences;] a parish of  
shire, lying mostly between the Tay and the  
mel, in the form of an irregular triangle, a-  
7 miles long. But one detached part of it  
ds a mile S. of the Tay; and another lies in  
och, 30 miles distant. The prospect it af-  
is grand beyond description. About 2700  
are arable, and produce oats, barley, pease,  
ses, and flax. The population, in 1791, was  
decrease 287 since 1755. A shock of an  
quake was felt about 1763.

) LOGIERAIT, a village in the above parish,  
ling 200 souls, in 1791; 7 miles N. of Dan-

GINOV, a town of Russia, in Tobolsk.

GISMUS, in rhetoric, an inconclusive kind  
ment. *Ash.*

GISTÆ, certain officers at Athens, in num-  
s, whose business consisted in receiving and  
g the accounts of magistrates when they  
out of office. The *logistæ* were elected by  
ad had ten *antibyni* or auditors of accounts  
them.

GISTIC, or } *adj.* Belonging to computa-  
GISTICAL, } tion; logarithmic; sexagesi-  
*Ash. Bailey.*

LOG. See LOG; § 4.

LOGMAN. *n. f.* [*log* and *man*.] One whose  
is to carry logs—

For your sake

I this patient *logman*? *Shak.*  
GOGRAPHER, *n. f.* [from *λογος*, Greek, a  
and *γράφω*, I write.] A lawyer's clerk; a  
of books of accounts. *Bailey.*

GOGRAPHIC, *adj.* Belonging to the writ-  
printing of words. See next article.

GOGRAPHY, *n. f.* a method of printing,  
hs the types, instead of answering only to  
atters, are made to correspond to *whole*  
This method, though seemingly a retro-  
gression in the art of printing, obtained  
sion of his Majesty's patent, and for some  
was actually put in execution in the way of

trade. In 1783, a treatise was published upon  
this subject, by Henry Johnson, in which the ori-  
gin and utility of the art are fully laid down. In  
this work Mr Johnson informs us, that in 1778,  
intending to publish a daily list of blanks and  
prizes in the lottery numerically arranged, he  
found it could not be accomplished in time by the  
ordinary way of printing. On this account he pro-  
cured types of 2, 3, or more figures as was neces-  
sary for his purpose; and thus any entire num-  
ber might as readily be taken up as if it had been  
a single type. His next attempt was to form some  
large mercantile tables of pounds, shillings, pence,  
and farthings. For these he procured types ex-  
pressive of any sum of money ready composed and  
united, "by which (says he) every species of fi-  
gure-printing could be performed for the 10th  
part of the cost, printers always charging it double  
the price of letter printing." Having thus suc-  
ceeded to his wish in his two first attempts, he  
next began to consider if the method could not  
be applied to words; and in this also the success  
was equal. "The properties of the logographic  
art (he says) are, 1. That the compositor shall  
have less charged upon his memory than in the  
common way. 2. It is much less liable to error.  
3. The type of each word is as easily laid hold of  
as that of a single letter. 4. The decomposition  
is much more readily performed, even by the  
merest novices than they now decompose letters.  
5. No extraordinary expence nor greater number  
of types is required in the logographic than in the  
common method of printing." But however plau-  
sible the logographic art may appear in theory,  
the practice seems not to have answered expecta-  
tion, else it would certainly have come into ge-  
neral use before this time: instead of which, after  
having excited much curiosity, it has been aban-  
doned even by its original inventors and patrons.  
An invention somewhat similar by Mr Ged, jeweler  
in Edinburgh, of 'printing by types cut on  
*quobale pages* met with a similar fate above 50 years  
ago. See GED.

\* LOGOMACHY. *n. f.* [*λογμαχία*.] A conten-  
tion in words; a contention about words.—For-  
ced terms of art did much puzzle sacred theology  
with distinctions, cavils, quiddities; and so trans-  
formed her to a meer kind of sophistry and *logo-  
machy*. *Howell.*

LOGOWOGOROD, a town of Poland, in  
Volhymia, on the W. bank of the Dnieper; 25  
miles NW. of Kiow. Lon. 35. 7. Lat. 50. 46. N.

LOGRONNO, or } a town of Spain, in Old  
LOGRONO, } Castile, on the Ebro, con-  
taining about 5000 people; 52 miles E. of Bur-  
gos, and 115 N. by E. of Madrid. Lon. 2. 20. W.  
Lat. 42. 29. N.

LOGSTOR, a town of N. Jutland.  
LOGSTOWN, a town of Pennsylvania, on  
the Allegany, 18 miles NW. of Pittsburg.

LOGUIRY, a town of France, in the dep. of  
the North Coasts; 12 miles S. of Lannion.

(1.) \* LOGWOOD. *n. f.* *Logwood* is of a ve-  
ry dense and firm texture; is the heart only of  
the tree which produces it. It is very heavy,  
and remarkably hard, and of a deep, strong, red  
colour. It grows both in the East and West In-  
dies, but no where so plentifully as on the coast

of the bay of Campeachy. *Hill*.—To make a light purple, mingle ceruse with *logwood* water. *Peachment*.

(2.) **LOGWOOD**. See *ΗΑΜΑΤΟΧΥΛΟΝ*. Logwood is used in great quantities for dyeing purple, but especially black colours. All the colours, however, which can be prepared from it are of a fading nature, and cannot by any art be made equally durable with those prepared from some other materials. Of all the colours prepared from logwood, the black is the most durable. Dr Lewis recommends it as an ingredient in making ink. "In dyeing cloth (says he), vitriol and galls, in whatever proportions they are used, produce only browns of different shades: I have often been surpris'd that with these capital materials of the black dye I could never obtain any true blackness in white cloth, and attributed the failure to some unheeded mismanagement in the process, till I found it to be a known fact among the dyers. Logwood is the material which adds blackness to the vitriol and gall-brown; and this black dye, though not of the most durable kind, is the most common. On blue cloth a good black may be dyed by vitriol and galls alone; but even here, an addition of logwood contributes not a little to improve the colour." See *COLOUR-MAKING, Index; DYEING, Part III. Sec. I. and VII.*; and *INK, § 5, 6*. Logwood is also found to have a considerable astringent virtue as a medicine, and an extract of it is sometimes given with great success in diarrhoeas.

**LOHE**, a town of Austria, 12 m. SW. of Crems.

**LOHEIA**, a town of Arabia, in Yemen, on the coast of the Red Sea, 375 miles SW. of Mecca. It has a great trade in Coffee. Lon. 42. 49. E. Lat. 15. 42. N.

**LOHHENSTEIN**, Daniel Gaspar DE, a learned German nobleman, born at Breslaw in 1635. He is esteemed the first regular dramatic poet of Germany. He died in 1683.

(1.) **LOHN**, or **LAHN**. See **LAHN**, N° 2.

(2.) **LOHN**. See **ISERLOHN**.

**LOHNSTEIN**, or **LAHNSTEIN**, a town of Germany, in the electorate of Mentz, at the conflux of the Rhine and the Lahn; 4 miles E. of Coblenz, and 10 W. of Nassau.

\* **LOHOCK**. *n. f.* *Lobock* is an Arabian name for those forms of medicines which are now commonly called Eclemmas, lambatives, or linctuses. *Quincy*.—*Lobocks* and pectorals were prescribed, and venesection repeated. *Wijeman*.

(2.) *А ЛОХОК*, or **LOCH**, in pharmacy, is a composition of a middle consistence between a soft electuary and a syrup, principally used in disorders of the lungs.

**LOHR**, a town of Franconia, in Rieneck.

**LOJANO**, a small post town of the Italian republic, in the dep. of the Reno, and district (late province) of Bologna.

**LOJBERSTORFF**, two towns of Germany, in Austria: 1. 14 miles S. of Vienna: 2. 10 miles SW. of St Polten.

**LOIBI**, a range of mountains in Germany; dividing Carinthia and Carniola, 12 miles S. of Clagenfurt.

**LOIGH**, a river of Scotland, in Ross-shire, which runs into Loch-Long.

**LOIGNON**, a river of France, which to the Loire; 24 miles below Puy.

(1.) **LOIN**, a river of France, which the Seine, a little below Moret.

(2.) \* **LOIN**. *n. f.* [*llwyn*, Welsh.] 1. of an animal carved out by the butcher. the reins.—

My face I'll grime with filth  
Blanket my *loins*.

Thou slander of thy heavy mother  
Thou loathed issue of thy father's *loi*  
Virgin mother, hail!

High in the love of Heav'n! yet from  
Thou shalt proceed, and from thy wot  
Of God most high. *Milton's*

A multitude! like which the popu  
Pour'd never from her frozen *loins*.

teaudun, Freteval, Vendosme, Chartre &c. and falls into the Sarthe above Ang

(2.) **LOIR AND CHER**, a department of republic, (so named from these two riv across it,) containing the ci-devant p Blaisois. It is about 66 miles long, as to 30 broad; being bounded on the dep. of Eure and Loire; on the NE. the Loiret; on the E. and SE. by that o on the S. by that of Indre; and on thofe of the Indre and Loire, and the S is the capital.

(1.) **LOIRE**, the largest river in France rises in Mount Gerbier, one of the C about 18 miles NNW. of Abenas, in t Ardeche; passes by Puy, St Rambert Marcigny, Nevers, Orleans, Blois, Bochefort, Chalonne, Nantes, &c. an the Bay of Biscay, 50 miles W. of N running a course of 500 miles.

(2.) **LOIRE, LOWER**, a department comprehending part of the ci-devant **BRETAGNE**, 55 m. long, and from 30 t It is bounded on the NW. by the o Morbihan; N. by that of Ille and Vil that of Maine and Loire; S. by that of t and W. by the Atlantic. Nantes is th

(3.) **LOIRE, UPPER**, a department containing the ci-devant prov. of **VELL long from E. to W. and 35 broad. It on the N. by the dep. of Puy de Don that of Rhone and Loire; SE. by that o SW. by that of Lozeze, and W. by the Puy is the capital.**

(1.) **LOIRET**, a river of France, into the Loire, 3 miles below Orleans

(2.) **LOIRET**, a department of France, containing the ci-devant province of Orleans long from E. to W. and 45 broad. It on the E. by the dep. of the Yonne; o thofe of the Nièvre, the Cher, and t Cher; W. by that of the Loir and Ch by thofe of the Eure and Loire, Sen and Seine and Marne. Orleans is the

LN, a town of France, in the dept. of miles W. of Laval, and 12 N. of Craon.

LOSEY, a town of France, in the dep. of e, 5 miles E. of Bar le Duc.

LOISEY, or } a town of France, in the dep. of }  
 } the Marne, 3 m. NW. of Vity.

LOITER. *v. n.* [*loiteren*, Dutch.] To linger; to loiter carelessly; to idle.—Sir John, here too long. *Shak.*—

Whence this long delay?  
*iter*, while the spoils are thrown away.

*Dryden.*  
 how he spends his time, whether he unloiters it away. *Locke.*—If we have gone et us redeem the mistake; if we have let us quicken our pace, and make the he present opportunity. *Rogers.*

LOITERER. *n. f.* [from *loiter*.] A lingerer; a lazy wretch; one who lives without one who is sluggish and dilatory.—

gloves to thy reapers a largess to cry, ally to loiterers have a good eye. *Tusser.* oor, by idleness or unthriftiness, are rioters, vagabonds, and loiterers. *Hayward.* ere hast thou been, thou loiterer? *Otway.* ence would only enter mankind into the owledge of her treasures, leaving the rest y our industry, that we live not like idle and truants. *More.*—

r listless loit'ners, that attend  
 ise, no trust, no duty, and no friend. *Rope.*

Z, a town of Saxony, in Pomerania.

ZENDORF, a town of Austria.

LCZ, a town of Poland, in Volhynia.

LO, in mythology, a deity of the northern answering to the ARIMANES among the whom they represent as at enmity both ls and men, and the author of all the evils solate the universe. Loke is described in as producing the great serpent which the world; which seems to have been ins an emblem of corruption or sin: he also h to Hela or death, the queen of the inferns; and to the wolf Fenris, that monster encounter the gods and destroy the world.

LOMAN, surnamed the Wise, an eminent her among the Easterns. The Arabians as the son of Baura, the son or grand- sifter of Job. He was an Ethiopian, ve for some time. It is said that he was the time of David, and lived till the age ophet Jonas, a period of about 240 years. ppose him to have been the same with e mythologist: and indeed his *Parables gues* in Arabic, as well as many particu- is life, resemble the fables and fortune of He is said, like Æsop, to have been de- n his person. Some of his pieces are ex- d he was looked upon as so excellent a that Mahomet entitled a chapter of the ter his name, in which he introduces God s, "We heretofore bestowed wisdom on ." He got his liberty on account of his e in eating the whole of a bitter melon, after's command. His master, surprised, ow it was possible for him to eat such a s fruit? He answered, "I have received favours from you, that it is no wonder I

should once in my life eat a bitter melon from your hand." M. Callaud translated all the fables of Lokman, and Bidpai or Pilpay, a braimin philosopher, which were published at Paris in 1724.

LOLIUM, DARNELL GRASS, in botany, a genus of the digynia order, belonging to the triandria class of plants; and in the natural method ranking under the 4th order, *Gramina*. The calyx is monophyllous, fixed, and uniflorous.

1. *LOLIUM PERENNE*, red darnel, or rye-grass, is very common in roads and dry pastures, and makes excellent hay upon dry, chalky, or sandy soils. It is advantageously cultivated along with clover, and springs earlier than other grasses; thereby supplying food for cattle at a time when it is most difficult to be obtained. Cows, horses, and sheep eat it; goats are not fond of it.

2. *LOLIUM TEMULENTUM*, or white darnel, grows spontaneously in plowed fields. If the seeds of this species are malted with barley, the ale soon occasions drunkenness; mixed with bread corn, they produce but little effect unless the bread is eaten hot.

(1.) \* *To LOLL. v. n.* [Of this word the etymology is not known. Perhaps it might be contemptuously derived from *lollard*, a name of great reproach before the reformation; of whom one tenet was, that all trades not necessary to life are unlawful.] 1. To lean idly; to rest lazily against any thing.—So hangs, and lolls, and weeps upon me. *Shak. Otello.*—

He is not lolling on a lewd love bed,

But on his knees at meditation. *Shak. Rich. III.*

Clofe by a softly murmur'ing stream,

Where lovers us'd to loll and dream. *Hudibras.*

To loll on couches, rich with cytron steds,

And lay your guilty limbs in Tyrian beds. *Dryd.*

Void of care he lolls supine in state. *Dryd.*

But wanton now, and lolling at our ease,

We suffer all th' invet'rate ills of peace. *Dryd.*

A lazy, lolling sort

Of ever listless loit'ners. *Dunciad.*

2. To hang out. Used of the tongue hanging out in weariness or play.—

The triple porter of the Stygian seat,

With lolling tongue lay fawning at thy feet. *Dryd.*

With harmless play amidst the bowls he pass'd,

And with his lolling tongue assay'd the taste. *Dryd.*

(2.) \* *To LOLL. v. a.* To put out: used of the tongue exerted.—

Hadst thou but, Janus-like, a face behind,

To see the people, when splay mouths they make,

To mark their fingers pointed at thy back,

Their tongues loll'd out a foot. *Dryd. Persus.*

Trees bent their heads to hear him sing his wrongs,

Fierce tygers couch'd around, and loll'd their fawning tongues. *Dryden.*

LOLLARD, Walter, founder of the sect of the LOLLARDS, is said to have been an Englishman. He first broached his doctrines, (which, in many points, have been since adopted by most protestants,) in Germany, about A. D. 1315. After preaching with great zeal, and gaining many profelytes on the continent, he returned to England, where his disciples were first called *Lollards*. He and his followers rejected the sacrifice of the mass, extreme unction, and penances for sin; insisting that

that Christ's sufferings were sufficient. He is likewise said to have set aside baptism as a thing of no effect; and repentance, as not absolutely necessary. But in that age, none who had the courage to oppose the errors of the church of Rome, escaped slander or persecution. Lollard sealed his testimony with his blood, being burnt alive at Cologne in 1322.

**LOLLARDS**, in ecclesiastical history, a religious sect, which arose in Germany about the beginning of the 14th century; so called from **W. LOLLARD**, their founder. See the last article. Some derive the name from *LOLIUM* a tare, as if the Lollards were *tares* in God's vineyard: Others derive *lollard*, *lullbard*, *lolbert*, or *lullert*, from the old German word *lullen*, *lullen*, or *lallen*, "to sing with a low voice;" and say Lollard means a singer, or one who is continually praising God with a song. The *Alexians* or *CELLITES* were called *Lollards*, because they were public singers who interred those who died of the plague, and sang a dirge in a mournful tone as they carried them to the grave. The name was afterwards assumed by persons who dishonoured it; for we find, among those Lollards who made extraordinary pretences to piety, and spent their time in meditation and prayer, there were many abominable hypocrites, who entertained the most ridiculous opinions, and concealed the most enormous vices under this specious disguise. And many injurious aspersions were propagated against those who assumed this name by the priests and monks; so that, by degrees, any person who covered heresies or crimes under the appearance of piety, was called a *Lollard*. Thus the name was formerly common to all persons and sects, who were supposed to be guilty of impiety against God or the church, under profession of extraordinary piety. However, many societies of *Lollards*, of both sexes, were formed in most parts of Germany and Flanders, and were supported partly by their manual labours, and partly by charitable donations. The magistrates and inhabitants of the towns, where they resided, favoured and protected them on account of their usefulness to the sick. They were thus supported against their malignant rivals, and obtained many papal constitutions by which their institute was confirmed, their persons exempted from the cognifance of the inquisitors, and subjected entirely to the jurisdiction of the bishops; but as these measures were insufficient to secure them from molestation, Charles D. of Burgundy, in 1472, obtained a solemn bull from Pope Sixtus IV. ordering that the Cellites or Lollards should be ranked among the religious orders, and delivered from the jurisdiction of the bishops; and Pope Julius II. granted them yet greater privileges in 1506. Mosheim says there are still many societies of this kind at Cologne, and the cities of Flanders, though they have departed from their ancient rules. In England, the followers of Wickliffe were called, by way of reproach, *Lollards*, from some affinity between their tenets. They were solemnly condemned by the Abp. of Canterbury, and the council of Oxford.

**LOLLARDY**, *n. f.* the doctrine of the Lollards. See the two last articles.

**LOLLONADO**, a town in the isle of

(1.) **LOM**, Josiu, or Joshua VAN, a physician, born at Bueren in 1500. He published several works on medicine, in elegant which were collected and printed at Am in 3 vols 12mo. He died in 1562.

(2.) **LOM**, a river of Turkey in Europe, into the Danube, near Lomgrad.

**LOMAZY**, a town of Lithuania, in E

**LOMAZZO**, John Paul, an ingenious born at Milan, in 1558. He excelled in landscapes and portraits. He also wrote Treatise on painting, in Italian; 1585, *Idea del Tempio della Pittura*; 1590, and died in 1598.

(1.) **LOMBARD**, Lambert, an eminent, born at Liege in 1500; who after a study of the antique at Rome, introduced style of painting among his countrymen in the Gothic. He painted history, arch and perspective; and though he could together free himself from his national ranked among the best painters of his time died in 1560.

(2.) **LOMBARD**, Peter, well known by of *Master of the Sentences*, was born at Lombardy; but being bred at Paris, he distinguished himself so much at that university, that he was first appointed canon of Chartres; afterwards tutor to Philip, son of Lewis VI. and last of Paris. He died in 1062. His works on Sentences is looked on as the source of the lastic theology of the Latin church. He also Commentaries on the Psalms, and Paul's Epistles.

(3.) **LOMBARD**, or **LOMBART**, Peter, graver of considerable eminence, who flourished about 1660. He was a native of Paris, and learned the art. He came into England during the revolution. He executed a vast number of plates, chiefly for books; but his best works are his portraits, mostly after Vandyck.—He also engraved historical subjects, from Poussin, Annibal Caracci, Guido, &c.

**LOMBARDA**, a town of the Italian Republic, in the dep. of the Lower Po, and district of the duchy of Ferrara.

(1.) **LOMBARDS**, a nation of Scandinavia, who formerly settled in Italy, and for some time made a considerable figure. The name *Lombards*, or *Longobards*, is derived from Paulinus, who was himself a Lombard, from the *length* of their *beards*. A nation of *Lombards*, is mentioned by Tacitus, Strabo, and Ptolemy; but these are different from the Lombards who afterwards settled in Italy, and are reckoned to be the same with the *GERPIDI*, the Italian Lombards almost exterminated. The Lombards who settled in Italy are first mentioned by Prosper Aquitanus, Bp. of Rhegium, who tells us, that about this time the Lombards, abandoning the most distant coasts of the sea, and their native country Scandinavia, and for new settlements, as they were overpowered with people at home, first attacked and overcame the Vandals in Germany. They were then divided by two chiefs, Iboreus and Aion; who, about A. D. 389, were succeeded by Agilulf.

(2.) **LOM**

(2.) **LOMBARDS, CHARACTER, GOVERNMENT AND MANNERS OF THE.** The Lombards were at first a cruel and barbarous nation; but their native fierceness gradually wore off, especially after they had embraced the Christian religion; and they governed with such equity and moderation, that almost all other nations envied the happiness of one who lived under them. Under the government of the Lombards (says Paulus Diaconus) no violence was committed, no one unjustly disposed of his property, none oppressed with taxes; theft, robberies, murder, and adultery, were seldom heard of: every one went, without apprehension, wherever he pleased. Their laws were just and equitable, that they were retained in Italy, and observed there some ages after their kingdom was at an end. Their dress was loose, and for the most part of linen, such as the Anglo-Saxons wore, being interwoven with various colours; their shoes were open to the end of their feet, and they used to button or lace them. From some ancient paintings, it appears, that they shaved the back part of their heads, but that their hair was long before; their locks being parted and laid on each side their foreheads.

(3.) **LOMBARDS, HISTORY OF THE.** Agilmond is commonly reckoned the first king of the Lombards. Before the time of ODOACER, the history of the Lombards affords nothing remarkable; in time, however, they settled on the Danube, in the country of the Rugians, whom Odoacer had exterminated or carried into captivity. During their stay in this country, they rendered themselves formidable to the neighbouring nations, and succeeded in successful wars with the Heruli and Gepidæ. In 526, they were allowed by the emperor Justinian to settle in Pannonia; and here they made war a second time with the Gepidæ. Alboinus, the Lombard king, killed the king of the Gepidæ with his own hand, put his army to rout, and cut such numbers of them in pieces, that they ceased from that time to be a nation. Alboinus caused the deceased king's head to be cut off, he made a cup of his skull, which he used in all his public entertainments. However, having taken among many other captives of great distinction, Rosamunda, the late king's daughter, he married her after the death of his former wife Clodivinta, the daughter of Clotaire king of France. By this marriage Alboinus gained such reputation, that his friendship was courted by Justinian; and, in consequence of the emperor's application, 6000 Lombards were sent to the assistance of Narfes against the Goths. The success of the Romans in this expedition, the invasion of Italy by the Lombards, and their successes, have been related under ITALY, § 13, 14. At last Alboinus having made himself master of Venetia, Liguria, Æmilia, Hetruria, and Umbria, was murdered in the year 575, the 4th year of his reign, by the treachery of his wife; whom he had irritated to the most implacable vengeance, by ordering her, one day at a feast at Verona, to sit at a table with her father, presenting her with a cup above mentioned. This she accomplished by the assistance of Helmichild the king's old bearer; who at first peremptorily refused to engage in the treason; but Rosamund having,

by placing herself in his mistress's bed, drawn him into an adulterous connection with herself, told him he must now either kill Alboinus, or be himself put to death; promising at the same time to marry him, if he accomplished it, and bestow on him the kingdom. This last part of her promise, however, she did not get fulfilled, as they were obliged to save themselves by flight. They fled to LONGINUS the exarch of Ravenna, taking with them all the jewels and treasure of the late king. Longinus received her with the greatest kindness, assured her of his protection; and judging this a favourable opportunity of making himself king of Italy, proposed to marry her, provided she dispatched Helmichild. Rosamund, pleased with the proposal, resolved to satisfy her ambition by getting rid of the man she had married to gratify her revenge. Accordingly, having prepared a strong poison, she mixed it with wine, and gave it to her husband as he came out of the bath; but he had not half emptied the cup, when, from its sudden effects, he concluded what it was, and compelled her to drink the rest. They both died in a few hours. Longinus, on her death, laid aside thoughts of making himself king of Italy, and sent the king's treasure to Constantinople, together with Alboinda, the daughter of Alboinus by Rosamund, whom she had brought along with her. After the death of Alboinus, the Lombards chose Clephis, one of the nobility for their king. He was murdered after a short reign of 18 months; upon which ensued an interregnum of 10 years. (See ITALY, § 14.) During this time, they extended their conquests in that country; but at last the Romans, jealous of their progress, resolved to put a stop to their victories, and, if possible, to drive them quite out. For this purpose, they entered into alliance with the Franks; which so alarmed the Lombards, that they re-established the monarchical form of government among themselves, and chose Autharis the son of Clephis for their king. This monarch, considering that the power of the dukes, who had governed Lombardy for 10 years, was very much established, allowed them to continue in their government; but obliged them to contribute a moiety of their revenues towards the support of his royal dignity; and took an oath, that, in the time of war, they would assist him to the utmost of their power. Having thus settled matters with the dukes, he enacted several wholesome laws against theft, rapine, murder, adultery, &c. and was the first Lombard king who embraced Christianity. Most of his subjects followed his example, but being instructed by Arian bishops, disputes continued long between them and the orthodox bishops of the cities subject to them. From the re-establishment of the monarchy under Autharis, to the reign of Rotharis in 636, the history of the Lombards affords nothing memorable. This period is remarkable for the introduction of written laws among these people. Before this time they had been governed only by tradition; but Rotharis, in imitation of the Romans and Goths, undertook the publishing of written laws; and to those which he enacted, many were added by succeeding princes. These laws were enacted in public assemblies,

convened.

propose, after they had been ex-  
 A of by all the lords of the  
 power being lodged in  
 ic. Rotharis also carried  
 the exarch of Ravenna,  
 med in several engagements,  
 ber of part of his territories,  
 the affairs of the Lombards  
 ly, till the ambition of Luit-  
 foundation of the total ruin of his  
 ascended the throne in 711, and  
 opportunities of enlarging his domi-  
 exence of the emperors. In 725, the  
 III. having forbidden the worship of  
 d orde hem to be pulled down, the  
 (ICONOCLASTÆ.) And ha-  
 his officers in the west, espe-  
 of Ravenna, to see his edict punc-  
 yed, Scholasticus, then exarch, began  
 the images in Ravenna; which in-  
 stitutions multitude to such a de-  
 ing arms, they openly declared  
 renounce their allegiance to the  
 the worship of images. Luitprand  
 opportunity of making himself master  
 of the exarch; having drawn together  
 forces, he unexpectedly appeared be-  
 a, and closely besieged it. But the exarch  
 d the place with such courage, that Luit-  
 woke up the siege and led his army against  
 which he took, plundered, and levelled  
 ground. The severe treatment the inha-  
 bet with threw the citizens of Ravenna  
 utmost consternation; which Luitprand  
 to take advantage of, and, returning be-  
 fore Ravenna with his whole army, by frequent  
 attacks tired the inhabitants and garrison to such  
 a degree, that the exarch, despairing of relief,  
 privately withdrew. Luitprand, having carried  
 the town by storm, gave it up to be plundered by  
 his soldiers, who found in it an immense booty,  
 as it had been long the seat of the emperors, the  
 Gothic kings, and the exarchs. The reduction of  
 Ravenna was followed by the surrender of several  
 cities of the exarchate, which Luitprand reduced  
 to a dukedom; appointing Hildebrand his grand-  
 son to govern it with the title of duke; and as he  
 was yet an infant, appointing Peredeus D. of Vicen-  
 za for his guardian. The conquest of the greater  
 part of the exarchate alarmed Gregory II. tho' he  
 was then at variance with the emperor, whose edict  
 against the worshipping of images he had opposed.  
 But, jealous of the power of the Lombards, he  
 exerted his influence with Ursus, doge of Venice,  
 who resolved to assist the exarch with the whole  
 force of the republic. The exarch accordingly  
 laid siege to Ravenna by land, while they invested  
 it almost at the same instant by sea. Peredeus de-  
 fended the town for some time with great courage  
 and resolution; but the Venetians having forced  
 open one of the gates, the city was taken, and  
 Peredeus slain, while attempting to drive the  
 enemy from the posts they had seized. Hilde-  
 brand fell into the hands of the Venetians; who,  
 having thus recovered Ravenna to the emperor,  
 returned home, leaving the exarch in possession  
 of the city. Luitprand was then at Pavia; but  
 the town was taken before he was able to assem-

ble his troops for its relief. Gregory persuading  
 himself, that the emperor would now, out of  
 gratitude for the recovery of Ravenna, give ear  
 to his admonitions, began to solicit him with the  
 most pressing letters to revoke his edict against  
 the worship of images: but Leo, instead of com-  
 plying, sent 3 officers to Rome, with private or-  
 ders either to assassinate the Pope, or send him  
 prisoner to Constantinople: and in 725, he recalled  
 Scholasticus, and sent Paul a patrician into Italy,  
 to govern in his room, with private instructions  
 to encourage the above-mentioned officers. But  
 in the mean time, the plot was discovered, and  
 two of the conspirators were apprehended by the  
 citizens of Rome, and put to death; the third  
 having escaped. Hereupon the exarch drew to-  
 gether a considerable body of troops, and set out  
 on his march to Rome, with a design to seize the  
 pope, and send him in chains to Constantinople.  
 But, the politic Luitprand now leagued with Gre-  
 gory against the exarch; in order to preserve the  
 balance of power between them, and by assisting  
 sometimes the one and sometimes the other, weak-  
 en both. The consequence of this coalition was,  
 that the superstition of the people being awak-  
 ed almost the whole of Italy revolted from the  
 emperor. Mean time, the exarch Paul, having  
 gained a considerable party in Ravenna, began to  
 remove the images out of the churches. Here-  
 upon the adverse party, encouraged by the pope,  
 flew to arms; and falling upon the ICONOCLASTÆ,  
 gave rise to a civil war within the walls of Ra-  
 venna. Great numbers were killed on both sides,  
 but the worshippers of images prevailing, a dread-  
 ful slaughter was made of the opposite party, and  
 the exarch himself was murdered. However, Ra-  
 venna continued faithful to the emperor; but  
 most of the cities of Romagna belonging to the  
 exarchate, and all those of Pentapolis, abhorring  
 the emperor as a heretic, submitted to Luitprand.  
 In Naples, Exhilaratus, the duke, having received  
 orders from Leo, to execute his edict, endeavoured  
 to persuade the people to receive it; but failing  
 in all his endeavours thwarted by the pope, to  
 whom the Neapolitans had a great veneration,  
 hired assassins to murder him. But the plot be-  
 ing discovered, the Neapolitans murdered both  
 the duke and his son, with one of his chief of-  
 ficers. They still, however, continued steadfast  
 their allegiance to Leo, who sent one Peter to  
 govern them in the room of Exhilaratus. In the  
 mean time, Leo, not doubting but the pope was  
 the chief author of so much mischief, sent the  
 much Eutychius into Italy, with the title and au-  
 thority of *exarch*, strictly enjoining him to get the  
 pope dispatched, as his death was absolutely ne-  
 cessary for the tranquillity of Italy. But a mes-  
 senger, whom the exarch had sent to Rome, be-  
 ing apprehended, and the emperor's order being  
 found upon him, the pope's friends thenceforth  
 guarded him with such care, that the exarch's as-  
 sassins could never afterwards find an opportunity.  
 The Romans were for putting the messenger to  
 death; but the pope interposed, contenting him-  
 self with excommunicating the exarch. And as  
 the Romans, provoked more than ever against  
 Leo, resolved to revolt and appoint their own ju-  
 gistrates, keeping themselves united under the  
 pope

not yet as their prince, but only as their Luitprand, having brought with him from the rebellion in Ravenna, and severely punished the authors. But he found he could never be so long as they were supported by the bards; and therefore he employed all his policy to take off Luitprand from the Romans, and bring him over to his side; but Thrasimund duke of Spoleto refused this juncture, the exarch offered to assist against the rebellious duke, provided he would assist him against the pope and the Romans. His proposal Luitprand readily closed; and the armies joined, and began their march towards Spoleto. At their approach, the duke, desirous of being able to resist two such powers, offered pardon; which Luitprand not only granted, but confirmed him in the dukedom, after he had made him take a new oath of allegiance, and hostages for his future fidelity. From the two armies marched to Rome; and encamped in the meadows of Nero, between the city and the Vatican. Gregory had caused the city to be fortified, but being sensible that the Romans could not long hold out against two such armies, he went to the king in his camp; and with a pathetic speech, softened Luitprand to such a degree, that, throwing himself at the feet of the king in the presence of the army, he begged pardon, and entering into an alliance against him; he made him to the church of St Peter; and his girdle, sword, gantlet, royal mantle, and gold, and crosses of silver, on the apostle's tomb. After this, he reconciled the pope and the exarch, who was thereupon received into the city, where he continued for some time, in correspondence with the pope. At this time an impostor, taking the name of *Tiberius*, pretending to be descended from the emperor, persuaded many people in Tuscany, and was proclaimed emperor. Gregory, wishing to see Leo, persuaded the Romans to attend him in his expedition against this usurper, and they soon took in a castle, sent his head to Rome, and suppressed the rebellion. But insisting upon his edict against the images received in Rome, the Romans, at the instigation of the pope, publicly renounced their obedience to him, paid him no more tribute, and withdrew their obedience to the Eastern emperor. On this Leo caused all the patrimoniae church in Sicily, Calabria, and his dominions, to be confiscated; and raised an army to recover the towns that had rebelled against Gregory, alarmed at these warlike preparations, resolved to recur to the protection of the Romans, the only nation then capable of coping with him; and on whom, on account of his piety for religion, he thought he might depend. They were at this time governed by the king Charles Martel, who was reckoned the hero of his age. To him, therefore, Gregory sent a solemn embassy, with a great number of bishops earnestly intreating him to take the Roman church, under his protection, and to assist against the attempts of Leo. The king complied. The

ambassadors were received with extraordinary marks of honour; and a treaty was soon concluded between them and Charles. But Gregory did not long enjoy the fruit of this negotiation; for he died the same year, 731, and was succeeded by Gregory III. The French nation, by the bravery and conduct of Charles Martel, had now become the most powerful kingdom in the west. His successor Pepin was no less wise and powerful than his father; and as the ambition of the Lombard princes would be satisfied with nothing less than the entire conquest of Italy, the French monarch, Charlemagne, under colour of assisting the pope, at last put an end to the empire of Lombardy, as related under the article FRANCE, § 13.

**LOMBARDY**, a country of Europe, in the N. of Italy, which comprehends almost the whole of the ancient *GALLIA CISALPINA*, and in the 6th century, formed the kingdom of the **LOMBARDS**. After the overthrow of that kingdom, it was divided into **UPPER** and **LOWER LOMBARDY**, and was subdivided among different states and princes; as the house of Austria, the republic of Venice, the K. of Sardinia, &c. and is now divided between the French and Italian republics, and Maritime Austria.

1. **LOMBARDY, LOWER**, the eastern part, comprehended the late duchies of Parma, Modena, Mantua, Bologna, Ferrara, Padua, Vicenza, Verona, Brescia, Como, Crema, and Bergamo. It is now mostly included in the Italian republic, except Padua and Vicenza, which belong to Maritime Austria.

2. **LOMBARDY, UPPER**, the western part, comprehended the late duchies of Milan, Montferrat, Piedmont, Nice, and some lesser principalities. It is now included in the French and Italian republics.

**LOMBART.** See **LOMBARD, N° 3.**

**LOMBERS**, a town of France, in the dep. of Tarn; 9 miles S. of Alby.

**LOMBES**, or } a town of France, in the dep. of  
**LOMBEZ**, } Gers, and ci-devant province of Gascony; seated on the Save; 17 miles SE. of Auch, and 27 SW. of Toulouse. Lon. 1. o. E. Lat. 43. 29. N.

**LOMBOC**, an island in the East Indian Sea.

**LOMENIE**, Henry Lewis, Count de Brienne, a French nobleman, who was secretary of state to Lewis XIV. The loss of his wife drove him melancholy; yet in this state, and under confinement, he wrote *Memoirs of his own Life*; an *Account of his Travels*; *Poems*, and other works of merit. He died in 1698.

**LOMENTACEÆ.** See **BOTANY, Index.**

**LOMGRAD**, a town of Turkey, in Bulgaria.

**LOMNITZ**, a river of Silesia.

(I.) **LOMOND, BEN.** See **BEN-LOMOND.**

(II.) **LOMOND HILLS**, several verdant hills of Scotland, in the W. part of Fifeshire, distinguished by different names; such as the *Black Hill*, *the Green Hill*, *Stony Field*, &c. The two highest are called the **EASTERN** and **WESTERN LOMONDS**. From their relative situation, more than from their magnitude, they command a very extensive and variegated prospect into many distant as well as adjacent counties, and are seen at a very great distance, by travellers in various directions.

1. LOMOND, EASTERN, the most regular and beautiful of the above hills, is said to be about 350 yards in height above the level of the plain; and where it is most accessible, seems to have been fortified near the top, with a deep trench. It lies a little W. of Falkland, and is skirted with furze, above which it exhibits a beautiful verdure at all seasons and rises into a conical summit. It slopes gradually on the E. but on the W. the descent is steep, down to the gap or valley below; which separates it from the Western Lomond, and extends above a mile nearly on a level. Very near the top, there is a small cavity about 1½ feet in diameter, which, by travellers, has been esteemed a volcanic crater. It abounds with lime-stone and has also some strata of good coal, and a lead mine, formerly wrought, and lately opened again.

2. LOMOND, WESTERN, is considerably higher than the EASTERN, and has a large cairn of loose stones on its top. From its summit, the southern aspect has little variety, but a gradual and uniform descent, till it joins the parishes of Leslie and Portmoak.

(III.) LOMOND, LOCH, a large lake of Scotland, in Lennox-shire, which Mr Pennant styles "the most beautiful of the Caledonian lakes." The view of it from Tarbat presents an extensive serpentine lake winding amidst lofty hills, on the N. barren, bleak, and rocky, which darken with their shade that contracted part of the water. About 28 islands are dispersed over the lake, well wooded; of these some just peep above the surface, and are tufted with trees; others are so disposed as to form magnificent vistas. Opposite Luss, at a small distance from shore, is a mountainous isle almost covered with wood, near half a mile long. The largest island is 2 miles long, and stocked with deer. The lake is 36 miles long; its greatest breadth is 8; its greatest depth, 125 fathoms. Its surface has for many years past been observed gradually to increase, and invade the adjacent shore; whence Mr Pennant "supposes that churches, houses, and other buildings, have been lost in the water." And from a passage in Camden's *Atlas Britannica*, it appears, that an island, existing in his time, called *Camstraddan*, in which was a house and orchard, is now lost. Large trees are also often found in the mud near the shore, overwhelmed in former times by the increase of water, occasioned by vast quantities of stone and gravel brought down by the rivers, and by the falls of their banks.

LOMONOZOF, a celebrated Russian poet, the great reformer of his native tongue, was the son of a fish-monger at Kolmogori. He was born in 1711, and was fortunately taught to read; a rare instance in a person of so low a station in Russia. His genius for poetry was first kindled by the perusal of the *Song of Solomon*, done into verse by Polotski; which inspired him with such an irresistible passion for the Muses, that he fled from his father, and took refuge in the Kaikonof-patki monastery at Moscow; where he indulged his taste for letters, and studied the Greek and Latin languages. In this seminary he made such progress in literature, as to be employed by the

Imperial Academy of Sciences. The society sent him to the university of Hesse Cassel, where he studied universal rhetoric, and philosophy, under the Christian Wolf. He continued at years, during which time he applied chemistry, which he afterwards pursued with still greater success under the famous Freyberg in Saxony. In 1741 he returned to Russia; was chosen in 1742 adjunct of the Imperial Academy; and in 1743, member of the Academy and professor of chemistry. In 1744 he was appointed inspector of the seminary, and in 1745, he was admitted to the Academy, and in 1764, Catharine the Great appointed him a counsellor of state. Lomonosoff was eminent in various kinds of composition; but his merit is derived from his poetical compositions, the finest of which are his odes. They are highly admired for originality of invention, and energy of sentiment, and energy of language. His great model, and those who were his great rivals in the Russian tongue, say, he has succeeded in imitating the Theban bard, without incurring the charge of Horace. In this, and other compositions, he enriched his native language with various kinds of metre, and is hence styled the *Father of Russian Poetry*. The titles of his principal works, which were printed in 1763, show the versatility of his genius, and his extensive knowledge. Vol. I. besides a Preface, contains several advantages derived to the Russian tongue from ecclesiastical writings, contains 10 faceted panegyric odes. The II. comprises a Translation of a Greek Idyll; *Tamira and Selim*; and *De Tragediis*; Poem on the Utility of the Cantos of an epic poem, entitled, *Peter the Great*; Heads of Lectures on Natural Philosophy; Translations in verse and prose, from which he is quoted as examples in his Rhetoric; Description of the Comet of 1744; Vol. III. consists chiefly of Speeches read before the Academy; Panegyric on Empress Elizabeth; on Peter the Great; Advantages of Chemistry; on the Phenomena of the Air occasioned by the Electrical Machine; Latin translation; on the Origin of the new Theory of Colours; Methods of determining the Course of a Vessel; on the Origin of Earthquakes; Latin Dissertation on the Nature and Fluidity of Air; with a German translation. He also wrote several of the Russian Sovereigns; and the History of Russia, from its Origin to the present time; Yaroslav I. in 1054; a work of great merit, which illustrates the most obscure period of Russian History. He died 4th April 1764.

\* LOMPRE, *n. s.* A kind of roundish stone, found in the dep. of Forêts, and elevated department of the Moselle; 12 miles E. of Givet.

LOMZA, a town of Poland, in Masovia, 12 miles S. of Warsaw. It is situated on the river Lona, which rises in Westmoreland, and running N. W. falls into the Irish Sea below Londale. Its banks are beautiful and romantic.

(1.) LONADO, or LONATO, a town

republic, in the dep. of Mellã, and distric province) of Brelcia; containing 5000 in 1797.

LOWADO, or ) a town of the Italian republic, capital of the above territory, 12 miles ESE. of Brelcia, containing 4000 in 1797. It was taken by the French Bonaparte, in the end of June 1796; and 31st July following a bloody battle was near it, between Bonaparte and Wurmsler, after a most obstinate resistance, the French were defeated, with the loss of 2000 men. Wurmsler, however, seizing a new opportunity, with 25,000 men, between the Chief and the French, risked another engagement, but was obliged to retreat over the Mincio, after losing, in the battle, 70 field pieces, 6000 men killed, and 1000 prisoners.

LOCHAUMOIS, a town of France, in the Dept. of Jura, 5 miles NNE. of St Claude.

LODE, Francis de LA, a French poet, born in Paris, in 1685. He wrote several tracts in besides his poems, which are esteemed. He died in 1765, aged 80.

LODINIÈRES, a town of France, in the Dept. of the Lower Seine, 15 miles ENE. of Dieppe.

LONDON, a large city of England, the chief and one of the most fertile and populous places in the world, is situated in Middlesex, on the Thames, 400 miles S. of Edinburgh, 270 SE. of Dublin; 180 W. of the Channel, 210 NW. of Paris, 500 SW. of Copenhagen, 600 NW. of Vienna, 790 SW. of Stockholm, 800 NE. of Madrid, 820 NW. of Rome, 1200 S. of Lisbon, 1360 NW. of Constantinople, 1400 SW. of Moscow. Lat. 51. 31. N.

LONDON, ANCIENT AND MODERN NAMES. This city was by the Romans first called *Londinium*. See Tacit. *Prot. Antonin.* That name was afterwards changed into *Londra*; but, in honour of whom, or how long the name prevailed is not known. After the conquest of the Saxons, it was called *Cæster*, *Lunden*, *Lunden Byrig*, *Lunden Cæster*, *Lunden-undenne*, *Lunden-bergh*, or *Lundenburgh*. Since the conquest the records call it *Londinia*, *Lundandine*, *Londres*; and, for several ages past, been called *London*, a modern variation of *Londinium*. The most probable derivation of these names appears to be, either from the British *lond*, a ship, and *din*, a town, i. e. a town favourable for ships; or from *Llin*, a lake, *q. d.* the town upon the lake, the Surry side supposed, upon good grounds, to have been by a great expanse of water. *Londinium*, was not the primitive name of this city, existing before the invasion of the Romans; it is now, or the *New City*; being, at the time of the Roman arrival in the island, the capital of the *Trinovantes* or *Trinouantes*. The name of this nation appears from Baxter's British Glossary, to have been derived from the 3 British words, *lond*, *ban*, which signify the *inhabitants of the land*; a name probably given them by the Romans, after it was built. At the time of the first invasion, this *New City* was so inconsiderable that it is not mentioned by Cæsar, though it must have been within sight of it. His silence

about it, indeed, is brought as a proof that he did not cross the Thames; while Norden by the *firmissima civitas* of the Trinobantes understands this city, the Trinobantes themselves having been among the first of the British states who submitted to that conqueror. By Ptolemy, and some other ancient writers, indeed, Londinium is placed in *CANTUM*, or Kent, on the S. side of the Thames, and they suppose the Romans had a station in St George's fields, between Lambeth and Southwark, where many Roman antiquities have been found. Three Roman ways from Kent, Surry, and Middlesex, intersected each other in this place; and therefore it is supposed to be the original Londinium, which it is thought became neglected after the Romans reduced the Trinobantes, and settled on the other side of the Thames; and the name was transferred to this new city.

(3.) LONDON, ANCIENT COMMERCE AND PRIVILEGES OF, UNDER THE ROMANS. The Romans possessed themselves of London, on their 2d invasion in the reign of Claudius, about 20 years after their first under Cæsar. They had taken Camalodunum, now MALDON in Essex, and planted in it a colony of veterans of the 14th legion. London and Verulam were next taken possession of. Camalodunum was made a *colonia*; or place governed entirely by Roman laws and customs; Verulam (on the site of which St Alban's now stands), a *municipium*, in which the natives enjoyed the privileges of Roman citizens, along with their own laws and constitutions; but Londinium, according to Mr Pennant and others, was only a *præfectura*, the inhabitants, a mixture of Romans and Britons, being suffered to enjoy no more than the name of *citizens of Rome*, being governed by *Præfects*, without having either their own laws or magistrates. But others observe, that the Romans, to secure their conquest, and to gain the affections of those Britons who had submitted to their authority, made London equally a *municipium* or free city with Verulamium, as may be seen in Aulus Gellius, l. 16. c. 13. and Spanhem *orbis Roman.* p. 37, 38. tom. ii. The general exports of London, at this period, according to Strabo, were, "corn, cattle, gold, silver, iron, skins, slaves, and dogs, naturally excellent hunters." The imports were salt, earthen wares, brass works, polished bone resembling ivory, horse-collars, toys of amber, glasses, &c. In the reign of Nero, Tacitus tells us, London was become famous for their great conflux of merchants, her extensive commerce, and plenty of all things. No fewer than 7 of the 14 itinera of Antoninus begin or end at London; which tends to corroborate the many other proofs, that this city was the capital of Britain in the times of the Romans.

(4.) LONDON, ANCIENT EXTENT AND WALLS OF. At first London had no walls or fortifications to defend it, and was therefore exposed to the attacks of every enemy; and thus it suffered severely about the year 64, being burnt by the Britons under Boadicea, and all the inhabitants massacred. But it was soon restored by the Romans; and increased so much, that in the reign of Severus it is called by Herodian a *great and wealthy city*. It continued, however, in a defence-

less state for more than a century after this; when at last a wall of hewn stone and British bricks was erected round it. London at this time extended in length from Ludgate-hill to a spot a little beyond the Tower. The breadth was not half equal to the length. Maitland ascribes the building of the walls to Theodosius governor of Britain in 369. Dr Woodward supposes them to have been founded under Constantine the Great; and this seems to be confirmed by the numbers of coin of his mother Helena, which have been discovered under them. He made it a bishop's see. The bishops of London and York were at the council of Arles in 314. He also settled a mint in it, as appears from his coins. The ancient wall began with a fort near the present site of the Tower, was continued along the Minories, and the back of Houndditch, across Bishopsgate-street, in a straight line by London-wall to Cripplegate; then returned S. by Crowder's Well Alley, to Aldergate; thence along the back of Bull and Mouth street to Newgate, and again along the back of the houses in the Old Bailey to Ludgate; soon after which it probably finished with another fort, where the late king's printing house, in Black Friars, now stands: hence another wall ran near the river side, along Thames street, to the fort on the E. extremity. The walls were 3 miles and 165 feet in circumference, guarded at proper distances on the land side with 15 lofty towers; some of which were remaining within these few years. Maitland mentions one 26 feet high, near Gravel-lane, on the W. side of Houndditch; another, about 80 paces SE. towards Aldgate; and the bases of another, supporting a modern house, at the lower end of Vinegar-yard, S. of Aldgate. The walls, when perfect, are supposed to have been 22 feet high, the towers 40. These remnants were evidently of Roman structure, from the tiles and disposition of the masonry. London Wall near Moorfields, is now the most entire part left of that ancient precinct. The gates, which received the great military roads, were four. The Pratorian way, the Saxon Watling street, passed under one, on the site of the late Newgate; vestiges having been discovered of the road in digging above Fleet-bridge; it turned down to Dowgate, or more properly *Duer-gate* or *Wier-gate*. The other was a *trajectus* or ferry, to join it to Watling street, which was continued to Dover. The Hermin street passed under Cripplegate; and a veinal way went under Aldgate by Bethel-street towards Oldford, a pass over the Lee to Duroleiton, the modern Leiton in Essex.

(5.) LONDON, BOUNDARIES AND LIBERTIES OF. That part of this immense capital which is distinguished by the name of *The City*, stands on the N. shore of the river, from the Tower to the Temple; occupy a narrow tract of space formerly encompassed by the wall. (See § 4.) In this wall there were five principal gates, viz. Ludgate, Aldergate, Cripplegate, Bishopsgate, and Newgate; the county gaol, which was taken down in 1777, and a massive building, erected a little S. of it, which by the rioters in 1780 (see § 14.) received damage to the amount of L.80,000.

On the side of the water there were Dowg Billingsgate, long ago demolished, as well as a postern gate near the Tower. In 1670 there was a gate erected, called *Temple-Bar*, which marks the bounds of the city westward. Liberties, or those parts of this great city, which are not subject to its jurisdiction, and lie without the walls of London, are bounded on the E. in Whitechapel, the Minories, and Bishopsgate, by the River; on the N. by the Fleet, and the Fleet-bridge, which were formerly posts and chains, the latter often arbitrarily taken away, when it was not proper to seize the franchises of the city; on the W. they are bounded in the same manner by Fleet-street, at the end of Fan-alley, and in St. Dunstons street: on the S. by the River, and in the Strand, at the end of Middle Row, and at the W. end of Fleet-street, by *Temple-Bar*; on the S. may be included the Liberties of the Thames, and over the River of Southwark.

(6.) LONDON, DIVISION OF, INTO WARDS AND PRECINCTS. The city, including the Liberties, is at present divided into 26 wards, and 120 precincts. 1. *Alder-gate ward*, so named from an old gate which stood near it, is very large, and is divided into *Alder-gate within* and *Alder-gate without*; each consisting of 4 precincts, one alderman, 8 common-council men, above 30 inferior officers, called *constable-men*, *scavengers*, and *beadles*; officers of 5 the wards have a greater or smaller number. 2. *Ald-gate*, named also from a gate of great antiquity, mentioned in king Edgar's charter, and probably of a much more ancient foundation. In the time of the wars betwixt king John and the barons, the latter entered the city through this gate, and committed great devastation; the gate was rebuilt of stone brought from Caen, and was very strong, and had a drawbridge within it. In 1606 it was again rebuilt; many Roman coins were found in digging the foundations. This ward is divided into 7 precincts, and governed by an alderman, six common-council men, and above 34 inferior officers. 3. *Bishopsgate ward* is very small, and only of two precincts, containing 142 houses, is governed by an alderman, 4 common-council men, and 24 petty officers. 4. *Billingsgate ward* is said to have derived its name from a British king named *Belinus*, an assistant of Brennus, the Gauls, at the taking of Rome, and the fish-market the *Belin-Market* mentioned in the Welsh legends; and *Lud-gate* to have been named from king *Lud*. It is divided into 12 precincts, governed by an alderman, 10 common-council men, and 32 inferior officers. The situation of this ward on the river, gives it great advantage with respect to trade; so that it is well inhabited, and is in a continual hurry of business at all times. 5. *Bishopsgate within* and *without* ward is divided into 3 precincts; the 2d is governed by an alderman, 12 common-council men, and 31 petty officers. The gate which it is named, was built by Edward I. of London in 1271; and is said to have been repaired by William I. In the time of Henry II. the Hanse merchants had certain privileges

which they rebuilt this gate elegantly in 16. *Bread-street ward* is divided into 13 fts; governed by an alderman, 12 common councilmen, and 40 inferior officers; though it has only 331 houses. It is named from the ancient market, held in *Bread-street*. 7. *Bridge-within* is divided into 14 precincts, of which 3 in *London bridge*, (whence the name,) and is governed by an alderman, 15 common councilmen and 44 inferior officers. 8. *Broad-street ward* is divided into 10 precincts; and governed by an alderman, 10 common councilmen and 32 inferior officers. It is named from that part of it *Old Broad-street*, which, before the fire of 1666, was one of the broadest streets in London. 9. *St. Dunstons ward*, *Candlewick streets*, or *Candlewick ward*, is a small ward, consisting of about 100 houses; yet is divided into 7 precincts; governed by an alderman, 8 common-councilmen, and 12 petty officers. It is named from a street, formerly inhabited chiefly by *candle-wrights* or *makers*, now called *Canon-street*. 10. *Cannon-ward* is divided into 10 precincts, under an alderman, 10 common councilmen, and 12 inferior officers. It is named from a castle on the bank of the river, by one Baynard, a knight, who was raised to great honours by William I. 11. *Cheap ward* is divided into 9 precincts, governed by an alderman, 12 common councilmen, and 34 inferior officers. The name is derived from the Saxon word *chepe*, i. e. a market, kept in this division, now called *Cheapside*, or *Westcheap*. 12. *Coleman-street ward* is divided into 6 precincts, governed by an alderman, 10 common councilmen, and 26 petty officers. 13. *Cordwainers ward* is divided into 8 precincts, governed by an alderman, 8 common councilmen, and 12 petty officers. It is named from *Cordwainers*, now *Bow-lane*, formerly occupied chiefly by *shoemakers*, or *shoemakers*. 14. *Cornhill ward* is a small ward, and is divided into 4 precincts, governed by one alderman, 6 common councilmen, and 12 petty officers. It is named from its principal street, *Cornhill*, so named from the cornmarket, very early held in it. 15. *Cripplegate ward* is divided into 13 precincts, 9 within and 4 without the wall; and is governed by an alderman, 10 common councilmen, and 66 inferior officers. 16. *Dougate ward* is divided into 8 precincts, governed by an alderman, 8 common councilmen, and 12 petty officers. It is named from the ancient water-gate, called *Dougate*, which was in the original wall along the N. side of the city, for the security of the city against invasion by water. 17. *Farringdon ward within* is divided into 18 precincts, governed by one alderman, 17 common councilmen, and 57 inferior officers. It was named after William Farringdon, a goldsmith, who, in 1279, purchased all the aldermen's lands within the city and suburbs, between *St. Dunstons* and *Newgate*, and also *without* these. 18. *Farringdon ward without*, so named from the same goldsmith, is governed by one alderman, 16 common councilmen, and 99 inferior officers. 19. *Langbourn ward* is divided into 12 precincts, and was named from a *long bourn*, or stream, which anciently flowed from a spring near

*Magpye alley*. 20. *Limestreet ward* is very small, and consists of 4 precincts, governed by an alderman, 4 common councilmen, and 22 petty officers. 21. *Portoken ward* is divided into 5 precincts, governed by an alderman, 5 common councilmen, and 30 constables, &c. Its name signifies the *franchise of liberty gate*. It was for some time a guild, and had its beginning in the reign of K. Edgar, when 13 knights requested to have a portion of land on the E. part of the city, with the liberty of a guild for ever. The king granted their request on these conditions; that each of them should victoriously accomplish three combats, one above ground, one under ground, and the 3d in the water: and after this, at a certain day, in E. Smithfield, they should run with spears against all comers. All this being performed, the king named it *Knights Guild*, and extended it from *Aldgate* to the places where the bars now are on the E. to the Thames on the S. and as far into the water as a horseman could ride at low water and throw his spear. 22. *Queen-bithew ward* is divided into 9 precincts, governed by an alderman, 6 common councilmen, and 9 constables. It is named from the *bithew*, or harbour for large boats, barges, and lighters; for which it was the anchoring place, and the key for loading and unloading vessels of almost any burden used in ancient times. It is called *Queen bithew*, because the queens of England usually possessed the tolls of vessels that unloaded goods at this bithew. 23. *Tower ward* or *Tower-street ward*, is governed by one alderman, 12 common councilmen, and 38 inferior officers. It takes its name from *Tower-street*, which leads in a direct line to the principal entrance of the Tower. 24. *Vintners ward* is a small ward, containing only 418 houses; but is divided into 9 precincts, and governed by an alderman, 9 common councilmen; and 26 petty officers. It is named from the *vintners*, or wine-merchants of Bourdeaux, who formerly dwelt in it. 25. *Wallbrook ward* is small, containing only 306 houses; but is divided into 7 precincts, governed by an alderman, 8 common councilmen, and 27 petty officers. It is thus named from the rivulet *Wallbrook*, that ran down *Wallbrook street* into the Thames near *Dowgate*; but at last was hid by bridges and buildings, that its channel became a common sewer. 26. *Bridge-ward without* includes the borough of *Southwark*, and the parishes of *Rotherhithe*, *Newington*, and *Lambeth*. It has its name from *London bridge* with the addition of *without*, because the bridge must be passed in order to come at it. See *SOUTHWARK*. *Westminster* is generally reckoned a part of London, but as it is a distinct city and under a distinct government, it will be found described in its order. See *WESTMINSTER*.

(7.) LONDON EXTENT OF. The irregular form of London makes it difficult to ascertain its extent. However, its length from E. to W. is generally allowed to be above 7 miles from *Hyde-park* corner to *Poplar*; and its breadth in some places three, in others two, and in others again not much above half a mile. Hence the circumference of the whole is almost 18 miles; or, according to a later measurement, the extent of continued buildings is 35 miles two furlongs and 39 rods.

(8.) LONDON, GOVERNMENT OF. The city and liberties of London are under a civil, an ecclesiastical, and a military government.

I. LONDON, GOVERNMENT, CIVIL, OF. The civil government of London divides it into wards and precincts, (See § 6.) under a lord mayor, aldermen, and common council. The lord mayor, is the supreme magistrate, chosen annually by the citizens, pursuant to a charter of King John. The manner of electing a lord mayor is by the liverymen of the several companies, assembled in Guildhall annually, on Michaelmas-day, (according to an act of common council in A. D. 1476;) when, the liverymen nominate two aldermen below the chair, who have served the office of sheriff, to be returned to the court of aldermen, who may choose either of the two; but the senior, so returned, is generally declared lord mayor elect. The election being over, the lord mayor elect, accompanied by the recorder and divers aldermen, is soon after presented to the lord chancellor for his approbation; on the 9th Nov. following, is sworn into office at Guildhall; and on the 10th, before the barons of exchequer at Westminster; the procession on which occasion is exceedingly grand and magnificent. The lord mayor sits every morning at the mansion-house, where he keeps his mayoralty, to do the business incident to his office. Once in 6 weeks, or 8 times in the year, he sits as chief judge of Oyer and Terminer, or gaol-delivery of Newgate for London and Middlesex. His jurisdiction extends all over the city and suburbs, except some places that are exempted. It extends also from Colney-ditch, above Staines-bridge in the W. to Yeudale, or Yenflete, and the mouth of the Medway, and up that river to Upnor-castle, in the E. by which he has the power of punishing or correcting all persons that shall annoy the streams, banks or fish. For this purpose he holds several *courts of conservancy* in the counties adjacent to the said river, for its conservation, and for the punishment of offenders. See MAYOR. The office next in dignity, is that of Alderman. (See ALDERMAN.) Of these there are 26, who are properly the subordinate governors of their respective wards under the lord mayor's jurisdiction. They originally held their office either by inheritance or purchase; but the oppressions, to which the citizens were subject from such a government, put them upon means to abolish the perpetuity of that office; and they brought it to an annual election. But that mode of election becoming a continual bone of contention among the citizens, the parliament, 17 Rich. II. A. D. 1394, enacted, That the aldermen of London should continue in office during life or good behaviour. And so they still continue, though the manner of electing has several times varied. At present it is regulated by an act of parliament, passed in 1724-5: and the person so elected is returned to the court of lord mayor and aldermen, by whom he must be admitted and sworn into office before he can act. If the person chosen refuseth to serve the office of alderman, he is finable 50*l*. These high officers constitute a 2d part of the city legislature when assembled in a corporate capacity, and exercise an executive power in their respective wards. The al-

dermen, who have passed the chair, or office of lord mayor, are justices of the peace, and all the other aldermen are not only the peace, but by stat. 43 Eliz. entitled *for the relief of the poor*, "every alderman, within his ward, shall and may dute, in every respect, so much as is and allowed by the said act to be done by one or two justices of peace of within this realm." Every one keeps *mate*, or *court*, for choosing ward officers, settling the affairs of the ward, to redress, and to prevent all defaults found ward. The next branch of the legislature is the COMMON COUNCIL. The conveniences that attended the popularly called FOLK-MOTES, determined the court of London to choose representatives to name, with the lord mayor and aldermen, affairs relating to the city. At first representatives were chosen out of the companies, these not being found satisfactory, no the representatives of the whole body of inhabitants, it was agreed to choose a certain number of discreet men out of each ward; who has from time to time increased, according to the dimensions of each ward. At present, (§ 6.) being subdivided into 23 wards, each precinct sends a representative to the common council, who are elected after the manner as an alderman; and as the lord mayor presides in the wardmote, and is judge of the election of an alderman, so the alderman of each ward is judge of the poll at the election of a common council man. Thus the lord mayor, aldermen, and common council, are a city parliament, resembling the great national parliament. For it consists of two houses, the lord mayor and aldermen, or the upper house, and another for the commoners or representatives of the people, commonly called the *common council*. They have power to make and alter laws; and the citizens are bound to obey them. When they meet in their incapacity, they wear deep-blue silk gowns; these assemblies are called the *courts*, and the acts are called *acts of common council*. No act is formed in the name of the city, without the concurrence. But they cannot absent a summons from the lord mayor, who is obliged to call a common council if demanded, by 6 reputable citizens and a recorder. This corporation is assisted by SHERIFFS and a RECORDER. The recorder is a chartered officer, to perform certain services, in the king's name, within the county of Middlesex, chosen by the liverymen of the companies on Midsummer day. Their office is to sit at Cambden, is to collect the public money within their several jurisdictions; to receive the exchequer all fines belonging to the king; to save the king's writs of process; to judge, and execute their orders; to compel obstinate men by the *tailors* to submit to the decisions of the court; to take care that all condemned criminals be punished. They also execute the orders of the common council, when they have reso-

dress his majesty, or to petition parliament. In virtue of their office, they hold a court at Guildhall every Wed. and Frid. for actions entered at Wood-street Compter; and on Thurs. and Sat. for those entered at the Poultry Compter: of which the sheriffs being judges, each has his assistant or deputy. To each of these courts belong attorneys, who are sworn upon their being admitted by the court of aldermen; also a secondary, a clerk of the papers, a prothonotary, and 4 clerks sitters. The secondary's office is to allow and return all writs brought to remove clerks out of the said courts; the clerk of the papers writes and copies all declarations upon actions; the prothonotary draws and ingrosses all declarations; the clerks sitters enter actions and attachments, and take bail and verdicts. To each of the compters, or prisons belonging to these courts, appear 16 serjeants at mace, with a yeoman to each, besides inferior officers, and the prison-keeper. In the sheriff's court may be tried actions of debt, trespass, account, covenant, and all personal actions, attachments, and sequestrations. The testimony of an absent witness in writing is admitted as evidence. When an erroneous judgment is given in either of the sheriffs courts of the city, the writ of error to reverse this judgment must be brought in the court of hustings before the lord mayor. The sheriffs of London may take arrests and serve executions on the Thames. The RECORDER, by his office, seems to have been intended as an assistant to, or assessor with, the lord mayor, in matters of justice and law. He is chosen by the lord mayor and aldermen only; and sits in place in all courts, and in the common council before any who hath not been mayor. He is considered as the mouth of the city; and delivers addresses to the king, &c. from the corporation. (See RECORDER.) The next chartered officer is the CHAMBERLAIN; an office of great repute and trust. He is elected by the livery annually, on Midsummer day, but is never displaced during his life, unless some great crime be proved against him. He has the keeping of the money, lands, and goods, of the city orphans, or takes security for the payment thereof when the parties die before age. And to that end he is deemed in law a sole corporation, for orphans; and therefore a bond or recognizance made to him or his successors, is recoverable by his successors. He has a court peculiarly belonging to him. His office may be termed a public treasury, collecting customs, moneys, and yearly revenues, and other payments belonging to the corporation of the city. The other officers under the lord mayor are, 1. The *common serjeant*. He attends the lord mayor and court of aldermen on courts, and is in council with them on all occasions, with or without the liberties of the city. He has the care of orphans estates, and manages them, according to his judgment, to the best advantage. The TOWN-CLERK keeps the original charters of the city, the books, rolls, and other records, and in are registered the acts and proceedings of the city; so that he may not be improperly called the city register: he attends the lord mayor and men at their courts, and signs all public instruments. 3. The city REMEMBRANCER, attends

the lord mayor on certain days, his business being to put his lordship in mind of the select days he is to go abroad with the aldermen, &c. He attends daily at the parliament house, during the sessions, and reports to the lord mayor their transactions. 4. The SWORD-BEARER, attends the lord mayor at his going abroad, and carries the sword before him, the emblem of justice. This is an ancient and honourable office, representing the state and princely office of the king's majesty, in his representative the lord mayor; and, according to the rule of armory, "He must carry the sword upright, the hilts being holden under his bulk, and the blade directly up the middle of his breast, and so forth between the sword-bearer's brows." 5. The *common hunt*; whose business it is to take care of the hounds belonging to the lord mayor and citizens, and to attend them in hunting in those grounds to which they are authorized by charter. 6. The *common crier*, and the *serjeant at arms*, summon all executors and administrators of freemen to appear, and bring in inventories of the personal estates of freemen, within two months after their decease: and he must have notice of the appraisements. He also attends the lord mayor on set days and at the courts held weekly by the mayor and aldermen. 7. The *water bailiff* looks after the preservation of the Thames against all encroachments, and looks after the fishermen for the preservation of the young fry. For that purpose there are juries for each county, that hath any part of it lying on the shores of the said river; which juries, summoned by the water bailiff at certain times, make inquiry into all offences relating to the river and the fish, and make their presentments accordingly. He also attends the lord mayor on set days in the week. These 7 purchase their places; except the town clerk, who is chosen by the livery. There are also 3 serjeant carvers; 3 serjeants of the chamber, a serjeant of the channel; 4 yeomen of the water side; an under water-bailiff; two yeomen of the chamber; two meal weighers; two yeomen of the wood wharfs; with a number of clerks, city marshals, and many other inferior officers. There is also a coroner, a most useful and necessary office in a great city. See CORONER, § 1-3. There are likewise several courts for executing justice, viz. the court of hustings, lord mayors court, &c. There are also two subordinate kinds of government in the city; one executed by the alderman, deputy, and common council men, and their inferior officers, in each ward; under which form are comprehended all the inhabitants, free or not free, of the city. Every ward is therefore like a little free state, subject to the lord mayor as chief-magistrate. The housekeepers of each ward elect their representatives, the common council, who join in making bye-laws for the government of the city. The officers of each ward manage the affairs belonging to it, and each has a court called the WARDMOTE, for this purpose. The other subordinate government is by the master, wardens, and court of assistants, of the incorporate companies; whose power reaches no further than the members of their respective guilds; except that in them is vested the power to choose representatives in parliament for the city, and all those magistrates and officers elected by a common hall; which compa-

ties are invested with distinct powers, according to their respective charters.—A court is also held in the Old Bailey, 8 times a-year, in a hall named *Justice hall*, or the *Sessions house*, by the king's commission of oyer and terminer, for the trial of criminals; for offences committed within the city and county. Of this court the lord mayor, and such aldermen as have served that office, are judges; along with the recorder and sheriffs; attended by one or more of the national judges.

ii. LONDON, GOVERNMENT, ECCLESIASTICAL, OF. London is a bishop's see, the diocese of which comprehends not only Middlesex, Essex, and part of Hertfordshire, but the British plantations in *America*. The bishop of London takes precedence next to the archbishops of Canterbury and York; but the following parishes of this city are exempted from his jurisdiction, being peculiar under the immediate government of the archbishop of Canterbury; viz. All-hallows in Breadstreet, All-hallows Lombard-street; St Dionys Back-church, St Dunstan in the East, St John Baptist, St Leonard Eastcheap, St Mary Aldermay, St Mary Bothaw, St Mary le Bow, St Michael Crooked-lane, St Michael Royal, St Pancras Soper-lane, and St Vedast Foster-lane.

iii. LONDON, GOVERNMENT, MILITARY, OF. The military government is lodged in a lieutenancy, consisting of the lord mayor, aldermen, and other principal citizens, who receive their authority by a commission from the king. Those have under their command the city trained bands, consisting of 6 regiments of foot, distinguished by the names of the *white, orange, yellow, blue, green, and red*, each containing 8 companies of 150 men, amounting in all to 7200. There is also a corps called the *artillery company*, from its being taught the military exercise in the artillery ground. This company is independent of the rest, and consists of 700 or 800 volunteers. These, with two regiments of foot of 800 men each, commanded by the lieutenant of the Tower, make the whole militia of this city; which, exclusive of Westminster and Southwark, amounts to about 10,000 men.

(9.) LONDON HISTORY OF, AFTER THE DEPARTURE OF THE ROMANS, TILL ITS IMPROVEMENT BY ALFRED THE GREAT. After the Romans deserted Britain, a new and fierce race succeeded. The Saxons landed in 448; (See ENGLAND, § 13;) London fell into their hands, about 457; and became their chief city in Essex. It suffered much in the wars between the Britons and Saxons, but soon recovered; so that Bede calls it a *princely mart town*, under the government of a chief magistrate, whose title of *portgrace* or *portreve*, conveys a grand idea of the mercantile state of London in those early ages, that required a governor of the port. During the civil wars of the Saxons, the Londoners kept themselves neuter; and about 819, when the whole Heptarchy fell under the power of Egbert, London became the metropolis of England, which it has ever since continued. During the invasions of the Danes, London suffered greatly. In 849, these invaders entered the Thames with 250 ships, plundered and burnt the city, and massacred the inhabitants, and two years after they returned

with a fleet of 350 sail, determined to do every thing that had escaped their former fury. But they were disappointed, most troops being cut in pieces by K. Ethel his son Ethelbald. London suffered not these two incursions than ever it had done. In the reign of king ALFRED the Great, began to recover. He rebuilt its walls, and the Danish inhabitants who had settled there restored the city to its former liberties, and committed the care of it to his son-in-law, duke of Mercia. In 893, however, he mortification to see his capital totally reduced to ashes by an accidental fire, which could not be extinguished, as the houses at that time were built of wood. The walls, however, being constructed of incombustible materials, could afford the same protection as before; they were quickly rebuilt, and the city divided into wards and precincts. Alfred also instituted the office of sheriff, so that here we have the origin of the order of magistrates afterwards established in London; in the person of the portreve, or grave, as supreme magistrate; in the sheriff, in the subordinate magistrate, placed at the head of each ward or precinct, analogous to the modern office of *aldermen* and *common-council*. Alfred next began to ornament the city, and excite the English to an emulation in their houses of stronger and more durable materials than wood. Having begun to build palaces of stone and brick, the opulent and the nobility followed his example, the custom did not become general till some time after.

(10.) LONDON, HISTORY OF, FROM THE DEATH TO THAT OF HENRY II. In 1013, king of Denmark invaded and plundered the counties of Dorset, Somerset, and Wilts, sailed up the Thames with 200 ships, and laid siege to London. The citizens made such a brave defence, that Canute withdrew his army, leaving a fleet to blockade the city by water. At length, however, being defeated in several battles by Ironside, he was obliged to call off his fleet to cover his own army. But in the course of the year afterwards made between Edmund and Canute, London was given to the latter. The history of London at this time appears from the charter upon it by Canute to pay his army; which was no less than 10,500 l. while the rest of the city was taxed only at 72,000 l. In 1046, the first instance occurs of the Londoners sending deputies to parliament. This happened on the succession after Canute's death. They were in general declared for Edward son of king Harold II. or, if that could not be carried, for Godwin, son of Canute by queen Emma at Denmark. London espoused the party of Harold Harefoot, son also of Canute, by the name of Northampton. Edward's party soon prevailed, and the Londoners agreed, that the two should divide the kingdom; but as Harold did not return in proper time to England, the *tenage-moot* was held at Oxford, where the Danes on the N. of the Thames, with the lords of London, chose Harold for their king; *patres* was meant the directors, magis-

ten of the city; which shows, that London of such consequence, that no imational affair was transacted without the consent of the inhabitants; for the Saxon annals that none were admitted into this election, but the nobility and the pindon. On the invasion of the Normans William I. London submitted as well as the kingdom; and received two charters from the prince, confirming all the privileges under the Saxon kings, and adding several more. But while the citizens were promoting themselves tranquillity under the new government, it was almost entirely reduced to ashes by a fatal fire in 1077. It had scarcely recovered from this calamity, when it was visited with another of the same kind in 1086, which bedegate, and burnt the most opulent part of the city; consuming, among other buildings, the church of St Paul's; which, however, was rebuilt more magnificently than before. Under King Henry II. London suffered considerably by pestilences, and inundations, as well as by the tyranny of that prince; but Henry I. granted several charters to it, which revived its trade; and encouraged the arts. The king, however, reserved to himself the privilege of appointing the portreeve; and several immunities granted to the Londoners for their services, and tended much to fix the crown on the throne. At the same time there was a great plenty of provisions, that as much corn was sold for as would suffice 100 people for a day; and as much hay and corn as would purchase 20 horses for a day; and a sheep bought for a groat. These pieces of good fortune were then of much more intrinsic value than at present; the shilling being the 20th part of a groat the 60th of a pound weight of silver; and still provisions of all kinds were amazing.

Henry also checked the licentiousness of the Londoners, who, by the favour showed them by King William, had been guilty of the most various practices, and had dreadfully harried and plundered the country. Many of them were so extravagant in their barbarity, that what they did not eat or drink in their quarters, they sold to the people to sell for their use, or they would throw it into the fire: and, at their own request, they often staved the casks containing the liquor. Henry to stop these disorders published a proclamation, that all who were convicted of such barbarities should have their eyes pulled out, or their hands or feet cut off. This effectually checked the insolence of the Londoners, and the city continued to flourish in the reigns of Henry I. and Stephen. The discontentment of the citizens to Stephen, however, was never forgiven by Henry II. who made it one of the objects of his displeasure, by making friends of money from them. About the year 1140, indeed, the Londoners were arrived at the pitch of licentiousness. The sons of the wealthy citizens entered into a confederacy to rob and murder all that came in their way at night. The king took the opportunity of these irregularities to enrich himself. He granted several loans and free gifts; till at last

III. PART. II.

the Londoners, to prevent further inquiries, paid into the exchequer 5000*l.* in 3 years. These disorders, however, were at last stopped by the execution of John Scnex; who, though very rich, had engaged in these villanies. He offered 500*lb.* weight of silver, a prodigious sum in those days, for his pardon, but was refused. The king, however, continued to drain the citizens of their money, and fined every guild, fraternity, and company, that had acted as bodies corporate without the royal letters patent. On the death of Henry II. the title of the first magistrate of London was changed from *portreeve* to that of *bailliff*; and in 1189, the bailliff claimed and acted in the office of the *chief butler* at the coronation of Richard I.

(II.) LONDON, HISTORY OF, FROM HENRY II'S DEATH TO THAT OF HENRY III. In 1191, King Richard I. permitted the bailliff *Henry Fitz-Alwine*, to assume the title of *MAYOR*. In 1192, we find certain orders of the mayor and aldermen to prevent fires, and "that 12 aldermen of the city should be chosen in full huffings, and sworn to assist the mayor, in appeasing contentions that might arise among neighbours in the city," &c. Such confidence also did Richard put in the wisdom and fidelity of the citizens of London, that when it was resolved to fix a standard for weights and measures for the whole realm, he committed the execution thereof to the sheriffs of London and Middlesex. This happened in 1198, when corn was advanced to the enormous price of 18*s.* 4*d.* per quarter. London was much favoured by King John, who granted it 3 charters soon after his accession. The first was a recital and confirmation of those granted by Henry I. and II. with the additional privilege of being free from all tolls, duties, and customs, in his foreign dominions; for which they paid the sum of 3000 marks. The second was a confirmation of one granted by King Richard, giving the citizens of London the jurisdiction and conservancy of the Thames; and extending that jurisdiction to the Medway; with a power to inflict a penalty of 10*l.* upon any person that should erect a weir in either of these rivers. The third charter granted them a *fee-farm* rent of the sheriffwicks of London and Middlesex at the ancient rent, of which they had been deprived by Queen Matilda; with the power of choosing their own sheriffs. This charter was given by way of conveyance from the crown to the citizens for a valuable consideration, by which the sheriffwick became their freehold; and this is the first conveyance on record with the legal terms of *to have and to hold*, which are now accounted an essential part in all conveyances of property. Under Henry III. London was greatly oppressed. In 1218, he exacted a fine of 40 marks for selling a sort of cloth not two yards within the lists; and a 15th part of the citizens personal estates for the enjoyment of their ancient rights and privileges. In 1221, he commanded all the foreign merchants to depart the city; which drew 30 marks from the Antient company of the *Steelyard*, to have seisin of their guild or a hall in Thames-street. In the same year, in consequence of a riot, wherein the citizens were most barbarously used, some of them being hanged, and others having their hands and

B b b

sect

feet cut off, without any form of trial, the mayor and all the magistrates were degraded; a *custos* placed over the city, and 30 persons bound as securities for the good behaviour of the city. Several thousand marks were also exacted by the king before he would consent to a reconciliation. This arbitrary behaviour alarmed the whole nation. The parliament, in 1224, addressed the king, to confirm the charter of liberties which he had sworn to observe; and the consequence of this application was a confirmation of the *MAGNA CHARTA*, in the full parliament at Westminster, in 1225. At this time also, the rights and privileges of the citizens were confirmed. They were exempted from prosecutions for *BURELS*, *i. e.* lifted cloth; and were granted the right of having a common seal. The necessitous circumstances of this monarch, however, made him often exact money arbitrarily as long as he lived.

(12.) LONDON, HISTORY OF, FROM HENRY III'S DEATH, TO THE DREADFUL PESTILENCE AND FIRE IN 1665 & 1666. Under the succeeding monarchs, as the liberty of the people in general was augmented, so the freedom, opulence, and power of the citizens of London increased, until they became a kind of balance to the power of the crown itself, which in some measure they still continue to be. Riots indeed, for which they generally suffered, were by no means unfrequent; they also often suffered by fires and plagues. Nothing, however, happened which materially affected the welfare of the city, till the reign of Charles II. in 1665, when London was ravaged by the most violent plague ever known in Britain. The whole summer had been remarkably still and warm, so that the weather was sometimes suffocating even to people in perfect health; and by this unusual heat and sultry atmosphere, people were undoubtedly prepared for receiving the infection, which appeared with violence in July, August, and September. A violent plague had raged in Holland in 1663; on which account the importation of merchandize from that country was prohibited by the British legislature in 1664. The infection, however, had actually been imported, for in the close of 1664, 2 or 3 persons died suddenly in Westminster, with marks of the plague on their bodies. Some of their neighbours, terrified at their danger, removed into the city, and communicated the infection to so many others, that it became impossible to extinguish it by separating those that were infected from such as were not. It was confined, however, through a hard frosty winter, till February, when it appeared in St Giles's parish, to which it had been originally brought; and, after another interval, showed its malignant force afresh in April. At first, it took off one here and there, without any certain proof of their having infected each other, and houses were shut up, to prevent its spreading. But it was now too late; the infection gained ground every day, and the shutting up of houses only made the disease spread wider. People, afraid of being shut up, concealed their illness; while numbers either escaped from their places of confinement, or expired in the greatest torments, destitute of every assistance; and many died both of the plague and other diseases, who would in all

probability have recovered, had they been secured their liberty, with proper exercise and diet. The house was shut up on account of a maid who had only spots, and not the gangrenous blotches upon her, so that her distemper was probably a petechial fever. She recovered; the people of the house obtained no liberty either for air or exercise, for 40 days. The air, fear, anger, and vexation, attending this rigorous treatment, cast the mistress of the house into a fever. The visitors, appointed to see the houses, said it was the plague, though the physicians were of a different opinion: the family ever, were obliged to begin their quarantine, though it had been almost expired. This ad confinement affected them so much, that most of them fell sick of one distemper or another. Every illness that appeared in the family produced a fresh prolongation of their confinement, till at last the plague was actually brought into the city, and almost every person in the house was infected. Many examples of a similar kind happened in other parts of the city. This was one of the worst consequences of the shutting up of houses. All means of stopping the infection proved ineffectual. Multitudes fled into the country; many merchants, owners of ships, shut themselves up, on board their vessels, supplied with provisions from Greenwich, Deptford, and farm-houses on the Kentish side, where they were safe; for the infection never reached below Deptford, though the people were obliged to go a-shore to buy fresh provisions. As the number of the plague increased, the ships which were laden with millics on board removed farther off; for they were quite out to sea, and put into such harbours as they could get at. In the mean time, the plague increased rapidly in the city. In the last week of July, the number of burials amounted to 3817; in the first week of August it rose to 3880; to 4237; the next week, to 4929; and at last to 7000 and 8000 weekly. In the first week of September, however, the fury of the plague began to abate; though vast numbers were still sick, yet the number of burials decreased to 7155 to 5538; next week to 4929; then to 2665; then to 1421, and the next week to 1031. All this while, the poor people were reduced to the greatest distresses, by the stoppage of trade, and the sicknesses occasioned by their manner of living. The rich, however, were not so much affected; they contributed to their subsistence in a most liberal manner. The sums collected, on this occasion, were indeed almost incredible; being said to amount to 100,000*l.* per week. The king contributed 1000*l.* weekly; and in the parish of St Dunstons, the plegate alone 17,000*l.* was distributed among the poor inhabitants. By the vigilance of the magistrates, provisions continued to be sold at a remarkably cheap price throughout the whole time of this dreadful calamity, so that all riots on that account were prevented; and at last, on the cessation of the disease in winter 1665, the inhabitants had fled returned, and London to appear as populous as ever, though it was computed that 100,000 persons had been carried off by the plague. The city was scarcely recovered from this desolation, when it was almost

laid in ashes by a most dreadful fire; which broke out in a baker's shop in Pudding-lane, on Saturday night, Sept. 2, 1666. In a few hours Billingsgate ward was entirely burnt down; and before morning the fire had crossed Thames-street, and destroyed the church of St Magnus. Thence it proceeded to the bridge, and consumed a great pile of buildings there; but was stopped by the want of any thing more to destroy. The flames, however, being scattered by a strong east wind, continued their devastations in other quarters. All efforts to stop it proved unsuccessful throughout Sunday, when it proceeded up as far as Garlic-bithe; and destroying Canon-street, invaded Corn-hill and the Exchange. On Monday, the flames having proceeded eastward against the wind thro' Thames-street, invaded Tower-street, Gracechurch-street, Fenchurch-street, Dowgate, Old Fish-street, Watling-street, Thread-needle-street, and several others, from all which it broke at once into Cheap-side; which, in a few hours, was all in flames, the fire having reached it from so many places at once. The fire then continuing its course down the river on one side, and from Cheap-side on the other, surrounded the cathedral of St Paul's. This building stood by itself at some distance from the houses; yet such was the violence of the flames, and the heat of the atmosphere, that the cathedral took fire at top. The great beams and heavy stones broke through into Faith-church underneath, which was quickly burnt; after which, the flames invaded Pater-noster-row, Newgate-street, the Old Bailey, Ludgate-hill, Fleet-street, Fishmonger-lane, Old Jury, Laurence-lane, Milk-lane, Wood-street, Gutter-lane, Foster-lane, Chiswell-lane, Cateaton-street; and, having destroyed St Martin's church, burnt furiously through St Martin's Grand toward Aldersgate. The fire had now attained its greatest extent, and was several miles compass. The vast clouds of smoke obscured the sun so, that he either could not be seen, or appeared as red as blood. The flames reached an immense way up in the air, and their reflection in the smoke, which in the night-time seemed like flame, made the appearance still more terrible. The atmosphere was illuminated to a great extent, and this illumination is said to have been visible as far as Jedburgh in Scotland. Some of the light ashes also are said to have been carried the distance of 16 miles. Guildhall exhibited a singular appearance. The oak with which it was built was so solid that it would not flame, but burnt like charcoal, so that the building appeared for several hours like an enchanted palace on fire. At last, on Wednesday morning, when every one expected that the suburbs were to have been burnt, the fire began to abate, the wind having ceased. It was checked by the great building in Leaden-hall-street, and in other streets by running up several houses with gun-powder; and on Thursday the flames were quite extinguished. In this extraordinary conflagration, there were destroyed, 13,200 houses, 87 churches, 6 chapels, 12 public halls, the royal exchange, the custom-house, 3 city gates, the jail of New-gate, 4 stone bridges, the Sessions house, Guildhall, with its offices, Blackwell hall, Bridewell, the Compter, Woodstreet Compter, and St

Paul's Church; which, with wares, household furniture, money, goods, books, wine, sugar, tobacco, &c. have been estimated to amount to no less than L. 10,689,000 sterling.—It was never certainly known whether this fire was accidental or designed. A suspicion fell upon the Papists; and this gained such credit, that it is asserted for a truth on the monument erected in memory of the conflagration. (See § 18.) Though there was no sufficient proof of this, it had the effect of making the Papists most violently suspected and abhorred by the Protestants.

(13.) LONDON, HISTORY OF, FROM THE GREAT FIRE IN 1666, TO THE REVOLUTION IN 1688. From this calamity, great as it was, London soon recovered, and became much more magnificent than before; the streets, formerly crooked and narrow, being now built wide and spacious; and the industry of its inhabitants soon repaired the losses they had sustained. In 1679, the city was again alarmed by the discovery of a design to destroy it by fire a second time. Elizabeth Oxley, servant to one Rind in Fetter-lane, having set her master's house on fire, was apprehended, and confessed, that she had been hired to do it by one Stubbs a Papist, for a reward of 5 l. Stubbs being taken into custody, acknowledged that he had persuaded her to it; and that he himself had been prevailed upon by one father Gifford his confessor, who had assured him, that by burning the houses of heretics he would do a great service to the church. He also owned that he had several conferences with Gifford and two Irishmen on the affair. The maid and Stubbs also declared, that the Papists intended to rise in London, expecting to be powerfully supported by a French army. In consequence of this discovery, the Papists were banished from the city and ten miles round, and 5 Jesuits were hanged. The Papists, in revenge, forged what was called the *meal-tub plot*, in which the Presbyterians were said to hatch treacherous designs against the king's life. Sir Edmondbury Godfrey also, who had been very active in the proceedings against the Papists, was found murdered; and this murder, together with their discovering the falsehood of the meal-tub plot, so exasperated the Londoners, that they resolved to show their detestation of Popery, by an extraordinary procession and exhibition on the 17th Nov. Q. Elizabeth's accession to the throne, on which day they annually burnt the pope in effigy. This procession and exhibition (of which it is unnecessary now to detail the particulars,) gave great offence to the court. The breach was farther widened by the election of sheriffs. The candidates set up by the court were rejected by a majority of almost two to one; and upon their demanding a poll, a tumult ensued. On this the king issued out a commission that same evening for trying the rioters; which, however, was so far from intimidating the rest, that they determined, not only to oppose the Popish party, but to exclude the duke of York from his succession to the crown. In the mean time, the king prorogued the parliament, to prevent them from proceeding in their inquiry concerning the Popish plot, and the exclusion bill. Upon this the lord mayor, aldermen, and common council, presented a petition to the king, requesting

such judges as would not approve of their proceedings; and, on the 12th June 1683, Justice Jones pronounced the following sentence: "That a city might forfeit its charter; that the malversations of the common council were acts of the whole city; and that the points set forth in the pleadings were just grounds for the forfeiting of a charter." But notwithstanding this sentence, the attorney-general was directed to move that the judgment might not be recorded; being afraid of the consequences. Yet it was judged that the king might seize the liberties of the city. A common council was immediately summoned. The country party moved to have the judgment entered; but the court party insisted upon an absolute submission to the king before judgment was entered; and though this was in effect a voluntary surrender of the city liberties, the act of submission was carried by a great majority: and in a petition from the lord mayor, aldermen, and common council, they "acknowledged *their own misgovernment*, and his majesty's *lenity*; begged his majesty's *parдон*; promised constant loyalty and obedience; and humbly begged his majesty's commands and directions." To this the king answered, that he would not reject their suit, if they would agree upon the following particulars: "1. That no lord mayor, sheriff, recorder, common serjeant, town-clerk, or coroner, of the city of London, or steward of the borough of Southwark, shall be capable of, or admitted to, the exercise of their respective offices, before his majesty shall have approved of them under his sign manual. 2. That if his majesty shall disapprove the choice of any person to be lord mayor, and signify the same under his sign manual to the lord mayor, &c. the citizens shall, within one week, proceed to a new choice; and if his majesty shall disapprove the said choice, he may nominate a person to be lord mayor for the year ensuing. 3. If his majesty shall disapprove the persons chosen to be the

when it was put to the vote, there appeared a majority of 18 for submission. Thus the government of the city into his own hands, though he and his brother entirely lost the affections of the Londoners. But, not content with their submission, he departed from his promise, and commanded the judgment upon the *quo warranto* to be entered; and commissioned Sir John Pritchard, the lord mayor, to hold the same during his pleasure. He also appointed and succeeded the other magistrates as he thought fit after which the ministry, having nothing to do but to proceed in the most arbitrary manner, subjected to the will of the court, the same continued till the Revolution.

(14.) LONDON, HISTORY OF, FROM THE RESTORATION TO THE PRESENT PERIOD. In the immediate restoration of the Londoners their franchises was ordered; and in such a manner, as to put it entirely out of the power of an arbitrary ministry, and a corrupt judge; to deprive them of their chartered liberties for a time to come. Accordingly a bill was introduced into parliament, and passed, for a reversal of the judgment of the *quo warranto* against the city of London, and for restoring the same to the city their ancient rights and privileges. From that time to the present (1802) London hath enjoyed its liberties, with little interruption, except in a few instances; such as, the riots that took place during Anne's reign, in 1709, by the disputes between the high and low church parties, respecting Sacheverel: (See SACHEVEREL;) those threatened in his present majesty's reign, respecting the Middlesex election; (See ENGLAND, § 10, and WILKES;) and, above all, those riots that happened in 1780, respecting the Bill, which at one period threatened the destruction of London. (See ENGLAND, § 10, and GORDON, N<sup>o</sup> 2.) We cannot come to a full history of this metropolis, without the

, circulated a vast number of political pamphlets throughout the kingdom, ministry became bold; and in 1794, 12 of the leading members apprehended and indicted for high treason. He, however, only three were brought to trial, viz. *Thomas Hardy*, *John Horne-Tooke*, Esq; and *John Thelwall*, who being acquitted, the others were dismissed without a trial; and these acquittals were attended with much exultation, no riots whatever occurred.

**LONDON, HOSPITALS IN.** There are in this city about 20 hospitals and infirmaries, or alms houses. Of these we shall here only mention three. Adjoining to Christ-church in Te-street is *Christ's Hospital*, which, before dissolution of monasteries, was a house of monks. The hospital was founded by Edward I. for the fatherless children of poor free-born city; of whom 1000 of both sexes are daily maintained in the house or out at nurse, likewise clothed and educated. In 1673, a grammatical school was founded here by Charles II. with L. 320 a-year; and a writing school was added in 1694 by Sir John Moor, an alderman of the city. After the boys have been 7 years on the foundation, some are sent to the sea and others to sea; while the rest, at a certain age, are put apprentices to trades at the disposal of the hospital. At first their habit was a blue coat, but was soon after changed for blue, and has ever since continued to be their colour; this account the foundation is frequently called the *blue-coat hospital*. The affairs of this hospital are managed by a president and about 300 governors, besides the lord mayor and aldermen. The building, which is partly Gothic and partly modern, was much damaged by the fire of 1666, but was repaired, and has been since increased by several additions. The principal buildings, which form the 4 sides of an area, have a piazza between them with Gothic arches, and the walls are supported by abutments. The front has Doric columns supported on pedestals. Contiguous to this hospital, is *St Bartholomew's Hospital*. It was originally founded soon after the accession of Henry I. by Rahere the king's jester, as an infirmary for the priory of St Bartholomew the Great, then stood near the spot. But upon the dissolution of religious houses, Henry VIII. dissolved it, and endowed it with 500 marks a-year in condition that the citizens should pay the sum annually for the relief of 100 infirmaries. The endowments have been since so much diminished, that it now receives the distressed of all nations. In 1702, a beautiful frontispiece was erected towards Smithfield, adorned with pilasters and entablature, and a pediment of the Ionic order with a statue of Henry VIII. in a niche in the middle, and those of two cripples on the sides supporting the pediment over it. In 1729, a plan was made for rebuilding the rest of this hospital, the execution of which a magnificent edifice has since been erected. In Colman-street ward, on the S. side of the square called *Moorfields* stands *Bethlehem Hospital*, founded in 1674 by the lord-mayor and aldermen of London for the reception and cure of lunatics. It is a noble edifice, built with brick, and adorned with pilasters, entablatures,

and sculptures; particularly with the figures of two lunatics over the grand gate, which are well executed. This building is 540 feet long and 40 broad, exclusive of two wings of a later erection, for lunatics deemed incurable. This hospital contains a great number of convenient apartments, where the patients are maintained, and receive all medical assistance, without any expence to their friends, except bedding. The structure is divided into two stories, through each of which runs a long gallery from the one end to the other. On the S. side are the cells, and on the N. the windows that give light to the galleries, divided in the middle by handsome iron grates, to keep the men and women separate. This hospital being united to that of Bridewell, both are managed by the same president, governors, treasurer, clerk, physician, surgeon, and apothecary; but each has a steward and inferior officers of its own. Opposite to Bethlehem hospital stood that of *St Luke*, a long plain building, appropriated to the same purposes, but wholly independent of the former. Of late the patients were removed from this hospital (since pulled down) to a new one erected under the same name in Old-street, on the same plan, extending in front 393 feet.

(16.) **LONDON, INNS OF COURT IN.** There are 15 inns of court and chancery. In Farringdon Ward Without are the Inner and Middle Temple, Serjeant's Inn, Clifford's Inn, Barnard's Inn, Staples Inn, and Furnival's Inn. The *Temple* was originally founded by the Knight's Templars, who settled here in 1185. It was divided into 3 parts; the Inner, Middle, and Outer Temple; so called from their situations respecting the Bar. On the dissolution of the order of Knights Templars, it devolved to the Knights Hospitallers of St John of Jerusalem, who granted a lease of it to the students of the common law, and converted the Inner and Middle Temple into two inns of court for the study and practice of the common law. The Outer Temple became a house for the E. of Essex. The buildings of the Temple escaped the fire in 1666, but were most of them destroyed by subsequent fires, and have been since rebuilt. The two Temples are each divided into several courts, and have pleasant gardens on the banks of the Thames. They are appropriated to distinct societies, and have separate halls. The Inner Temple hall is said to have been built in the reign of Edw. III. and the Middle Temple hall, which is a magnificent edifice, was rebuilt in 1572 in form of a college hall. The Middle Temple gate was erected by Sir Amias Powlet, on a singular occasion. Sir Amias, about 1501, put Cardinal Wolsey, then parson of Lynton, into the stocks. In 1515 he was sent for to London by the cardinal on account of that ancient grudge, and commanded not to quit town till farther orders. In consequence, he lodged 5 or 6 years in this gateway, which he rebuilt; and to pacify his eminence, adorned the front with the cardinal's cap, badges, cognisance, and other devices of this butcher's son: so low were the great men obliged to stoop to that meteor of the times! Each temple has a good library, adorned with paintings and well furnished with books. An assembly called a *parliament*, in which the affairs of the society of the Inner Temple are managed

naged, is held there every term. Both Temples have one church, founded in 1183 by the Knights Templars; but the present edifice is supposed to have been built in 1420. It is supported by neat slender pillars of Suffolk marble, and is one of the most beautiful Gothic structures in England. In this church are many monuments, particularly of 9 Knights Templars cut in marble, in full proportion, some of them 7½ feet long; 6 are cross-legged, and therefore supposed to have been crusaders. The minister, who is called the *master of the Temple*, is appointed by the senior members of both societies, and presented by a patent from the crown. *Serjeant's Inn* is a small inn in Chancery lane, where the judges and serjeants have chambers, but not houses. In each of them there is a hall and a chapel. *Clifford's Inn* is an inn of chancery belonging to the Inner Temple. It was originally a house granted by Edward II. to the family of the Cliffords; but was afterwards let upon lease to the students of the law, and in the reign of Edward III. sold to the members of this society. *Bernard's Inn* is an inn of Chancery belonging to Gray's Inn, and is situated in Holborn. John Mackworth, dean of Lincoln, gave it to professors of the law. *Staple's Inn* belongs also to Gray's Inn, and is situated in Holborn. It was once a hall for the merchants of the staple for wool, whence its name; but was purchased by the benchers of Gray's Inn, and has been an inn of chancery since 1415. *Furnival's Inn* is an inn of chancery belonging to Lincoln's Inn, and was once the house of the family of the Furnivals, by whom it was let out to the professors of the law. It is a large old building, with a hall and a pleasant garden. *Gray's Inn* and *Lincoln's Inn* are two of the principal inns of court, but both are without the liberties of the city, though the former is situated within the parish of St Andrew Holborn. See WESTMINSTER.

(17.) LONDON, MARKETS IN. There are 15 flesh markets, one for live cattle, and 25 for corn, coals, hay, herbs, &c. Of these the 3 principal are, at Smithfield for cattle and hay, at Leadenhall for butcher's meat, wool, hides, and Colchester baize, and at Billingsgate for fish. The following are also very considerable, *viz.* Honey-lane, Newgate, and Fleet markets, chiefly for flesh, though with separate divisions, for fish, butter, eggs, poultry, herbs, and fruit; the Three-Cranes market for fruit. The principal corn market is held in a neat exchange in Marklane, and that for flour at Queenhithe. In Thames-street, near Billingsgate, there is an exchange for dealers in coals and masters of vessels in that trade. In Basing hall ward, is *Blackwellhall*, which adjoins to Guildhall, and is the greatest mart of woollen cloth in the world. It was purchased of King Richard II. by the city; and has ever since been used as a weekly market for broad and narrow woollen cloths, brought out of the country. It was burnt in 1666, but rebuilt in 1672, and is now a spacious edifice, with a stone front adorned with columns.

(18.) LONDON, MONUMENT OF. Near the N. side of London bridge stands the *Monument*, a beautiful and magnificent fluted column of the Doric order, built with Portland stone, and erected in memory of the conflagration in 1666. It was begun by *Sir Christopher Wren* in 1671, and finished by him

in 1677. Its height from the pavement feet; the diameter of the shaft, or body column, is 15 feet; the ground plinth, or part of the pedestal, is 28 feet square; a pedestal is 40 feet high. Over the capital on balcony encompassing a cone 32 feet which supports a blazing urn of gilt brass. In is a large staircase of black marble, consisting of 245 steps, each 10 inches and a half broad six inches thick. The W. side is adorned with a curious emblem in alt-relief, denoting the creation and restoration of the city. The first figure represents London sitting in ruins, in a guilting posture with her head dejected, dishevelled, and her hand carelessly lying on a sword. Behind is *Time*, gradually raising at her side is a woman touching her wrist, whilst a winged sceptre in the other hand, her to regard the goddesses in the cloud with a cornucopia, denoting *Pleanty*; the other with a palm branch, the emblem of *Peace*. Above the figure is a bee-hive, showing, that by industrious application the greatest misfortunes are to be overcome. Behind the figure of *Time* are two figures exulting at his endeavours to restore her; one is seated, in the midst of the ruins is a dragon as the supporter of the city arms, with a sword in his paw, endeavouring to preserve the same. Opposite to the city, on an elevated pavement, stands a king, in a Roman habit, with a laurel wreath, and a truncheon in his hand; and appearing her, commands three of his attendants to send to her relief. The first represents *Truth* with a winged head and circle of naked dancing thereon; and *Nature* holding out her breasts, ready to give all to all. The second is *Architecture*, with a compass in one hand, and a square and pair of compasses in the other; and the third is *Liberty*, waving in the air, showing her joy at the prospect of the city's speedy recovery. Behind her stands his brother the duke of York, with a garland in one hand to crown the rising city, and a sword in the other for her defence. Two figures behind are *Justice* and *Fortitude*; the former with a coronet, and the latter with a lion; and under the royal pavement lies a man gnawing a heart, and incessantly emitting infernal fumes from her mouth. On the plan of the reconstruction of the city is represented by the names of the artificers and labourers at work upon houses. (N., S. and E. sides, are inscriptions relating to the destruction occasioned by the conflagration, and the regulations about rebuilding the city, and the monument; and round it is the following —“ This pillar was set up in perpetual remembrance of the most dreadful burning of this constant city, begun and carried on by the treachery and malice of the Popish faction, in the night of September, in the year of our Lord 1666, in order to their carrying on their horrid project of extirpating the Protestant religion and abolishing *Liberty*, and introducing popery and slavery.”

(19.) LONDON, NUMBER OF CHURCHES, SCHOOLS, SQUARES, STREETS, HOUSES, &c. On the N. side St Paul's cathedral and the collegiate church at Westminster, there are 102 parish churches, 69 chapels, of the established religion; 21

tant chapels; 11 chapels belonging to the monks, Dutch, Danes, &c.; 16 independent churches; 34 presbyterian meetings; 20 baptist churches; 19 popish chapels, and meeting-houses for the use of foreign ambassadors and people of 15 sects; and three Jewish synagogues. So there are at least 305 places devoted to religious worship in the compass of this vast pile of buildings, without reckoning those in the 21 out-parishes, usually included in the bills of mortality, a great number of methodist tabernacles. There are also 27 public squares, besides those in single buildings, as the Temple, &c.; 3 streets, 55 halls for companies; 207 inns, 447 taverns, 551 coffeehouses, 5975 alehouses; 1000 hack-coaches, 400 ditto chairs; 7000 streets, 15 courts and alleys, and 150,000 dwelling houses.

**B.) LONDON, PLACES OF PUBLIC AMUSEMENT.** The principal of these are Vauxhall, St. James's gardens, the 2 play-houses, the little theatre in the Hay-market, Sadlers-wells, Hughes's theatre, and Astley's Royal Grove, &c. The finest collections of rarities and natural history, are those in Sloane's in the British Museum, and that collected by the late Sir Ashton Lever, now the property of Mr Parkinson, and deposited in paper apartments for public inspection, near the south end of Black-friars bridge. See LEVER,

**C.) LONDON, POPULATION, AND CONSUMPTION OF PROVISIONS, &c. IN.** The total population of London is estimated at about one million inhabitants; who, according to a moderate calculation, are calculated to consume provisions to the amount of 228,652 *l.* 12 *s.* 10 *d.* and fuel, candles, paper, pens, ink, wax, snuff, tobacco, &c. to the amount of 415,104 *l.* 7 *s.* 7 *d.*; which, with the addition of 4,000 *l.* per week for corn, hay, and beans to horses, makes 47,756 *l.* 16 *s.* 2 *d.* per week, or £33,783,354: per annum.

**D.) LONDON, PRISONS IN.** There are ten prisons in London. In the street called the *Old Bailey* in Farringdon ward without, stands the prison for Criminals, called *Newgate*; built in a much more convenient situation, and on a more enlarged plan than the former. Here the unfortunate debtor is no longer annoyed by the rattling of chains, or by the more horrid imprecations issuing from the lips of those wretched beings who set defiance to all laws divine and human; and here also the offender, whose crime is capital, may enjoy all the benefits of a free country. In this ward is likewise the *Fleet prison*, which is removed from the *Fleet*, a rivulet which formerly ran through it. This building is large, and reckoned the most convenient in the city for conveniences. It has the advantage of a large yard, which is enclosed with a high wall. This prison is as ancient as the reign of Richard I. and belongs to the court of Chancery, &c. In Farringdon ward Without is a building called *BRIDEWELL*, from a spring in the garden named *St Bridget's* or *St Bride's Well*. This was originally a royal palace, and occupied all the ground from *Fleet-ditch* on the E. to *Water-lane* on the W. That part of it now called *Salisbury-yard* was given to the bishops of *Salisbury* for

their town residence; and the E. part, which was rebuilt by King Henry VIII. is the present *Bridewell*. It was granted to the city by Edward VI. as an hospital; and he endowed it for the lodging of poor travellers, and for the correction of vagabonds, strumpets, and idle persons, as well as for finding them work. In one part of the building 20 artificers have houses; and about 150 boys, distinguished by white hats and blue doublets, are put apprentices to glovers, flax dressers, weavers, &c. and when they have served their time are entitled to the freedom of the city, with 10 *l.* towards carrying on the respective trades. The other part of *Bridewell* is a receptacle for disorderly persons, who are kept at beating hemp and other hard labour.

**(23.) LONDON, PUBLIC BUILDINGS, BRIDGES, &c. IN.** The streets and public buildings in London and its liberties being far too numerous for a particular description in this work, we shall only select the most remarkable. The original bridge, in *Bridge-ward*, was of wood, and appears to have been first built between 993 and 1016; but being burnt down about 1136, it was rebuilt of wood in 1163. The expences, however, of maintaining and repairing it became so burdensome to the inhabitants of the city, that they resolved to build a stone bridge a little W. of the wooden one. This was begun in 1176, and finished in 1209; and was 915 feet long, 44 feet high, and 73 feet wide; but houses being built on each side, the space between was only 23 feet. In one part had been a drawbridge, useful either by way of defence or for the admission of ships into the upper part of the river. This was protected by a strong tower. It served to repulse *Fauconbridge the Bastard* in his general assault on the city in 1471, with a set of banditti, under pretence of releasing the unfortunate *Henry*, then confined in the *Tower*. Sixty houses were burnt on the bridge on the occasion. It also served to check, and in the end annihilate, the insurrection of *Sir Thomas Wyatt*, in the reign of *Q. Mary*. The top of this tower, in turbulent times, used to be covered with heads or quarters of unfortunate partizans. Even so late as 1598, *Hentzner*, the German traveller, with German accuracy, counted on it above 30 heads. The old map of the city in 1597 represents them in a most horrible cluster. — An unparalleled calamity happened on this bridge within 4 years after it was finished. A fire began on it at the *Southwark* end; multitudes of people rushed out of London to extinguish it; while they were engaged in this charitable design, the fire seized on the opposite end, and hemmed in the crowd. Above 3000 persons either perished in the flames, or were drowned by overloading the vessels sent to their relief. The narrowness of the passage on this bridge having occasioned the loss of many lives from the number of carriages continually passing; and the straitness of the arches, with the enormous size of the stercoraries, which occupied one 4th part of the waterway, having also occasioned frequent and fatal accidents, the magistrates in 1756 obtained an act of parliament for improving and widening the passage over and through the bridge, which granted them a toll for every carriage and horse passing

over it, and for every vessel with goods passing through it; but these tolls proving insufficient, were abolished by an act made in 1753, for explaining, amending, and rendering the former act more effectual; and for granting the city of London money towards carrying on that work. In consequence of these acts, a temporary wooden bridge was built, and the houses on the old bridge were taken down. Instead of a narrow street 23 feet wide, there is now a passage of 31 feet for carriages, with a raised pavement of stone on each side, 7 feet broad, for the use of foot passengers. The sides are secured by stone balustrades, enlightened in the night with lamps. The passage thro' the bridge is enlarged by throwing the two middle arches into one, and other improvements. Under the 1st, 2d, and 4th arches, from the N. side of the bridge, and now likewise towards the S. extremity, there are engines worked by the flux and reflux of the river, the water of which they raise to such a height as to supply many parts of the city. Those engines were contrived in 1582 by one Peter Morice a Dutchman, and are called *London-bridge-water-works*. Opposite Fleet-ditch, stands **BLACKFRIARS BRIDGE**; an elegant structure. See **BRIDGE**, § 9; N° 1. The whole length is 995 feet: the breadth of the carriage way 28 feet, and that of the two footways 7 each. This bridge was begun in 1760; and finished in 1768, at the expence of L. 152,840. It is almost at an equal distance between those of Westminster and London, commands a view of the Thames from the latter to Whitehall, and shows the majesty of St Paul's in a very striking manner. Limestreet ward is remarkable for a very large building, of great antiquity, called *Leadenhall*, with flat battlements leaded on the top, and a spacious square in the middle. In 1309 it was the house of Sir Hugh Nevil knight; in 1384, of Humphry Bohun Earl of Hereford; in 1403 it became the property of the celebrated Whittington, who presented it to the mayor and commonalty of London; and in 1419, a public granary was erected here by Sir Simon Eyre, a citizen and draper, who built it with stone in its present form. A little to the E. of Leadenhall market, is the India house, built in 1726, on the spot occupied by Sir William Craven, mayor in 1610. The India Company have also erected a most magnificent warehouse on the site of the old Navy Office, on the W. side of the city walls, at the Minories. It is an oblong square of about 250 feet, by 160, and incloses a court of 150 feet by 60. The entry is by an arched gateway. In Broadstreet is the **BANK OF ENGLAND**, a stone building, which occupies one side of Threadneedle street. (See **BANK**, N° 10.) The entrance, and the building behind, were founded in 1703. Before that time the business was transacted in Grocers-hall. The front is a sort of vestibule; the base rustic, the ornamental columns above Ionic. Within is a court leading to a 2d elegant building, which contains a hall and offices, where the interest of above 500 millions is punctually paid. Two wings of uncommon elegance, designed by Sir Robert Taylor, have been added, and still further additions have been made and are making. The name of the projector of this national glory (says Mr Pennant) was Mr James

Paterfon of Scotland. This palladian country was in 1780 saved from the infamous banditti by the virtue of it who formed suddenly a volunteer company over-awed the miscreants; while the estate skulked, trembling in his man and left his important charge to its ENGLAND, § 101.) This important building since been very properly guarded by ry. At the extremity of Threadneedle is *Merchant-Taylors Hall*. In this street *South-Sea House*, first established in 1711 purpose of an exclusive trade to the and for supplying Spanish America with St Giles's Church, said to have been a hospital founded in 1117, by Q. M. rebuilt in 1625. By the amazing rail ground by various adventitious matter, in 1730 was 8 feet below the surface.

it necessary to rebuild the church in 17 finished in 1734, at the expence of 10, the W. side of Broad-street flood the Augustines, founded by the E. of S 1253. On the dissolution of the mona of the house was granted to William Lo afterwards Marquis of Winchester, w a magnificent house named *Winchester*. W. end of the church was granted in 15 a-Lasco for the use of the Germans an gitive Protestants, and afterwards to as a place for preaching. A part of i converted into a glass-house, and after *Pinnac-ball*, for the company of pin-n the E. of Winchester-street flood the b very eminent merchant, Sir Thomas afterwards known by the name of *Gresham*. (See **GRESHAM**.) It was pulled do years ago; and the *Excheq Office*, built i In Walbrook ward is the *Manfion-houf* dence of the lord mayor; begun in 17 nished in 1753. It is built of Portland; a portico of 6 fluted columns, of the order, in the front. The basement f masonry, and consists of rustic work; in is the door, which leads to the kitchen and other offices. On each side rise s steps, leading up to the portico, in which is the principal entry. The f trade of the stairs is continued along th the portico, and the columns support a gular pediment, adorned with a group in bas relief, representing the dignity a of the city of London. It is a heavy b an oblong form, and its depth is the lon ving several magnificent apartments, not well lighted, on account of the b surround it. Behind the mansion-houf *phen's Church*, justly reputed Sir C. Wren piece, and said to exceed every modern in the world in proportion and elegn mansion-house, and many adjacent. Round on the place where the *St. Luke's* flood. This took its name from a pair erected near the spot in 1281; and was market for provisions during many cent this ward is situated one of the most n pieces of antiquity in London. It is a g now standing in a case on the N. side c

et, close under the S. wall of St Swithin's church. It is called *London Stone*; and was formerly pitched edgewise on the other side of the street, opposite to where it now stands, fixed deeply in the ground, and strongly fastened with iron bars. It is mentioned so early as the time of beltran, K. of the W. Saxons, and has been carefully preserved. Of the original cause of its position no memorial remains; but it is supposed, as London was a Roman city, this stone might be the centre, and might serve as an object from which the distance was computed to the other considerable cities or stations in the province. The church of *St Mary le Bow*, in Cordwainer-street ward, is the most eminent parochial church in the city. It was built in the reign of William the First, being the first church the steeple of which was embellished with stone arches or *bosses*, was called *le Bow*. It was burnt in 1666, but was after rebuilt. The steeple is reckoned the most beautiful of its kind in Europe. In Cheap is *Guildhall*, or the *town-house* of London. It was originally built in 1111, but being much damaged by the fire in 1666, it was rebuilt in 1671. The front has a Gothic appearance, as well as two gigantic effigies in the hall. The hall is 13 feet long, 50 broad, and 55 high, adorned with the royal arms, and those of the city and its princes, as well as with several portraits of British sovereigns and judges. In this building are many apartments for transacting the business of the city, besides one for each of the judicial officers, of King's-Bench, Common-Pleas, and Chancery. *Goldsmiths Hall* stands in Foster-lane, and opens into the W. end of Cheap-side. In the same also is St Martin's le Grand, which, though surrounded by the city, was subject, near centuries, to Westminster Abbey. A fine church was built here in 700 by Wythred king of the Saxons, and rebuilt in 1056. On the N. side of Cheap-side stood the hospital of *St Thomas Acon*, founded by Fitz-Theobald and his wife Agnes, and by Thomas a BECKET, to whom it was dedicated. It was granted by king Henry VIII. to a company of mercers; destroyed by the fire in 1666; but rebuilt by the mercers company, and gave their hall here. Immediately to the E. of the narrow street called the *Old Jewry*, so named from a great synagogue which stood here till the Jews were expelled the kingdom in 1291. In thelegate ward is a hall, which belonged to the company of barber-surgeons, built by the celebrated Inigo Jones, and the upper end is formed by one of the towers or barbicans of London. The anatomical theatre is elliptical, and is finely contrived. This hall is now called *St Bartholomew's Hall*; the surgeons having obtained a separate charter, and built a new hall in the Old Jewry. Near Bridewell is *St Bride's Church*, a fine fabric 111 feet long, 57 broad, and 41 high, with a beautiful spire 254 feet in altitude, and a ring of 12 bells in its tower.

LONDON, PUBLIC OFFICES IN. The *Treasury Office for the Navy*, is seated on Little Britain. It is separated from Tower-hill by a wall and gate, and contains houses for the officers, store-houses, store-rooms, &c. under the direction of 7 commissioners and other officers. In

Tower ward is also the CUSTOM-HOUSE, a large, handsome, and commodious building of brick and stone. It stands upon the bank of the Thames, and is accommodated with large vaults, cellars, and ware-houses. On this spot is the busy concourse of all nations, who pay their tribute towards the support of Great Britain. The first custom-house was erected in 1559; which, being burnt in 1666, was rebuilt by Charles II. In 1718 it underwent the same fate, and was restored in its present form. In 1268 the half year's customs for foreign merchandise came only to L. 75:6:10; the annual produce of the customs, ending in April 1789, amounted to L. 3,711,126. In Water-lane, a little to the NW. of the custom house, is *Trinity-house*; founded in 1515, at a period in which the British navy began to assume a system. The founder was Sir Thomas Spert comptroller of the navy, and commander of the great ship *Henry Grace de Dieu*. The society is a corporation, consisting of a master, 4 wardens, 8 assistants, and 18 elder brethren selected from commanders in the navy and the merchants service. They may be considered as the guardians of our ships, military and commercial. Their powers are very extensive: they examine such of the children of Christ's hospital as study mathematics, and the masters of his majesty's ships; they appoint pilots for the Thames; settle the general rates of pilotage; direct light houses and beacons; grant licences to poor boatmen, not free of the city, to row on the Thames; prevent foreigners from serving on board our ships, without licence; punish offenders for mutiny and desertion; hear and determine complaints of officers and men in the merchant service; but unable to approach the court of admiralty; superintend the deepening and cleansing of the Thames, and have under their jurisdiction the tithing-office; have power to buy lands, and receive donations for charitable uses; and, in consequence, relieve annually many thousands of poor families, their widows, and orphans. In this house the business of the institution is carried on, but the mother house is at Deptford. The EXCISE OFFICE is a most magnificent building, erected on the site of GRESHAM COLLEGE. (See § 23.) The payments into this office amount to above 5½ millions a-year. S. of the Royal Exchange (§ 25.) and near the W. extremity of Lombard Street, is the *General Post-office*; a very handsome and commodious building.

(25.) LONDON, ROYAL EXCHANGE OR. The Royal Exchange, which is the meeting-place of the merchants of London, stands in the ward of Cornhill, and is the finest and strongest fabric of the kind in Europe. It was founded in 1566. Sir Thomas Gresham, merchant in London, made an offer to the lord mayor and citizens, to build, at his own expence, a commodious edifice for merchants to meet and transact business in, provided the city would find him a convenient situation for the same. The citizens, accordingly, purchased, for 35,218. 80 nobles, in the two alleys called *New St Christopher's*, and *Sutton's*, leading out of Cornhill into Thread-needle Street. The material of those houses were sold for 4781. and the ground, when cleared, was conveyed to Sir Thomas Gresham, who, accompanied by several aldermen,

See

and

laid the first brick of the new building on the 7th of June that year. The whole fabric was roofed by Nov. 1567, and was soon after completed under the name of the *Burſe*. This building was totally destroyed by the fire in 1666; and in its place the present magnificent structure was erected, at the expence of L. 80,000, upon a plat of ground 203 feet in length and 171 in breadth, containing an area in the middle, of 61 square perches, surrounded with a substantial and regular stone building, wrought in rustick. It has two fronts, N. and S. each of which is a piazza; and in the centre are the grand entrances into the area, under a very lofty and noble arch. The S. front in Cornhill is the principal; on each side of which are Corinthian demi-columns, supporting a compass pediment; and, in the intercolumniation on each side, in the front next the street, is a niche, with the statues of Charles I. and II. in Roman habits, well executed. Over the aperture, on the cornice between the two pediments, are the king's arms in relieve; on each side of this entrance is a range of windows between demi-columns, and pilasters of the composite order, above which runs a balustrade. This building is 56 feet high: and from the centre, in this front, rises a lantern and turret 178 feet high, on the top of which is a fan of gilt brass in the shape of a grasshopper, the crest of Sir Thomas Gresham. The N. front in Thread-needle street is adorned with pilasters of the composite order; but has triangular pediments. The inside of the area is also surrounded with piazzas, forming ambulatories for merchants, &c. Above the arches of this piazza is an entablature with curious ornaments; and on the cornice a range of pilasters with an entablature extending round, and a compass pediment in the middle of the cornice of each of the four sides. Under the pediment on the N. side are the king's arms; on the S. the city's arms; on the E. Sir T. Gresham's arms; and on the W. the mercer's arms. In these intercolumns are 24 niches, 20 of which are filled with the statues of the kings and queens of England. Under these piazzas, within the area, are 28 niches, all vacant but that in which Sir Thomas Gresham's statue is placed in the NW. angle, and that in the SW. where the statue of Sir John Barnard stands. The centre of this area is ornamented with a statue of Charles II. in a Roman habit, upon a marble pedestal about 8 feet high, encompassed with iron rails. The pedestal is enriched on the S. side with an imperial crown, a sceptre, sword, palm-branches, &c. On the W. side is a cupid cut in relieve, resting his right hand on a shield with the arms of France and England quartered, and holding a rose in his left hand. On the N. side is another cupid supporting a shield with the arms of Ireland; and on the E. side are the arms of Scotland, with a cupid holding a thistle; all done in relieve, by Gibbon. In this area, merchants and men of business meet every day at change hours; and for the more regular and readier dispatch of business, they dispose of themselves into separate walks. In building this expensive structure, not only magnificence, and convenience, but also œconomy, were consulted. A gallery was built over the 4 sides of the royal exchange, divided into 200 shops, which were let out to haberdashers, milli-

ners, &c. and which for several years occupied. But these galleries are now the Royal Exchange Assurance-office, the merchant-seamens office, the Marine Societioncers, &c. Under the whole area the finest dry vaults that can be found, which are let out to the East India company the turret is a good clock with 4 dials, regulated every day, so that it is a standard to all the mercantile part of the town; and with chimes at 3, 6, 9, and 12 o'clock upon 12 bells. The outside of this gallery suffers very much in appearance, from that surround it, and are built within, and which are occupied by bookfellers, cutlers, hosiery, watchmakers, &c.

(26.) LONDON, ST PAUL'S CATHEDRAL Farringdon-ward Within, is distinguished most magnificent Protestant church in the cathedral of *St Paul*. Sir Christophorus opinion that there had been a church on built by the Christians in the time of the was confirmed, when he searched for so for his own design; by discovering the original semicircular chancel of the old. They consisted of Kentish rubble stone, dated with exceedingly hard mortar, in man manner, much excelling the super. He explodes the notion of there having a temple of Diana. The first church is to have been destroyed in the Dioclesian tion, and to have been rebuilt under C. This was again demolished by the pagan and restored, in 603, by Seburt, a pet under Ethelbert king of Kent, the first monarch of the Saxon race; who, at the of St Augustine, appointed Melitus the fi of London. Erkenwald, the son of k 4th in succession from Melitus, ornam cathedral very highly, and improved the with his own patrimony. When Lor burnt in 1086, this church was rebuilt, Mauritius laid the foundations, which till its 2d destruction, in 1666. Thoug tius lived 20 years after he had begun it and Bp. Beauvages enjoyed the see 20 n such was the grandeur of the design, it remained unfinished. The style of the a cathedral was a most beautiful Gothic; ov end was an elegant circular window; the central tower rose a lofty and most spire. The dimensions, as taken in 1 these: The length 690 feet; the brea the height of the roof of the W. part, floor, 102; of the E. part, 188; of th 260; of the spire, which was made of v vered with lead, 274. The whole spac acres and a half, 1 rood and a half, and 6 The high altar dazzled with gems and g gifts of its numerous votaries. John France, when prisoner in England, fir his respects to St Erkenwald's shrine, basons of gold; and the gifts at the ob princes, foreign and British, were of im lue. On the day of the conversion of ti faint, the charities were prodigious, wh indulgence of 40 days pardon was given, *tentibus, contritis et confectis*; and, by

II. 1500 tapers were placed in the church, 1000 poor people fed in the church-yard. The holiness of this place did not prevent and profligates from lurking within the walls, and committing murders and every sort of crime. Edward I. permitted the dean and chapter to inclose the whole within a wall; and gates to exclude disorderly people.— These walls, on the NW. side, was the bishop's palace. Froissart tells us, that after the ornament in Smithfield, Edward III. and his queen lodged here, on occasion of their nuptials in 1361, the noble spire was totally burnt down, and never restored. In consequence of resolutions taken in 1620, by James I. to recathedralize the celebrated Inigo Jones was directed to the work. But it was not attempted, when Laud laid the first stone, and Inigo Jones

That great architect began with a most improper propriety, giving to the W. end a front of the Corinthian order, beautiful indeed, and in the style of the gothic pile; and to the ends of the transepts, gothic fronts in a most horrible manner. The great fire made way for restoring this ancient pile in its present noble form by Sir Christopher Wren, an architect worthy of so noble a design. It is built of fine Portland stone, of a cross. On the outside are two ranges of columns, consisting of 120 each; the lower of the Corinthian order, and the upper of the Composite. The spaces between the arches and windows and the architrave of the lower range are filled with a great variety of curious sculptures, as are also those above. On the N. portico, the ascent to which is by 22 steps of marble, and its dome supported by six Ionic columns. Over the dome is a pedimental face of which is engraved with the royal regalia, and other ornaments. On the S. portico, the ascent to which is by 25 steps, is a dome supported by 6 columns, corresponding to those on the N. side. The W. front has a magnificent portico, supported by 12 lofty Doric columns; over these are 8 columns of the Composite order, which support a noble pediment adorned with its acroteria, and in this pediment is a representation of St Paul's conversion, carved in bas relief. The ascent to this portico is by a flight of steps of black marble, extending the whole length of the portico; and the corner of the W. front is a beautiful turban dome, or cupola, rises in the centre of the building: 20 feet above the church is a circle of 32 columns with niches, placed exactly like others within; and terminated by a balustrade, which supports a handsome pediment adorned with a stone balustrade. Above this is a range of pilasters, with windows; and from the entablature of these, the height of the dome gradually decreases. On the summit of the dome is an elegant balcony, the centre of which runs a beautiful lantern adorned with Corinthian columns. The lantern is crowned with a copper ball, supporting a clock finely gilt. Within, the cupola stands on four enormous pillars, curiously adorned: the choir is supported by 6 pillars, and the church by two ranges, consisting of 20

more. The roof of the church and choir is adorned with arches and spacious peripheries of enrichments, admirably carved in stone. Quite round the inside of the cupola, there is a whispering iron balcony, or gallery, the top of which is richly painted by Sir James Thornhill. The first stone of this superb edifice was laid on June 21, 1675; and the building was completed in 1710; but the whole decorations were not finished till 1723. It was a most singular circumstance, that, notwithstanding it was 35 years in building, during which a revolution intervened, it was begun and finished by one architect, and under one prelate, Henry Compton, Bp. of London. The church of St Peter's was 135 years in building, in the reigns of 19 popes, and went through the hands of 12 architects. It is not, as has been said, built after the model of that famous temple: it is the entire conception of our great countryman, and has been preferred in some respects, by a judicious writer, to even the Roman Basilica. Its dimensions are less. The comparative view is given in the Parentalia, and copied in London and its Environs. The height of St Peter's, to the top of the cross, is 437½ feet; that of St Paul's 340 feet; so that, from its situation, it is lofty enough to be seen from the sea. The length of the first is 729 feet; of the latter, 500. The greatest breadth of St Peter's is 364; of St Paul's, 180. In the reigns of James I. and Charles I. the body of this cathedral was the common resort of the politicians, the newsmongers, and the idle in general. It was called *Paul's walk*; and is mentioned in the old plays, &c. of the times. Notwithstanding the magnificence of this noble pile, its defects have been remarked. Its situation is such, that it cannot be viewed at a distance. The division of the porticos, and the whole structure into two stories on the outside, indicate a like division within. The dome bears too great a proportion to the rest of the pile, and ought to have been raised exactly in the centre of the building; and there ought to have been two steeples at the E. end, to correspond with those at the W. On entering this church, we instantly perceive an obvious deficiency, not only of elevation but length, to assist the perspective; and the columns are heavy and clumsy, rather incumbering the prospect than enriching it. St Paul's occupies an area of 6 acres, and is railed all round with iron balustrades, each about 5½ feet high, fixed on a dwarf wall of hewn stone. In the W. end of this area is a marble statue of Q. Anne, holding a sceptre and globe, surrounded with 4 emblematical figures, representing Great Britain, France, Ireland, and America. Besides very large contributions for carrying on this edifice, the parliament granted a duty on sea-coal, which, at a medium, produced 5000l. a-year; and the whole expense of the building is said to have amounted to 736,752l. 2s. 3d.

(27.) LONDON, SCHOOLS, COLLEGES, &c. IN. There are 3 colleges, 8 public free schools, and 131 charity schools; wherein above 5000 poor children are educated. In Dowgate ward is a noted academy, called *Merchant-Taylor's School*, founded by the merchant-taylor's company, in 1651. It was burnt in 1666, but since rebuilt; and is a

very large structure, with commodious apartments for the masters and ushers, and a fine library. Sir Thomas White, lord mayor, having founded St John's college in Oxford in 1557, appointed this school as a seminary for it, and established at Oxford 46 fellowships for scholars elected from this school. In Cripplegate ward is a college, called *Sion College*, founded in 1627, on the site of Elsing hospital or priory, by Dr Thomas White vicar of St Dunstan's in the West, for the improvement of the London clergy; and with alms houses, under their care, for 20 poor persons, 10 men and 10 women. In 1631, the clergy of London were constituted fellows of the college; and from them are annually elected, on Tuesday 3 weeks after Easter, a president, two deans and 4 assistants, who meet quarterly, to hear a Latin sermon, and dine in the college hall. John Simpson rector of St Olaves, who superintended the building, added, at his own expence, a library 120 feet long, and amply filled with books. On the E. side of St Paul's cathedral is *St Paul's School*, founded in 1509 by Dr John Collett dean of this church, who endowed it for a master, an under master, a chaplain, and 153 scholars. In Warwick lane, stands the *College of Physicians*, erected in 1682 by Sir C. Wren. It is built of brick, and has a spacious stone frontispiece. Near the S. extremity of the Old Bailey, on the E. side, is the hall of the Company of Surgeons, with a theatre for dissection. In Castle Baynard ward is a large structure called *Doctors Commons*. It consists of several handsome paved courts, in which the judges of the court of admiralty, those of the court of delegates, of the court of arches, and the prerogative court, with the doctors that plead causes, and the proctors of the place, all live in a collegiate way; and from communing together, as in other colleges, the name of Doctors Commons is derived. Here courts are kept for the trial of civil and ecclesiastical causes under the Abp. of Canterbury and the Bp. of London. The college has an excellent library, every bishop at his consecration giving 20l. or 50l. towards purchasing books for it. Near Doctors Commons, on St Bennet's Hill, is the *College of Heralds*. See HERALDS, § 3. This building, originally the house of the earl of Derby, is a spacious quadrangle built of brick, and has convenient apartments. Here are kept records of the coats of arms of all the families and names in England.

(18.) LONDON, TOWER OF. The Tower stands E. of the Bridge and Monument. (§ 18, 2.) It is the chief-fortress of the city, and supposed to have been built by William the Conqueror, in 1066. It appears, however, to have been raised upon the remains of a more ancient fortress, erected probably by the Romans; for in 1720, in digging on the S. side of what is called *Cæsar's Chapel*, there were discovered some old foundations of stone, 3 yards broad, and so strongly cemented that it was with the utmost difficulty they were forced up. The great square tower, called the *White Tower*, was erected in 1078, under the direction of Gundulph Bp. of Rochester. This building originally stood by itself. Fitzstephen gives it the name of *Are Palatine*, or *the Palatine Tower*; the commander of which had the title of

Palatine. Within this tower is a very ancient chapel appropriated to the devotions of the king and queens. In 1092 a violent tempest did injury to the Tower; but it was repaired by William II. and Henry I. The former added castellated building on the S. side, between the Thames, afterwards called *St Thomas's Tower*. The Tower was first inclosed by Williamchamp, Bp. of Ely and chancellor under Henry I. who surrounded the whole with walls and made on the outside a vast ditch, into which in after times, water from the Thames was introduced. Different princes added other works present extent within the walls is 12 acre rods, the circuit on the outside of the ditch. The *Lions Tower*, originally called *quark*, was built by Ed. IV. Henry I. had a nagerie at his manor of Woodstock, where lions, leopards, lynxes, porcupines, and other wild animals, which were afterwards removed to the Tower. The royal menagerie is excellently well supplied. In 1738 the Tower ditch was filled all round. New barracks were some years ago erected on the Tower wharf, which part of the river; and upon the wharf is a line of pieces of cannon, which are fired upon state occasions. On this side of the Tower the ditch is filled and over it is a draw-bridge. Parallel to the wharf, within the walls, is a platform 70 feet length, called the *Ladies Line*, as it is frequented by ladies in summer, being shaded inside with a row of lofty trees; and will afford a delightful prospect of the shipping on the river. The ascent to this line is by stone steps, and once upon it one may walk almost round the tower without interruption. The principal entrance into the Tower is by a gate W. large enough to admit coaches and barges; but these are first admitted through the outward gate, situated without the ditch, and must pass a stout stone-bridge over the ditch before they can approach the principal entrance. There is, besides, an entrance SW. corner of the Tower outward wall, for footmen on foot, over the draw-bridge to the river. There is also a water-gate, commonly called *Traitor's gate*, through which traitors and state-prisoners are conveyed to or from the river, and which is seldom opened on any occasion; but the lords committed to the Tower in 1746 were admitted at the main entrance. This gate is a regular building, terminated at each end by two round towers, on which are fixed the infirmary, the mill, and the water-wheel to supply the Tower with water. In the Tower is a church, the offices of ordnance and of the mint, which comprehends near one third of the whole. There are also the offices of the keepers of the records, of the office, of the Spanish armoury, the hospital, and the new or small armoury; with barracks for the soldiers of the garrison, and a bandon for several officers who reside here. The principal officers of the Tower are, a constable, a lieutenant, and a deputy lieutenant. Eleven belong to this fortress; the militia of the Tower is 400 men, are obeyed, at the command of the constable of the Tower, to repair

and reinforce the garrison. It would swell this title beyond all due bounds, to give a description of all the curiosities in this ancient repository: the relics of royal magnificence. We shall therefore only give a very brief sketch of them. The first object of curiosity shown to strangers is the wild beasts. The next is the Mint, which comprehends about one 3d of the Tower. The next is the *White Tower* built by William I. a large square stone building nearly in the centre, containing a great variety of warlike engines; a complete set of arms for 10,000 seamen; various models of new invented engines of destruction; and the memorable spoils of the *invincible Spanish Armada*. On the NW. of the White Tower is the Grand Store-house, 245 feet long and 60 feet broad; containing what is called a *wilderness of arms*, for 80,000 men, all bright and fit for service, ranged in order. This grand store-house was begun by James II, and finished by William III. The horse armour contains a representation of the kings and heroes of England, in their like accoutrements, some of them on horseback. About 20 yards E. of the grand store-room, the Royal Jewels are deposited in a dark flag stone room; viz. 1. The imperial crown used at the coronation of the kings, made of gold and enriched with diamonds, rubies, emeralds, sapphires, and pearls: the cap within is of purple velvet, lined with taffety and turned up with ermine. 2. The golden globe, put into the king's hand before he is crowned, enriched with precious stones. 3. The golden sceptre, with its orb upon a large amethyst set round with diamonds. 4. The sceptre and dove perched upon a Jerusalem cross, enriched with diamonds, &c. It is Edward's staff, 4 feet  $7\frac{1}{2}$  inches long, and of circumference, all of beaten gold, which is carried before the king at his coronation. 6. The crown of State, worn by the king in parliament, in which is a large emerald, 2 inches round; and is reckoned the finest in the world, and of an immense value. 7. The prince of Wales's crown. 8. The crown, globe, and sceptre, used by Mary II, with the diadem she wore at her coronation. 9. An ivory sceptre garnished with pearls, with a dove on the top, or gold enamelled white; made for K. James II's queen. 10. The *Cartana*, or *Sword of mercy*, with a blade 32 inches long, and near 2 broad, without a point; which is carried before the king at his coronation, between the two swords of justice. 11. The golden rings, and *armillas*, or bracelets for the wrists. The *AMPULLA*, or *golden eagle*, which holds holy oil, with which the monarchs are anointed, and the golden spoon into which it is poured. A salt-cellar of gold, in the form of the square tower, of most exquisite workmanship. All these are very ancient, and are used only at coronations. 14. A silver font, double gilt, elegantly wrought, in which the royal family are baptized. A large silver fountain presented to K. Charles II. by the town of Plymouth: besides all the other jewels, worn by the princes, and much antique plate. The public records are also kept in a hall, which is open for inspection, from November 1st, 9 months in the year, and from eight to ten in winter.

(29.) LONDON, TRADING COMPANIES OF. The trading part of London is divided into 89 companies; though some of them have neither charters, halls, nor liveries. Of these, 55 have each a hall for transacting the business of the corporation; and this consists of a master, or prime warden, a court of assistants, and livery.—Of these companies 12 are superior to the rest both in antiquity and wealth; and of one of those 12 the lord mayors have generally made themselves free at their election. These are the mercers, grocers, drapers, fish-mongers, goldsmiths, skinners, merchant-tailors, haberdashers, salters, iron-mongers, vintners, and clothworkers.—The principal incorporated societies of the merchants are, the *Hamburgh Company*, the *Hudson's Bay Company*, the *Russia Company*, the *Turkey Company*, the *East India Company*, the *Royal African Company*, the *South Sea Company*, and some *Insurance Companies*. Most of these companies have stately houses for transacting their business, particularly the *East India* and *South Sea companies*. See COMPANY, § IV.

(30.) LONDON, WARDS OF. See § 6.

(31.) LONDON, WATER, &c. OF. This great and populous city is happily supplied with abundance of fresh water from the Thames and the New River; which is not only of inconceivable service to every family, but by means of fire-plugs every where dispersed, the keys of which are deposited with the parish officers, the city is in a great measure secured from the spreading of fire; for these plugs are no sooner opened, than vast quantities of water supply the engines. This plenty of water has been attended with another advantage, it has given rise to several companies, who insure houses and goods from fire, the premium is small, and the recovery in case of loss is easy and certain. (See INSURANCE, § 1.) Each of these offices keeps a set of men in pay, who are ready at all hours to give their assistance in case of fire; and who are extremely bold, dexterous, and diligent.

(32.) LONDON, WEALTH AND GRANDEUR OF. Before the conflagration in 1666, LONDON was very elegant, inconvenient, and unhealthy, of which latter misfortune many melancholy proofs are authenticated in history, and which proceeded from the narrowness of the streets, and the projections of the buildings, that confined the putrid air, and joined with other circumstances, such as the want of water, rendered the city seldom free from pestilential devastation. The fire which consumed the greatest part of the city, dreadful as it was to the inhabitants at that time, was productive of consequences which made ample amends for the losses sustained by individuals; a new city arose on the ruins of the old; but, though more regular, open, convenient, and healthful, than the former, yet it is ever to be regretted, that the magnificent, elegant, and useful plan of the great Sir Christopher Wren, was disregarded, and sacrificed to the mean and selfish views of private property; views which did irreparable injury to the citizens themselves and to the nation in general; for had that great architect's plan been followed, the metropolis of Great Britain would incontestably have been the most

most magnificent and elegant city in the universe, and would, of consequence, from the prodigious resort of foreigners of distinction and taste who would have visited it, have become an inexhaustible fund of riches to this nation. But though the deplorable blindness of that age deprived the nation of this valuable acquisition, London, by its modern improvements is still in a great degree rendered suitable to the character of the richest and most powerful people in the world. For although the want of regularity and uniformity in the streets of the city, and the mean avenues to many parts of it, are circumstances that greatly lessen the grandeur of its appearance, yet the improvements for several years past have been very great; and the new streets, which are numerous, are spacious, and built with great regularity and elegance. The very elegant method of paving and enlightening the streets is also equally useful and ornamental. The roads are continued for several miles around upon the same model; and, exclusive of lamps regularly placed on each side, at short distances, are rendered more secure by watchmen stationed within call of each other. Nothing can appear more brilliant than those lights viewed at a distance, especially where the roads run across; and in the principal streets, such as Pall Mall, New Bond-street, Oxford-street, &c. London, then, in its large sense, including WESTMINSTER, SOUTHWARK, and part of MIDDLESEX, (see these articles,) forms one great metropolis, of vast extent and prodigious wealth. When considered with all its advantages, it is now what ancient Rome once was; the seat of liberty, the encourager of arts, and the admiration of the world. It is the centre of trade; has an intimate connection with all the counties in the kingdom; and is the grand mart of the nation, to which all parts send their commodities, whence they are again sent back into every town in the nation, and to every part of the world. Hence innumerable carriages by land and water are constantly employed; and hence arises that circulation in the national body which renders every part healthful, vigorous, and prosperous. Merchants are here as rich as noblemen; witness their incredible loans to government; and there is no place in the world where the shops of tradesmen make such a grand and elegant appearance, or are better stocked. The THAMES, on the banks of which London is situated, is a river which, though not the largest, is the richest and most commodious for commerce of any in the world. (See THAMES.) It is continually filled with fleets, sailing to or from distant climates; and its banks, from London-bridge to Blackwall, form almost one continued magazine of naval stores; containing 3 large wet docks, 32 dry docks, and 33 yards for building ships for the use of the merchants; besides the places allotted for building boats and lighters, and the king's yards lower down for building men of war. As the city is about 60 miles distant from the sea, it enjoys, by means of this beautiful river, all the benefits of navigation, without the danger of being surpris'd by foreign fleets, or of being annoyed by the moist vapours of the ocean. It rises regularly from the water side, and, extending itself

on both sides along its banks, reaches a prodigious length from E. to W. in a kind of theatre towards the N. and is continued for 20 miles on all sides, in a succession of numerous villas, populous villages, and country.

(II.) LONDON, a town of Maryland, in del county, 5 miles SW. of Annapolis.

(III.) LONDON, LITTLE, a village in near Samford Magna.

(IV.) LONDON, LITTLE, a village in Essex, S. of Hillingdon Heath.

(V.) LONDON, NEW, a county of Connecticut.

(VI.) LONDON, NEW, a sea port of Connecticut, on the W. side of the Thames, 80 NE. of New York.

(I.) LONDONDERRY, COLERAIN, or RY, a county of Ireland, in the province of Ulster. It is bounded on the S. and SW. by Donegal; on the E. by Antrim, from which it is separated by the BAN; W. and NW. by Donegal; N. by the Deucalidonian ocean. Its greatest length is about 36 miles, its breadth 30, containing about 251,510 acres. The bogs and moorlands of this county are manured with sea-sheep dung, which is generally pretty champaign, and not very fertile. It is noted for a very clear river called the *Bann*, abounding with salmon. This is distinguished from a less one of the same name called the *Greater or Lower Bann*. To cultivate and civilize this county, James I. granted a charter to a society at London; whence the name. It had two members to the imperial parliament.

(2.) LONDONDERRY, or DERRY, the chief town of the above county, and the see of a bishop at the bottom of Lough-Foyle. It has a good port, to which ships of the greatest burden have access, and a considerable trade. It has been 3 memorable sieges, which it withstood in consequence of the greatest hardships and discontents; viz. 1. In 1641, when the rebels could not reduce it either by fraud or force. 2. In 1649, when it was besieged by Lord Arden, reduced almost to extremity by famine, but relieved by troops sent from England. 3. In 1688, it held out against the French and Irish from 7th Dec. 1688 to the 31st July 1689, though it was neither well fortified nor provided with provisions or stores, and hardly any attempt was made to relieve it during so long a time. Though the city is 20 miles up the Foyle yet very large ships can come up to the quay, where there are 10 fathoms of water. It is now well fortified with a strong wall, besides outworks; and the banks of the river are several castles and forts. This city is of no great antiquity, having been first built and planted in the reign of James I. It was first settled by the society above-mentioned (see N<sup>o</sup> 1.) Its trade is very considerable, having only a large share in the herring-fishery, bringing ships to the W. Indies, New England, and Newfoundland, for which it is more advantageously situated than London. Though there are many rivers in LOUGH-FOYLE, which serve it in the way of a road; yet they are easily avoided, as the deep channels between them. Those ports are called *Emiffone*, *Rufferbull*, or *Caldy-head*, which is a little W. of the mouth of the harbour, and is the most northerly of Ireland, lying in

nhabitants are almost all Protestants, reckoned the cleanest, best built, and most civilly situated town in Ireland; and, says Corke, as convenient as any for commerce and domestic." The lake almost entirely surrounds it; and the whole ground plot of it belongs to the 12 great companies. Great quantities of salmon, salted, are exported hence to America.

**DONDERRY**, a town of New Hampshire, in Rockingham county, 30 miles WSW. of Portsmouth, and 48½ from Philadelphia.

**DONDERRY**, a township of Nova Scotia, in Cumberland county, on the N. side of the Cobequid mountains, settled by emigrants from Scotland and

**DONDONDERRY**, 2 townships of Pennsylvania, in Berks and Dauphin counties.

**DONDERRY**, a township of Vermont, in Franklin county; 33 miles NE. of Bennington.

**DONDERRY-GROVE**, a township of Pennsylvania.

**DONNE**, *adj.* [contracted from *alone*.] 1. Solitary; having no company.—  
The lone hour a blank of life displays.

*Savage.*  
vanish sceptres, coronets and balls,  
And you in lone woods, or empty walls.

*Pope.*  
not conjoin'd or neighbouring to others.  
In a house in Wales, with a mountain and  
is more contemplative than this court.

**DONNA**, a town of Sardinia, 22 m. E. of Bosa.  
**DONNELLY**, *n. f.* [from *lonely*.] 1. Solitude; solitude.  
company.—The huge and sportful assembly  
to him a tedious loneliness. *Sidney.* 2.  
to solitude.—

I see  
solitude of your loneliness. *Shakespeare.*  
**DONNELLY**, *adj.* [from *lone*.] 1. Solitary.—  
I go alone,

a lonely dragon. *Shakespeare.*

Why thus close up the stars  
in nature hung in heav'n, and fill'd their  
eyes

perlasting oil, to give due light  
to mist and lonely traveller? *Milton.*  
has made you dote, and vainly tell  
of imagin'd, in your lonely cell. *Dryden.*  
led to solitude.—

When, fairest princess,  
I fly thus from the full court retire,  
And find the graces follow. *Rowe.*

**DONNELLY**, *n. f.* [from *lone*.] Solitude; solitude; solitude.  
company.—

court life you knew the good,  
I could leave loneliness. *Donne.*  
I love her who loves loneliness best. *Donne.*  
**DONNELLY**, *adj.* [from *lone*.] Solitary; solitude.

What a dreadful face will nature wear?  
And how will these loneliness seats appear?

*Blackmore.*  
**DONNENFELD**, a town of Austria.

**DONNÉ**, James LE, a French writer of the 17th century, born at Paris in 1665. He was a member of the Académie Française, and librarian of St Honoré. *ed.* 1. *Bibliotheca Sacra*; 2 vols. folio,

1723; 2. *Bibliothèque de la France*; fol. 3. A historical Discourse on Polyglott Bibles. He died at Paris in 1721.

(2.) **LONG**, Roger, D. D. a native of Norfolk-shire, was educated at Cambridge; where he became master of Pembroke-hall, and Lowndes's professor of astronomy. He was also rector of Cherryhinton in Huntingdonshire, and of Bradwell juxta mare in Essex; and was author of a Treatise of Astronomy, and the inventor of a very curious astronomical machine, thus described by himself: "I have, in a room lately built in Pembroke-hall, erected a sphere of 18 feet diameter, wherein above 30 persons may fit conveniently; the entrance into it is over the south pole by six steps; the frame of the sphere consists of a number of iron meridians, not complete semicircles, the northern ends of which are screwed to a large round plate of brass, with an hole in the centre of it; through this hole, from a beam in the ceiling, comes the north pole, a round iron rod, about three inches long, and supports the upper parts of the sphere to its proper elevation for the latitude of Cambridge; the lower part of the sphere, so much of it as is invisible in England, is cut off; and the lower or southern ends of the meridians, or truncated semicircles, terminate on, and are screwed down to, a strong circle of oak, of about 13 feet diameter; which, when the sphere is put into motion, runs upon large rollers of lignum vitæ, in the manner that the tops of some windmills are made to turn round. Upon the iron meridians is fixed a zodiac of tin painted blue, whereon the ecliptic and heliocentric orbits of the planets are drawn, and the constellations and stars traced: the Great and Little Bear and Draco are already painted in their places round the north pole; the rest of the constellations are proposed to follow: the whole is turned round with a small winch, with as little labour as it takes to wind up a jack, though the weight of the iron, tin, and wooden circle, is about 1000 lb. When made use of, a planetarium will be placed in the middle. The whole, with the floor, is well supported by a frame of large timber." This curious piece of mechanism has been since perfected; all the constellations and stars of the northern hemisphere, visible at Cambridge, are painted in their proper places upon plates of iron joined together, which form one concave surface. Dr Long published a Commencement Sermon in 1728; and an answer to Dr Galley's pamphlet on Greek Accents. He died Dec. 16th 1770, aged 91.

(3.) \* **LONG**, *adj.* [*long*, French; *longus*, Latin.] 1. Not short: used of time.—He talk'd a long while, even till break of day. *Acts* xx.—He was desirous to see him of a long season. *Luke* xxiii. 2. Not short: used of space.—Emp'ress, the way is ready, and not long. *Milton.* 3. Having one of its geometrical dimensions in a greater degree than either of the other.—His branches became long because of the waters. *Ezek.*—We made the trial in a long neck'd phial left open at the top. *Boyle.* 4. Of any certain measure in length.—Women eat their children of a span long. *Lam.* ii. 20.—

These, as a line, their long dimensions drew,  
Stretching the ground with sinuous trace. *Milt.*  
The

The fig-tree spreads her arms,  
Branching so broad and long. *Milton.*  
A pond'rous mace,

Full twenty cubits long, he swings around. *Pope.*  
5. Not soon ceasing, or at an end.—Man goeth to his long home. *Ecclef. xii. 5.*—Honour thy father and thy mother, that thy days may be long upon the land. *Exodus xx. 12.*—

They open to themselves at length a way  
Up hither under long obedience try'd. *Milton.*  
Him after long debate of thoughts revol'd  
Irresolute, his final sentence chose. *Milton.*  
Long and ceaseless his.

6. Dilatory.—Death will not be long in coming, and the covenant of the grave is not shewed unto thee. *Ecclef. xiv. 12.* 7. Tedious in narration.—Chief man'ry to dissect,

With long and tedious havock, fabled knights. *Milton.*  
Reduce, my muse, the wand'ring song,  
A tale should never be too long. *Prior.*

8. Continued by succession to a great series.—  
But first a long succession must ensue. *Milton.*  
9. [From the verb, *To long.*] Longing; desirous; or perhaps, long continued, from the disposition to continue looking at any thing desired.—Praying for him, and casting a long look that way, he saw the galley leave the pursuit. *Sidney.*—

Yet he but doubts, and parries, and casts out  
Many a long look for succour. *Dryden.*  
10. [In music and pronunciation.] Protracted; as, a long note, a long syllable.

(4.) \* LONG, adv. 1. To a great length in space.  
The marble brought, erects the spacious dome,  
Or forms the pillars long-extended rows. *Prior.*

2. Not for a short time.—  
With mighty barres of long-enduring brass. *Vaisfix.*

—When the trumpet soundeth long, they shall  
come up to the mount. *Exodus xix. 13.*—  
The martial Aeneas

Resum'd the long forgotten shield. *Dryden.*  
—One of these advantages, which Cernieus has  
laid down, is the making choice of some signal  
and long-expected day, whereon the action of the  
play is to depend. *Dryden.*—

So stood the pious prince unmov'd, and long  
Sustain'd the madness of the noisy throng. *Dryd.*  
The muse resumes her long-forgotten lays,  
And love, restor'd, his ancient realm serves us. *Dryden.*

—No man has complained that you have discour-  
sed too long on any subject, for you leave us in an  
eagerness of learning more. *Dryden.*—

The realm of Candahar for dow'r I brought,  
That long-contended prize for which you fought. *Dryden.*

—It may help to put an end to that long-agitated  
and unresolvable question, whether man's will be  
free or no? *Locke.*—

It av'n restores  
To thy fond wish the long-expected shores. *Pope.*  
3. In the comparative, it signifies for more time; and in the superlative, for most time.—When he could not longer hide him, she took for him an ark of bulrushes. *Exodus ii. 3.*—Eldst parents signifies either the eldest men and women that have had children, or those who have long had issue.

*Locke.* 4. Not soon.—Not long after the  
against it a tempestuous wind. *Acts xxvi.*  
At a point of duration far distant.—If it  
had been eternal, those would have been  
it, and generally spread long ago, and be  
memory of all ages. *Tillotson.*—

Say, that you once were virtuous &  
A frugal, hardy people. *Philips.*  
6. [For along; au long, Fr.] All along;  
out: of time.—

Them among  
There sat a man of ripe and perfect age  
Who did them meditate all his life long  
Some say, that ever gainst that feast  
Wherein our Saviour's birth is celebr  
The bird of dawning singeth all night  
*Shal.*

—He fed me all my life long to this c  
xlvi. 15.—Forty years long was I grow  
this generation. *Psalms.*

(5.) \* LONG, adv. [gelang, a fault, Sa  
the fault; by the failure. A word now  
use, but truly English.—Respective and  
had rather seek quietly their own, and  
the world may go well, so it be not long  
than with pains and hazard make them  
visers for the common good. *Hooker.*—

Maine, Blois, Poitiers, and Tours  
away,  
Long all of Somerset, and his delay.

Mistress, all this coil is long of you.  
—If we owe it to him that we know fo  
is perhaps long of his fond adopers that  
so little more. *Glanv.*

(6, 7.) LONG, in geography, 2 towns:  
in the provinces of Quang-si and Chen-si  
\* To LONG, v. n. [gelangen, German  
*Slimmer.*] To desire earnestly; to wish  
germs continued: with *for* or *after* a  
thing desired.—

Fresh expectation troubled not the  
With any long for change, or better it  
—And time eyes shall look, and sail will  
for them. *Dant.* xxviii. 32.—

If caus'd he wished, now he long'd fore.  
—The great master perceived, that K  
the place the Turkish tyrant long'd after

If the report be good, it causeth joy  
And longing hope, and well assured joy  
His sons, who seek the tyrant to ruin  
And long for arbitrary lords again,  
He dooms to death deserv'd.

Glad of the gift, the new-made war  
And arms among the Greeks, and lon  
qual fees.

Else whence this pleasing hope, this  
fire,  
This longing after immortality?

There's the tie that binds  
You long to call him father: Marcell's  
Work in your heart unken, and plea  
to.

—Nicomedes, longing for herring, was  
with such ones by his cook, at a great  
from the fish. *Arundel.*—

Through stormy f.  
I courted dangers, and I long'd for de  
A.

**NIMITY.** *n. f.* [*longanimitas*, Lat.] Forbearance; patience of offence. — Patience of Job, as it was of Moses, and surely had mastered the *longanimitas* and lasting sufferings. *Brown.*—That innocent and honest rather go clad in the snowy white robes and *longanimitas*, than in the red of blood. *Hoswel.*

**ES,** a town of Naples, in Calabria.  
**ES,** a town of Spain, in Arragon.  
**ES,** 3 bays of Jamaica, on the E. W. of the Island.

**LONGBOAT.** *n. f.* The largest boat or ship.—At the first descent on shore, the landing in his *longboat*. They first betray their masters, and then the vessel sinking, save themselves. *L'Esfrange.*

**LONG-BOAT** is principally employed for burdens, as anchors, cables, ballast, &c. *BOAT*, § II.

**CHAMP,** a town of France, in the dep. of Marne; 12 miles E. of Chaumont.  
**CHAMP,** a town of France, in the dep. of Marne; 3 miles W. of Paris.

**CHAMPS,** a town of France, in the dep. of Marne; 4 miles NNE. of Epinal.

**CHAMP,** a town of Salop, near Drayton. A territory of the ci-devant Austrian Empire now included in the French republic of the Ourte.

**CHAMP,** a town of France in the dep. of Marne; 6 miles S. of Langres.

**CHAMP,** a town of France, in the dep. of Marne and Loire, near the Doubs; 16½ miles S. of Chalons.

**CHAMP,** a town of Africa, in Loango.

**CHAMP,** a town of France, in the dep. of Marne; 4½ miles ESE. of Boulay.

**CHAMP,** a town of France, in the dep. of Marne; 15 miles SSW. of St

**LONGEVITY.** *n. f.* [*longævus*, Latin.] — That those are countries suitable for the habitation of man, and convenient to live in, where the *longevity* of the natives. *Roy.* — The *longevity* are chiefly amongst the *Arbuthnots*.

**LONGEVITY.** Immediately after the creation of the world was to be peopled by one woman, the ordinary age was 900

(See **ANTEDILUVIANS**, § 4, 10.) After the flood, when there were 3000 years, the world, their age was cut down to one of those patriarchs, but Shem, lived 900 years.

In the 2d century we find none lived 100 years; in the 3d none but Terah that lived 206 years; the world, at least a part of it, was not so well peopled, that they were not so long lived, and were cut down into different degrees.

By degrees, as the number of people increased, their *longevity* dwindled, till it was reduced to 70 or 80 years: and there it stood till the time of the flood.

**LONGEVITY, ANCIENT AND MODERN IN PART II.**

**LONGEVITY.** That the common duration of man's life has been the same in all ages since the above period, is plain both from sacred and profane history. Yet instances of lives greatly exceeding that period, are not only to be found in the history of all ages and countries, but even in our own country and in the present age. Mr Whitehurst, in his *Inquiry into the Origin and Strata of the Earth*, has given a list (since enlarged by Dr Fothergill,) of 32 persons, who died between 1635 and 1781, all of whom had lived above a century, most of them considerably longer, and one who was living in 1780, had attained the astonishing age of 175! Lord Bacon assures us from the most incontestable evidence, that in A. D. 76, when a general taxation was made over the Roman empire, by Vespasian, there were found living in Italy, between the Appennines and the Po, no fewer than 124 persons aged 100 and upwards. Of these 54 were 100 years old; 57 were 110; two 125; four 130; four 136; and three 140 years old each: besides 19 others in Parma, Placentia, Faventia, Kimino, &c. of whom six were 110 years old, seven 120, one 125, two 130, one 131, one 132, and one 150! And in our own age and country, *Sir John Sinclair's Statistical Account* affords numerous and authentic evidences, that *longevity* is far from being uncommon. In proof of this we might, if room permitted, give quotations from above 400 of the 918 parochial accounts in that work; but we shall content ourselves with only one from that of Crossmichael in Galloway:—"Within these 20 years (says the rev. J. Johnstone) at least 12 persons have died in the lower parts of Galloway, from 100 to 115 years old. William Marshall a tinker in this place, is now 118. He might pass for 60: His faculties are unimpaired, and he walks through the country with ease." (*Vol. I. p. 168.*) From the various instances of *longevity* given by Mr Whitehurst and others; we shall only select a few of the most remarkable:

Names.	Ages.	Places of birth or abode.	Living or dead about.
Hippocrates	104	Isle of Coos	A. A. C. 358
Democritus	109	Abdera	361
Galen	140	Pergamus	A. D. 271

(4.) LONGEVITY, CAUSES OF. Although longevity evidently prevails more in certain districts than in others, yet it is by no means confined to any particular nation or climate; for instances of it are to be found in almost every quarter of the globe. Longevity does not depend, so much as has been supposed, on any particular climate, situation, or occupation in life: for it often prevails in places where all these are extremely dissimilar; and it would, moreover, be difficult, in the histories of a number of different persons remarkable for longevity, to find any circumstance common to them all, except perhaps, that of being born of healthy parents, and of being inured to daily labour, temperance, and simplicity of diet. Among the inferior ranks of mankind, therefore, we find the most numerous instances of longevity; even frequently, when other external circumstances are extremely unfavourable: as in the case of the poor sexton of Peterborough, who, notwithstanding his unpromising occupation among dead bodies, lived long enough to bury two crowned heads, and to survive two complete generations. The almoner of Henry Jenkins and old Parr, is said to have subsisted chiefly of the coarsest fare, as they depended on precarious alms. Agnes Milbourne, after bringing forth a numerous offspring, and being obliged, through extreme indigence, to pass the latter part of her life in St Luke's workhouse, yet reached her 106th year in that sordid and unfriendly situation. The plain diet and invigorating employments of a country life are generally reckoned highly conducive to health and longevity; yet it has been justly remarked, that "the employment of the husbandman is not the most favourable for a very advanced life. Engaged in incessant toils, driven often from the extremity of heat to cold, exposed to all the inclemencies of the elements; these wear out the best constitutions; and extreme old age is to be ascribed more to the uncommon strength of stamina than to fine

air or climate." (Sir John Sinclair's *Stat. Acc.* Vol. xvi. p. 302.) But it is allowed on a large scale, that the luxury and refinements of large cities are destructive to the human species; and that moderation alone, perhaps, more than counteracts all the boasted privileges of a city life. It is not luxury alone that shortens human life in cities. The want of pure air is a most important cause. Upon a general glance through Sinclair's *Stat. Acc.* we have observed that parishes which are most remarkable for the purity of their inhabitants, are also remarkable only for purity of air, but even many of these are subject to occasional high winds. See § 5.

(5.) LONGEVITY, CIRCUMSTANCES TO PROMOTE, OR PREVENT. Every thing is most essentially necessary to life, may be comprised under the six following heads: 1. Climate; 2. Meat and drink; 3. Motion; 4. The secretions and excretions; 5. Sleep; 6. Affections of the mind. 1. Climate. The vivifying principle contained in the atmosphere, so essential to the support of animal life, concerning which authors have proposed so many conjectures, appears to be nothing else but that pure fluid discovered by the ingenious Dr Priestley, and erroneously by him denominated *dephlogisticated air*, but more accurately by the great Lavoisier, *OXYGENOUS AIR*. See *CHEMISTRY, Index*. The common atmospheric air is doubtless more or less healthy in proportion as it abounds with this animating principle. Oxygenous air exhales in copious streams from the leaves of all kinds of vegetables, even from the most poisonous kind, we may conclude as one cause, why instances of longevity are more frequent in the country than in the city, where the atmospheric air, instead of being impregnated with this salutary impregnation, is contaminated with noxious animal effluvia and gas. See *CHEMISTRY, Ind.* With respect to various observations prove, that those regions lie within the temperate zones are best calculated to promote long life. Hence, perhaps, may be explained, why Italy has produced so many long-lived persons, and why islands in general are more fertile than continents; of which Bermudas and others afford examples. And our own islands, liable to many sudden vicissitudes, afford instances of longevity than could well be expected. (See § 3.) Mr Whitehurst assures us, from facts, that Englishmen are in general longer lived than North Americans; and that a British constitution will last longer, even in that climate, than a native one. And Mr Wilkie has proved that the man's chance for long life is superior to that of an Englishman. (See *ANNUITIES, &c.*) In general it must be allowed, that the human constitution is adapted to the peculiar state of temperature of each respective climate, so that no part of the habitable globe can be pronounced to be either too hot or too cold for its inhabitants. Yet to promote a friendly intercourse between remote regions, the Author of nature has enabled the inhabitants to endure great and frequent changes of temperature without inconvenience. 2. Though food and drink of the most simple kinds, are allowed to be the

abled for supporting the body in health, yet it is hardly to be doubted but variety may be safely indulged occasionally, if men would not exceed the bounds of temperance. (See FOOD, § 4—6.)

4. *Motion and rest, sleep and watching.* It followed on all hands, that alternate motion and sleep and watching, are necessary to health and longevity; and that they ought to be adapted to age, temperament, constitution, temperature of the climate, &c.; but the errors which mankind daily commit in these respects become a fruitful source of diseases. While some are bloated and relaxed with ease and indolence, others are wasted, and become rigid by hard labour, and want of sleep and fatigues. 5. *Secretions and excretions.* Where the animal functions are duly performed, secretions go on regularly; and the different evacuations so exactly correspond to the quantity of food taken in, in a given time, that the body is found to return daily to nearly the same weight. If any particular evacuation happen to be preternaturally diminished, some other evacuation is proportionally augmented, and the equilibrium is not only preserved; but continued irregularities, in these important functions, cannot but terminate in disease. 6. *Affections of the mind.* The due regulation of the passions, perhaps, contributes more to health and longevity, than that of any other of the NON-NATURALS, as physicians absurdly pretend to them. The animating passions, such as hope, love, &c. when kept within proper bounds, gently excite the nervous influence, promote an equable circulation, and are highly conducive to health; while the depressing affections, such as fear, grief, and despair, produce the converse effect, and lay the foundation of the most dreadful diseases. There is reason to believe, that longevity is often in a great measure hereditary; and that healthy long-lived parents would not only transmit longevity and health to their children, but did not the frequent errors in the non-natural daily shorten human life. From these errors, and the unnatural modes of living, nearly all of the children born in the capital of Europe, die in infancy. Such an amazing number of premature deaths is not to be found among savage nations, or among the young of other animals! Man seems naturally destined to live in the sun, to spend a large portion of his life in the open air, to inure his body to rough exercises and the inclemency of the seasons, to make a plain repast when hunger dictates, and to lead the patriarchal life. But art and luxury have defeated the plan of nature; and by enslaving man to all the blandishments of sense, has rendered him an easy victim to vice and disease. To regulate the various abuses which take place in infancy, and are continued through every stage of modish life, would lead us far beyond our present subject. Suffice it to observe, that they are the most among people who are the most highly civilized and refined. To compare their artificial mode of life with that of nature or even with the mode of life of long-livers in the above list, (§ 3.) might afford a very striking contrast; and at the same time supply an additional reason, why in large numbers instances of longevity are so very rare.

b) LONGEVITY, PROPOSAL FOR AN ACCURATE

INVESTIGATION OF THE CAUSES OF. As the love of life, and the desire of protracting its short span, are natural to all men, it seems to be a public duty to examine minutely into the various causes that have been considered as conducive to health and long life, and, if possible, to distinguish such circumstances as are essential to that great end, from those which are merely accidental. But here it is much to be regretted, that an accurate history of the lives of persons remarkable for longevity, so far as relates to their diet, regimen, &c. has not been faithfully handed down to us; without which it is impossible to draw the necessary inferences. It is indeed astonishing, that historians and philosophers have hitherto paid so little attention to this important subject. Were writers of abilities, to undertake a full investigation of so interesting a subject, the inquiry might prove not only curious but highly useful. To furnish materials for a history of longevity, the bills of mortality throughout the kingdom ought to be revised, and put on a better footing, agreeable to the scheme of which Manchester and Chester have already given a specimen worthy of imitation. The plan might be further improved with very little trouble, by adding a particular account of the diet and regimen of every person who dies at 90 years of age or upwards; and mentioning whether his parents were healthy, long-lived people, &c. An accurate register, thus established throughout the British dominions, would be productive of many important advantages to society, not only in a medical and philosophical, but also in a moral and political view.

(1.) LONGFORD, a county of Ireland in the province of Leinster, bounded by the counties of Leitrim and Cavan on the N. Meath on the E. and S. and Roscommon on the W. It contains 134,700 Irish plantation acres, 24 parishes, 6 baronies, and, 4 boroughs; and before the Union, returned 10 members to parliament. It now sends 2 representatives to the Imperial parliament. It has a tolerable good soil, but much encumbered with marshes; and is about 25 miles long and 16 broad.

(2.) LONGFORD, the capital of the above county, is situated on the Cromlin, which falls, a few miles below, into the Shannon. It is a borough and market town, and has a barrack for a troop of horse. It is large and well built; and in a very early age an abbey was founded here, of which St Idos, one of St Patrick's disciples, was abbot. In 1400, a fine monastery was founded for Dominican friars, by O'Ferral prince of Annaly. It being destroyed by fire, Pope Martin V. in 1429, and Eugene IV. in 1433 and 1438, granted indulgences to all who should contribute to the rebuilding of it. The church of this friary, now the parish church, is in the diocese of Ardagh. There are 4 fairs. Longford is 64 miles NW. by W. of Dublin. Lon. 8. o. W. Lat 53. 42. N.

(3—7.) LONGFORD is also the name of 5 English villages; in Derby, Gloucester, Middlesex, Salop, and Wilts.

(1.) LONGFORGAN, a parish of Scotland, in the SE. corner of Perthshire, 7 miles long, and no-where above 3½ broad, but in some places very narrow; containing about 7,000 acres all in high cultivation, bounded for 3 miles on the S. by the

Tay. The climate is mild and salubrious; the surface partly hilly; the soil fertile, and much improved by leveling, embanking, draining, &c. producing excellent crops of wheat, barley, oats, pease, potatoes, yams, linseed, turnips, clover, hay, &c. There are five orchards abounding in fruits, besides fine gardens at Castle Huntly, which produce peaches, nectarines, apricots, almonds, figs, melons, &c. These have above 300 feet of glass, and a melon-pit, 20 feet by 12, so constructed as to receive the steam from a boiler of cast iron, containing 20 gallons, built in a chamber that occupies the whole space under the melon bed. The melons thus produced are highly flavoured. The population, in 1797, was 1526; increase 241 since 1755; number of horses, 347; sheep above 400; and black cattle 900; besides calves, pigs, poultry, 8 dove-cots, and great numbers of hares, foxes, partridges, &c. Bee husbandry is much cultivated, and excellent honey produced. Servitudes are abolished, and the roads are good. Castle-Huntly is the most ancient and remarkable edifice, being seated on the point of a singular rock, in the middle of a plain, 116 feet perpendicular in height on the SW. and sloping gradually to the E. The prospect from its top is one of the grandest in Perthshire; commanding a view of the Tay for 20 miles, and of Fife and Angus shires for above 60. The parish abounds with wood, shell marl, and excellent stone quarries.

(2.) LONGFORD, a village in the above parish, occupying 23 Scots acres, on the E. corner of the Carse of Gowrie. It was erected into a burgh of barony in 1672, by Charles II, with a market and 2 fairs, on 3d Wed. of June and Oct. It contained 126 families and 650 souls, in 1756. It lies 12 miles ENE. of Perth. Lon. 3° 16' 45" W. Lat. 56° 27' 48".

LONGFOURMACUS, a hilly parish of Scotland, in Berwickshire, 12 miles long, and 6 broad. The surface is mostly covered with heath. Oats, barley, pease, clover and rye-grass, are raised on a few acres improved by lime. The air is dry, cold, and piercing. The population, in 1796, was 452, increase 53, since 1755; number of horses 70; black cattle, 200; and sheep 10,000. Some cart loads of rich copper ore have been dug up in making a road, but the mine is not wrought.

LONGHAVEN, a bay on the W. coast of Aberdeenshire, 4 miles S. of Peterhead.

\* LONGIMANOUS. *adj.* [*longuemain*, French; *longimanus*, Lat.] Longhanded; having long hands.—The villainy of this Christian exceeded the persecution of heathens, whose malice was never so longimanous as to reach the soul of their enemies, or to extend unto the exile of their elyiums. *Quarant's F. Lear Errors.*

(1.) \* LONGIMETRY. *n. f.* [*longus* and *metron*; *longimetre*, French.] The art or practice of measuring distance.—Our two eyes are like two distant stations in *imagination*, by the assistance of which the distance between two objects is measured. *Milner's math. Principles.*

(2.) LONGIMETRY is properly the art of measuring lengths, both accessible and inaccessible. See *Geometrick*, and *Trigonometrick*.

(3.) \* LONGING. *n. f.* [from *long*.] *Laracæ*

desire; continual wish.—When within I came to the degree of uncertain wish that those wishes grew to unquiet longings I would fix my thoughts upon nothing, within little varying they should end with clea. *Sidney*.—

I have a woman's longing,

An appetite that I am sick withal,

To see great Hector in the weeds of peace.—The will is left to the pursuit of negotiations, and to the removal of those which it then feels in its want of, and to alter them. *Locke*.

(2.) LONGING is a preternatural appetent woman, and in some sick persons about to recover. It is called *PICTA*, from that name, which is said to be the same disorder. It consists of a desire of things to eat and drink, and in being of one and wanting another. It is called *PICTA*, from *μαλακία*, *weakness*. Cholera and men who labour under suppressions, are very subject to this complaint, are relieved by promoting the suppressions. In general, whether this disorder served in pregnant women, in persons from an acute fever, or in those who suffer obstructions of the natural evacuation of the appetite should be indulged.

\* LONGINGLY. *adv.* [from *longing*] incessant wishes.—

To his first bias longingly he leans,  
LONGINICO, the ancient OLYMP  
LANGANICO, and OLYMPIA.

(1.) LONGINUS, Dionysius, a Greek critic of the 3d century, by whom have been born in Athens, by others. His father's name is unknown, but by whom he was allied to the celebrated Platonist youth was spent in traveling with him, which gave him an opportunity to increase his knowledge, and improve his mind. Afterwards, he fixed his residence at Athens, the greatest assiduity applied to study, published his *Treatise on the Sublime*; with his reputation to such a height, and given the Athenians such an opinion of his judgment and taste, that they made him sovereign judge of authors, and every thing was received by the public, according to his judgment. He seems to have staid at Athens a long time, here he taught the academic philosophy, among others had the famous Porphyry for pupil. But it was at length his fortune to depart from Athens, and to mix in more active life, to train up young princes to virtue and to guide the busy passions of the great to moderation; to struggle for, and at last to procure of liberty. ZENOBIUS, queen of Armenia prevailed on him to undertake the education of her sons; and he soon gained an uncommon esteem; she spent the vacant hours of her life in his conversation, and modelled her manners and conduct by his instructions; prince Sivas at war with Artaban; and fortified by his power Artaban was compelled to march upon Pontus, her capital city. Zeno wrote her a letter, in which he

ender; to which she returned an answer, up by Longinus, which filled him with resentment. The emperor laid siege to the city; the Palmyrians were at length obliged to surrender. The queen and Longinus endeavoured to escape to Persia; but were overtaken and made prisoners on the point of crossing the Euphrates. She was intimidated weakly laid the blame of losing the liberty of her country on its true author; and the brave Longinus, to the disgrace of a conqueror, was immediately executed. (See *FRANCE*.) The writings of Longinus were numerous, some on philosophical, but the greater part on critical subjects. Dr Pearce has collected 25 treatises, none of which, excepting *the Sublime*, have escaped the depredations of the East and barbarians. On this imperfect piece of antiquity the fame of Longinus is raised, who, as he expresses it—"is himself the great sublime writer." The best edition of his works is that published at Utrecht in 1694, *cum notis* &c. It has been translated into English by G. G. G.

LONGINUS. See ITALY, § 14; and LOMBARDY, § 3.

LONGIONO, a town of the Italian republic, in the dep. of the Rubicon, and late province of Romagna.

\* LONGISH, *adj.* [from *long*.] Somewhat long.

LONG ISLAND, an island of New York, separated from the continent by a narrow channel. It extends from the city of New-York 140 miles E. terminating with Montauk point; and is 100 miles broad. It is divided into 3 counties, King's, Queen's, and Suffolk. The S. side is flat land, of a light sandy soil, bordered on the sea coast with large tracts of salt marsh and meadow, extending from the W. point of the island to Southampton; and well calculated for raising Indian corn. The N. side is hilly, and of a strong-soil, adapted to grain, hay, and fruit. A ridge of hills extends from Jamaica to South-hold. Large herds of cattle feed upon Hempstead plain, in Queen's county, which is 16 miles long, from E. to W. and 7 or 8 broad. It is frequented by vast numbers of plover. Rye grows tolerably well, but most part of the plain, lies common for cattle, horses, and sheep. The island contained 32,110 citizens, and 4,839 slaves in 1795.

LONGISSIMUS DORSI. See ANATOMY, § 209.

## L O N G I T U D E.

### DEFINITIONS.

LONGITUDE is thus defined and illustrated. Dr Johnson:

LONGITUDE. *n. f.* [*longitudo*, French; *longitudo*, Latin.] 1. Length; the greatest dimension.—The ancients did determine the *longitude* of all places which were longer than broad, by the extent of their latitude. *Wotton*.—The variety of climates had their origin in mere *longitude* only; but the different parts of our bodies may be diversified in all the dimensions of solid bodies; multiplies all over and over again, and opens the fancy in a new abyss of unfathomable variety. *Bentley*.—This universal gravitation exerts a constant and uniform action by certain and fixed laws, according to quantity of matter and distance of distance, that it cannot be determined or impaired. *Bentley*. 2. The circumference of the earth measured from any meridian. Some of Magellanus's company were the first who did compass the world through all the degrees of *longitude*. *Abbot*. 3. The distance of any place from the east or west of any

other place, or westward, counted in degrees upon the equator; but when the distance is reckoned by leagues or miles, and not in degrees, or in degrees on the meridian, and not of the parallel of latitude, in which case it includes both latitude and longitude, it is called *departure*.

Although the LONGITUDE, properly speaking, can neither be styled a science, nor even a branch of a science, yet the methods and instruments, invented to discover it at sea, form so important a branch of the sciences of navigation and geography, that we think it proper to insert every thing respecting it, in the usual form of the sciences in this work. We shall therefore give, 1. A brief history of the attempts made to discover it: 2. An account of some desiderata still required to complete the discovery: 3. Practical directions for finding it: And, 4. Examples of the methods generally used for that purpose.

### SECT. I. HISTORY of the ATTEMPTS made to discover the LONGITUDE at SEA.

To find the longitude at sea, is a problem to which the attention of navigators and mathematicians has been drawn ever since navigation began to be improved. The importance of this problem soon became so well known, that, in 1598, Philip III. of Spain offered a reward of 1000 crowns for the solution; and his example was soon followed by the States General, who offered 10,000 florins. In 1714 an act was passed in the British parliament, empowering certain commissioners to make out a bill for a sum not exceeding 2000l. for defraying the necessary expences of experiments for ascertaining this point; and likewise granting a reward to the person who made any progress in the solution, proportionable to the degree of accuracy with which the solution was

To conclude: *Longitude*, what other way have we, to mark when and where the dark eclipses be? *Donne*. was the method of discovering the *longitude* of bomb vessels. *Arbutnot* and *Pope's Mart*. 4. The position of any thing to east or west. The *longitude* of a star is its distance from the first point of numeration towards the east, first point, unto the ancients, was the vertex. *Brown*. 5. *Longitude*, in geography and navigation, is the distance of any place from another eastward

was performed: 10,000. was to be granted if the longitude should be determined to one degree of a great circle, or 60 geographical miles; 15,000 if to two thirds of that distance; and 20,000. if to the half of the distance.

In consequence of these offered rewards, innumerable attempts were made to discover this important secret. The first was that of JOHN MORIN professor of mathematics at Paris, who proposed it to Cardinal Richelieu; and though it was judged insufficient on account of the imperfection of the lunar tables, a pension of 2000 livres per annum was procured for him in 1643 by Cardinal Mazarine. Gemma Frisius had indeed, in 1530, projected a method of finding the longitude by means of watches, which at that time were newly invented; but the structure of these machines was then by far too imperfect to admit of any attempt; nor even in 1631, when METIUS made an attempt to this purpose, were they advanced in any considerable degree. About 1664, Dr HOOKE and Mr HUYGENS made a very great improvement in watchmaking, by the application of the pendulum spring. Dr Hooke having quarrelled with the ministry, no experiment was made with any of his machines; but many were made with those of Mr Huygens. One experiment, particularly, made by Major HOLMES, in a voyage from the Coast of Guinea in 1665, answered so well, that Mr Huygens was encouraged to improve the structure of his watches; but it was found that the variations of heat and cold produced such alterations in the rate of going of the watch, that unless this could be remedied, the watches could be of little use in determining the longitude.

A whimsical method of finding the longitude was proposed by Messrs WHISTON and DIXON from the report and flash of great guns. The motion of sound is known to be nearly equable, from whatever body it proceeds or whatever be the medium. Supposing therefore a mortar to be fired at any place the longitude of which is known, the difference between the moment that the flash is seen and the report heard will give the distance between the two places; whence, if we know the latitudes of these places, their longitudes must also be known. If the exact time of the explosion be known at the place where it happens, the difference of time at the place where it is heard will likewise give the difference of longitude. Let us next suppose the mortar to be loaded with an iron shell filled with combustible matter, and fired perpendicularly upward into the air, the shell will be carried to the height of a mile, and will be seen at the distance of near 100; whence, supposing neither the flash of the mortar should be seen nor the report heard, still the longitude might be determined by the altitude of the shell above the horizon.

According to this plan, mortars were to be fired at certain times and at proper stations along all frequented coasts for the direction of mariners. This indeed might be of use, and in stormy weather might be a kind of improvement in light-houses, or a proper addition to them; but with regard to the determination of longitudes, is evidently ridiculous.

In 1714, HENRY SULLY, an Englishman, ed a small tract at Vienna upon the art of watch-making. Having afterwards removed to Paris, he applied himself to the improvement of time-keepers for the discovery of the longitude. He taught the famous JULIAN DE ROY; a gentleman, with his son, and M. BERTHOUD, the only persons, who, since the days of Frisius, have turned their thoughts this way. But his experiments were made at sea with some watches, they were not able to accomplish anything of importance with regard to the point.

The first who succeeded in any considerable degree was Mr JOHN HARRISON; who, in 1714, produced a watch which went so exact for ten years together it did not err above a second in a month. In 1736 it was tried on a voyage to Lisbon and back again, on board of his Majesty's ships; during which it varied an error of a degree and an half in the computation of the ship's reckoning. In consequence of this he received public encouragement to go on; and by the year 1761 had finished time-keepers, each of them more accurate than the former. See HARRISON, N<sup>o</sup> 2.

The last turned out so much to his satisfaction, that he now applied to the commission of longitude for leave to make an experiment of his watch in a voyage to the West Indies, his mission being granted, his son Mr William Harrison set out in his Majesty's ship the *Dept. Jamaica* in the month of November 1761. The trial was attended with all imaginable success. The longitude of the island, as determined by the time-keeper, differed from that found by astronomical observations only one minute and a half of the equator; the longitudes of places on the way being also determined with great exactness. On the ship's return to England, it was found to have erred no more during the voyage than 1' 54" in time, little more than 10 miles in distance; which being within the error prescribed by the act, the inventor claimed the L. 20,000 offered by government. Objections however, were started. Doubts were proposed about the real longitude of Jamaica, as we were in the manner in which the time had been found there and at Portsmouth. It was alleged that although the time-keeper happened to be right at Jamaica, and after its return to England this was by no means a proof that it had been so in the intermediate times; in consequence of which allegations, another trial was agreed in a voyage to Barbadoes.

Precautions were now taken to obviate all these objections as possible. The commission sent out proper persons to make astronomical observations at that island; which, when compared with others in England, would ascertain beyond a doubt its true situation. In 1764 then, the *Dept. Jamaica* junior set sail for Barbadoes; and the result of the experiment was, that the difference of longitude betwixt Portsmouth and Barbadoes, shown by the time-keeper to be 3 h. 55 m. by astronomical observations to be 3 h. 55 m. the error being now only 43" of time, or 6' of longitude. In consequence of this and

ner trials, Mr Harrison received one half of the reward promised, upon making a discovery of the principles upon which his time-keepers were constructed. He was likewise promised the other half of the reward, as soon as time-keepers should be constructed by other artists, which should answer the purpose as well as those of Mr Harrison himself. At this time he delivered up all his time-keepers, the last of which was sent to Greenwich to be tried by Mr Nevil Maskelyne the astronomer royal. On trial, however, it was found to go with much less regularity than had been expected; and Mr Harrison attributed this to his having made some experiments with it which he had not time to finish when he was ordered to deliver up the watch. Soon after this, an agreement was made by the commissioners with Mr Kendall to construct a watch upon Mr Harrison's principles; and this upon trial was found to answer the purpose even better than any that Harrison himself had constructed. This watch was sent out with Capt. Cook in 1772; and during all the time of a voyage round the world in 1772, 1773, 1774, and 1775, never erred quite  $14\frac{1}{2}$  seconds per day: consequence of which, the house of commons, in 1774, ordered the other L. 10,000 to be paid Mr Harrison.

Still greater accuracy, however, has since been obtained. A watch was lately constructed by Mr Arnold, which during a trial of 13 months, from Dec. 1779 to Feb. 1780, varied no more than  $6^{\circ}69''$  in any two days; and the greatest difference between its rates of going on any day and the rate to it was  $4^{\circ}11''$ . The greatest error it would be committed therefore in the longitude during a single day would have been very little more than one minute of longitude; and thus might longitude be determined with as great exactness as the latitude generally can.—This watch, however, has not yet been tried at sea.

SECT. II. Of CERTAIN DESIDERATA still requisite to PERFECT the DISCOVERY of the LONGITUDE.

THE method of constructing time-keepers for determining the longitude seems to be brought to a great degree of perfection as can be expected. However, as these watches are subject to accidents, and may thus alter the rate of their going without a possibility of a discovery, it is necessary that some other method should be fallen upon, to correct from time to time those errors which may arise either from the natural going of the watch, or from any accident which may happen to it. Methods of this kind are all founded on celestial observations of some kind or other; and for these methods, or even for an improvement in time-keepers, rewards are still held out by Government.

After the discoveries made by Mr Harrison, the Act concerning the longitude was repealed, except so much of it as related to the constructing, selling, publishing, &c. of nautical almanacks and other useful tables. It was enacted also, that any person who shall discover a method for finding longitude by means of a time-keeper, the principles of which have not hitherto been made use of, shall be entitled to a reward of L. 5000, if,

after certain trials made by the commissioners, the said method shall enable a ship to keep her longitude during a voyage of six months within 60 geographical miles or a degree of a great circle. If the ship keeps her longitude within 40 geographical miles for that time, the inventor is entitled to a reward of L. 7500, and to L. 10,000 if the longitude is kept within half a degree. If the method is by improved astronomical tables, the author is entitled to L. 5000 when they show the distance of the moon from the sun and stars within 15 seconds of a degree, answering to about 7 minutes of longitude, after allowing half a degree for errors of observation, and under certain restrictions, and after comparison with astronomical observations for a period of  $18\frac{1}{2}$  years, during which the lunar irregularities are supposed to be completed. The same rewards are offered to the person who shall, with the like accuracy, discover any other method of finding the longitude.

These methods require celestial observations; and any of the phenomena, such as the different apparent places of stars with regard to the moon, the beginning and ending of eclipses, &c. will answer the purpose; only it is absolutely necessary, that some variation should be perceptible in the phenomenon in the space of two minutes; for even this short space of time will produce an error of 30 miles in longitude. The most proper phenomena therefore for determining the longitude in this manner are the eclipses of Jupiter's satellites. Tables of their motions have been constructed, and carefully corrected from time to time, as the mutual attractions of these bodies are found greatly to disturb the regularity of their motions. The difficulty here, however, is to observe these eclipses at sea; and this difficulty has been found so great, that no person seems able to surmount it. The difficulty arises from the violent agitation of a ship in the ocean, for which no adequate remedy has ever yet been found, nor probably will ever be found. Mr CHRISTOPHER IRWIS indeed invented a machine which he called a MARINE CHAIR, with a view to prevent the effects of this agitation; but on trying it in a voyage to Barbadoes, it was found to be totally useless.

SECT. III. PRACTICAL DIRECTIONS for FINDING the LONGITUDE.

WE now proceed to give some practical directions for finding the longitude at sea by proper celestial observations; exclusive of those from Jupiter's Satellites, which, for reasons just mentioned, cannot be practised at sea. In the first place, however, it will be necessary to point out some of those difficulties which stand in the way, and which render even this method of finding the longitude precarious and uncertain. These lie principally in the reduction of the observations of the heavenly bodies made on the surface of the earth to similar observations supposed to be made at the centre; which is the only place where the celestial bodies appear in their proper situation. It is also very difficult to make proper allowances for the refraction of the atmosphere, by which all objects appear higher than they really are; and another difficulty arises from their parallax, which

which makes them, particularly the moon, appear lower than they would otherwise do, excepting when they are in the very zenith. It is also well known, that the nearer the horizon any celestial body is, the greater its parallax will be; and as the parallax and refraction act in opposite ways to one another, the former depressing and the latter raising the object, it is plain, that great difficulties must arise from this circumstance. The sun, for instance, whose parallax is less than the refraction, must always appear higher than he really is; but the moon, whose parallax is greater than her refraction, must always appear lower.

To render observations of the celestial bodies more easy, the commissioners of longitude have caused an EPHEMERIS or NAUTICAL ALMANACK to be published annually, containing every requisite for solving this important problem, which can be put into the form of tables. But whatever may be done in this way, it will be proper to make the necessary preparations concerning the dip of the horizon, the refraction, semidiameters, parallax, &c. in order to reduce the apparent to the true altitudes and distances; for which we shall here subjoin two general rules.

The principal observation for finding the longitude at sea is that of the moon from the sun, or from some remarkable star near the zodiac. To do this, the operator must be furnished with a watch which can be depended upon, for keeping time within a minute for six hours; and with a good Hadley's quadrant, or, which is preferable, a sextant: and this last instrument will still be more fit for the purpose, if it be furnished with a screw for moving the index gradually; likewise an additional dark glass, but not so dark as the common kind, for taking off the glare of the moon's light in observing her distance from a star. A small telescope, which may magnify 3 or 4 times, is also necessary to render the contact of a star with the moon's limb more discernible. A magnifying glass of 12 or 20 inches focus will assist the operator in reading off his observations with the greater facility.

1. *To MAKE THE OBSERVATION.* Having examined and adjusted his instrument as well as possible, the observer is next to proceed in the following manner: If the distance of the moon from the sun is to be observed, turn down one of the screens; look at the moon directly through the transparent part of the horizon glass; and keeping her in view, gently move the index till the sun's image be brought into the silvered part of that glass. Bring the nearest limbs of both objects into contact, and let the quadrant librate a little on the lunar ray; by which means the sun will appear to rise and fall by the side of the moon; in which motion the nearest limbs must be made to touch one another exactly by moving the index. The observation is then made; and the division coinciding with that on the Vernier scale, will show the distance of the nearest limbs of the objects.

When the distance of the moon from a star is to be observed when the moon is very bright, turn down the lightest screen, or use a dark glass lighter than the screens, and designed for this particular purpose; look at the star directly through

the transparent part of the horizon-glass; and keeping it there, move the index till the moon's image is brought into the silvered part of the same glass. Make the quadrant librate gently on the star's ray, and the moon will appear to rise and fall by the star: move the index between the librations, until the moon's enlightened limb is exactly touched by the star, and then the observation is made. In these operations, the plane of the quadrant must always pass through the two objects, the distance of which is to be observed; and for this purpose it must be placed in various positions according to the situation of the objects, which will soon be rendered easy by practice.

The observations being made, somebody, at the very instant when the operator calls, must observe by the watch the exact hour, minute, and quarter minute, if there be no second hand, in order to find the apparent time; and at the same instant, or as quick as possible, two assistants must take the altitudes of those objects the distance of which is observed; after which, the observations necessary for finding the longitude are completed.

The ephemeris shows the moon's distance from the sun, and likewise from proper stars, to every 3 hours of apparent time for the meridian of Greenwich; and that the greater number of opportunities of observing this luminary may be given, her distance is generally set down from at least one object on each side of her. Her distance from the sun is set down while it is between 90 and 120 degrees; so that, by means of a sextant it may be observed for 2 or 3 days after her last, and before her last quarter. When the moon is between 40 and 90 degrees from the sun, her distance is set down both from the sun and from a star on the contrary side; and, lastly, when the distance is above 120 degrees, the distance is set down from two stars, one on each side of her. The distance of the moon from objects on the east side of her is found in the ephemeris in the 8th and 9th pages of the month; and her distance from objects on the west is found in the 10th and 11th pages of the month.

When the ephemeris is used, the distance of the moon must only be observed from those stars the distance of which is set down there; and therefore a ready means of knowing the star from which her distance ought to be observed. The observer has then nothing more to do, than to set his index to the distance roughly computed at the apparent time, estimated nearly for the meridian at Greenwich; after which he is to look to the E. or W. of the moon, according as the distance of the star is found in the 8th or 9th, or in the 10th or 11th, pages of the month; and having found the moon upon the horizon glass, the star will be easily found by sweeping with the quadrant to the right or left, provided the air be clear and the star be in the line of the moon's shortest axis produced. The time at Greenwich is estimated by turning into time the supposed longitude East of that place, and adding it to the apparent time of the ship, or subtracting it from it as occasion requires. The distance of the moon from the sun, or a star, is roughly found at this time, by saying As 180 minutes (the number contained in three hours) is to the difference in minutes between the  
nearly

nearly estimated time and the next preceding time set down in the ephemeris; so is the difference in minutes between the distances in the ephemeris for the next preceding and next following times, to a number of minutes; which being added to the next preceding distance, or subtracted from it according as it is increasing or decreasing, will give the distance nearly at the time the observation is to be made, and to which the index must be set.

An easier method of finding the angular distance by bringing the objects nearly into contact in the common way, and then fixing the index tight to a certain degree and minute; waiting until the objects are nearly in contact, giving notice to the assistants to get ready with the altitudes, and when the objects are exactly in contact to call for the altitudes and the exact time by the watch. The observer may then prepare for taking another distance, by setting his index 3 or 5 minutes backwards, or forwards, as the objects happen to be receding from or approaching to each other, and proceeding to take the distance, altitudes, and time by the watch, as before. Thus the observer may take as many distances as he thinks proper; but 4 at the distance of 3 minutes, or 3 at the distance of 4 minutes, will at all times be sufficient. Thus not only the eye of the observer will be less fatigued, but he will likewise be enabled to manage his instrument with much greater facility in every direction, a vertical one only excepted. If in taking the distances the middle one is to be taken at any even division on the arch, such as a degree, or a degree and 20 or 40 minutes, that distance will be independent of the semidiameter division, and consequently free of those errors which frequently arise from the inequality of that division in several parts of the graduated scale. The observation ought always to be made about two hours A. M. or P. M. and the true distance may be found by the altitude of the sun taken at the precise time of the distance. If three altitudes are taken, then find the time by the altitude corresponding with the middle distance; thus the observation will be secured from any error arising from the irregularity of the going of the watch. As the time, however, found by the altitude of a star cannot be depended upon, because of the uncertainty of the horizon in the night, the best way of determining the time for a distance observation will be by two altitudes of the sun; one taken on the preceding afternoon, before he is within six degrees of the horizon; and the other on the next morning, when he is more than six degrees high. It must be observed, however, that in order to follow these directions, it is necessary that the atmosphere should be pretty clear from clouds; otherwise the observer must be obliged to make the observations at such times as he can best find them.

**3. To REDUCE the OBSERVED DISTANCE of the MOON, or a STAR, from the MOON, to the TRUE DISTANCE.** 1. Turn the longitude into time, and add it to the time at the ship if the longitude be West, but subtract it if it be E. which will give the proposed time at Greenwich; and this we may call the reduced time. 2. Find the nearest noon or midnight both before and after the reduced time in the seventh page of the month in the ephemeris.

3. Take out the moon's semidiameter and horizontal parallax corresponding to these noons and midnights, and find their differences. Then say, As 12 hours is to the moon's semidiameter in 12 hours, so is the reduced time to a number of seconds; which, either added to or subtracted from the moon's semidiameter at the noon or midnight just mentioned, according as it is increasing or decreasing, will give her apparent semidiameter; to which add the correction from Table VIII. of the ephemeris, and the sum will be her true semidiameter at the reduced time. And as 12 hours is to the difference of the moon's horizontal parallax in 12 hours, so is the reduced time to a fourth number; which, being added to or subtracted from the moon's horizontal parallax at the noon or midnight before the reduced time, according as it is increasing or decreasing, the sum or difference will be the moon's horizontal parallax at the reduced time. 4. If the reduced time be nearly any even part of 12 hours, viz. one 6th, one 4th, &c. these parts of the difference may be taken, and either added or subtracted according to the directions already given, without being at the trouble of working by the rule of proportion. 5. To the observed altitude of the sun's lower limb add the difference betwixt his semidiameter and dip; and that sum will be his apparent altitude. 6. From the sun's refraction take his parallax in altitude, and the remainder will be the correction of the sun's altitude. 7. From the star's observed altitude take the dip of the horizon, and the remainder will be the apparent altitude. 8. The refraction of a star will be the correction of its altitude. 9. Take the difference between the moon's semidiameter and dip, and add it to the observed altitude if her lower limb was taken, or subtract it if her upper limb was taken; and the sum or difference will be the apparent altitude of her centre. 10. From the proportional logarithm of the moon's horizontal parallax, taken out of the nautical almanack (increasing its index by 10), take the logarithmic cosine of the moon's apparent altitude, the remainder will be the proportional logarithm of her parallax in altitude; from which take her refraction, and the remainder will be the correction of the moon's altitude. 11. To the observed distance of the moon from a star add her semidiameter if the nearest limb be taken, but subtract it if the farthest limb was taken, and the sum or difference will be the apparent distance. 12. To the observed distance of the sun and moon add both their semidiameters, and the sum will be the apparent distance of their centres.

**3. To FIND the TRUE DISTANCE of the OBJECTS, having their APPARENT ALTITUDES and DISTANCES.** 1. To the proportional logarithm of the correction of the sun or star's altitude, add the logarithmic cosine of the sun or star's apparent altitude; the logarithmic sine of the apparent distance of the moon from the sun or star, and the logarithmic co-secant of the moon's apparent altitude. The sum of these, rejecting 30 from the index, will be the proportional logarithm of the first angle. 2. To the proportional logarithm of the correction of the sun or star's altitude, add the logarithmic co-tangent of the sun

sun or star's apparent altitude, and the logarithmic tangent of the apparent distance of the moon from the sun or star. The sum of these, rejecting 20 in the index, will be the proportional logarithm of the second angle. 3. Take the difference between the first and second angles, adding it to the apparent distance if it be less than 90, and the first angle be greater than the second; but subtracting it if the second be greater than the first. If the distance be greater than 90, the sum of the angles must be added to the apparent distance, which will give the distance corrected for the refraction of the sun or star. 4. To the proportional logarithm of the correction of the moon's altitude add the logarithmic cosine of her apparent altitude; the logarithmic sine of the distance correct for the sun or star's refraction, and the logarithmic cosecant of the sun or star's apparent altitude. The sum, rejecting 30 in the index, will be the proportional logarithm of the third angle. 5. To the proportional logarithm of the correction of the moon's apparent altitude, add the logarithmic cotangent of her apparent altitude, and the tangent of the distance corrected for the sun or star's refraction; their sum, rejecting 20 in the index, will be the proportional logarithm of the fourth angle. 6. Take the difference between the third and fourth angles, and subtract it from the distance corrected for the sun or star's refraction if less than 90, and the third angle be greater than the fourth; or add it to the distance if the fourth angle be greater than the third; but if the distance be more than 90, the sum of the angles must be subtracted from it, to give the distance corrected for the sun or star's refraction, and the principal effects of the moon's parallax. 7. In Tabl. XX. of the ephemeris, look for the distance corrected for the sun and star's refraction, and the moon's parallax in the top column, and the correction of her altitude in the left-hand side column; take out the number of seconds that stand under the former, and opposite to the latter. Look again in the same table for the corrected distance in the top column, and the correction of the moon's altitude in the left-hand side column; take out the number of seconds that stand under the former, and opposite to the latter. Look again in the same table for the corrected distance in the top column, and the principal effects of the moon's parallax in the left-hand side column, and take out the number of seconds. The difference between these two numbers must be added to the corrected distance if less than 90, but subtracted from it if greater; and the sum or difference will be the true distance.

4. To DETERMINE the LONGITUDE, after having obtained the TRUE DISTANCE. Look in the ephemeris among the distances of the objects for the computed distance betwixt the moon and the other object observed on the given day. If it be found there, the time at Greenwich will be at the

top of the column; but if it falls betwixt distances in the ephemeris which stand ately before and after it, and also the between the distance standing before computed distance; then take the proportional logarithms of the first and second differences between these two logarithms, and the difference between these two logarithms will be the proportional logarithm of a number of hours, minutes, and seconds; which being added to the time standing over the first distance will give the true time at Greenwich. Or it may be found by saying, As the first difference is to the second difference as the first difference is to a fractional part of time; which being added directed, will give the time at Greenwich. The difference between Greenwich time and the ship, turned into longitude, will be the time the observations were made; and will be the time at the ship is greatest, but W. if

#### SECT. IV. EXAMPLES of FINDING the LONGITUDE at SEA, by all the DIFFERENT METHODS usually tried.

1. To FIND the LONGITUDE by COMPUTATION from the SHIP'S COURSE. Were it possible to keep an accurate account of the distance the ship has run, and to measure it exactly by (see LOG, § 8.) or any other means, then the latitude and longitude would easily be settled by settling the ship's account to that time. If the course and distance being known, the course of latitude and departure is readily found in the Traverse Table; and the difference of longitude being known, the true longitude and latitude also be known. A variety of causes, however, concur to render this computation inaccurate, particularly the ship's continual defect from the course set by her playing to the right round her centre of gravity; the unequal force at the helm, and the distance sup- posed, being erroneous, on account of head, unsteady winds, currents, &c. for which seems impossible to make any allowance. The place of the ship, however, is judged of by the latitude every day, if possible, by observations; and if the latitude found by observations agrees with that by the reckoning, it is presumed that the ship's place is properly determined; if they disagree, it is concluded that the longitude stands in need of correction, and the latitude by observation is always to be depended upon.

Currents very often occasion errors in the computation of a ship's place. The causes in the great depths of the ocean are known, though many of the motions there can be accounted for. It is supposed some of those in the great ocean are owing to the tide following the moon, and a certain of the waters arising thence; likewise the settled nature of these currents may be the changes in the moon's declination toward the torrid zone, however, a considerable one occasioned by the trade winds, the motion constantly to the W. at the rate of 8 or 10 miles per day. At the extremities of the trade winds or near the 30th degree of N. or S. Lat.

probably compounded of this motion to  
 rd, and of one towards the equator ;  
 ships sailing within these limits ought  
 course each day for the current.

The error is supposed to have been occa-  
 a current, it ought, if possible, to be  
 the case is so or not ; or a reason-  
 ate must be made of its drift and  
 hen with the setting and drift, as a  
 distance, find the difference of latitude  
 ure ; with which the dead reckoning  
 reased or diminished : and if the lati-  
 orrected agrees with that by observa-  
 earture thus corrected may be safely  
 ae, and thus the ship's place with re-  
 longitude determined.

Suppose a ship in 24 hours finds, by  
 cknowing, that she has made 96 miles of  
 of lat. N. and 38 miles of departure W.  
 ervation finds her difference of latitude  
 n trial that there is a current which in  
 takes a difference of 16 miles lat. N.  
 es of departure E. Required the ship's

Miles 112 Miles 28 W.  
 ad reckoning corrected by the current  
 difference of lat. 112 miles which is  
 is that found by observation ; whence  
 re 28 is taken as the true one.

The error is supposed to arise from the  
 l distances, we must observe, that if the  
 of latitude is much more than the de-  
 the direct course has been within 3  
 the meridian, the error is most probably  
 ince. But if the departure be much  
 n the difference of latitude, or the di-  
 be within 3 points of the parallel, or  
 5 points from the meridian, the error  
 to be ascribed to the course. But if  
 in general are near the middle of the  
 the error may be either in the course,  
 iftance, or both. This method admits  
 ces.

By the dead reckoning, the difference  
 is more than once and an half the de-  
 r when the course is less than 3 points :  
 ource to the difference of latitude and

With this course and the meridional  
 of latitude by observation, find the dif-  
 ference of longitude.

If the dead reckoning is more than once  
 f the difference of latitude ; or when  
 s more than five points : find the course  
 ce with the difference of latitude ; by  
 s, and departure by account ; then with  
 dle latitude by observation, and de-  
 account find the difference of lon-

If the difference of latitude and depar-  
 ture is nearly equal, or the direct  
 etween 3 and 5 points of the meridian :

 by account since the last observation.  
 s course and the difference of latitude

by observation find another departure. Take half  
 the sum of these departures for the true one. With  
 the true departure and difference of latitude by  
 observation find the true course ; then with the  
 true course and meridional difference of latitude  
 find the difference of longitude.

3. To FIND the LONGITUDE at SEA by a VARI-  
 ATION CHART. Dr HALLEY having collected a  
 great number of observations on the variation of  
 the needle in many parts of the world, by that  
 means was enabled to draw certain lines on Mer-  
 cator's chart, showing the variation in all the  
 places over which they passed in the year 1700,  
 at which time he first published the chart ; whence  
 the longitude of those places might be found by  
 the chart provided its latitude and variation was  
 given. The rule is, Draw a parallel of latitude  
 on the chart through the latitude found by ob-  
 servation ; and the point where it cuts the curved  
 line marked with the variation that was observed  
 will be the ship's place.

EXAM. A ship finds by observation the lati-  
 tude to be 18° 20' north ; and the variation of the  
 compass to be 4° west. Required the ship's  
 place ? Lay a ruler over 18° 20' N. parallel to the  
 equator ; and the point where its edges cut the  
 curve of 4° W. variation gives the ship's place,  
 which will be found in about 27° 10' W. from  
 London.

This method of finding the longitude, however,  
 is attended with two inconveniencies. 1. That  
 when the variation line runs E. or W. or nearly  
 so, it cannot be applied ; though as this happens  
 only in certain parts of the world, a variation  
 chart may be of great use for the rest. Even in  
 those places indeed where the variation curves do  
 run E. or W. they may be of considerable use in  
 correcting the latitude when meridian observa-  
 tions cannot be had ; which frequently happens  
 on the northern coasts of America, the Western  
 Ocean, and about Newfoundland ; for if the va-  
 riation can be found exactly, the east and west  
 curve answering to it will show the latitude. But,  
 2. The variation itself is subject to continual  
 change ; whence a chart, though ever so perfect  
 at first, must in time become totally useless ; and  
 hence the charts constructed by Dr Halley, tho'  
 of great utility at their first publication, became  
 at length almost entirely useless. A new one was  
 published in 1746 by Messrs Mountaine and Dod-  
 son, which was so well received, that in 1756  
 they again drew variation lines for that year, and  
 published a third chart the year following. They  
 also presented to the Royal Society a curious pa-  
 per concerning the variation of the magnetic  
 needle, with a set of tables annexed, containing the  
 result of more than 50,000 observations, in six pe-  
 riodical reviews from 1700 to 1756 inclusive, a-  
 dapted to every 5° of lat. and lon. in the more  
 frequented oceans ; all of which were published  
 in the *Philos. Transf.* for 1757.

3. To FIND the LONGITUDE by the SUN'S DE-  
 CLINATION.—Having made such observations on  
 the sun as may enable us to find his declination at  
 the place, take the difference between this computed  
 declination and that shown at London by the eph-  
 eris ; from which take also the daily difference of

declination at that time; then say, as the daily difference of declination is to the above found difference, so is 360 degrees to the difference of longitude. In this method, however, a small error in the declination will make a great one in longitude.

4. *To FIND the LONGITUDE by the MOON'S CULMINATING.*—Seek in the ephemeris for the time of her coming to the meridian on the given day and on the day following, and take their difference; also take the difference betwixt the times of culminating on the same day as found in the ephemeris, and as observed; then say, as the daily difference in the ephemeris is to the difference between the ephemeris and observation; so is 360° to the difference of longitude. In this method also a small difference in the culmination will occasion a great one in the longitude.

5. *By ECLIPSES of the MOON.*—This is done much in the same manner as by the eclipses of Jupiter's satellites: For, if in two or more distant places where an eclipse of the moon is visible, we carefully observe the times of the beginning and ending, the number of digits eclipsed, or the time when the shadow touches some remarkable spot, or when it leaves any particular spot on the moon, the difference of the times when the observations were made will give the difference of longitude. Phenomena of this kind, however, occur too seldom to be of much use.

6. In the 76th vol. of the *Philos. Trans.*, Mr EDWARD PIGOT gives a very particular account of his method of determining the lon. and lat. of York; in which he also recommends the method of determining the longitude of places by observations of the moon's transit over the meridian. The instrument used in his observations were a gridiron pendulum clock, a two feet and an half reflector, an eighteen inch quadrant made by Mr Bird, and a transit instrument made by Mr Sisson. By these instruments an observation was made, on the 10th Sept. 1733, of the occultation of a star of the 9th magnitude by the moon, during an eclipse of that planet, at York and Paris. Besides this, there were observations made of the immersions of  $\phi$  *Aquarii* and  $\delta$  *Pisium*; the result of all which was, that between Greenwich and York the difference of meridians was 4' 27".

In 1733, Mr PIGOT thought of finding the difference of meridians by observing the meridian right ascensions of the moon's limb. This he thought had been quite original; but he found it afterwards in the *Nautical Almanack* for 1769, and in 1784 read a pamphlet on the same subject by the Abbé TOALDO; but still found that the great exactness of this method was not suspected; though he is convinced that it must soon be universally adopted in preference to that from the first satellite of Jupiter. After giving a number of observations on the satellites of Jupiter, he concludes, that the exactness expected from observations, even on the first satellite, is much overrated. "Among the various objections (says he), there is one I have often experienced, and which proceeds solely from the disposition of the eye, that of seeing more distinctly at one time than another. It may not be improper also to mention, that the observation I should have relied on as the

best, that of Aug. 30. 1785, marked as one of those most distant from the truth.

After giving a number of observations of the eclipse of the moon Sept. 10, 1783, he concludes that the eclipses of the moon's spots are not too much neglected, and that it might be relied upon much more were the following circumstances attended to: 1. To be particular in trying the clearness of the sky. 2. To choose spots as are well defined, and leave no part as to the part eclipsed. 3. That every observer should use, as far as possible telescopes of powerful, or at least let the magnifying power be the same. "A principal objection (may still be urged, viz. the difficulty of distinguishing the true shadow from the penumbra; this obviated, I believe the results would be exact than from Jupiter's first satellite: Undoubtedly the shadow appears better defined if viewed little; but I am much inclined to think with high magnifying powers, there is great uncertainty of choosing the same part of the shadow which perhaps is more than a sufficient objection for the loss of distinctness."

The following rule for meridian observations of the moon's limb is next laid down: "To create of the moon's right ascension in 12 hours as the increase of the moon's right ascension between two places found by observation to the difference of meridians.

EXAMPLE.—Nov. 30. 1782.

h.	m.	s.	
13	12	57.62	Meridian transit of moon's } second limb
13	13	29.08	Ditto of $\alpha$ $\mu$ } _____
		31.46	Difference of right ascension

13	14	8.05	Meridian transit of moon's } second limb
13	14	30.13	Ditto of $\alpha$ $\mu$ } _____
		22.08	Difference at York.
		31.46	Difference at Greenwich.

9.38 Increase of the moon's apparent right ascension between Greenwich and York, by observation.

141" in seconds of a degree, ditto, ditto  
The increase of the moon's right ascension in 12 hours, by computation, is 23,340 seconds; reduced into seconds is 43,200. According to the rule stated above,

23,340" : 43,200" : diff. of merid. = 2

"These easy observations and short (says Mr Pigot) are the whole of the business instead of computing the moon's right ascension 12 hours, I have constantly taken it from the *Nautical Almanacks*, which give it sufficiently exact, provided some attention be paid to create or decrease of the moon's motion the following circumstances attended to: 1. To be particular in trying the clearness of the sky. 2. To choose spots as are well defined, and leave no part as to the part eclipsed. 3. That every observer should use, as far as possible telescopes of powerful, or at least let the magnifying power be the same. 4. A principal objection (may still be urged, viz. the difficulty of distinguishing the true shadow from the penumbra; this obviated, I believe the results would be exact than from Jupiter's first satellite: Undoubtedly the shadow appears better defined if viewed little; but I am much inclined to think with high magnifying powers, there is great uncertainty of choosing the same part of the shadow which perhaps is more than a sufficient objection for the loss of distinctness."

1. Compare the observations with those made in several other places. 2. Let the

be observed at these places. 3. Such are in right ascension and declination are infinitely preferable. 4. It is strongly urged to get, as near as equal number of observations of each a mean of each set, and then a mean. 5. This will in a great measure correct of telescopes and sight. 5. The use of the telescopes to the eye of the observer the observation is also very necessary, subject to vary. 6. A principal error from the observation of the moon's may be considerably lessened, if certain spots near each limb were also settled observatories; in which case of the moon will perhaps be a constant. 7. When the difference of meridians,itudes of places, is very considerable, of the moon's diameter becomes an

such are the requisites to use this method, advantage, only one or two of them employed in the observations that I have two thirds of these observations had the same stars observed at Greenwich and yet none of the results, except a difference of 15" from the mean; therefore may expect a still greater exactness, within 10' if the above particulars be at-

the same stars are not observed, it is the observers from both places to compute right ascension from tables, in order to ascertain right ascension of the moon's though this is not so satisfactory as by observation, still the difference will be trifling the star's right ascensions are accurate. I am also of opinion, that the same may be put in practice by travellers with a transit instrument, constructed up with facility in any place. It is very, perhaps, that the instrument should be in the meridian for a few seconds of the stars, nearly in the same parallel with the moon, are observed; nay, I do not think, that if the instrument deviate a quarter or half a degree, or more, exactness can be attained; as a table computed, showing the moon's parallax for such deviation; which last may be found by the well known method of observing the whole difference of declination is

observers very seldom meet with suitable stars near the pole, or find a proper method of determining the error of the line of collimation. I shall recommend the following method.—Having computed the apparent declination of four, six, or more stars, which are in the same parallel of declination, observe them with the instrument inverted, or half when in its right position. If the difference of right ascensions between each set of observations agrees with the computation, there is no error; but if they disagree, half that difference is the error of the line of collimation. observations may also serve to determine the distance of the corresponding

wires are equal. In case of necessity, each limb of the sun might be observed in the same manner, though probably with less precision. By a single trial I made above two years ago, the result was much more exact than I expected. Mayor's catalogue of stars will prove of great use to those that adopt the above method.—I am rather surprised that the immersions of known stars of the 6th and 7th magnitude, behind the dark limb of the moon, are not constantly observed in fixed observatories, as they would frequently be of great use."

Mr JOHN McLEAN of the observatory, Edinburgh, gives the following rule for finding the ship's place, with miscellaneous observations on different methods. The rule was examined and approved of by Sir Joseph Banks, P. R. S.

1. With regard to determining the ship's place by the help of the course and distance sailed, the following rule may be applied.—It will be found as expeditious as any of the common methods by the middle latitude or meridional parts; and is in some respects preferable, as the common tables of sines and tangents only are requisite in applying it.—Let  $a$  and  $b$  be the distances of two places from the same pole in degrees, or their complete latitudes;  $c$  the angle which a meridian makes with the rhumb line passing through the places: and  $L$  the angle formed by their meridians, or the difference of longitude in minutes: then  $A$  and  $B$  being the logarithmic tangents of  $\frac{1}{2}a$  and  $\frac{1}{2}b$ ,  $S$  the sine of  $C$ , and  $S'$  the sine of  $(C + L)$ , we shall have the following equation

$$L = \frac{A - B}{S' - S} \quad (A - B \text{ signifies the difference between}$$

$A$  and  $B$ .) Also, from a well known property of the rhumb line, we have the following equation:

$S + E = R + D$ , where  $S$  is the logarithmic cosine of  $C$ ,  $E$  the logarithm of the length of the rhumb line, or distance,  $D$  the logarithm of the minute's difference of latitude, and  $R$  the logarithm of the radius.

By the help of these two equations, we shall have an easy solution of the several cases to which the middle latitude, or meridional parts, are commonly applied.

**EXAMPLE.** A ship from a port, in latitude  $56^\circ$  N. sails SW. by W. till she arrives at the latitude of  $40^\circ$  N: Required the difference of longitude.

Here  $a = 34^\circ$ ,  $b = 50^\circ$ ,  $c = 56^\circ 15''$ ,  $A = 9.48534$ ,  $B = 9.56107$ ,  $S = 9.9199308$ ,  $S' = 9.9198464$ ; there-

fore,  $L = \frac{A - B}{S' - S} = \frac{.757300}{.844} = 897$  the minutes dif-

ference of longitude. Also,  $S = 9.74474$ ,  $D = 2.98227$ ; therefore  $E = R + D - S = 3.23753$ , to which the natural number is 1728, the miles in the rhumb line sailed over.

2. The common method of finding the difference of longitude made good upon several courses and distances, by means of the difference of latitude and departure made good upon the several courses, is not accurately true.

For example: If a ship should sail due S. 600 miles, from a port in  $60^\circ$  N. lat. and then due W. 600 miles, the difference of longitude found by the common methods of solution would be 1053;

whereas

whereas the true difference of longitude is only 933, less than the former by 120 miles, which is more than  $\frac{1}{4}$  of the whole. Indeed every considerable alteration in the course will produce a very sensible error in the difference of longitude. Though, when the several rhumb lines sailed over are nearly in the same direction, the error in longitude will be but small.

The reason of this will easily appear from Fig. 2. Plate CCV; in which the ship is supposed to sail from Z to A, along the rhumb lines ZB, BA; for if the meridians PZ, PkaBL be drawn; and very near the latter other two meridians Pbd, Pmn; and likewise the parallels of latitude B<sub>2</sub>, D<sub>2</sub>, mo, bk; then it is plain that D<sub>2</sub> is greater than bk (for D<sub>2</sub> is to bk as the sine of DP to the sine of bP): and since this is the case every where, the departure corresponding to the distance PZ and course BZC, will be greater than the departure to the distance oZ and course oZC. And in the same manner, we prove that nB is greater than mo; and consequently, the departure corresponding to the distance AB, and course ABL, is greater than the departure to the distance A<sub>2</sub>, and course A<sub>2</sub>L: Wherefore, the sum of the two departures corresponding to the courses ABL and BZC, and to the distances AB and BZ, is greater than the departure corresponding to the distance AZ and course AZC: therefore the course answering to this sum as a departure, and CZ as a difference of latitude, (AC being the parallel of latitudes passing through A), will be greater than the true course AZC made good upon the whole. And hence the difference of longitude found by the common rules will be greater than the true difference of longitude; and the error will be greater or less according as BA deviates more or less from the direction of BZ.

3. Of determining the ship's longitude by lunar observations.

Several rules for this purpose have been lately published, the principal object of which seems to have been to abbreviate the computations requisite for determining the true distance of the sun or a star from the moon's centre. This, however, should have certainly been less attended to than the investigation of a solution, in which considerable errors in the data may produce a small error in the required distance. When either of the luminaries has a small elevation, its altitude will be affected by the variability of the atmosphere; likewise the altitude, as given by the quadrant, will be affected by the inaccuracy of the instrument, and the uncertainty necessarily attending all observations made at sea. The sum of these errors, when they all tend the same way, may be supposed to amount to at least one minute in altitude; which, in many cases, according to the common rules for computing the true distance, will produce an error of about 30 minutes in the longitude. Thus, in the example given by M. CALLET, in the *Tables Portatives*, if we suppose an error of one minute in the sun's altitude, or call it  $6^{\circ} 26' 34''$ , instead of  $6^{\circ} 27' 34''$ ; we shall find the alteration in distance according to his rule to be  $54''$ , producing an error of about 27 minutes in

the longitude: for the angle at the sun found, in the spherical triangle whose sides are the complement of the sun's altitude, complement of the moon's altitude, and observed distance about  $26^{\circ}$ ; and as radius is to the cosine so is  $60''$  the supposed error in altitude, alteration in distance. Perhaps the only objection of determining the distance, so as not to be affected by the errors of altitude, is that by first finding the angles at the sun and moon, and by then determining the correction of distance for parallax. The rule is as follows:

Add together the complement of the apparent altitude, the complement of the apparent distance, and the apparent distance; from half the sum of these three subtract the complement of the sun's altitude, and the logarithmic cosecant of the complement of the moon's altitude, the logarithmic sine of the apparent distance of centres, the logarithmic sine of the half sum, and the logarithm of the remainder; and half the sum of these logarithms, after rejecting 20 from the index, is the logarithmic cosine of half the angle at the moon.

As radius is to the cosine of the angle at the moon; so is the difference between the parallax and refraction in altitude to the correction of distance; which is to be added to the distance of centres when the angle at the moon is obtuse; but to be subtracted when it is acute, in order to have the distance once corrected.

In the above formula, if the word *sun* be changed for *moon*, and *vice versa*, wherever they occur, we shall find a second correction of distance to be applied to the distance, once corrected, but by addition when that angle is acute, and by subtraction when that angle is obtuse.

In applying this rule, it will be sufficient to take the complement, altitudes, and apparent distance of centres, true to the nearest minute or second; a small error in the angles at the sun and moon will have very little effect on the corrections of distance.

If D be the computed distance in feet, S the difference between the moon's parallax and refraction in altitude, S the sine of the angle at the moon, and R the radius; then

$$\frac{d^2 S^2}{2DR}$$

will be the third correction of distance, to be added to the distance twice corrected: But it is plain, from the nature of this correction, that it may be rejected, except when the distance D is very small, and the angle at the moon nearly equal to a right angle.

This solution is likewise of use in finding the true distance of a star from the moon, by changing the word *sun* into *star*, and using the refraction of the star, instead of the difference between the parallax and refraction in altitude of the sun, in finding the second correction of distance.

Ex. Given the observed distance of a star from the centre of the moon,  $50^{\circ} 8' 41''$ ; the altitude,  $55^{\circ} 58' 55''$ ; the star's altitude,  $5^{\circ} 5''$ ; and the moon's horizontal parallax,  $57''$ . Required the true distance?

Cofec. — 0°02512 — \*'s co. alt. — 70° 42'  
 D's co. alt. — 34 4 — Cofec. — 0°25169  
 Cofec. — 0°11479 — obf. dift. — 50 9 — Cofec. — 0°11479

2)154 55

Sine — 9°28950 — 77 27 — Sine — 9°98950

Rem. 6. 45 — Sine — 9°07018

Sine — 9°83688 — Rem. 43 23 — 2)19°42616

2)19°96629

Cofec. — 9°71308 — 58° 54'

Cofec. — 9°98314 — 15° 54'

117 48 = D's angle.

31 48 = \*'s angle.

Rad. : Cofec. 117° 48' : D's diff. parall. & refract. 1980" : 923" = 1st correct. of distance.  
 Rad. : Cofec. 31° 48' : star's refract. 162" : 138" = 2d correct. of distance.

Here the first correction of distance is additive, if the angle at the moon is obtuse; and the second correction is also additive, since the angle at the star is acute; therefore their sum 923" + 138" = 1061" = 17° 41", being added to 50° 8' 41", the present distance of the star from the moon's centre gives 50° 26' 21" for the true distance of centre nearly; — and 2 x L (d + S) — L (2 LR + L L D) = L. 8", which, being added to the distance twice corrected, gives 50° 26' 29" for the

true distance. By comparing this distance with the computed distances in the ephemeris, the time at Greenwich corresponding to that of observing the distance will be known; and the difference of those times being converted into degrees and minutes, at the rate of 15 degrees to the hour, will give the longitude of the place of observation: which will be E. if the time at the place be greater than at Greenwich, but W. if it be less.

L O N

L O N

**LONGITUDINAL.** *adj.* [from *longitude*; *Latin*, French.] Measured by the length; being in the longest direction.—*Longitudinal* is said to transverse: these vesiculæ are distended their longitudinal diameters straitened, and the length of the whole muscle shortened. *Cbeyne.*  
**LONGITUDINALLY,** *adj.* placed lengthwise.  
**LONG-KANG,** a town of Asia, in Corea.  
**LONGLY.** *adv.* [from *long.*] Longingly; great liking.—

Master, you look'd so longly on the maid,  
 whaps, you mark not what's the pith of all.

*Shak.*

**LONGMAY.** See LONMAY.  
**LONG-MEN,** a town of China, in Canton.  
**LONG-NAN,** a city of China, of the first rank, Schuen, on the Mouqua. It has several forts, and is of great use against the Tartars, 710 miles from Pekin.  
**LONGNY,** a town of France, in the dept. of Sarthe, 9 miles E. of Mortagne.  
**LANGOBARDI.** See LANGOBARDI.  
**LANGOBARDS.** See LOMBARDS, § 1.  
**LANGOBUCO,** a town of Naples  
**LANGOMONTANUS,** Christian, a learned astronomer, born in a village of Denmark in 1562. He was the son of a ploughman, and was obliged during his studies many hardships, during his time, like the philosopher Cleanthes, to the cultivation of the earth and the letter he received from the minister of the place. When he was 15, he stole away from his

family, and went to Wiburg, where there was a college, in which he spent 11 years; and though he was obliged to earn a livelihood, he studied with such ardour, that among other sciences he learned the mathematics in great perfection. He afterwards went to Copenhagen; where the professors of that university in a short time conceived so high an opinion of him, that they recommended him to the celebrated Tycho Brahe. He lived 8 years with that famous astronomer, and was of great service to him in his observations and calculations. At length, being extremely desirous of obtaining a professor's chair in Denmark, Tycho Brahe consented, though with some difficulty, to deprive himself of his service; gave him a discharge, filled with the highest testimonies of his esteem; and furnished him with money for the expense of his journey. He obtained a professorship of mathematics in the university of Copenhagen in 1605; and discharged the duty of it worthily till his death, in 1647. He wrote many learned works, the chief of which is his *Astronomia Danica*: 1640, fol. He also endeavoured to square the circle, and thought he had made that discovery; but Dr John Pell, an English mathematician, attacked him, and proved that he was mistaken.

(1.) **LONGSIDE,** a parish of Aberdeenshire, in the district of Buchan, about 5 miles square but irregular in its form. The surface is so level, that it is often overflowed by the Ugie, which runs through it from W. to E. This has suggested the idea of making a canal along its banks, from its

mouth

mouth near Peterhead, to Old Deer, 10 miles distant; which would be of great advantage to the country. The soil is light but fertile. Of 12,000 acres, 7000 are cultivated, 257 planted, 1800 under moss, and the rest uncultivated. About 7000 bolls of grain are produced, of which 3000 are exported, besides 300 black cattle; and butter, cheese and eggs to the amount of 3000 l. annually. The population in 1790 and 1791 was 1792: Decrease 187 since 1755. The parish abounds with various species of beautiful granite; and manufactures of narrow woollen cloths, jemmies, thread, &c. are established in it.

(2.) LONGSIDE, a town in the above parish, 4 miles W. of Peterhead.

\* LONGSOME. *adj.* [from *long*.] Tedious; wearisome by its length.—They found the war so churlish and *longsome*, as they grew then to a resolution, that, as long as England stood in state to succour those countries, they should but consume themselves in an endless war. *Bacon*.—

When chill'd by adverse snows, and beating rain,

We tread with weary steps the *longsome* plain.

*Prior*.

(1.) \* LONG-SUFFERING. *adj.* [from *long* and *suffering*.] Patient; not easily provoked.—The Lord God, merciful and gracious, *long-suffering*, and abundant in goodness. *Exodus*, xxxiv. 6.

(2.) \* LONG-SUFFERING. *n. f.* Patience of offence; clemency.—We infer from the mercy and *long-suffering* of God, that they were themselves sufficiently secure of his favour. *Rogers*.

\* LONGTAIL. *n. f.* [from *long* and *tail*.] Cut and long tail: a canting term for one or another. A phrase, I believe, taken from dogs, which belonging to men not qualified to hunt, had their tails cut.—He will maintain you like a gentlewoman.—Aye, that I will come cut and *longtail* under the degree of a quire. *Shak. Merry Wives*.

LONGTOWN, a town of Cumberland, on the Scots border, near the conflux of the Esk and Kirkcub, 9 miles from Carlisle, and 313 from London. It has a charity-school for 60 children; a market on Thursday, and two fairs. Lon. 2. 50. W. Lat. 55. 8. N.

LONGUE, a town of France, in the dep. of Maine and Loire, 7½ miles N. of Saumur.

(1.) LONGUEIL, Christopher DE, a learned writer, born at Malines in 1490. He was much in favour with several princes. He was employed by Pope Leo X. to write against Luther. He wrote also Commentaries on Pliny's book of Plants; and Observations on the Civil Law. He died in 1522.

(2.) LONGUEIL, Gilbert DE, a learned Dutch physician, born at Utrecht, in 1507. He published a Greek and Latin Lexicon; Remarks on Classic authors; and other works.

LONGUEMARCH, a town of the French republic, in the dept. of the Lys, and late province of Austrian Flanders; 7 miles NNE. of Ypres.

LONGUERUE, Lewis DE, a learned French divine, born at Charleville, in 1652. He wrote, 1. A Latin Dissertation on Tadian. 2. La Description Historique de la France. 3. Annales Archaicorum. 4. A Discourse on Transubstantiation; and, 5. Remarks on the Life of Cardinal Wolfey.

LONGUEVAL, a town of France, of Somme; 9 miles NW. of Peronne.

LONGUEVILLE, a town of France, dep. of the Lower Seine, and late prov. Normandy, seated on the Lee, 17 m. Rouen, and 9 S. of Dieppe. Lon. 1. 1. 49. 30. N.

LONGUION, a town of France, in the Moselle; 7½ miles SW. of Louviers, 22½ W. of Thionville. It has an iron-works, and a foundry of cannons.

LONGUS, a Greek sophist, author entitled *Heracles*, or Pastoral, and containing the loves of Daphnis and Cleitias, bishop of Avranches, speaks very geouly of this work, but censures son as obscene. As no ancient author mentions the time when he lived cannot be a J. Craggs, Esq. secretary of state, tra work into English.

\* LONGWAYS. *adv.* [This and r words so terminated are corrupted from the longitudinal direction.—This island a vast mole, which lies *longways*, almost parallel line to Naples. *Addison on Italy*.]

\* LONGWINDED. *adj.* [from *long* and *winded*.] Breathed; tedious.—

My simile you minded  
Which, I confess, is too *longwinded*.

\* LONGWISE. *adv.* [from *long* and *wise*.] Longitudinal direction.—They make a of a quill, *longwise* of that part of the quill which hath the pith, and crosswise of that part which is without pith. *Bacon*.—He was laid in beds, the one joined *longwise* unto the other, which he filled with his length. *Hakewell*.

(1.) LONGWY, a town of France, in the Jura, on the Doubs; 9 miles S. of Luxemburg.

(2.) LONGWY, a town of France, in the Moselle, and ci-devant duchy of Lorraine, with a castle; divided into the old and the new. This last was built and fortified by Louis XIV. It was taken by the Prussians and Austrians, Gen. Clairaut, on the 21st Aug. 1792, by the French, under Gen. Valence, on the 10th October, 1792. It is seated on an eminence, 167 miles SW. of Luxemburg, and 167 NW. of Paris. Lon. 5. 51. E. Lat. 49. 30. N.

LONG-YEN, a town of China, in the province of Szechuan.

LONIA, a river of Hungary, in Croatia.

LONICERA, HONEYSUCKLE, in botany, a genus of the monogynia order, belonging to the pentandria class of plants. The corolla is tubular and irregular; the berry polylocular and inferior. There are 10 species.

1. LONICERA ALPINA, the upright honey-suckle, rises with a shrubby stem, upright stem, branching from a 4 or 5 feet high; largish, spear-shaped leaves, opposite; and from the sides of the stem many red flowers by twos on long pedicels, each succeeded by two red berries together at their base; it flowers in August, and the berries ripen in autumn.

2. LONICERA CARULEA, the blue right honey-suckle, rises with a shrubby stem, branching moderately 3 or 4 feet high; many white flowers proceeding from the

s; appearing in May, and succeeded  
ries joined together at their base.

**ERA CAPRIFOLIUM**, the Italian ho-  
rises with shrubby declinated stalks,  
long slender trailing branches, termi-  
nate or whorled bunches of close-  
rs, very fragrant, and white, red, and  
irs.

**ERA DIERVILLA**, the yellow-flowered  
neyfuckle, rises with shrubby upright  
sing erect to the height of three or  
re branches terminated by clusters of  
flowers, appearing in May and June,  
ies continuing till autumn; but rarely  
ls here.

**ERA NIGRA**, the black-berried upright  
rises with a shrubby stem, branching  
igh, with white flowers succeeded by  
distinct black-berries.

**ERA PERICLYMENUM**, the common  
yfuckle, hath two principal varieties,  
;ish wild honeyfuckle, or woodbine of  
ind hedges, and the Dutch or Ger-  
uckle. The former rises with shrub-  
ry long, slender stalks, and branches  
e ground, or climbing round a sup-  
minated by oval imbricated heads,  
allish flowers of white or red colours,  
ng from June or July till autumn.  
ies with a shrubby declinated stalk,  
iling purplish branches, terminated  
ricated heads, furnishing large beau-  
wers of a fragrant odour, appearing  
July.

**ERA SEMPERVIRENS**, the evergreen  
ered honeyfuckle, rises with a shrub-  
l stalk, sending out long slender trail-  
l, terminated by naked verticillate  
ng, unreflexed, deep scarlet flowers,  
il, but of little fragrance.

**ERA SYMPHORICARPOS**, the shrubby  
rt, rises with a shrubby, rough stem,  
ect 4 or 5 feet high, with small green-  
e appearing round the stalk in August.

**ERA TARTARICA**, the Tartarian bo-  
; with a shrubby upright stem, branch-  
or 4 feet high; heart-shaped, oppo-  
nd whitish erect flowers succeeded  
s, sometimes distinct, and sometimes

**ERA XYLOSTEMUM**, the FLY HONEY-  
s with a strong shrubby stem, branch-  
he height of 7 or 8 feet; with erect  
s proceeding from the sides of the  
ch succeeded by large double red  
d together at their base. The flow-  
n June, and the berries ripen in  
The easiest method of propagating  
ts is by layers or cuttings. In both  
idly emit roots, and form plants in  
or transplantation. Some sorts are  
ed by suckers and seed.

**CERUS**, John, a learned German  
; born at Orthern. He was a Pro-  
ublished a Greek and Latin lexicon,  
her works. He died in 1569.

**CERUS**, Adam, the son of the pre-  
PART II.

ceding, was bred a physician, and published sever-  
ral books on natural history, and botany; parti-  
cularly a History of Plants, Animals, and Metals.  
He died in 1586.

**LONIGO**, or **LEONICO**, a trading town and  
district of Maritime Austria, in the Vicentino.

**LONINGEN**, a town of Germany, in West-  
phalia; 8 miles SSW. of Cloppenburg.

**LONJUMEAU**, a town of France, in the dep.  
of the Seine and Oise; 9 miles SE. of Versailles,  
and 10½ S. of Paris.

**LONKA**, a town of Poland, in Podolia.

**LONLAY**, a town of France, in the dep. of  
the Lower Charente, 6 m. N. of St Jean d'An-  
gely.

**LONMAY**, a parish of Scotland, on the coast  
of Aberdeenshire, 10 miles long, but hardly 4  
broad; 12 miles from Peterhead. The soil is va-  
rious; the air moist but healthy. Husbandry is not  
yet much improved. The population, in 1795,  
was 1650; the decrease 24, since 1755. There  
are several extensive moors.

**LONS**, or **LONS LE SAUMIER**, a city of France,  
capital of the dep. of Jura, formerly famous for  
its salt works, whence its name, *le saumier*, *le ei-  
salter*. It is seated on the Solvan, 30 miles from  
Dole. Lon. 5. 30. E. Lat. 46. 41. N.

(1.) **LONSDALE**. See **KIRKBY**, N<sup>o</sup> 1.

(2.) **LONSDALE**, a vale of Westmorland.

**LONTHAL**, a river of Germany, in Sussia.

(1.) **LOO**, a town of the Batavian republic, in  
the dep. of the Rhine, and late province of Guel-  
derland, 8 miles W. of Deventer. Lon. 6. 0. E.  
Lat. 52. 18. N.

(2.) **LOO**, a town of the French republic; in the  
dep. of Lys, and late province of Austrian Flan-  
ders; 6 miles SSE. of Dixmude.

(3.) **LOO**, or **LOW**, a river of Cornwall, running  
into the British Channell, between E. and W.  
**LOOZ**, where it is navigable for vessels of 100 tons.

(4.) \* **LOO**. *n. f.* A game at cards.—A secret  
indignation, that all those affections of the mind  
should be thus vilely thrown away upon a hand  
at *loo*. *Addison*—

In the fights of *loo*. *Pope*.

\* **LOOBILY**. *adj.* [*looby* and *like*.] Awkward;  
clumsy.—The plot of the farce was a grammar  
school, the master setting his boys their lessons,  
and a *loobily* country fellow putting in for a part  
among the scholars. *L'Esfrange*.

\* **LOOBY**. *n. f.* [Of this word the derivation is  
unsettled. *Skinner* mentions *lapp*, German, *fool-  
ish*; and *Junius Ilabe*, a clown; Welsh; which  
seems to be the true original, unless it come from  
*lob*.] A lubber; a clumsy clown.—

Who could give the *looby* such airs? *Swiss*.

(1.) **LOOE**, an island in the British Channell,  
on the coast of Cornwall, 3 miles SE. of E.  
**LOOE**.

(2.) **LOOE, EAST**, or **EAST LOW**, an ancient  
borough of Cornwall, incorporated by charter  
from Q. Elizabeth, seated on the E. side of the  
**LOO**, 16 miles W. of Plymouth, and 32 WSW.  
of London. It has 2 fairs; and a battery of 4  
guns; and is connected with W. **LOOE**, by a large  
stone bridge of 15 arches. It is governed by a  
mayor, recorder, aldermen, and 9 burgesses.

*F f f* (2.) **LOOZ**,

tance.—

She once being loof, Antony

Claps on his sea-wing like a doating mallard,  
Leaving the fight. *Shak.*

(1.) \* LOOK. *interj.* [properly the imperative mood of the verb; it is sometimes *look ye.*] See! lo! behold! observe!—*Look*, where he comes, and my good man too; he's as far from jealousy as I am from giving him cause. *Shakespeare.*—*Look* you, he must seem thus to the world. *Shakespeare.*—*Look*, when the world hath fewest barbarous people, but such as will not marry, except they know means to live, as it is almost every where at this day, except Tartary, there is no danger of insundations of people. *Bacon.*—*Look* you! we, that pretend to be subject to a constitution, must not carve out our own quality; for at this rate a cobbler may make himself a lord. *Collier.*

(s.) \* LOOK. *n. f.* 1. Air of the face; mien; cast of the countenance.—

Thou cream-fac'd loon,

Where got'st thou that goose look? *Shak.*  
—Thou wilt save the afflicted people, but wilt bring down high looks. *Psal. xviii. 27.*

Then gracious Heav'n for nobler ends design'd,

Their looks erected, and their clay refin'd.

*J. Dryden, jun.*

—And though death be the king of terrors, yet pain, disgrace, and poverty, have frightful looks, able to discompose most men. *Locke.* 2. The act of looking or seeing.—

Then on the croud he cast a furious look,

And wither'd all their strength. *Dryden.*

When they met they made a furlly stand,

And glar'd, like angry lions, as they pass'd,

And with'd that ev'ry look might be their last.

*Dryden.*

And saw the woman's tears.

Bertran; if thou dar'st, look out

Upon yon slaughter'd host.

—I cannot, without some indignation, ill copy of an excellent original; much behold with patience Virgil and Homer their faces, by a botching interpreter. *Dry* tellectual beings, in their constant endeavor true felicity, can suspend this prof particular cases, till they have looked bef and informed themselves, whether that thing lie in their way to their main end. There may be in his reach a book, c pictures and discourses capable to delig struct him, which yet he may never take to look into. *Locke.*—Towards those who nicate their thoughts in print, I cannot with a friendly regard, provided there idency in their writings to vice. *Addison.* and substantial greatness of soul looks d a generous neglect of the censures plauses of the multitude. *Spektor.*—I thing left but to gather up the reliques of and look about me to see how few friend left. *Pope.*—The optick nerves of such look the same way with both eyes, as meet before they come into the brain optick nerves of such animals as do the same way with both eyes, as of fishes meet. *Newton.* 3. To have power of s Fate sees thy life lodg'd in a brittle

And looks it through.

3. To direct the intellectual eye.—In our deliverance past, and our danger pr to come, let us look up to God, and reform his own ways. *Bacon.*—We are to look at the bare action, but at the re: *Stillingfleet.*—The man only saved the pi

other battle before he could reach Ox-  
*ndon.* 5. To take care; to watch.—  
 hat ye bind them fast. *Shak.*  
 gathered bushels of apples, had there-  
 in them: he was only to *look* that  
 m before they spoiled, else he robbed  
*he.* 6. To be directed with regard to  
 —Let thine eyes *look* right on, and let  
 ds *look* straight before thee. *Prov.* iv.  
 have any particular appearance; to

I took the way,  
 through a path, but scarcely printed,  
 'd as lightly press'd by fairy feet.

*Dryden.*  
 stlefs modesty of private and publick  
 ous spirit, which all other Christi-  
 o labour after, should *look* in us as if  
 atural. *Spratt.*—Piety, as it is thought  
 e favour of God; and fortune, as it  
 e effect either of that, or, at least of  
 id courage, beget authority. *Temple.*  
 all they see me do an act that *looks*  
 e courage of a Spartan king. *Dryden.*  
 lain of want, and yet refuse all offers  
*looks* very fullen. *Burnet.*—Should I  
 favours done me by your lordship, I  
 would *look* more like vanity than gra-  
 tison.—Something very noble may be  
 out it *looketh* cumbersome. *Felton.*—  
 i sad spectacle of woe, he trod  
 rt sands, and now he *looks* a god. *Pope.*  
 vices and follies of others, observe  
 practice *looks* in another person, and  
 hat it *looks* as ill, or worse, in your-  
 —This makes it *look* the more like  
 e being frugal in her principles, but  
 the effects thence arising. *Cheyne.* 8.  
 air, mien, or manner.—  
*look* not big, nor stamp, nor stare, nor

nafter of what is mine own. *Shak.*  
 waste *looks* through his eyes?  
 l he *look* that seems to speak things  
 ge. *Shak.*  
 our hand, and trust me you *look* well,  
 ur years very well. *Shak.*—  
 ce, or such, be any aids to us?  
 as they were built to shake the world,  
 moment to our enterprize? *Ben.* 7.  
 cannot tell what a man says; if he  
 re, I may easily know what he *looks*.  
 will be his lot to *look* singular in loose  
 us times, and to become a bye-word.  
 9. To form the air in any particular  
 regarding or beholding.—  
 me the condition of the time,  
 must *look* more hideously on me,  
 ve drawn it in my fantasy. *Shak.*  
 ght, confus'd with shame,  
 d I once *look* up, or heave the head?

*Milton.*  
 up to you with reverence,  
 mated by the sight of him at whose  
 ve taken fire in his writings. *Swift.*  
*about one.* To be alarmed; to be  
 will import those men who dwell

careless to *look about* them; to enter into serious  
 consultation, how they may avert that ruin.  
*Decay of Piety.*—If you find a wasting of your flesh,  
 then *look about you*, especially if troubled with a  
 cough. *Harvey.*—John's cause was a good milch  
 cow, and many a man subsisted his family out of it;  
 however, John began to think it high time to *look*  
*about him.* *Arbutnot.* 11. To *look after.* To  
 attend; to take care of; to observe with care,  
 anxiety, or tenderness. Mens hearts failing them  
 for fear, and for *looking after* those things which  
 are coming on the earth. *Luti.*—Politeness of  
 manners, and knowledge of the world, should  
 principally be *looked after* in a tutor. *Locke.*—A  
 mother was wont to indulge her daughters, when  
 any of them desired dogs, squirrels, or birds;  
 but then they must be sure to *look* diligently *after*  
 them, that they were not ill used. *Locke.*—My  
 subject does not oblige me to *look after* the wa-  
 ter, or point forth the place whereunto it is now  
 retreated. *Woodw.* 12. To *look for.* To expect.  
 —Phalantus's disgrace was engriev'd, in lieu of  
 comfort, of Artelia, who telling him she never  
*looked for* other, bad him seek some other mistress.  
*Sidney.*—Being a labour of so great difficulty, the  
 exact performance thereof we may rather wish  
 than *look for.* *Hooker.*—

Thou  
 Shalt feel our justice, in whose easiest passage  
*Look for* no lets than death. *Shak.*  
 —If we sin wilfully that we have received  
 the knowledge of the truth, there remaineth no  
 more sacrifice for sins, but a certain fearful *looking*  
*for* of judgment. *Heb.* x.—In dealing with cunning  
 persons, it is good to say little to them, and that  
 which they least *look for.* *Bacon.*—This mistake  
 was not such as they *looked for*; and, though the  
 error in form seem'd to be consented to, yet the  
 substance of the accusation might be still insisted  
 on. *Clarendon.*—Inordinate anxiety, and unneces-  
 sary scruples in confession, instead of setting you  
 free, which is the benefit to be *looked for* by confes-  
 sion, perplex you the more. *Taylor.*—

*Look now for* no enchanting voice, nor fear  
 The bait of honied words. *Milton.*

Drown'd in deep despair,  
 He dares not offer one repenting prayer:  
 Amaz'd he lies, and sadly *looks for* death. *Dryd.*

I must with patience all the terms attend,  
 Till mine is call'd; and that long *look'd for* day  
 Is still encumber'd with some new delay. *Dryd.*  
 —This limitation of Adam's empire to his line,  
 will save those the labour who would *look for* one  
 heir among the race of brutes, but will very lit-  
 tle contribute to the discovery of one amongst  
 men. *Locke.* 13. To *look into.* To examine;  
 to sift; to inspect closely; observe narrowly to.—

His nephew's levies to him appear'd  
 To be a preparation 'gainst the Polack;  
 But better *look'd into*, he truly found  
 It was against your highness. *Shak.*

—The more frequently and narrowly we *look in-*  
*to* the works of nature, the more occasion we  
 shall have to admire their beauty. *Atterbury.*—It  
 is very well worth a traveller's while to *look into*  
 all that lies in his way. *Addison.* 14. To *look*  
*on.* To respect; to esteem; to regard as good or  
 bad.—Ambitious men, if they be checked in their  
 desires

desires, become secretly discontent, and look upon men and matters with an evil eye. *Bacon*.—

If a harmless maid

Should ere a wife become a nurse,

Her friends would look on her the worse. *Prior*.

15. To LOOK on. To consider; to conceive of; to think.—I looked on Virgil as a succinct, majestic writer; one who weighed not only every thought, but every word and syllable. *Dryden*.—He looked upon it as morally impossible, for persons infinitely proud to frame their minds to an impartial consideration of a religion that taught nothing but self-denial and the cross. *South*.—Do we not all profess to be of this excellent religion? but who will believe that we do so, that shall look upon the actions, and consider the lives of the greatest part of Christians. *Tillotson*.—In the want and ignorance of almost all things, they looked upon themselves as the happiest and wisest people of the universe. *Locke*.—Those prayers you make for your recovery are to be looked upon as best heard by God, if they move him to a longer continuance of your sickness. *Wake*. 16. To LOOK on. To be a mere idle spectator.—

I'll be a candle-holder, and look on. *Shak*.

—Some come to meet their friends, and to make merry; others come only to look on. *Bacon*. 17. To LOOK over. To examine; to try one by one.

Look o'er the present and the former time,

If no example of so vile a crime

Appears, then mourn.

*Dryden*.

—A young child, distracted with the variety of play-games, tired his maid every day to look them over. *Locke*. 18. To LOOK out. To search; to seek.—When the thriving tradesman has got more than he can well employ in trade, his next thoughts are to look out for a purchase. *Locke*.—Where the body is affected with pain or sickness, we are forward enough to look out for remedies. *Atterbury*.—Where a foreign tongue is elegant, expressive, and compact, we must look out for words as beautiful and comprehensive as can be found. *Felton*.—The curious are looking out, some for flattery, some for ironies, in that poem. *Swift*. 19. To LOOK out. To be on the watch.—Is a man bound to look out sharp to plague himself? *Collier*. 20. To LOOK to. To watch; to take care of.—There is not a more fearful wild fowl than your lion living, and we ought to look to it. *Shak*.—

Who knocks so loud at door?

Look to the door there, Francis.

*Shak*.

—Let this fellow be looked to: let some of my people have a special care of him. *Shak*.—

Uncleanly scruples fear not you; look to't.

*Shak*.

—Know the state of thy flocks, and look well to thy herds. *Prov*. xxvii. 33.—When it came once among our people, that the state offered conditions to strangers that would stay, we had work enough to get any of our men to look to our ship. *Bacon*.—If any took sanctuary for ease of treason, the king might appoint him keepers to look to him in sanctuary. *Bacon*.—The dog, running away with the flesh, bids the cook look better to it another time. *L'Esrange*.—For the truth of the theory I am in nowise concerned; the composer of it must look to that. *Woburn*. 21. To LOOK to. To behold.

(2.) \* To LOOK. v. a. 1. To feel for.—

Looking my love, I go from place

Like a young fawn that late hath laid

And seek each where.

2. To turn the eye upon.—Let us look ther in the face. 2 *Kings*, xiv. 8. 3. by looks.—

A spirit fit to start into an empire

And look the world to law.

4. To LOOK out. To discover by searching my eye upon so many of the ge next came to hand, I found encourage them to look out all the bills I could. Whoever has such treatment when I will look out other company, with will be at ease. *Locke*.

\* LOOKER. n. f. [from look.]

looks. 2. LOOKER on. Spectator, Shepherds poor pipe, when his harsh sighs anguish, into the fair looker on, passion enters. *Sidney*.—Such labour necessary then pleasant, both to them undertake it, and for the lookers on. He

My business in this state

Made me a looker on here in Vienna

Where I have seen corruption boil

Till it o'er-run the stew.

Did not this fatal war affront thee

Yet fattest thou an idle looker on?

—The Spaniard's valour lieth in the looker on; but the English valour lieth in the soldier's heart. *Bacon*.—

The people love him;

The lookers on, and the enquiring

Will talk themselves to action.

He wish'd he had indeed been g

And only to have stood a looker on

(1.) \* LOOKING-GLASS. n. f. [from

Mirror; a glass which shews forms

Go some of you and fetch a look

—There is none so homely but look glass. *South*.—We should make no our neighbours faults, than of a look mend our own manners by. *L'Esrange* surface of the lake of Nemi is never the least breath of wind, which together with the clearness of its waters, generally the name of Diana's looking-glass.

(2.) LOOKING-GLASS. See CATOPTRIC, and OPTICS.

(3.) LOOKING-GLASSES, CASTING AND POLISHING OF. See GLASS-MEN XII. XIII.

(4.) LOOKING-GLASSES, FOLIATING FOLIATING.

(1.) LOOK OUT, n. f. in the sea watchful attention to some important vent, which is expected to arise from situation of a ship, &c. It is principally navigation, when there is a probability from the real or supposed proximity of enemies. There is always a look-ship's fore-castle at sea, to watch for various objects lying near her track, as she makes a gradual approach as if the mate of the watch according

he quarter-deck, "Look out afore there!" persons appointed for this service.

LOOK-OUT, CAPE, a cape of N. Carolina. 6. 48. W. Lat. 34. 22. N.

LOOK-OUT, CAPE, a cape of Hudson's Bay. 19. 10. W. Lat. 55. 30. N.

LO, *n. f.* in metallurgy, a vessel made to : the washings of ores of metals. The hea- more metalline part of the ores remain in ough in which they are washed; the lighter ore earthy run off with the water, but set- the lool.

\* LOOM. *n. f.* [from *glomus*, a bottom of , *Minshew*. *Lome* is a general name for a : instrument. *Junius*.] The frame in which avers work their cloth.—He must leave no i thread in his loom. *Gov. of the Tongue*.— The web the string,

l o'er a loom of marble hung. *Addif.*  
 thousand maidens ply the purple loom,  
 weave the bed. *Prior.*

LOOM, in weaving, is a machine whereby distinct threads are woven into one piece. : are of various structures, accommodated various kinds of materials to be woven, and rious maner of weaving them; *viz.* for ns, silks, lincns, cottons, cloths of gold: her works, as tapestry, ribbands, stockings, hich will be found under their proper heads. EAVING. The weaver-loom-engine, other- alled the Dutch loom-engine, was brought se from Holland to London, in or about

\* LOOM. *n. f.* A bird.—A loom is as big as fe; of a dark colour, dappled with white on the neck, back, and wings; each fea- rked near the point with two spots: they in Farr Island. *Greav.*

LOOM, in geography, a town of Norway.

\* To LOOM. *v. n.* [*looman*, Sax.] To appear *Skinner*.

To Loom is also used to denote the indif- ferance of any distant object.

LOM-GALE, *n. f.* at sea, a gentle easy gale of in which a ship can carry her top-sails a-trip, M, HEIR, in law. See HEIR-LOOM.

\* LOON. *n. f.* [This word, which is now nly in Scotland, is the English word *loam*.] y fellow; a scoundrel; a rascal.—

Thou cream-fac'd loon!  
 ere got't thou that goose look? *Sbak.*  
 he false loom, who could not work his will  
 open force, employ'd his flatt'ring skill.

*Dryden.*  
 s young lord had an old cunning rogue; or,  
 Scots call it, a false loom of a grandfather,  
 he might call a Jack of all trades. *Arbutn.*

\* LOOP. *n. f.* [from *loopen*, Dutch, to run.] ble through which a firing or lace is drawn; amental double or fringe.—  
 or any skill'd in loops of ning'ring fine. *Spens.*  
 lake me to see it, or at least so prove it,  
 t the probation bear no hinge, nor loop,  
 hang a doubt on. *Sbak. Oibello.*

ind our crooked legs in hoops  
 le of shells, with silver loops. *Ben Jonson.*  
 old fellow shall wear this or that sort of cut  
 cloath's with great integrity, while all the

rest of the world are de,enerated into buttons, pockets, and loops. *Addison.*

(2.) LOOP, in the iron works, is a part of a sow or block of cast iron broken or melted off from the rest, and prepared for the forge or hammer. The usual method is, to break off the loop of about 3 of a cwt. This loop they take up with their slinging tongs, and beat it with iron sledges upon an iron plate near the fire, that so it may not fall to pieces, but be in a condition to be carried under the hammer. It is then placed under the hammer, and a little water being drawn to make the hammer move but softly, it is beat very gently, and by this means the dross and foulness are forced off, and after this they draw more and more water by degrees, and beat it more and more till they bring it to a square mass, of about two feet long, which they call a BLOOM.

\* LOOPED. *adj.* [from *loop*.] Full of holes.—  
 How shall your houseless heads and unfed sides,  
 Your loop'd and window'd raggedness, defend  
 you

From seasons such as these? \* *Sbak. K. Lear.*

\* LOOPHOLE. *n. f.* [*loop* and *hole*.] 1. Aper- ture; hole to give a passage.—

At loopholes cut thro' thickest shade. *Milton.*

Ere the blabbing Eastern scout

The nice morn on the Indian steep,

From her cabin'd loophole peep. *Milton.*

—Walk not near yon corner house by night; for

there are blunderbusses planted in every loophole,

that go off at the squeaking of a fiddle. *Dryden.*

2. A shift; an evasion.—

Needless, or needful, I not now contend,

For still you have a loophole for a friend. *Dryd.*

\* LOOPHOLED. *adj.* [from *loophole*.] Full of holes; full of openings, or void spaces.—

This uneasy loopbol'd gaol,

In which ye're hamper'd by the fetlock,

Cannot but put y'in mind of wedlock. *Hudibr.*

LOOPING, in metallurgy, a word used by the miners of some counties of England, to express the running together of the matter of an ore into a mass, in the roasting or first burning, intended only to calcine it so far as to make it fit for powdering. This accident, which gives the miners some trouble, is generally owing to the continuing the fire too long in this process.

LOO-POOL, a lake of Cornwall, formed by the Loo; near Helston, 2 miles long; separated from the sea, by a ridge over which the waves beat in high tides.

\* LOORD. *n. f.* [*loerd*, Dutch; *lourdant*, Fr.

*lurdan*, Erie; a heavy, stupid, or witless fellow.

*D. Trevoux* derives *lourdant* from *Lorde* or *Lourde*,

a village in Gascoigny, the inhabitants of which were formerly noted robbers, say they. But dex-

terity in robbing implies some degree of subtily,

from which the Gascoigns are so far removed,

that they are aukward and heavy to a proverb.

The Erie imports some degree of knavery, but in

a ludicrous sense, as in English, you pretty rogue;

though in general it denotes reproachful heaviness,

or stupid laziness. *Spenser's* Scholiast says, *loord*

was wont, among the old Britons, to signify a

lord; and therefore the Danes, that usurped their

tyranny here in Britain, were called, for more

dread than dignity, *lurdans*, i. e. lord Danes,

whole

whose insolence and pride was so outrageous in this realm, that if it fortun'd a Briton to be going over a bridge, and saw the Dane set foot upon the same, he must return back till the Dane was clean over, else he must abide no less than present death: but being afterwards expelled, the name of *lurdane* became so odious unto the people whom they had long oppress'd, that, even at this day, they use for more reproach to call the quartan ague the fever *lurdane*. So far the Scholiast, but erroneously. From *Spenser's* own words, it signifies something of stupid dulness rather than magisterial arrogance. *Macbean.*] A drone.—

Siker, thou'st but a lazy *lord*. *Spenser's Past.*

LOOSA, in botany, a genus of the monogynia order, in the polyandria class of plants. The calyx is pentaphyllous, superior; there are five subovate, cucullated, and large petals; the nectarium consists of 3 leaves, gathered into a conical figure, each terminated by two filaments; the capsule is turbinate, unilocular, and trivalved at top; the seeds are very numerous; and there are 3 linear and longitudinal sinuses.

LOOSDUYNEN, or LAUSDUN, a village of the Batavian republic, in the dep. of the Delft;  $3\frac{1}{2}$  miles SSW. of the Hague; famous for a monument in its church-yard, in memory of the countess of Henneberg, concerning whom it records a most incredible legend. The inscription bears, that this countess, Margaret, was daughter of Florence IV. earl of Holland and Zealand, sister to William, K. of the Romans, and wife of Herman, earl of Henneberg: That having one day challenged a poor woman with infidelity to her husband, because she had twins, the woman wished that she might bring forth as many children at a birth as there are days in the year; in consequence of which imprecation the countess was delivered of 365 children of both sexes; who, after being baptized by Guido, Bp. of Utrecht, all died, with the mother, and were buried in this church; A. D. 1276. This ridiculous story is gravely related as a fact well attested by Erasmus, Vives, Camerarius, Guiccardini, and many other authors.

(1.) \* LOOSE. *adj.* [from the verb.] 1. Unbound; untied.—If he should intend his voyage towards my wife, I would turn her *loose* to him; and what he gets more of her than sharp words, let it lie on my head. *Shak.*—Lo! I see four men *loose*, walking. *Dan.* iii. 25. 2. Not fast; not fixed.—Those few that clash'd might rebound after the collision; or if they cohered, yet by the next conflict might be separated again, and so on in an eternal vicissitude of fast and *loose*. *Bentley.* 3. Not tight; as, a *loose* robe. 4. Not crowded; not close.—

With extended wings a host might pass,

With horse and chariots, rank'd in *loose* array.

*Milton.*

5. Wanton; not chaste.—

Now a *loose* leman to vile service bound. *F. Q.*

When *loose* epistles violate chaste eyes,

She half consents who silently denies. *Dryden.*

6. Not close; not concise; lax.—If an author be *loose* and diffuse in his style, the translator needs only regard the propriety of the language. *Felton.*

7. Vague; indeterminate; not accurate.—It is but a *loose* thing to speak of possibilities, without the particular designs. *Baron.*—It seems unaccounta-

ble to be so exact in the quantity of liquor a small error was of little concern, and to *loose* in the doses of powerful medicines. *A.*

8. Not strict; not rigid.—Because com-

maketh them diligent observers of circum-

stances, the *loose* regard whereof is the nurse of vul-

garly. *Hooker.* 9. Unconnected; rambling.—

venture nothing without a strict examination as much ashamed to put a *loose* indigestion

upon the publick, as to offer brass for mon-

ey payment. *Dryden.*—Vario spends whole months

in running over *loose* and unconnected pages with fresh curiosity is ever glancing over words and ideas, and yet treasures up but little

knowledge. *Watts.* 10. Lax of body; not firm.—What hath a great influence upon the body is going to stool regularly: people that are *loose* have seldom strong thoughts, or strong

reason. *Locke.* 11. Difengaged; not enslaved.—The vailing principle is, to fit as *loose* from pleasure and be as moderate in the use of them, as the

Attorney. 12. Difengaged from obligation commonly with *from*; in the following line will

Now I stand

*Loose* of my vow; but who knows my thoughts?

13. Free from confinement.—They did deliver their prisoners *loose* homeward. *Isaiab.*—

With the wildest tempests *loose*.

14. Remiss; not attentive. 15. To break loose. To gain liberty.—If to break *loose* from the re-

straint of reason, and to want that restraint of reason which keeps us from chusing the worst

liberty, madmen and fools are the only fit

examples. *Locke.*—

Like two black storms on either hand  
Our Spanish army and the Indians stand  
This only space betwixt the clouds is eld  
Where you, like day, broke *loose* from bound  
to appear.

16. To let loose. To set at liberty; to set large; to free from any restraint.—And leaving bird *loose* into the open field. *Luc.*

When God lets *loose* a tyrant upon us, or a pest, if we fear to die, or know not to be free, the calamity sits heavy upon us. *Taylor.*—

Division and division, either of space or duration, the number of its repeated additions or deductions that alone remains distinct, as will appear in one who will let his thoughts *loose* in the expansion of space, or divisibility of matter. *I.* If improvement cannot be made a recreation must be let *loose* to the childish play they which they should be weaned from, by made surfeit of it. *Locke.*

(2.) \* LOOSE. *n. f.* [from the verb.] 1. Liberty from restraint.—

Come, give thy soul a *loose*, and taste pleasures of the poor.  
Lucia, might my big swollen heart  
Vent all its griefs, and give a *loose* to fear  
Marsio could answer thee in sighs.  
When glorious fields and opening car  
views,  
He runs with an unbounded *loose*.  
—Poets should not, under a pretence of imitating the ancients, give themselves such a *loose* in language as if there were no connection in the world

Dismission from any restraining force.—  
 ge maketh no noise, except it be sharply  
 l by a hard and stiff body; and with a  
*lc. Bacon.*

To LOOSE. *v. a.* [*lesan*, Saxon.] 1. To  
 to untie any thing fastened.—The shoes  
 t I am not worthy to loose. *Abis.*—Can'st  
 the bands of Orion? *Job.*—Who is wor-  
 ofe the seals thereof? *Rev. v. 2.*—This is  
 e knot when we cannot loose it. *Burnet.*  
*lax.*—The joints of his loins were loosed.  
 3. To unbind any one bound.—Loose him  
 ; him to me. *Luke.* 4. To free from im-  
 nt.—The captive hasteneth that he may  
 . *Isaiab.*—He loosed, and set at liberty,  
 ive kings of the people of that country,  
 k kept in chains. *Abbot.* 5. To free from  
 ation.—Art thou loosed from a wife? seek  
 e. *1 Cor.* 6. To free from any thing that  
 the mind.—

there's the man, who, loos'd from lust  
 id self,  
 the pretor owes than to himself. *Dryd.*  
 e from any thing painful.—Woman, thou  
 from thy infirmity. *Luke.* 8. To disen-

They loos'd their hold again. *Dryden.*  
 To LOOSE. *v. n.* To set sail; to depart  
 g the anchor.—Ye should have hearken-  
 not have loosed from Crete. *Abis.*—The  
 loosing from Barcelona, came to the port  
 , in the island of Minorca. *Knolles.*—  
 hence by night, they were driven by con-  
 ds back into his port. *Raleigh.*

LOSELY. *adv.* [from loose.] 1. Not fast;  
 y; easily to be disengaged.—  
 ought your love eternal: was it ty'd  
 ily, that a quarrel could divide?

*Dryden's Aurengzebe.*

out bandage.—  
 golden locks for haste were loosely shed  
 her ears. *Fairy Queen.*

out union or connection.—  
 loosely wing the region, part more wise,  
 mon, rang'd in figure, wedge their way.  
*Milton.*

s within himself, all degrees of perfection  
 loosely and separately in all second beings.

4. Irregularly.—A bishop, living loosely,  
 ged that his conversation was not accor-  
 he apostles lives. *Camden.* 5. Negligent-  
 :fully.—We have not loosely through silence  
 d things to pass away as in a dream.  
 The chiming of some particular words  
 :mory, and making a noise in the head,  
 appeas but when the mind is lazy, or ve-  
 and negligently employed. *Locke.* 6.

; meanly; without dignity.—A prince  
 t be so loosely studied, as to remember  
 a composition. *Shak.* 7. Unchastely.—  
 stage how loosely does Astræa tread,  
 airly puts all characters to bed? *Pope.*

To LOOSEN. *v. a.* [from loose.] 1. To re-  
 hing tied. 2. To make less coherent.—  
 ear's rooting, then shaking doth the tree  
 loosening of the earth. *Bacon.* 3. To se-

compages.—

From their foundation loosing to an d fro,  
 They pluck'd the seated hills. *Milton.*  
 She breaks her back, the loosen'd sides give  
 way,

And plunge the Tuscan soldiers in the sea. *Dryd.*  
 4. To free from restraint.—It loosens his hands, and  
 assists his understanding. *Dryden.* 5. To make  
 not costive.—Fear loosenseth the belly; because the  
 heat retiring towards the heart, the guts are relax-  
 ed in the same manner as fear also causeth trem-  
 bling. *Bacon.*

(2.) \* To LOOSEN. *v. n.* [from loose.] To part;  
 to tend to separation.—When the polypus appears  
 in the throat, extract it that way, it being more  
 ready to loosen when pulled in that direction than  
 by the nose. *Sbarr's Surgery.*

\* LOOSENESS. *n. f.* [from loose.] 1. State con-  
 trary to that of being fast or fixed.—The cause of  
 the casting of skin and shell should seem to be the  
 looseness of the skin or shell, that sticketh not close  
 to the flesh. *Bacon.* 2. Latitude; criminal levity.  
 —A general looseness of principles and manners  
 hath seized on us like a pestilence, that walketh  
 not in darkness, but wasteth at noon-day. *Atter-*  
*bury.* 3. Irregularity; neglect of laws.—He en-  
 deavoured to win the common people both by  
 strained curtesy and by looseness of life. *Hayward.*  
 5. Lewdness; unchastity.—

Courtly court he made still to his dame,  
 Pour'd out in looseness on the grassy ground,  
 Both careless of his health and of his fame. *Spensf.*

5. Diarrhœa; flux of the belly.—Taking cold mo-  
 veth looseness by contraction of the skin and out-  
 ward parts. *Bacon.*—In pestilent diseases, if they  
 cannot be expelled by sweat, they fall likewise in-  
 to looseness. *Bacon.*—Fat meats, in phlegmatick sto-  
 machs, procure looseness and hinder retention.  
*Arbutnot.*

(1.) \* LOOSESTRIFE. *n. f.* [*Lysimachia*, Lat.] An  
 herb. *Miller.*

(2.) LOOSE-STRIPE. See LYSIMACHIA.

(1.) LOOTS, a ci-devant county of Germany,  
 in the late bishopric of Liege, now included in the  
 French republic, and dep. of the Ourte. It was  
 bounded on the E. by Lunburg, S. by Halby, W.  
 by Brabant, and N. by Champagne.

(2.) LOOTS, a town of the French republic, late  
 capital of the above county, 16 miles W. of Mac-  
 stricht. Lon. 5. 19. E. Lat. 50. 52. N.

\* LOP. *n. f.* [from the verb.] 1. That which  
 is cut from trees.—

Now thyself hath lost both lop and top,  
 As my budding branch thou would'st crop.

—You must cut it down, or else both body and  
 lop will be of little value. *Martimer.* 2. [LOPPA,  
 Swedish.] A flea.

\* To LOP. *v. a.* [It is derived by *Skinner* from  
 laube, German, a leaf.] 1. To cut the branches  
 of trees.—

Gentle niece, what stern ungentle hands  
 Have lopp'd and hew'd, and made thy body bare  
 Of her two branches? *Shak.*

Like to pillars,  
 Or hollow'd bodies, made of oak or fir,  
 With branches lopp'd in wood, or mountain  
 fell'd. *Mill.*

The

plants, whose luxury was lopp'd, with cranes underprop'd. *Cleavel.* grow from a plant to a great tree, d, is the same oak. *Locke.*—the bore, instead of Cynthia's spear, growth of the luxuriant year. *Pope.* v this —The gardener may lop reli-

if leap. Obsolete.—

ing forth a naked swain, ngs like peacock's train,

*Spenser.*

ope to a tree.

town of Naples, in Abruzzo.

DP) LOPPHIUS, or INDIAN ROOT, in the materia medica. plant to which this article belongs is unknown. neither the woody nor cortical part of the root has any remarkable sensible quality. A slight bitterness is perceptible; and it is recommended, like simarouba, in diarrhoeas even of the colliquative kind, in half-dram doses four times a-day. Little of this root has been brought to Europe: but some of those who have had an opportunity of employing it, speak in very high terms of the effects obtained from it.

(2.) LOPEZ DE VEGA. See VEGA.

LOPHIUS, FISHING FROG, TOAD-FISH, or SEA-DEVIL; a genus of the branchiostegous order of fishes, whose head is in size equal to all the rest of the body. There are 3 species; the most remarkable is

LOPHIUS PISCATORIUS, the common *fishing frog*, an inhabitant of the British seas. This singular fish was called by the ancients *βαγχαλις*, and *rana*, for the same reason that we call it the *fishing frog*; because it resembles the frog in a tadpole state. Pliny takes notice of the artifice used by it to take its prey: "It puts forth the slender horns it has beneath its eyes, enticing by that means the little fish to play round, till they come within reach, when it springs on them." The fishing frog grows to a large size, some being between 4 and 5 feet long. The fishermen on that coast have a great regard for this fish, from a supposition that it is a great enemy to the dog-fish; and whenever they take it with their lines, set it at liberty. It is a fish of very great deformity: the head is much bigger than the whole body; is round at the circumference, and flat above, the mouth of a prodigious wideness. Mr Pennant mentions one taken near Scarborough, whose mouth was a yard wide. The under jaw is much longer than the upper: the jaws are full of slender sharp teeth: in the roof of the mouth are 2 or 3 rows of the same: at the root of the tongue, opposite each other, are two bones of an elliptical form, thick set with very strong sharp teeth. The nostrils do not appear externally, but in the upper part of the mouth are two large orifices that serve instead of

them. On each side the upper jaw are spines, and others are scattered about the part of the head. Immediately above the two long tough filaments, and on the others; these are what Pliny calls *cornua* says it makes use of to attract the little fish seem to be like lines flung out for that long the edges of the head and body are tude of short fringed skins, placed at equies. The aperture to the gills is placed each of these is very wide, so that four have imagined it to be a receptacle for in time of danger. The body grows like the tail, the end of which is quite even. four of the upper part of this fish is d lower part white; the skin smooth.

in bitterness of soul deplor'd  
nt daughter, and my dearer lord. *Pope.*  
io is at the head of any business; an o-

: harvest lord more by a penny or two,  
on his fellows the better to do. *Tupper.*  
man.—

art a lord, and nothing but a lord. *Shak.*  
al name for a peer of England.—Nor  
rimes objected against him so clear, as  
winning satisfaction to the major part  
uses, especially that of the lords. *King*  
l. A baron, as distinguished from those  
title. 9. An honorary title applied to  
3, lord chief justice, lord mayor, lord

is a title of honour given to those who  
ither by birth or creation; amounting  
e same as *peer of the realm*. The title is  
also given to all the sons of dukes and  
and to the eldest sons of earls. The  
d, *blaford*, is abbreviated from *Illaford*,  
and *Lord*. "The etymology of the  
J. Coates) is well worth observing; for  
posed of *illaf*, a loaf of bread, and *ford*,  
*fford*; so that *Illaford*, implied a giver  
cause, in those ages, such great men  
rdinary houses, and fed all the poor;  
reason they were called *givers of bread*,  
v much out of date, great men being  
aining the title, but few regarding the  
which it was first given." See *LADY*, § 2  
s, *HOUSE OF*, one of the three estates  
nt, is composed of the Lords Spiritual  
ral. (See § I. and II.) The following  
I. PART II.

are among the peculiar privileges of the house of  
Lords: 1. One very ancient privilege is declared  
by the charter of the forest, confirmed in parlia-  
ment, 9 Hen. III.; viz. that every lord spiritual  
or temporal summoned to parliament, and passing  
through the king's forests, may, both in going  
and returning, kill one or two of the king's deer  
without warrant; in view of the forester if he be  
present, or on blowing a horn if he be absent; that  
he may not seem to take the king's venison by  
stealth. 2. They have a right to be attended  
and constantly are, by the judges of the court of  
king's bench and common pleas, and such of the  
barons of the exchequer as are of the degree of the  
coif, or have been made serjeants at law; also by  
the king's learned counsel, being serjeants, and by  
the masters of the court of chancery; for their ad-  
vice in point of law, and for the greater dignity  
of their proceedings. The secretaries of state, with  
the attorney and solicitor general, also used to at-  
tend the house of peers, and have to this day (to-  
gether with the judges, &c.) their regular writs  
of summons issued out at the beginning of every  
parliament, *ad tractandum et consilium impenden-*  
*dum*, though not *ad consentiendum*; but, whenever  
of late years they have been members of the house  
of commons, their attendance in the house of lords  
bath fallen into disuse. 3. Every peer, by licence  
obtained from the king, may make another lord  
of parliament his proxy, to vote for him in his  
absence: A privilege, which a member of the  
other house can by no means have, as he himself is  
but a proxy for a multitude of other people. 4.  
Each peer has a right, by leave of the house, when  
a vote passes contrary to his sentiments, to enter his  
dissent on the journal of the house, with the rea-  
sons for such dissent; which is usually styled his *pro-*  
*test*. 5. All bills, that may in their consequences  
any way affect the rights of the peerage, are by  
the custom of parliament to have their first rise in  
the house of peers, and to suffer no changes or a-  
mendments in the house of commons. 6. There  
is also one statute peculiarly relative to the house  
of lords; 6 Ann. c. 13. which regulates the elec-  
tion of the 16 representative peers of North Bri-  
tain, in consequence of the 22d and 23d articles  
of the union; and for that purpose prescribes the  
oaths, &c. to be taken by the electors; directs  
the mode of balloting; prohibits the peers elec-  
ting from being attended in an unusual manner;  
and expressly provides, that no other matter shall  
be treated of in that assembly, save only the elec-  
tion, on pain of incurring a præmunite; and a sim-  
ilar act was passed in 1800, regulating the elec-  
tions of the Irish Peers. See *NOBILITY* and *PEERS*.

1. *The LORDS, SPIRITUAL*, consist of 2 arch-  
bishops and 24 bishops; and, at the dissolution  
of monasteries by Henry VIII. consisted likewise  
of 26 mitred abbots and two priors: a very con-  
siderable body, and in those times equal in num-  
ber to the temporal nobility. All these hold, or  
are supposed to hold, certain ancient baronies un-  
der the king's for William I. thought proper to  
change the spiritual tenure of frankalmoign or  
free-tiths, under which the bishops held their  
lands during the Saxon government, into the feo-  
dal or Norman tenure by barony; which sub-  
jected their estates to all civil charges and assess-

ments, from which they were before exempt; and in right of succession to those baronies, which were unalienable from their respective dignities, the bishops and abbots were allowed their seats in the house of lords. But though these lords spiritual are in the eye of the law a distinct estate from the lords temporal, and are so distinguished in most of our acts of parliament; yet in practice they are usually blended together under the name of *the lords*; they intermix in their votes, and the majority of such intermixture joins both estates. And from this want of a separate assembly, and separate negative of the prelates, some writers have argued very cogently, that the lords spiritual and temporal are now in reality only one estate: which is unquestionably true in every effectual sense, though the ancient distinction between them still nominally continues. For if a bill should pass their house, there is no doubt of its validity, though every lord spiritual should vote against it; of which Selden and Sir Edward Coke give many instances: as, on the other hand, doubtless it would be equally good, if the lords temporal present were inferior to the bishops in number, and every one of those temporal lords gave his vote to reject the bill; though this Sir Edward Coke seems to doubt of.

II. *The Lords, TEMPORAL*, consist of all the peers of the realm, (the bishops not being in strictness held to be such, but merely lords of parliament), by whatever title of nobility distinguished; dukes, marquises, earls, viscounts, or barons. Some of these sit by descent, as do all ancient peers; some by creation, as do all new made ones; others, since the union with Scotland, and lately with Ireland, by election, which is the case of the 16 Scots peers, and 30 Irish peers who represent the body of the Scots and Irish nobility. Their number is indefinite, and may be increased at will by the power of the crown: and once, in the reign of Queen Anne, there was an instance of creating no less than 12 together; in contemplation of which, in the reign of K. George I. a bill passed the house of lords, and was countenanced by the then ministry, for limiting the number of the peerage. This was thought by some to promise a great acquisition to the constitution, by restraining the prerogative from gaining the ascendancy in that august assembly, by pouring in at pleasure an unlimited number of new-created lords. But the bill was ill received, and miscarried in the house of commons, whose leading members were then desirous to keep the avenues to the other house as open and easy as possible. See KING, NOBILITY, PARLIAMENT; also COMMONS, and COMMONALTY, § 2.

(4.) *LORES OF REGALTY*. See LAW, PART III, Chap. I, § 3, III, § 4; and REGALTY.

\* *To LORD*, *v. n.* To dominate; to rule despotically: with *over* before the subject of power.

The virtues the *lordeth* in licentious bliss

Of her free will. *Spenser*.

I see them *lording* it in London streets. *Shak.*

—Those huge tracts of ground they *lorded over*, begat wealth, wealth us'd in pride. *Howel.*—

They had by this possess'd the towers of Gath,

And *lorded over* them.

*Milton.*

—I should choose rather to be tumbled  
dust in blood, bearing witness to any kn  
of our Lord, than by a denial of truths  
blood and perjury, wade to a sceptre  
it in a throne. *South.*—

But if thy passions *lord* it in thy br  
Art thou not still a slave?

The valour of one man th' afflicte  
Imperial, that once *lorded o'er* the w  
Sustain'd.

Proud vagabonds! who make the  
home,

And *lord* it where you have no right  
LORD HOWE'S ISLAND. See HOWE!  
LORDI, a nation of Illyricum.

\* *LORDING*, *n. f.* [from *lord*.] A  
a lord in contempt or ridicule.—

I'll question you  
Of my lord's tricks, and yours, who  
boys.

You were pretty *lordings* then!  
To *lordings* proud I tune my lay,  
Who feast in bower or hall.

\* *LORDLINESS*, *n. f.* [from *lordly*  
nity; high station.—

Thou vouchsafest here to visit me  
Doing the honour of thy *lordliness*  
To one so weak!

2. Pride; haughtiness.

\* *LORDLING*, *n. f.* A diminutive  
Traulus, of amphibious breed,  
By the dam from *lordlings* sprung,  
By the fire exhal'd from dung.

(1.) \* *LORDLY*, *adj.* [from *lord*.]  
ting a lord.—*Lordly* sins require *lordly*  
support them. *South.* 2. Proud; nar  
picious; insolent.—

Bad, as yourself, my Lord;  
Ain't like your *lordly*, lord protector!

ORON. *n. f.* [from *loran*, Saxon.] An aoundrel. Obsolete.—

ORON, a town of Maritime Austria, of Friuli, and territory of Cadorno, of Cadorna.

ORENZO, ST a town, district and ritime Austria, in Istria. The town NE. of Rovigno.

ORENZO, ST, 3 towns of Naples: 1. in 1: 2. in Calabria Ultra, 8 miles W. of Capitanata, 3 miles SE. of Lesina.

OREZO, a district of Maritime Austria, ensive in the Dogado of Venice, com all the alluvions of the Po, and con rishes; and 12,500 souls, in 1797.

OREZO, a large town in the above district, 3,300 souls.

ORTO, a town of Italy, in the Marche with a bishop's see. It is small, but d contains the famous *casa santa*, or so much visited by pilgrims. This rding to the legend, was originally a n Nazareth, inhabited by the Virgin ich she was saluted by the angel, and ed our Saviour. After their deaths, u great veneration by all Christians, i consecrated into a chapel, and de be virgin; upon which occasion St

Luke (according to the Catholics,) made that identical image, which is still preserved here, and dignified with the name of *Our Lady of Loretto*. This sanctified edifice was allowed to sojourn in Galilee as long as that district was inhabited by Christians; but when infidels got possession of the country, a band of angels, to save it from pollution, took it in their arms, and conveyed it from Nazareth to a castle in Dalmatia. But, not having been entertained with suitable respect at this castle, the same indefatigable angels are said to have carried it over the sea, and placed it in a field belonging to a noble lady called *Lauretta*, from whom the chapel takes its name. This field happening unfortunately to be frequented by highwaymen, the angels removed it to the top of a hill belonging to two brothers; who, being equally enamoured of their new visitor, became jealous of each other, quarrelled, fought, and fell by mutual wounds. After this catastrophe, the angels finally removed the holy chapel to the eminence where it now stands, and has stood there 400 years, having lost all relish for travelling, in so much that even the arrival of the French atheists could not make it stir one foot. The sacred chapel stands due E. and W. at the farther end of a large church, of the most durable stone of Istria, which has been built round it. The inside is of the choicest marble, after a plan of San Savino's, and ornamented with basso-relievos, the workmanship of the best sculptors which Italy could furnish in the reign of Leo X. The subject of these basso-relievos are, the history of the blessed virgin, and other parts of the Bible. The whole case is about 50 in length, and 30 in breadth, and 30 in height; but the real house itself is no more than 32 feet in length, 14 in breadth, and 22 the sides about 18 feet in height; the centre of the roof is 4 or 5 feet higher. The walls of this little holy chapel are composed of pieces of a reddish substance, of an oblong square shape, laid one upon another, in the manner of brick. Before the late war, this chapel was the richest receptacle of the tribute of superstition, in Europe; and to the devotees of the Roman Catholic persuasion, the most sublime object of pilgrimage. But Gen. Bonaparte, notwithstanding his recent zeal for the church, having profanely appropriated its immense sacred treasures, its gold and silver angels, images, crucifixes, globes, and sceptres, precious stones, &c. to the use of his army and the French republic, it is unnecessary here to give a detail of its ci-devant riches and reliques. Readers who still feel any curiosity on this subject, may be amply gratified by perusing the ingenious Dr Moore's entertaining *Tour through Italy*. Loretto was taken by the French on the 4th of June 1796. Its only trade, even before the war, consisted in rosaries, crucifixes, Madonnas, Agnus Dei's, and medals, which are manufactured in this town, and sold to pilgrims, some of them at a high price; but the greater part are adapted to the purses of the buyers, and sold for a mere trifle. The poverty of these manufactures, and of the inhabitants in general, is a proof that the reputation of our Lady of Loretto was on the decline, even before the war. In the great church which contains the holy chapel are confessionals, where the penitents

from every country of Europe may be confessed in their own language, priests being always in waiting for that purpose; each of them has a long white rod in his hand, with which he touches the heads of those to whom he thinks it proper to give absolution. They place themselves on their knees in groups around the confessional chair; and when the holy father has touched their heads with the expiatory rod, they retire, freed from the burden of their sins, and with renewed courage to begin a fresh account. In the spacious area before this church there is an elegant marble fountain, supplied with water from an adjoining hill by an aqueduct. In this area there is also a statue of Sixtus V. in bronze. Over the portal of the church is a statue of the Virgin. The gates are likewise of bronze, embellished with basso-reliefs of admirable workmanship; the subjects taken from the Old and New Testaments, and divided into different compartments. There are also several paintings which are highly esteemed, particularly two in the treasury. The subject of one of these is the Virgin's Nativity, by Annibal Carracci; and of the other, a Holy Family, by Raphael. The altars, or little chapels in the great church, are lined with marble and embellished by sculpture; but nothing within it interests a traveller of sensibility so much as the iron grates before those chapels, which were made of the fetters and chains of the Christian slaves, who were freed from bondage by the glorious victory of Lepanto. The place where the governor resides stands near the church, and the ecclesiastics who are employed in it lodge in the same palace, where they receive the pilgrims of distinction. The environs of this town are very agreeable, and in fine weather the high mountains of Croatia may be seen from it. It is seated on a mountain. Lon. 13. 30. E. Lat. 43. 24. N.

(2.) **LORETTO**, a small town of Canada, 9 miles NE. of Quebec, inhabited by Christian Indians of the Huron tribe.

(3.) **LORETTO**, a town of the French republic, in Corsica, 7 miles NE. of Porta.

(4.) **LORETTO**, a river of Calabria Citra.

**LORETZ**, a river of Switzerland, which runs from the lake Zug, and falls into the Reufs.

**LORGUES**, a populous town of France, in the dep. of Var, and late prov. of Provence, on the Argens, 5 miles W. by S. of Draguignan, and 360 S. by E. of Paris. Lon. 6. 27. E. Lat. 43. 30. N.

**LORICA**, in Roman antiquity, was a cuirass, brigantine, or coat of mail, in use among the soldiers. It was generally made of leather, and is supposed to be derived from *lorum*, a thong. The loricae were set with plates of metal in various forms; sometimes in hooks or rings like a chain, sometimes like feathers, and sometimes like the scales of serpents or fishes, to which plates of gold were often added. There were many other lighter cuirasses, consisting only of many folds of linen cloth, or of flax made strong enough to resist weapons. Such soldiers as were rated under 1000 drachms, instead of the lorica now described, wore a *pellorale*. The Roman lorica was made like a shirt, and defended the wearer both before and behind, but was so contrived that the back part could be occasionally separated from the front.

Some of the loricae were made of cords or flax, close set together; whence they were called *thoraces*, *bilices*, *trilices*, &c. from the cords fixed one upon another; but they were used rather in hunting than in battle.

\* **To LORICATE**, *v. a.* To plate or ture hath *loricated*, or plaistered over, the tympanum in animals with ear-wax and entangle any insects that should at creep in there. *Ray*.

**LORICATION**, *n. f.* or **COATING**, in chemistry, is the covering a glass or earthen vessel with a coat or crust of a matter able to resist fire to prevent its breaking in the performance of a process that requires great violence of heat. *See* CHEMISTRY, § 318, 319.

(1.) \* **LORIMER**. **LORINER**, *n. f.* [from *Lorimer*] Bridlecutter.

(2.) *The LORIMERS* are one of the companies of London, that make bits for bridles, of such a size as will fit such like small iron ware. They are mentioned in stat. 1 Rich. II. c. 12.

**LORIOLE**, a town of France, in the Drome; 9 m. W. of Crest, and 12 S. of Valence.

\* **LORIENT**, *n. f.* [from *galgulus*] A kind of stone.

**LORIS**, in zoology. See **LEMUR**, N° 1.

**LORIT**, Henry, a learned critic of the 17th century, born in 1488, at Glaris, in Switzerland, and hence surnamed *Glareanus*. He was contemporary with Erasmus. His writings are numerous, and chiefly in the classics. He died in 1563.

(1.) **LORME**, Phillibert DE, one of the celebrated architects in the 16th century, born at Lyons. Q. Catherine de Medicis gave him the superintendance of buildings; and he directed the construction of those of the Louvre, the Tuileries, the castle of St Anet, St Germain's, and other edifices erected by her orders. He wrote several books of architecture, which are esteemed. He died about 1577.

(2.) **LORME**, a town of France, in the dioc. of Nevers, 6 m. ENE. of Corbigny, and 330 N. of Paris.

\* **LORN**, pret. pass. [of *lorian*, Saxo-Frisian] faken; lost.—

Who after that he had fair Una  
Through light misseeming of her loya

**LORNE**, a division of Scotland, in Argyllshire, which extends about 30 miles in length to S. and about 9 at its utmost breadth; on the E. by Braidalbin; on the W. by the Lochaber; on the N. by Lochaber; and divided on the N. by Loch Melford, and on the S. by Loch Eive; on the banks of Loch Eive stands the castle of Bergomarn, wherein the courts of justice were anciently held. This district, bounding with lakes, is the most pleasant part of Argyllshire, producing plenty of wheat and barley. It once belonged to the family of Macdougall, still residing on the estate, but devolved to the lords of Argyll in consequence of a marriage with the heiress, at that time of the Stuart family. The chief place of this district is the castle of **DUNSTAFFNAGE** (**DUNSTAFFNAGE**), a seat of the Scotts, famous previous to the conquest of the Picts by Kenneth II. On the bank of Loch Eive are the ruins of the monastery of Ardchattan, founded by the monks of Vallicaulum in Burgundy, for

Donald Macdougall, ancestor of the Mac-  
of Lorn. Here K. Robert Bruce, before  
entire possession of Scotland, held a par-

See ARDCHATTAN.—The country a-

OROUX BECONNOIS, a town of France,  
ep. of Mayne and Loire, 13½ miles WNW.

OROUX BOTTEBAU, a town of France,  
lep. of the Lower Loira.

OUI, a town of Spain in Murcia.—

QUIN, a town of France, in the dep. of  
e, 4½ miles SE. of Sarrbourg, and 20 E.  
ville.

RACH, a town of Suabia, in Baden.

ORRAIN, a ci-devant sovereign state of  
, and late province of France; now divi-  
d 4 departments, viz. the Meuse, Meurthe,  
, and Vosges. It was bounded on the N.  
emburg and Treves; on the E. by Alsace  
ux Ponts; on the S. by Franche Comte,  
the W. by Champagne and Bar. It is a-  
o miles long, and 75 broad; and abounds  
wine, hemp, flax, rapefeed, game, fish, and  
necessaries of life. It has fine meadows  
e forests, with mines of iron, silver, and  
; also salt pits. The principal rivers are the  
Moselle, Seille, Meurthe, and Sarre. It was  
into 3 parts; viz. 1. the duchy of Lorraine  
r so called, anciently a sovereign state; 2.  
hy of Barr, which formerly belonged to  
es of Lorraine, but afterwards came under  
ernment of France; and 3. the bishoprics  
, Toul, and Verdun, which have belonged  
ce ever since 1552. Lorraine, was ancient-

LOTHARINGIA from Lothaire I; (See  
; § 17;) and after various revolutions,  
nch, in 1733, during the war between  
and Germany, obtained possession of it.  
re peace in 1735, it was agreed, that Sta-  
king of Poland, should possess these du-  
nd that after his death they should be u-  
r ever to France. It was also agreed, that  
Stephen, duke of Lorraine, the emperor's  
w, should have the grand duchy of Tuf-  
an equivalent for Lorraine. After the death  
rand duke of Tuscany, in 1737, K. Stanis-  
the duke of Lorraine took possession of their  
ve dominions, and the cessation was con-  
nd guaranteed by a treaty in 1738. Upon  
h of K. Stanislaus in 1766, Lorraine was  
l to France. The inhabitants are labo-  
nd valiant. Their trade consists chiefly of  
d linen cloth. Nancy is the capital.

ORRAIN, Claude DE. See CLAUDE, N° 2.

ORRAIN, Henry DE, 3d Duke of Guise,

son of duke Francis, and grandson of

the first duke of Guise; and born in 1550.

a great general, but of an ambitious and

it disposition. He formed the rebellious

on called the *Leigue*, (See FRANCE, § 43.)

ined by his uncle, the cardinal of Lorraine.

retence of defending the catholic faith,

in open rebellion against Henry III, who

eanly got him assassinated at Blois, whi-

had summoned the duke to appear before

the 23d Dec. 1587.

ORRAIN, Robert DE, an eminent sculptor,

born at Paris in 1666. He made so rapid a pro-

gress in the art of designing, that at the age of 18,

the celebrated Girardon intrusted him with the

care of teaching his children and correcting his

disciples. He committed to him also, in conjunc-

tion with Noulisson, the execution of the famous

tomb of Cardinal Richelieu in the Sorbonne, and

his own tomb at St Landres in Paris. On his re-

turn from Rome, he finished several pieces at Mar-

seilles, which had been left imperfect by the death

of Mr Puget. He was received into the academy

of sculpture in 1701. His master piece is *Galatea*,

a work universally admired. He afterwards made a

Bacchus for the gardens at Versailles, a Faun for

those of Marly, and several bronzes, among which

is an Andromeda; all in an excellent taste. This

artist succeeded chiefly in heads; particularly in

those of young girls, which he performed with

incomparable delicacy and truth. He died go-

vernor of the Academy in 1742.

(1.) LORRIS, a town of France, in the dep. of

the Loiret, and late prov. of Orleanois; 12 miles

S. of Montargis, and 24 E. of Orleans.

(2.) LORRIS William DE, a French poet of the

13th century, author of the famous romance of

*the Rose*; which was early translated into English.

He died about 1250.

LORRY, Charles, A. M. D. an eminent French  
physician, born at Crosne, in 1725. He publish-  
ed, 1. *Essai sur l'usage des Alimens*; 1770. 2. *De*  
*Melancholia et morbis melancholicis*: 2 vol. 8vo 3.  
*De Morbis Cutaneis*: 4to. A translation of Dr  
Mead's works into Latin: 2 vols 8vo. He died  
in 1783.

LORYMA, an ancient town of Doris. *Liv.*

LOSARI, a town of the French republic, in  
the island and dep. of Corfica; 15 m. N. of Calvi.

LOSDORF, a town of Bohemia.

(1.)\* To LOSE. v. a. prot. and part. *loft*. [*lofan*,

Saxon.] 1. To forfeit by unsuccessful contest:

the contrary to *win*.—

I fought the battle bravely which I *loft*,

And *loft* it but to Macedonians. *Dryden.*

The lighten'd courses ran;

They rush'd and *won* by turns and *loft* the day.

*Dryden.*

2. To forfeit as a penalty. In this sense is *Para-*

*dic loft*.—

Fame—few, alas! the casual blessing boast,

So hard to gain, so easy to be *loft*! *Pope.*

3. To be deprived of.—He *loft* his right hand with

a shot, and, instead thereof, ever after used a hand

of iron. *Knolles*.—

Who conquer'd him, and in what fatal strife

The youth, without a wound could *lose* his life.

*Dryden.*

4. To suffer diminution of.—The fear of the Lord

goeth before obtaining of authority; but rough-

ness and pride is the *lofing* thereof. *Ecclef. x. 21*.—If

the salt have *loft* his labour, wherewith shall it be

salted? *Mat. 5.* To possess no longer: contrary

to *keep*.—They have *loft* their trade of woollen

drapery. *Graunt*.—

The Trojan honour and the Roman boast,

Admir'd when living, and ador'd when *loft*. *Dryd.*

—We should never *lose* sight of the country,

though sometimes entertained with a distant prof-

pect of it. *Addison*. 6. To miss, so as not to find.

*Venus*

Venus wept the sad disaster  
Of having *lost* her fav'rite dove. *Prior.*  
7. To separate or alienate. It is perhaps in this  
sense always used passively, with *to* before that  
from which the separation is made.—

But if to honour *lost* 'tis still decreed  
For you my bowl shall flow. *Pope.*  
—When men are openly abandoned, and *lost* to  
all shame, they have no reason to think it hard,  
if their memory be reproached. *Swift.* 8. To  
ruin; to send to perdition.—

In spite of all the virtue we can boast,  
The woman that deliberates is *lost*. *Addison.*  
9. To bewilder, so as that the way is no longer  
known.—

I will go *lose* myself  
And wander up and down to view the city. *Shak.*  
—Nor are constant forms of prayer more likely  
to flat and hinder the spirit of prayer and devo-  
tion, than unpremeditated and confused variety  
to distract and *lose* it. *King Char.*—When the  
mind pursues the idea of infinity, it uses the ideas  
and repetition of numbers, which are so many  
distinct ideas, kept best by number from running  
into a confused heap, wherein the mind *loses* it-  
self. *Locke.*—

*Lost* in the maze of words he turns again. *Pope.*  
10. To deprive of.—How should you go about to  
*lose* him a wife he loves with so much passion?  
*Temple.* 11. Not to employ; not to enjoy.—

The happy have whole days, and those they  
use,  
Th' unhappy have but hours, and these they  
*lose*. *Dryden.*

To *lose* these years which worthier thoughts  
require,  
To *lose* that health which should those thoughts  
inspire. *Swage.*

12. To squander, to throw away.—  
I no more complain,  
Time, health, and fortune are not *lost* in vain. *Pope.*  
13. To suffer to vanish from view.—

Like following life in creatures we dissect,  
We *lose* it in the moment we detect. *Pope.*  
Off in the passions' wild rotation tost,  
Our spring of action to ourselves is *lost*. *Pope.*

14. To destroy by shipwreck.—  
The coast

Where first my shipwreck'd heart was *lost*. *Prior.*  
15. To throw away; to employ ineffectually.—  
He has merit, good-nature, and integrity, that  
are too often *lost* upon great men. *Pope.* 16. To  
miss; to part with, so as not to recover.—These  
sharp encounters, where always many more men  
are *lost* than are killed or taken prisoners, put  
such a stop to Middleton's march, that he was  
glad to retire. *Clarendon.* 17. To be freed from;  
as, to lose a fever.—

His feely back the bunch has got  
Which Edwin *lost* before. *Parnel.*  
(2.) \* To LOSE. *v. n.* 1. Not to win.—

We'll hear poor rogues  
Talk of court news, and we'll talk with them too,  
Who *loses*, and who wins. *Shak.*

2. To decline; to fail.—  
Wisdom in discourse with her  
*Loss*: discomfiteance. *Milton.*

\* LOSABLE. *adj.* [from *lost*.] Subject to

privation.—Consider whether motion, or a propen-  
sity to it, be an inherent quality belonging to  
atoms in general, and not *loseable* by them. *Boyle.*

\* LOSEL. *n. f.* [from *lostan*, Saks. to perish.] A  
scoundrel; a sorry worthless fellow. A word now  
obsolete.—Such *losels* and scatterlings cannot easi-  
ly, by any sheriff, be gotten, when they are  
challenged for any such fact. *Spenser.*—

A *lofel* wand'ring by the way,  
One that to bounty never cast his mind,  
Ne thought of honour ever did assay  
His baster breast. *Fairy Q.*

Be not with work of *losels* wit defamed,  
Ne let such verses poetry be named. *Hubberd.*  
By Cambridge a town I do know,  
Whose *losses* by *losels* doth show  
More here then is needful to tell. *Tupper.*

A gross hag!  
And, *lofel*, thou art worthy to be hang'd  
That wilt not slay her tongue. *Shak.*

(1.) \* LOSER. *n. f.* [from *lose*.] One that is de-  
prived of any thing; one that forfeits any thing;  
one that is impaired in his possession or hope; the  
contrary to *winner* or *gainer*.—

With the *losers* let it sympathize. *Shak.*  
—If one of the speakers be vain, tedious, and  
trifling, he that hears, and he that answers, are  
equal *losers* of their time. *Taylor.*—It cannot last,  
because that act seems to have been carried on  
rather by the interest of particular countries, than  
by that of the whole, which must be a *loser* by it.

*Temple.*—  
A bull with guided horns,  
Shall be the portion of the conquering chief,  
A sword and helm shall cheer the *loser's* grief. *Dryd.*

—*Losers* and malecontents, whose portion and  
inheritance is a freedom to speak. *South.*

(2.) LOSER, a town of Bavaria, in Saltzburg.  
LOSPA, a town of Sweden, in Smaland.  
LOSTO, a town of Naples, in Bari.

\* LOSS. *n. f.* [from *lofs*.] 1. Detriment; pri-  
vation; diminution of good; the contrary to  
*gain*.—The only gain he purchased was to be ca-  
pable of *loss* and detriment for the good of others.

*Hooker.*—An evil natured son is the dishonour of  
his father that begat him; and a foolish daughter  
is born to his *loss*. *Ecclus.*—The abatement of  
price of any of the landholder's commodities, less-  
ens his income, and is a clear *loss*. *Locke.* 2.

Miss; privation.—  
If he were dead, what would betide of me?  
—No other harm but *loss* of such a lord.

The *loss* of such a lord includes all harms. *Shak.*  
3. Deprivation; forfeiture.—  
*Loss* of Eden, till one greater man  
Restore it, and regain. *Milton.*

4. Destruction.—  
Her fellow ships from far her *loss* deserv'd;  
But only she was sunk. *Dryden.*

—There succeeded an absolute victory for the  
English, with the slaughter of above 20,000 of the  
enemy, with the *loss* but of one man, though not  
at all hurt. *Bacon.* 5. Fault; puzzle: used only  
in the following phrase.—Not the least transac-  
tion of sense and motion in man, but philosophers  
are at a *loss* to comprehend. *South.*—Reason is al-  
ways striving, and always at a *loss* while it is cre-  
dited.

that which is not its proper object. nan may sometimes be at a *loss* which with. *Baker*. 6. Useless application. *at loss* of time to explain any farther to the enemy in numbers of men *addison*.

(3.) LOT, in geography, a department of France, bounded on the E. by that of Cantal; SE. by that of Aveyron; S. by those of the Tarn, and the Upper Garonne; W. by that of Lot and Garonne; NW. by that of Dordogne; and N. by that of Correze. It is 70 miles long, about 35 broad; and comprehends the ci-devant prov. of QUERCY. The capital is CAHORS.

(4.) LOT, a river of France, which rises about 10 miles ESE. of Mende, in the dep. of Lozere; runs through the above dep. passes by Mende, St Come, Cahors, Villeneuve, Agen, &c. and joins the Garonne near Aiguillon.

(5.) LOT AND GARONNE, a dep. of France, bounded on the N. by that of the Dordogne; E. by that of Lot; (N° 3.) S. by that of Gers, and W. by those of Landes and Gironde: 45 miles long from E. to W. and 36 broad from N. to S. It contains part of the ci-devant province of GUYENNE. AGEN is the capital.

LO-TCHANG, a town of China, in Canton.

(1.) \*LOTE tree, or nettle tree. *n. s.* A plant. —The leaves of the *lote* tree are like those of the nettle. The fruit of this tree is not so tempting to us, as it was to the companions of Ulysses: the wood is durable, and used to make pipes for wind instruments: the root is proper for hafts of knives, and was highly esteemed by the Romans for its beauty and use. *Miller*.

(2.) LOTE, or LOTE TREE. See CELTIS.

LOTEN, John, a good landscape painter of the English school, though born in Switzerland. His taste led him to solemn and dreary scenes, as land storms accompanied with showers of rain, &c. His landscapes are generally large; and he painted with nature, truth, and force; but his colouring is reckoned cold, and a darkish tint predominates in it. He died in London about 1681.

(1.) LOTH, a parish of Scotland, in Sutherlandshire, on the N. side of the Frith of Murray; 14 miles long, but no-where above  $\frac{1}{2}$  of a mile broad. The climate is healthy, and the soil fertile; producing good crops of oats, barley, pease, and potatoes. About 3000 bolls of barley, of 18 stones each, are produced annually. The population, in 1791, was 1370; increase 177, since 1755: the number of horses was about 500; sheep, 1800; and black cattle, 500. Relics of Pictish castles are to be seen in the parish; and a human skeleton of a *gigantic size* was found in one of them.

(2.) LOTH, a small river in the above parish, which rises in the adjacent mountains, and falls into the sea, a mile below the village of *Glen-Loth*; in a channel cut through a rock 20 feet high, by Lady Jane Gordon, countess of Sutherland. It is very rapid, and in high floods impassable. Salmon are occasionally taken in it.

(3.) LOTH, or LOATH. See LOATH.

LOTHAIRE, the name of a king of France, 2 emperors of Germany, and a king of Lorrain. See FRANCE, § 17, 20; and GERMANY, § 14, 15.

LOTHARINGIA, the ancient name of Lorrain, so called from the emperor Lothaire I. See FRANCE, § 17; and LORRAIN.

LOTHBURY, a town of Bucks, N. of Newport.

To LOT  
100

To LOATHE.  
e common to three counties  
ddington, Edinburgh, and  
therwise called EAST, MID.

LIANS. The total population of  
the three Lothians, as reported to Sir John Sin-  
clair, between 1790 and 1798, was 169,191 souls;  
and the total increase was 32,241, since 1755.

I. LOTHIAN, EAST, OR HADDINGTON-SHIRE,  
is bounded on the NW. by the Frith of Forth;  
on the E. by the German Sea; on the SE. by Ber-  
wickshire; and on the W. by the county of Edin-  
burgh. It extends about 25 miles from E. to W.  
and where broadest, nearly 15 from N. to S. The  
coast, advancing northward into the Frith, forms  
an irregular curve. This is one of the most fruit-  
ful counties in Scotland, producing great quanti-  
ties of wheat and all sorts of grain; and being  
well watered, and plentifully supplied with fish,  
fowl, fuel, and all the necessaries of life. It a-  
bounds with towns, villages, and farms, interper-  
sed with a great number of elegant houses belong-  
ing to persons of rank and fortune. For cultivat-  
ion, populousness, and fertility, this shire may  
vie with any tract of land in Great Britain. Be-  
sides the farming, which turns out to great ac-  
count, the people on the sea coast employ them-  
selves in the fishery, salt-making, and in foreign  
trade; and some of the more inland inhabitants  
engage in the linen and woollen manufactures.  
Lime-stone and coal are found in most parts of  
the country, and great numbers of sheep are fed  
on the hills of LAMERMUIR. The population of  
E. Lothian, between 1790 and 1798, was 28,966;  
and had decreased 743 since 1755.

II. LOTHIAN, MID, OR EDINBURGH-SHIRE, is  
about 35 miles long, but varies in its breadth in  
different places from 5 to 16 miles. It is bound-  
ed on the E. by East Lothian; on the S. by the  
county of Peebles; on the W. by that of Linlith-  
gow; and on the N. by part of West Lothian and  
the Frith of Forth. The aspect of the country is  
in general level and pleasant, interspersed with a  
few hills, that help to exhibit the agreeable pros-  
pects. It is well watered with rivers, and shaded  
with woods. It produces plenty of coal, lime-  
stone, a soft black marble, and some copper ore.  
The soil, naturally fertile, is finely cultivated, and  
yields as plentiful harvests of excellent wheat as  
are found in any part of Great Britain. The whole  
country is interspersed with grand houses and plan-  
tations, belonging to noblemen and gentlemen of  
fortune. The farmers are masters of agriculture;  
and wealthy in consequence of their skill, some of  
them paying 500 l. of yearly rent. The country  
is well inhabited, and contains a great number of  
towns and populous villages. Along the sea coast  
the people subsist by fishing, and traffic in coals  
and salt, &c. Those in the inland parts are em-  
ployed in farming, and some branches of the weav-  
ing manufacture. The sterility of this shire is  
in the gift of the crown; and Edinburgh is a  
county in itself. The population of Mid Lothian,  
between 1790 and 1798, amounted to 122,937;  
and had increased 32,241 since 1755.

III. LOTHIAN, WEST, OR DISTRICT-SHIRE,  
is bounded on the N. by the Frith of Forth; by  
the Almond, which divides it from Mid Lothian,

on the E. On the SW. it joins the coun-  
ty of Perth; and on the W. it is separated from  
shire by the Avon. Its form, though  
approaches to a parallelogram. It mea-  
sures NE. to SW. nearly 20 miles. Its breadth  
on the shore of the Frith, does not ex-  
ceed 10 miles. The country is pleasant and fertile,  
and abounds with corn, pasturage, coal, lime-stone,  
ore; and, in the reign of James VI. it had a  
silver mine. The population of West Lothian,  
between 1790 and 1798, amounted to 17,  
and had increased 741, since 1755.

LO-TIEN, a town of China, in Hou-

(1.) \* LOTION. *n. f.* *Uctio*, Latin;

—A *lotion* is a form of medicine composed  
of aqueous liquids, used to wash any part of the  
body. *Quincy*.—In *lotions* in women's cases, he  
uses portions of hellebore macerated in two  
water. *Arbitratot*.

(2.) A LOTION is, strictly speaking, su-  
perintending as beautifies the skin, by cleansing it  
of deformities which a disordered blood  
deposits upon it. Medicines of this kind, however  
the most part insignificant, and some-  
times dangerous; the only proper method of  
treating these disorders is, by administering such  
as tend to correct that morbid state of the  
constitution whence they arise.

(3.) LOTION, in pharmacy, denotes a  
preparation of medicines, by washing them in a  
liquid, either made very light, so as to touch  
only the dregs; or sharp, so as to penetrate  
in order to clear them of some salt, or  
spirit, as is done to antimony, precipi-  
tation, &c. or intended to take away  
the grossness or ill quality, or to communicate  
some.

LOTOPHAGI, in ancient geography  
the people of the Regio Syrtica, so called from  
living on the LOTUS; inhabiting between  
Syrtis, from the Cinyphus to the Triton;  
lotus was said to be a food so delicious, that  
strangers forget their native country.  
The wine was expressed from it which did not  
keep above ten days. (*Pliny*.) See MENISIX.

LO-TSE, a town of China, in Yun-

(1.) \* LOTTERY. *n. f.* *Lotteria*, Fr.

A game of chance; a sortilege; distributing  
prizes by chance; a play in which lots  
are drawn for prizes.—

Let high-sighted tyranny rage on,

Till each man drop by lottery.

—The *lottery* that he hath devised in the  
effects of gold, silver, and lead, will never  
be taken by any but who you shall rightly  
call Fortune, that with malicious joy

Does man, her slave, oppress,

Sillious and unconstant still,

Promotes, dignities, debauches in strife

And makes a way of life.

—Every warrior may be said to be a  
lottery, and the best commanders to have  
their own for their work. See *Lottery*.

(2.) The LOTTERY, or the STATE LOT-  
tery, a kind of public game, at hazard, frequented  
in, as well as France, and Holland, be-  
fore the late war, to raise money for the service of  
the State. It is appointed with us by the authority

sent, and managed by commissioners appointed by the lords of the treasury for that purpose. It consists of great numbers of blanks and prizes, which are drawn out of wheels, one of which contains the numbers, and the other the corresponding blanks or prizes. The Romans invented lotteries to enliven their Saturnalia. This festival began by the distribution of tickets which gained some prize. Augustus made lotteries which consisted of things of little value; but Nero established some for the people, in which 1000 tickets were distributed daily, and several of those who were favoured by Fortune got rich by them. Herodotus invented some very singular lotteries; the prizes were either of great value, or of none at all; one gained a prize of six slaves, and another of six slaves; some got valuable vases, and others vases of common earth. A lottery of this kind exhibited an excellent picture of the inequality with which Fortune distributes her favours. The first English lottery we find mentioned in history was drawn A. D. 1569. It consisted of 60,000 lots, at 10s. each lot: the prizes were great; and the profits were to go towards repairing the havens of this kingdom. It was drawn at the W. door of St Paul's cathedral. The drawing began on the 11th of January 1569, and continued incessantly drawing, *day and night*, till the 1st of May following; as Maitland, from Stowe, informs us in his History, Vol. I. p. 257. There were then only three lottery offices in London. The proposals for this lottery were published in 1567 and 1568. It was first intended to have been drawn at the house of Mr Dericke, her majesty's agent (*i. e.* her jeweller), but was afterwards drawn as above mentioned. Dr Rawlinson shows in the Antiquarian Society, in 1748, one of the original proposals for this state lottery, printed by Henry Bynneyman, in 1568. In 1612, king James, in favour of the plantation of English colonies in Virginia, granted a lottery, to be held at the W. end of St Paul's; whereof one Thomas Waply, a taylor of London, had the chief prize, which was 4000 crowns in plate. (*Baker's Chron.*)

(3.) LOTTERY OFFICES, LAWS RESPECTING. In the reign of queen Anne, it was thought necessary to suppress lotteries, as nuisances to the public. Since that time, however, they have been licensed by an act of parliament, under various regulations. The act passed in 1778 restrains any person from keeping an office for the sale of tickets, shares, or chances, or for buying, selling, or registering, without a licence; for which licence each office-keeper must pay 50l. to continue in force for one year, and the produce to be applied towards defraying the expences of the lottery. And no person is allowed to sell any share or chance less than a 16th, on the penalty of 50l. All tickets divided into shares or chances are to be deposited in an office, to be established in London by the commissioners of the treasury, who are to appoint a person to conduct the business thereof; and all shares are to be stamped by the said officer, who is to give a receipt for every ticket deposited with him. The numbers of all tickets so deposited are to be entered in a book

VOL. XIII. PART II.

of shares into which they are divided; and two pence for each share is to be paid to the officer on depositing such tickets, who is therewith to pay all expences incident to the office. All tickets deposited in the office are to remain there three days after the drawing. And any person keeping an office, or selling shares, or who shall publish any scheme for receiving moneys in consideration of any interest to be granted in any ticket in the said lottery, &c. without being in possession of such ticket, shall forfeit 500l. and suffer three months imprisonment. And no business is to be transacted at any of the offices after eight in the evening, except on the evening of the Saturday preceding the drawing. No person is to keep any office for the sale of tickets, &c. in Oxford or Cambridge, on penalty of 20l. Before this regulating statute took place, there were upwards of 400 lottery offices in and about London only; but the whole number afterwards, for all Britain, as appeared by the list published by authority, amounted to no more than 51.

(4.) LOTTERY, STATUTES AGAINST SALES BY. See GAMING, § 3.

(1.) LOTUS, or BIRD'S-FOOT TREFOIL, in botany, a genus of the decandria order, belonging to the diadelphica class of plants; and in the natural method ranking under the 3d order, *Papilionaceae*. The legumen is cylindrical and very erect; the axis closing upwards longitudinally; the calyx is tubulated. There are many species, but only 6 are usually cultivated in our gardens; viz.

1. LOTUS CRETICUS, the Cretan silvery lotus, hath a slender under shrubby stalk, rising by support 3 or 4 feet high, ornamented with trifoliate, bright, silvery leaves; and branches terminated by several yellow flowers succeeded by subternate pods.

2. LOTUS DORCYNIMUM, white Austrian lotus, or shrub trefoil of Montpellier, has under shrubby smooth stalks, branching 3 or 4 feet high, and the branches terminated by aphyllous heads of small white flowers appearing in June, succeeded by short pods.

3. LOTUS EDULIS, sends forth several trailing stalks about a foot long, furnished at their joints with trifoliate, roundish smooth leaves, having oval stipules. The flowers come singly from the sides of the stalks, on long peduncles, with 3 oval floral leaves, the length of the flower: the latter is small, yellow; and is succeeded by a thick arched pod, having a deep furrow on its outside. This species is an annual, and a native of Italy, where the pods are eaten, like kidney beans.

4. LOTUS HIRSUTUS, the hairy Italian lotus, hath upright hairy stalks branching a yard high; and terminated by heads of whitish hoary-cupped flowers, appearing in June, and succeeded by oval pods full of seed, which ripens in autumn.

5. LOTUS JACOBÆUS, the lotus of St James's Island, hath upright herbaceous stalks branching 2 or 3 feet high; and, from the upper part of the branches, long slender footstalks, terminated each by 3 or 5 yellowish purple flowers, appearing most part of the summer and autumn, and succeeded by subternate pods filled with plenty of seeds. These 5 species may be propagated either by seeds or cuttings,

H h h

tings, but require to be kept in pots in the greenhouse during winter.

6. **LOTUS TETRAGONOLOBUS**, or *the winged pea*, hath trailing, slender, branchy stalks, about a foot long, garnished with trifoliate oval leaves; and, from the axillas of the branches, large, papilionaceous red flowers, one on each footstalk; succeeded by tetragonous solitary pods, having a membranous wing or lobe running longitudinally at each corner. It flowers in June and July, and they ripen in autumn. It is a hardy annual, and is easily raised from seed sown between February and May; requiring only to be kept from weeds. It was formerly cultivated here as an esculent; for its young green seed-pods may be dressed and eat like peas, or kidney beans; and are used so still in the N. of England.

(II) **LOTUS**, the *Lote tree*. See **CELTIS**.

(III) **LOTUS**, **EGYPTIAN**. See **NYMPHÆA**, § II, N<sup>o</sup> 3.

(IV) **LOTUS**, **HONEY**. See **TRIFOLIUM**.

(V) **LOTUS**, **LIBYAN**. See **RHAMNUS**, N<sup>o</sup> 6.

(VI) **LOTUS** OF **HOMER**. See **DIOSPYROS**, N<sup>o</sup> 1.

**LOTZIN**, a town of Prussia, with a fort, seated on a canal, 56 miles SE. of Königsberg.

**LOVA**, a town of Hungary, 20 m. W. of Crot.

(1.) \* **LOVAGE**. *n. f.* [*Jewishicum*, Lat.] A plant.

(2.) **LOVAGE**, in botany. See **LIGUSTICUM**.

**LOVANDA**, a river of **LOANGO**.

**LOVANGIRI**, a province of **Loango**.

**LOUANS**, a town of France, in the dept. of Saone and Loire, on an island formed by the Seilles, Sallé, and Solnan. It has several manufactories, and lies 18 miles SE. of Chalons.

**LOVARD**, a town of Dorsetsh. in Piddleton.

(1.) **LOVAT**, a river of Russia, in Polotsk.

(2.) **LOVAT**, a town of Turkey, in Bulgaria.

**LOUBENS**, a town of France, in the dep. of Upper Garonne; 15 miles E. of Toulouse.

**LOUBIERE**, a town of Hispaniola.

\* **LOUD**. *adj.* 1. Noisy; striking the ear with great force.—

His prowess Philomelides confests'd,  
And loud acclaiming Greeks the victor blefs'd.  
*Popc.*

The numbers soft and clear,  
Gently steal upon the ear;  
Now *louder*, and yet *louder* rise,  
And fill with spreading sounds the skies. *Popc.*  
2. Clamorous; turbulent.—She is *loud* and stubborn. *Prov.*

**LOUDE**, a town of France in the dep. of the Upper Loire; 6 miles NW. of Puy en Velay.

\* **LOUDEAC**, a town of France in the dep. of North Coasts, 20 miles S. of St Brieux.

\* **LOUDLY**. *adv.* [from *loud*.] 1. Noisily; so as to be heard far.—

The soldier that philosopher well blam'd,  
Who long and *loudly* in the schools declaim'd.  
*Denham.*

2. Clamorously; with violence of voice.—I read above fifty pamphlets, written by as many presbyterian divines, *loudly* disclaiming toleration. *Saviff.*

\* **LOUDNESS**. *n. f.* [from *loud*.] 1. Noise; force of sound; turbulence; vehemence or fierceness of clamour.—Had any disaster made room for grief, it would have moved according to prudence, and the proportion of the provocation; it

would not have fallied out into complacency. *South.*

**LOUDOHN**, or } Gideon Ernest, I  
(1.) **LOUDON**, } See **LAUDOHN**.

(2.) **LOUDON**, a large township of fetts, in Berkshire county, comprehending acres, of which 2,944 are under lakes. About 124 miles W. of Boston.

(3.) **LOUDON**, a township of New England in Rockingham county, on the E. side of the river; containing 1084 citizens, in 1790.

(4.) **LOUDON**, a rich and fertile county in Virginia, bounded on the E. by the Potomac, by Fairfax, S. by Fauquier, and NW. by Loudoun counties; 50 miles long and 20 broad; contained 14,932 citizens, and 4,030 slaves. Leesburg is the capital.

(5.) **LOUDON**, a hill of Scotland in Ayrshire.

**LOUDOUN**, a parish of Ayrshire, from the above hill which stands in its NW. corner, 9 miles long from E. to W. and from 3 to 4 miles broad. The climate is rainy, but healthy.

The soil is a rich deep loam, improved by lime, inclosures, &c. into 1733, by John, Earl of Loudoun; who planted above a million of trees in it. There are oats, barley, and potatoes. About 1755, the population was 2,308; increase 814, since 1755: there are now 3,640 sheep.

**LOUDUN**, a town of France, in the dept. of Vienne, on an eminence between the Dives and the Dive; containing about 4,000 citizens. 17 E. Lat. 47. 2. N.

**LOUE**, a town of France, in the dept. of Sarthe, 15 miles W. of Mons.

(1.) \* **LOVE**. *n. f.* [from the verb.] A passion between the sexes.—

Hearken to the birds *love*-learned  
The dewie leaves among! *Spenser's*  
While idly I stood looking on,  
I found th' effect of *love* in idleness.  
My tales of *love* were wont to weep  
I know you joy not in a *love* discourse  
I look'd upon her with a soldier's  
That lik'd, but had a rougher task  
Than to drive liking to the name of *love*  
What need a vermil-tinctur'd lip  
*Love*-darting eyes, or tresses like the

*Love* quarrels off in pleasing conceits  
Not wedlock treachery, endang'ring  
—A *love* potion works more by the  
charm than nature. *Collier on Popularity*  
You know y' are in my pow'r by my

Let mutual joys our mutual trust  
And *love*, and *love*-born confidence

Cold is that breast which warm'd  
before,  
And these *love*-darting eyes must roll

2. Kindness; good-will; friendship.—  
What *love*, think'st thou, I sue for  
My *love* till death, my humble thanks, and

love which virtue begs, and virtue grants.

*Shakefp.*  
rought Daniel into favour and tender love  
prince. *Dan. i. 9.*—The one preach Christ  
ation, but the other of love. *Phil. i. 17.*  
s shall all men know that ye are my dis-  
ye have love one to another. *John, xiii. 35.*  
reared have we spent the nights,  
e Ledean stars, so fam'd for love,  
cr'd at us from above.

*Cowley.*  
Demetrius  
love to Nedar's daughter Helena,  
on her soul.

*Shak.*  
will marry make your loves to me,  
ly is bespoken.

*Shak.*  
quiry of truth, which is the love-making  
g of it; the knowledge of truth, the pre-  
f it; and the belief of truth, the enjoy-  
is the sovereign good of human nature.

*Issays.* 4. Tenderness; parental care.—  
on that ever was, so fully represents the  
of God, and his tender love to mankind,  
the most powerful argument to the  
God. *Tillotson.* 5. Liking; inclina-  
as, the love of one's country.—  
uth, of patrimonial wealth possist,  
ve of science faintly warm'd his breast.

*Fenton.*  
beloved.—  
the temple gates unto my Love. *Spens.*  
at the world and love were young,  
uth in every shepherd's tongue;  
pretty pleasures might me move,  
with thee, and be thy love. *Shakefp.*  
banish'd never hopes his love to see. *Dryd.*  
lover and the love of human kind. *Pope.*  
els.—

not lolling on a lewd love bed,  
his knees at meditation. *Shak. Rich. III.*  
onable liking.—The love to sin makes a  
against his own reason. *Taylor.*—Men in  
their own opinions may not only sup-  
is in question, but allege wrong matter  
ocke. 9. Fondness; concord.—

*Shakefp.*  
come unto you with a rod, or in love,  
spirit of meekness? *1 Cor. iv. 21.* 10.  
of union.—Love is the great instrument  
the bond and cement of society, the  
spring of the universe: love is such an  
s cannot so properly be said to be in the  
the soul to be in that; it is the whole  
it up into one desire. *South.* 11. Pic-  
representation of love.—

lovely babe was born with ev'ry grace:  
as his form as painters, when they show  
tmost art, on naked loves bestow. *Dryd.*  
'd of endearment.—  
so dishonour, trust me love, 'tis none;  
die for thee. *Dryden's Don Sebastian.*  
eference to God.—I know that you  
the love of God in you. *Jobn.*—Love is  
ts, of friendship and of desire; the one  
riends, the other betwixt lovers; the  
onal, the other a sensitive love: so our  
d consists of two parts, as esteeming of  
desiring of him. *Hammond.*—The love

of God makes a man chaste without the laborious  
arts of fasting, and exterior disciplines; he reach-  
es at glory without any other arms but those of  
love. *Taylor.* 14. A kind of thin silk stuff. *Inf-*  
*worth.*—This leaf held near the eye, and obverted  
to the light, appeared so full of pores, with such  
a transparency as that of a sieve, a piece of cy-  
press, or lovehood. *Boyle on Colours.*

(2.) LOVE, in a large sense of the word, denotes  
all those affections of the pleasing kind, which ob-  
jects and incidents raise in us.

(3.) LOVE, in its usual and more appropri-  
ate signification, may be defined, "that affec-  
tion which, being compounded of animal desire,  
esteem, and benevolence, becomes the bond of  
attachment and union between individuals of the  
different sexes; and makes them feel in the society  
of each other a species of happiness which they  
experience no where else." We call it an *affection*  
rather than a *passion*, because it involves a desire  
of the happiness of its object. In the savage state,  
and even in the first stages of refinement, the bond  
of union between the sexes seems to consist of no-  
thing more than mere animal desire and instinctive  
tenderness for their infant progeny. The former  
impels them to unite for the propagation of the  
species; and the latter preserves the union, till the  
children, who are the fruit of it, be able to pro-  
vide for their own subsistence. That in such uni-  
ons, whether casual or permanent, there is no  
mutual esteem and benevolence, is apparent from  
the state of subjection in which women are held  
in rude and uncultivated nations, as well as from  
the manner in which marriages are in such na-  
tions contracted. Sweetness of temper, a capital  
article with us in the female character, displays  
itself externally in mild looks and gentle manners,  
and is the first and perhaps the most powerful in-  
ducement to love in a cultivated mind. "But  
such graces (says the late Lord Kames, in his  
Sketches of the History of Man,) are scarce dis-  
cernible in a female savage; and even in the most  
polished woman would not be perceived by a  
male savage." Hence in the early ages of society  
a man purchased a woman to be his wife, as one  
purchases an ox or a sheep to be food; and valued  
her only as she contributed to his sensual gratifi-  
cation. Instances innumerable might be collected  
from every nation of which we are acquainted  
with the early history. The history of the patri-  
archal age recorded by Moses, affords several;  
(See Gen. xxi, xxix, &c.) and Homer's Iliad ab-  
ounds with them. The heroic Achilles, though  
susceptible of the purest friendship, when depriv-  
ed of his Briseis, complains only of his being rob-  
bed of his prize of war. His pride is offended, but  
his love seems not at all alarmed. Nor are the  
sentiments of Agamemnon one whit more refined,  
though Mr Pope and Mad. Dacier seem to think  
more favourably of him as a lover. Since then,  
it is evident, that in the heroic age of Greece e-  
ven princes and kings were strangers to the gen-  
erous affection of love, it cannot be surprising, that  
this affection has very little influence upon man-  
kind in the lowest ranks of the most polished so-  
cieties of modern Europe. That this is the case,  
that among the generality of uneducated men and  
women, there is little other bond of attachment  
than

than the sensual appetite, daily experience affords numberless proofs. We daily see youths, rejected by their mistresses, paying their addresses without delay to girls who, in looks, temper, and disposition, are diametrically opposite to those whom so lately they pretended to love; We daily see maidens, slighted by their lovers receiving the addresses of men, who, in nothing but their sex, resemble those to whom a week before they wished to be married; and it is not uncommon to find a girl entertaining several lovers together, that if one or more of them should prove false, she may still have a chance not to be totally deserted. Did esteem and benevolence, placed on manners and character, constitute any part of vulgar love, these people would act very differently; for they would find it impossible to change their lovers and their mistresses with the same ease that they change their cloaths. To this account of love, as it appears in savage nations, some may oppose the descriptions of the softer passion in the poems of OSSIAN. That bard describes the female character as commanding respect and esteem, and the Caledonian heroes as cherishing for their mistresses a flame so pure and elevated, as never was surpassed, and has seldom been equalled, in those ages which we commonly call most enlightened. This is indeed true; and it is one of the reasons which have induced Johnson and others to pronounce the whole a modern fiction. Into that debate we will not here enter. We may admit the authenticity of the poems, without acknowledging that they furnish any exception to our general theory. They furnish indeed in the manners which they describe a wonderful anomaly in the general history of man. All other nations of which we read were in the hunter state savage and cruel. The Caledonians, as exhibited by Ossian, are gentle and magnanimous. The heroes of Homer fought for plunder, and felt no clemency for a vanquished foe. The heroes of Ossian fought for fame; and when their enemies were subdued, they took them to their bosoms. The first of Greeks committed a mean insult on the dead body of the first of Trojans. Among the Caledonians insults offered to the dead, as well as cruelty to the living, were condemned as infamous. The heroes of Ossian appear in no instance as savages. How they came to be polished and refined before they were acquainted with the most useful arts of life, it is not our business to inquire; but since they unquestionably were so, their treatment of the female sex, instead of opposing, confirms our theory. Luxury indeed appears to be as inimical to love as barbarism; and in modern nations, the tender and exalted affection, which deserves that name, is as little known among the highest orders of life as among the lowest. Perhaps the Caledonian ladies of Ossian resembled in their manners the German ladies of Tacitus, who accompanied their husbands to the chase, fought by their sides in battle, and partook with them of every danger. If so, they could not fail to be respected by a race of heroes among whom courage took place of all other virtues: and this single circumstance, from whatever cause it proceeded, may sufficiently ac-

count for the estimation of the female character among the ancient Germans and Caledonians different from that in which it has been held by most every other barbarous nation. But entering farther into this subject, we then observe, that, a woman, whose disposition is gentle, delicate, and rather timid than bold, is possessed of a large share of sensibility and delicacy, and whose manners are soft and pleasing, must command the esteem and benevolence of every individual of the other sex who is possessed of sound understanding; but if her person is deformed, or not such as to excite some degree of animal desire, she will attract no man. In like manner, a man whose moral character is good, whose understanding is acute, and whose conversation is instructive, must command the esteem of every sensible and virtuous woman; if his figure be disagreeable, his manners ill, his habits slovenly, and above all, deficient in personal courage, he will hardly excite desire in the female breast. It is on the qualities which command esteem and benevolence in the female person, united with those which excite animal desire, that the individual so accomplished an object of love to one of the other sex, when these qualities are thus united, each increases the other in the imagination of the other. The beauty of his mistress gives her, by her person, a greater share of gentleness, and every thing which adorns the female character, than perhaps she really possesses; his persuasion of her internal worth makes her, on the other hand, apprehend her beauty absolutely unrivalled. The affection that is excited is more or less pure, and will be less permanent, according as the one or the other part of which it is compounded predominates. "Where desire of possession (says Lord Bolingbroke in his *Sketches*,) prevails over our esteem of the person and merits of the desirable object, love loses its benevolent character: the appetite for gratification becomes ungovernable, and tends to its end, regardless of the misery that it will procure. In that state love is no longer a sweet and agreeable affection; it becomes a selfish, painful, and insatiable passion, which, like hunger and thirst, produceth pain and distress but in the instant of fruition; as soon as fruition is over, disgust and aversion succeed to desire. On the other hand, esteem, founded on a virtuous character and noble manners, prevails over animal desire, and never would not for the world gratify himself at the expense of his mistress's honour or mind. He wishes, indeed, for enjoyment to him enjoyment is more exquisite than the mere sensual lover, because it unites itself with the gratification of sense; at the same time, so far from being succeeded by disgust and aversion, it increases his benevolence to her, whose character and manners he admires, and who has contributed so much to his happiness. Benevolence to an individual, having a certain end, admits of acts without number, and is not fully accomplished. Hence mutual affection, which is composed chiefly of esteem and benevolence, can hardly be of a shorter duration

ects. Frequent enjoyment endears such to each other, and makes constancy a pleasure when the days of sensual enjoyment are steem and benevolence will remain in the making sweet, even in old age, the society pair, in whom are collected the affections and, wife, lover, friend, the tenderest affections of human nature."—On the whole it is, that the affection between the sexes, deserves the name of LOVE, is inseparably tied with virtue and delicacy; that a man's morals cannot be a faithful or a generous one that in the breast of him who has ranged from woman for the mere gratification of sensual appetite, desire must have effaced them for the female character; and that, where, the maxim too generally received, a reformed rake makes the best husband, rarely seldom a chance to be true. We think likewise is inferred, that thousands fancy lives in love who know not what love is, or how it is generated in the human breast: and where we begin to advise such of our reason may imagine themselves to be in that state, mine their own minds, to discover, whether the objects of their love were old or ugly, could still esteem them for the virtues of character, and the propriety of their manner.

This is a question which deserves to be well considered by the young and the amorous, who, in making the matrimonial connection, are too fondly impelled by mere animal desire, inflammation, and beauty. "It may indeed happen, (says Lord Shaftesbury, in his *Elem. of Criticism*), after the pleasure gratifying that desire is gone (and if not by esteem and benevolence, go it must with respect to passion), that a new bond of attachment is formed upon more dignified and more rational principles; but this is a dangerous experiment."

Even supposing good sense, good temper, and internal worth of every sort, yet a attachment upon such qualifications is rare; because it commonly or rather almost never happens, that such qualifications, the foundation of an indissoluble connection, if they did not originally make esteem predominate, afterwards are rendered altogether ineffectual by satiety of enjoyment creating disgust."

**LOVE, EXTERNAL SYMPTOMS OF.** The symptoms produced by love, as a disease, according to medical writers, are as follow: The eyes twinkle; the eyes are hollow, and yet as if full with pleasure: the pulse is not altered to the passion, but the same with that attends solicitude and care. When the object of this affection is thought of, particularly if it is sudden, the spirits are confused, the senses change, and its force and time are very variable. In some instances, the person, is sad and melancholy; in others, the person not being conscious of his state, pines away, is slothful, and loses of food; though the wiser, when they themselves are in love, seek pleasant company and lively entertainments. As the force of love increases, sighs grow deeper; a tremor affects the face and pulse; the countenance alternately pale and red; the voice is suppressed in the fauces; the eyes grow dim; cold sweats break out; sleep ab-

sents itself, at least until the morning; the secretions become disturbed; and a loss of appetite, a hectic fever, melancholy, or perhaps madness, if not death, constitutes the sad catastrophe. On this subject the curious may consult *Agineta*, lib. iii. cap. 17. *Oribas. Synop.* lib. viii. cap. 9. or a treatise professedly written on love, as it is a distemper, by *James Ferrard*, Oxford, printed 1640.

(5.) **LOVE, SUPERSTITIOUS REMEDIES FOR.** The manners of the Greeks and Romans were similar to each other in the affairs of love. They generally made a discovery of their passion, by writing upon trees, walls, doors, &c. the name of their beloved. They usually decked the door of their dulcinea with flowers and garlands, made libations of wine before their houses, sprinkling the posts with the same liquor, as if the object of their affection was a real goddess. For a man's garland to be untied, and for a woman to compose a garland, were held to be indubitable indications of their love. When their love was without success, they used several arts to excite affection in the object of their desire. They had recourse to enchantresses, of whom the Thesalian were in the highest estimation.—The means made use of were most commonly philtres or love potions, the operation of which was violent and dangerous, and frequently deprived such as drank them of their reason. Some of the most remarkable ingredients of which they were composed were these: the hippocamane, the jynx, insects bred from putrefaction, the fish remora, the lizard, brains of a calf, the hairs on the tip of a wolf's tail, his secret parts, the bones of the left side of a toad eaten with ants, the blood of doves, bones of snakes, feathers of screech-owls, twisted cords of wool in which a person had hanged himself, rags, torches, reliques, a nest of swallows buried and famished in the earth, bones snatched from hungry bitches, the marrow of a boy famished in the midst of plenty, dried human liver; to these may be added several herbs growing out of putrid substances. Such were the ingredients that entered into the composition of that infernal draught a *love potion*. But, besides the philtres, various other arts were used to excite love, in which the application of certain substances was to have a magical influence on the person against whom they levelled their skill. A hyæna's udder worn under the left arm, they fancied would draw the affections of whatever woman they fixed their eyes upon. That species of olives called *olive*, and barley-bran made up into a paste, and thrown into the fire, they thought would excite the flame of love. Flour was used with the same intention. Burning laurel, and melting wax were supposed to have the like effect. When one heart was to be hardened, and another mollified, clay and wax were exposed to the same fire together. Images of wax were frequently used, representing the persons on whom they wished to make an impression; and whatever was done to the substitute of wax, they imagined was felt by the person represented. Enchanted medications were often sprinkled on some part of the house where the person resided. Love pledges were supposed to be of singular use and efficacy: these they placed under their threshold, to preserve the affections of the owner from wandering.

Love knots were of singular power, and the number three was particularly observed in all they did. But no good effect was expected, if the use of these things was not attended with charms or magical verses and forms of words. See MAGIC. The ancients imagined, that love excited by magic might be allayed by more powerful spells and medicaments; or by applying to demons more powerful than those who had been concerned in raising that passion. But love inspired without magic had no cure. The antidotes against love were generally *agnus castus*, which has the power of weakening the generative faculty; sprinkling the dust in which a mule had rolled herself; tying toads in the hide of a beast newly slain; and applying amulets of minerals or herbs, which were supposed of great efficacy in other cases; and invoking the assistance of the infernal deities. Another cure for love was bathing in the waters of the river Selennus; to which we may add as the most efficacious, the *lover's leap*, or jumping down from the Leucadian promontory. See LEUCATA.

\* To LOVE. *v. a.* [*lusjan*, Saxon.] 1. To regard with passionate affection, as that of one sex to the other.—

Good shepherd, tell this youth what 'tis to love.—

—It is to be made all of sighs and tears;  
It is to be made all of faith and service;  
It is to be made all of fantasy,  
All made of passion, and all made of wishes;  
All adoration, duty, and obedience;  
All humbleness, all patience, all impatience,  
All purity, all trial, all observance. *Shak.*

I could not love I'm sure

One who in love were wise. *Cowley.*

—The jealous man wishes himself a kind of deity to the person he loves; he would be the only employment of her thoughts. *Addison.* 2. To regard with the affection of a friend.—

None but his brethren he, and sisters, knew,  
Whom the kind youth prefer'd to me,  
And much above myself I lov'd them too.

*Cowley.*

3. To regard with parental tenderness.—He that loveth me shall be loved of my father, and I will love him. *John.* 4. To be pleased with.—We see that salmon and smelts love to get into rivers, though against the stream. *Bacon.*—

Wit, eloquence, and poetry,

Arts which I lov'd.

*Cowley.*

He lov'd my worthless rhimes, and, like a friend,

Would find out something to commend. *Cowley.*

5. To regard with reverent unwillingness to offend—Love the Lord thy God with all thine heart. *Deut. vi. 5.*

(1.) \* LOVEAPPLE. *n. f.* A plant. *Miller.*

(2.) LOVE-APPLE. See SOLANUM, N<sup>o</sup> 3.

\* LOVEKNOT. *n. f.* [*love* and *knot.*] A complicated figure, by which affection interchanged is figured.

LOVELACE, Richard, M. A. son of Sir Wm. Lovelace, an English poet, born at Kent in 1618, and educated at Oxford. He was a zealous royalist, and suffered much for his attachment to Charles I. His poems are elegant; and he wrote

also 2 plays; viz. The scholar, a Comedie, and The Soldier, a Tragedy. He died in 1658.

\* LOVELETTER. *n. f.* [*love* and *letter.*] A letter of courtship.—Have I escap'd *lovelet* hollyday time of my beauty, and am I not for them? *Shak.*—The children are of the different notions of their parents follow the father, while the daughters follow the mother, and romances to their mother.

\* LOVELILY. *adv.* [*from lovely.*] In such a manner as to excite love.—

Thou look'st

Lovely, dreadful

\* LOVELINESS. *n. f.* [*from lovely.*] A quality of mind or body that carries in one person the only of good will *loveliness* and lovingness.

When I approach

Her *loveliness*, so absolute she seems,  
That what she wills to do, or say,

Seems wisest, virtuous, best, discreetest,  
—If there is such a native *loveliness* in it to make them victorious when they are on the side of truth? *Addison.*

\* LOVELORN. *adj.* [*love* and *lorn.*] Of one's love.—

The *love-lorn* nightingale,

Nightly to thee her sad song mourns

\* LOVELY. *adj.* [*from love.*] Am citing love.—

The breast of Hecuba,

When she did suckle Hector, look'd

lier

Than Hector's forehead.

—Saul and Jonathan were lovely and p their lives, and in their death they were

vided. 2 *Sam.*—  
The flowers which it had press'd

Appared to my view,

More fresh and lovely than the rest.

That in the meadows grew.

—The Christian religion gives us a m character of God than any religion ever

lotson.—

The fair

With cleanly powder dry their hair;

And round their lovely breast and hea

Fresh flow'rs their mingl'd odours sha

\* LOVEMONGER. *n. f.* [*love* and *monger.*] who deals in affairs of love.—

Thou art an old *lovenonger*, and spe fully.

LOVENDEGEN, a fort of the French, in the dep. of the Scheldt, and late Austrian Flanders; on the Canal between Bruges; 5 miles W. of Ghent. *Lat. 51. 0. N.*

LOVENTINUM, or LUENTINUM, in geography, a town of the Demeta in Brit the mouth of the Tuerobis, or Tivy; to have been afterwards swallowed u earthquake, and to have stood where the led *Lin Sarutan* in Brecknockshire, now

\* LOVER. *n. f.* [*from love.*] 1. One in love.—

s blind, and *lovers* cannot see  
 ty follies that themselves commit. *Sbak.*  
 be never said, that he whose breaſt  
 with love, ſhould break a *lovers* reſt.

*Dryd.*  
 ; one who regards with kindneſs.—  
 rother and his *lover* have embrac'd.

*Sbak.*  
 I tell thee, fellow,  
 ral is my *lover*. *Sbak.*  
 o likes any thing.—To be good and  
 nd a *lover* of knowledge, are amiable  
 net.

ANO, a town of Naples in the prov.  
 ; 5 miles NE. of Nardò.

LEAP. See LEUCATA.  
 TON, a river of Maritime Auftria, in  
 e of the Vicentino.

ECRET. *n. f.* [*love* and *secret*.] Secret  
 vers.—

danger, Arimant, is this you fear?  
*love* secret which I muſt not hear. *Dryd.*

ICK. *adj.* [*love* and *sick*.] Disordered  
 languishing with amorous deſire.—

1 the ſhore inhabits purple ſpring,  
 ghtingales their *loveſick* ditty ſing. *Dryd.*

1 dear miſtreſs of my *loveſick* mind,  
 1 a pretty preſent has deſign'd. *Dryd.*

1 reliefs to eaſe a *loveſick* mind,  
 eſcribes deſpair. *Granville.*

OME. *adj.* [from *love*.] Lovely. A word

Nothing new can ſpring  
 thy warmth, without thy influence

iful or *lovesome* can appear. *Dryden.*

ONG. *n. f.* [*love* and *song*.] Song expreſſ-  
 Poor Romeo is already dead! Stabb'd  
 e wench's black eye, run through the

*loveſong*. *Sbak.*—  
 ig weeds and fatyrick thorns are grown,  
 eds of better arts were early ſown.

*Donne.*  
 UIT. *n. f.* [*love* and *suit*.] Courtſhip.—  
*eſuit* hath been to me

l as a ſiege. *Sbak.*

ALE. *n. f.* [*love* and *tale*.] Narrative

The *lovetale*  
 ſion's daughters with like heat. *Milt.*

a proper perſon to entruſt  
 with. *Addiſon.*

HOUGHT. *n. f.* [*love* and *thought*.] A-  
 cy.—

to ſweet beds of flowers,  
 e beds lie rich when canopied with bow-  
*Sbak.*

OY. [*love* and *toy*.] Small preſents given  
 Has this amorous gentleman preſent-  
 with any *lovetoy*s, ſuch as gold ſnuff-  
*tabinet*.

RICK. *n. f.* [*love* and *trick*.] Art of ex-  
 —

diſports than dancing jollities;  
 e tricks than glancing with the eyes.

*Donne.*  
 H. *n. f.* [*loch*, Irith, a lake.] A lake;  
 nd ſtanding water

A people near the northern pole that wot,  
 Whom Ireland ſent from *loughs* and forests  
 hore,

Divided far by ſea from Europe's ſhore. *Fairf.*  
 —*Lough* Neſs never freezes. *Philoph. Tranſact.*

LOUGH-AGHREE, a lake of Ireland, in Down  
 county, 4 miles ESE. of Dromore.

LOUGH-ALLEN, a lake of Ireland, in the coun-  
 ty of Leitrim, above 30 miles in circumference,  
 and ſurrounded by high mountains.

LOUGH-ALLUA, a lake in Cork, Munſter.

LOUGH-ARROW, a lake, in Sligo, Connaught.

LOUGHBOROUGH, a town of England, in Lei-  
 ceſterſhire, the 2d in the county. In the time of  
 the Saxons it was a royal village. Its market is  
 on Thurſday, and its fairs are on Apr. 25th, May  
 28th, Aug. 1ſt, and Nov. 2d. It has a large church,  
 a free ſchool, and 2 charity ſchools for 80 boys,  
 and 20 girls. It has been much reduced by fires,  
 but is ſtill a very agreeable town, and is ſeated  
 on the Foſſe, which runs almoſt parallel with the  
 Soar. The new canal has made its coal trade  
 very extenſive. It is 18 miles N. of Leiceſter,  
 and 109 NW. by W. of London. Lon. 1. 10. W.  
 Lat. 52. 48. N.

(1.) LOUGH-BRICKLAND, a lake of Ireland, in  
 the county of Down, abounding with *ſpeckled*  
*trouts*, which the name implies in the Iriſh.

(2.) LOUGH-BRICKLAND, a poſt town of Ire-  
 land, near the lake (Nº 1.) 58 miles from Dub-  
 lin. It conſiſts of one broad ſtreet, at the end of  
 which is the pariſh church, built by Bp. Taylor,  
 ſoon after the Reſtoration. The linen manufac-  
 ture is carried on very extenſively; and the town  
 is a great thoroughfare, the turnpike road from  
 Dublin to Belfast paſſing near it. It has 5 fairs.

LOUGH-COIN. See LOUGH-STRANGFORD.

LOUGH-COON, a lake of Ireland, in Mayo.

LOUGH-CORRIB. See CORRIB.

LOUGH-CURRAN. See CURRAN, Nº 3.

(1.) LOUGH-DERG, a lake of Ireland, in Done-  
 gal, anciently called *Derg-abbán*, i. e. *the river of*  
*the woody morafs*, from a river which iſſues out  
 of this lake. It is famous for an iſland that con-  
 tains St Patrick's purgatory, which is a narrow  
 little cell, hewn out of the ſolid rock, in which a  
 man could ſcarce ſtand upright.

(2.) LOUGH-DERG, a lake of Ireland, between  
 the counties of Galway and Tipperary.

LOUGH-DIAN, a lake in Down county, Ulſter.

LOUGH-DRINE, a lake in Cork, Munſter.

LOUGH-EARNE, a great lake of Ireland, in the  
 county of Fermanagh, near 20 miles in length,  
 and in ſome places 14 in breadth, diverſified with  
 upwards of 300 iſlands, moſt of them well wood-  
 ed, inhabited, and covered with cattle. It a-  
 bounds with great variety of fiſh; ſuch as huge  
 pikes, large breams, roaches, eels, trouts, and ſal-  
 mon. The water of the lake in ſome places is  
 ſaid to have a particular ſoftneſs and ſlimineſs,  
 that bleaches linen much ſooner than could be  
 done by other water. The lake is divided into  
 the Upper and Lower, between which it contracts  
 itſelf for 5 or 6 miles to the breadth of an ordinary  
 river.

LOUGH-ERIN, a lake in Down county, in ſome  
 places above 16 fathoms deep, producing very  
 large pikes, trouts, eels, &c.

(1.) LOUGH-

(1.) **LOUGH** is a lake in Down, Ulster.  
 (2.) **LOUGH** is, See **ESK**, N<sup>o</sup> 4.  
**LOUGH-F** is a lake of Ireland, in Down.  
**LOUGH-FULLA**, a large lake or gulf of Londonderry, before the mouth of which is a great sand bank called *the Towns*, which, however, does not obstruct the navigation, as there are 15 fathoms of water in the channel. See **LONDONDERRY**, N<sup>o</sup> 1.  
**LOUGH-GARA**. See **GARA**.  
**LOUGH-GILL**, two lakes, in Sligo and Antrim.  
**LOUGH-GUIR**, a lake of Limerick, Munster.  
**LOUGH-HINE**, a lake in Cork, 2 miles in circumference; abounding with salmon, white trouts, crabs, lobsters, efcalops, oysters, &c.  
**LOUGH-INCHQUIN**, a lake in Clare county, Munster; affording delicious fish and fine prospects.  
**LOUGH-INNY**, a lake in W. Meath, Leinster.  
**LOUGH-KAY**, a beautiful lake of Ireland, in Leitrim, Connaught, interspersed with islands, some containing old castles and ruins, and some of them highly cultivated.  
**LOUGH-KERNAN**, a lake in Down, Ulster.  
**LOUGH-LANE**, a lake in W. Meath, Leinster.  
**LOUGH-LEAN**. See **KILLARNEY**, N<sup>o</sup> 2.  
**LOUGH-LEE**, or **Lough-Curran**, an oval lake in Cork, 3 miles long and 1½ broad, containing 3 islands and abounding with salmon and trouts.  
**LOUGH-LIN**, a town in Roscommon.  
**LOUGH-LOUGHAIL**, a lake of W. Meath, 3 m. long, one broad, and containing 5 islands, planted with trees, and cultivated.  
**LOUGH-MACNEAN**, a lake in Cavan, Ulster, containing 3 well cultivated islands.  
**LOUGH-MAGHAN**, a lake in Down, Ulster, covering 23 acres, and stored with fish.  
**LOUGH-MORE**, a large lake in Limerick.  
**LOUGH-NEAGH**, an extensive lake of Ireland, in the counties of Armagh, Down, Derry, and Antrim. It is the largest in Europe, those of Ladoga and Onega in Russia, and that of Geneva in Switzerland, excepted; being 20 miles long and 16 broad. The area is computed to be 100,000 acres. It is remarkable for a healing virtue; and for petrifying wood, which is not only found in the water but in the adjacent soil at a considerable depth. On its shores several beautiful gems have been discovered. Its ancient name was *Loch-neacha* or *Loch-Neach*, from *loch* and *Neach*, *avondorf*, *divine*, or *eminent*. Its petrifying powers are not instantaneous, as several of the ancients have supposed, but require a long series of ages to bring them to perfection, and appear to be occasioned by a fine mud or sand, which insinuates itself into the pores of the wood, and which in process of time becomes hard like stone. On the borders of this lake is Shane's castle, the ancient seat of the Rt. Hon. John O'Neil. Dr Smyth seems to doubt whether the healing quantity in this lake is not to be confined to one side of it, called the *fishing bark*; and he informs us, that this virtue was discovered in the reign of Charles II. in the instance of the son of one Mr Cunningham, who had an *evil* which run on him in 8 or 10 places; and after all application seemed in vain, was perfectly healed, by bathing in this lake about 8 days. Hence that writer gives another

derivation of the name *Lochneach*, which seems to hint at this quality; *Neagh*, Irish signifying a sore or ulcer, which corrupted into *Neagh*: hence he apprehends this lake was remarked at a much earlier for its healing property. As to its power it is mentioned by Nennius a w 9th century, who says, *Est aliud flugnum, cui ligna durascere in lapides. Homines dum ligna, et postquam formaverunt, flugnum, et manent in eo usque ad caput capite anni lapis invenitur, et vocatur flug Ecbach.*

**LOUGH-RAMOR**, a lake of Ireland, near Virginia, about 40 miles from I has several islands, with ruinous forts.

**LOUGH-REA**, a town and lake in C miles SW. of Galway, and 86 from D

**LOUGH-REE**, a spacious lake be counties of Langford and Roscommon by the Shannon, and containing several

**LOUGH-RIGG**, a town of England morland, near Rydal, with which it cates by a bridge.

**LOUGH-SALT**, a lake of Ireland, is on a mountain, between Kilmacrenan Inn.

**LOUGH-SCUDY**, a lake of W. Meath

**LOUGH-SHARK**, a lake in Down, 80

**LOUGH-SHELLIN**, a large lake in W one mile from Dairy's Bridge, conn Lough-Inny at Finae.

**LOUGH-SKY**, a lake of Mayo, Com

**LOUGH-STRANGFORD**, a lake of Ire county of Down, so named from the of STRANGFORD, on the W. side of into the sea. It was formerly name COIN, or LOUGH-COYNE. (See **DOWN**;) is a deep bay, about 17 miles long, and 5 broad; stretching W. to Downpatrick Comber and Newton, and covering 2 Irish. It abounds with excellent fish; but there is a herring fishery about Anbar or entrance is about 3 miles below ford; and has a long rock in the neck passage, dangerous on account of it though there is a broad passage on e and deep water. The current is very rapid, running at the rate of 6 or 7 mile Few vessels go higher up than Strang islands in this lake are numerous; Dr merated 260. From an actual survey, Dr Dr Smyth wrote his history, it appears 54 islands known by particular names, more nameless; these 54 islands cor acres. The great manufacture carried islands, and on the coasts of the lake which employs a number of hands, and computed to produce to the propriet 1000l. a-year clear profit. Four of the called SWAN ISLANDS, from the number that frequent them.

**LOUGH-SWILLY**, a lake in Louth, I

**LOUGHTON**, the name of 3 English in Bucks, Devonshire, Essex, and 2 in

**LOUGNON**, a river of France, w into the Seine, at Pentarlier.

**LOUHANS**. See **LOUANS**.

**IBOND**, Edward, Esq. an English poet, Middlesex, and educated at Kingston upon . He wrote several esteemed Poems, which lected and published in one volume, in and several Essays in the Periodical Paper, *the World*. He died at his seat near Hamp- 775.

**IGNANO**, a town of Naples, in the pro- Otranto; 12 miles SSW. of Brindisi.

**VING**. *particip. adj.* [from *love*.] *t.* Kind; late.—

So *loving* to my mother,  
he would not let ev'n the winds of heav'n  
her face too roughly. *Shak. Hamlet.*

arl was of great courage, and much loved  
ldiers, to whom he was no less *loving* a-  
2790. 2. Expressing kindness.—The king  
r in his arms till she came to herself, and  
ed her with loving words. *Essh. xv. 8.*

**VINGKINDNESS**, *n. f.* Tenderness; fan-  
ercy. A scriptural word.—Remember,  
, thy *lovingkindnesses*. *Psaln, xxv. 6.*—He  
pted the arguments of obedience to the  
tion of our understanding, requiring us to  
him only under the amiable attributes of  
s and *lovingkindness*, and to adore him as  
id and patron. *Rogers.*

**VINGLY**. *adv.* [from *loving*.] Affection-  
rith kindness.—The new king, having no  
*gly* performed all duties to him dead than  
rised on the sledge of his unnatural bro-  
much for the revenge of his father, as for  
lishing of his own quiet. *Sidney*.—It is no  
utter to live *lovingly* with good-natured  
k persons; but he that can do so with  
ard and perverse, he only hath true cha-  
lor.

**VINGNESS**. *n. f.* [from *loving*.] Kind-  
ction.—Carrying thus in one person the  
bands of goodwill, loveliness and *loving-*  
107.

**NGTON**, a town of Hampshire.

**LOUIS**, the French name for *Lewis*. See  
N° 1—27. It is astonishing how general  
ice has of late become, among modern  
uthors, of writing *Louis* instead of *Lewis*,

English name was *obsolete*. This and  
ilar pieces of affectation are the more ri-  
that at least 99 out of every 100 English  
an neither read nor *pronounce* properly  
ds as *Louis*, *Jean*, &c. (See *CI-DEVANT*.)

*antry* might be pardonable in the com-  
Newspaper, who, in the hurry of trans-  
r the press and the post, might *copy* the  
ames by mistake, instead of *translating*  
ut when we find such respectable writers  
*utkins* following the example of the News-  
s, and inserting in his *Biographical Dict.*  
of the whole 16 *Lewises* of France, and 9  
any, Hungary, Poland, &c. under **LOUIS**,  
so much as a single reference from the old  
ame **LEWIS**, it looks as if our literati  
mbined in a conspiracy with those of  
o explode the English language. What  
thought of a French author, who should  
at Paris, a *History of France*, or a *Bio-*  
*Dictionary*, in the *French Language*, and  
f *Louis* insert the English name **LEWIS**  
KILL. PART II.

throughout his work?—If the celebrated but un-  
fortunate Brissot was accused of a degree of *An-*  
*glo-mania*, for only inserting the English letter *W*  
instead of *Ou* in his French title of *Onarville*,  
(which it is said he did, from his fondness for  
*English liberty*.) what degree of **GALLOMANIA**  
may not those English authors be accused of, who  
daily pester us with French words, names, and  
phrases, while our own language is abundantly  
copious, and almost as much preferable to the  
French, as our laws, liberties, religion, and con-  
stitution, are to those of that nation? See **LAN-**  
**GUAGE**, *SECT. V.* and *VI.*

(2.) **LOUIS**, JOHN. See **LOUVS**.

(3.)\* **LOUIS D'OR**. *n. f.* [Fr.] A golden coin of  
France, valued at about twenty shillings.—If he  
is desired to change a *louis d'or*, he must consider  
of it. *Spectator*.

(4.) **The Louis D'OR**, or *Lewidore*, was first  
struck in 1640, under Lewis XIII. and had long a  
considerable currency, before the revolution. See  
**MONEY**.

(5.) **LOUIS, FORT**, a French settlement near the  
mouth of the Coza in Florida, 60 miles NE. of the  
mouth of the Mississippi. It was the residence of  
the governor of Louisiana, till the peace in 1763.

(6.) **LOUIS, KNIGHTS OF ST**, a ci-devant mili-  
tary order in France, instituted by Lewis XIV. in  
1693. Their colours were of a flame colour, and  
passed from left to right; the king was their grand  
master. There were in it 8 great crosses, and 24  
commanders; the number of knights was not li-  
mited. At their institution, the king charged his  
revenue with a fund of 300,000 livres for the pen-  
sions of the commanders and knights.

(7.) **LOUIS, ST**, an island on the W. coast of  
Africa, at the mouth of the Senegal, with a fort.  
It was ceded to the British at the peace in 1763;  
but retaken by the French during the American  
war, and ceded to them by the peace of 1783.  
Lon. 15. 35. W. Lat. 16. 0. N.

(8.) **LOUIS, ST**, a lake of Canada. Lon. 73. 40.  
W. Lat. 45. 25. N.

(9.) **LOUIS, ST**, a sea port town of Hispaniola,  
on the S. coast; 220 miles W. of St Domingo.

(10.) **LOUIS, ST**, a town of Louisiana, on the  
W. coast of the Mississippi. Lon. 90. 50. W.

(11.) **LOUIS, ST**, the capital of Grande Terre,  
in Guadeloupe; with a fort; 9 miles SE. of Salt  
River.

(12.) **LOUIS, ST**, a Spanish town on the W. side  
of the Mississippi, 13 miles below the mouth of the  
Missouri. It is under a Spanish commandant, but  
the inhabitants are chiefly French, who have had  
a liberal education, and, by conciliating the af-  
fections of the natives, have drawn all the Indian  
trade of the Missouri to the town. It consists of  
above 220 large stone houses, and above 800 inha-  
bitants, who have large flocks of cattle, &c. It  
is 5 miles N. by W. of Cahokia, and 150 W. by  
S. of St Vincents, on the Wabash.

(13.) **LOUIS, ST, DE MARANHAM**, a town on  
the N. coast of Brazil.

(1.) **LOUISA**, a sea port of Sweden, on the N.  
coast of the Gulf of Finland, built in 1745.

(2.) **LOUISA**, a county of Virginia, 35 miles  
long, and 20 broad; bounded on the N. by O-  
range, NE. by Spottsylvania, SE. by Goochland,  
SW.

by Fluvanna, and W. by Albemarle counties. It contained 3,894 citizens, and 4,573 slaves, in 1790.

LOUISA, a river of Virginia, which runs into the Cole, a SW. branch of the Great Kan-

LOUISBOURG, } the capital of Cape Breton.  
LOUISBURG, or } It has an excellent harbour, near 12 miles in circumference. It was taken by the British in 1745; restored by the treaty of Aix-la-Chapelle, in 1748; retaken by the British in 1758; and ceded to them in 1763, when the fortifications were rased. (See BRETON, CAPE, § 2, 3.) Lon. 59. 48. W. Lat. 45. 54. N.

LOUISIANA, a country of North America, bounded on the S. by the gulph of Mexico, on the E. by the Mississippi, on the W. by New Mexico, and on the N. by an unknown country. It extends from 29° to 40° Lat. N. and from about the 80° to 96° or 97° Lon. W. of London. The climate varies according to the latitudes. The southern parts are not so hot as those parts of Africa which lie under the same parallel, and the northern parts are colder than the countries of Europe at the same distance from the pole: the causes of which are supposed to be the thick forests which over-run the country, and the great number of rivers; the former preventing the sun from heating the earth, and the latter supplying it with moist vapours; besides the cold winds which come from the north over vast tracts of land. They have bad weather; but it never lasts long, for the rain generally falls in storms and sudden showers; the air is wholesome, the inhabitants healthy, and they who are temperate live to a great old age. The country is extremely well watered; and almost all the rivers that run through it fall into the Mississippi.

(1.) LOUISVILLE, a town of Georgia, on the NE. bank of the Great Ogeechee, 45 miles SW. of Augusta. Lon. 82. 42. W. Lat. 32. 55. N.

(2.) LOUISVILLE, a town of Kentucky, capital of Jefferson county, on the S. bank of the Ohio, at the rapids; 70 miles W. of Lexington. Lon. 86. 6. W. Lat. 38. 4. N.

LOUTZ, a town of Poland, in the palat. of Rava 44 m. E. of Gueda. Lon. 19 o. E. Lat. 52. 26. N.

LOU-KIEN, a river of China, in Chen-fi.

LOULAY, a town of France, in the dep. of Lower Charente, 6 miles N. of St Jean d'Angely.

LOULI, a town and river of Portugal, in Algarve; with a castle, in hospital, and about 4,200 inhabitants. 9 miles N. of Faro.

LOUNG, LOCH. See LOCH-LONG.

LOUNGAN, a city of China, of the first rank, in the prov. of Chan-li, 267 miles SSW. of Pekin. Lon. 130. 20. E. of Ferro. Lat. 36. 42. N.

\* To LOUNGE. v. n. [Landeron, Dutch.] To idle; to live lazily.

\* LOUNGER. n. s. [from lounge.] An idler.

(1.) LOUP, a river of Canada, which runs into the St Lawrence, 90 miles below Quebec.

(2.) LOUP, ST, a town of France, in the dep. of the Two Sevres; 9 miles NNE. of Partenay.

(3.) LOUP, ST, a town of France, in the dep. of the Upper Saone; 6 miles NW. of Luxeuil.

(4.) LOUP, ST DE SALLE, a town of France, in the dep. of Saone and Loire; 11 m. N. of Chalon.

LOUPPE, a town of France, in the dep. of Eure and Loire; 18 miles W. of Chartres.

LOURDE, a town of France, in the dep. of the Upper Pyrenees, and late prov. of Bigorre, with an ancient castle on a rock, 6 miles S. of Argeliez, and 10½ S. of Tarbe. Lon. o. Lat. 43. 8. N.

LOUREZA, a town of Spain, in Galicia.

LOUROUX, a town of France, in the dep. of Indre and Loire, 9 miles NW. of Loches, and 8 S. of Tours.

LOUROZA, a town of Portugal, in Beira.

LOURY, a town of France, in the dep. of Loiret; 9 miles NE. of Orleans.

(1.) \* LOUSE. n. s. plural lice. [Lus, Saxon Dutch.] A small animal, of which different species live on the bodies of men, beasts, and birds of all living creatures.—There were lice on man and beast. Exod. viii. 18.—

Frogs, lice, and flies, must all his path  
With loath'd intrusion.

—It is beyond even an atheist's credulity a pudence to affirm, that the first men might proceed out of the tumours of trees, as maggot flies are supposed to do now, or might grow on trees; or perhaps might be the lice of some enormous animals, whose species is now extinct.—Not that I value the money the fourth the skip of a louse. Swift.

(2.) LOUSE, in zoology. See PEDICULARIS.

\* To LOUSE. v. n. [from the noun.] To be troubled with lice.—As for all other good women love to do but little work, how handsome louse themselves in the sunshine, they that had but a while in Ireland can well witness. Swift.

You sat and lous'd him all the sun-shine

(1.) \* LOUSEWORT. n. s. The name of a plant called also rattle and cock's comb.

(2.) LOUSEWORT. See PEDICULARIS.

\* LOUSILY. adv. [from louse.] In a mean, and scurvy way.

\* LOUSINESS. n. s. [from lousy.] The abounding with lice.

(1.) \* LOUSY. adj. [from louse.] 1. Swarming with lice; over-run with lice.—

Let him be daub'd with lice, live he where,

Sometimes be lousy, but be never poor.

—Sweetbair and gooseberry are only lousy

times, or very hot places. Mortimer. 2.

low born, bred on the dunghill.—I pray y

remembrance on the lousy knave mine li

lousy knave, to have his gibes and his mo

Snake'sp.

(2.) LOUSY DISEASE. See MEDICINE.

\* LOUPE. n. s. [Loope, old Dutch.] A mean awkward fellow; a clown.—A plain noble heart doth disdain, that the trust of the is repaid in such a loupe's hands, had show an obedience, taken on shepherdis. Subv.

This loupe, as he exceeds our lords, t

Is, that we scarce are men, and you ar

Tis no trusting to you foolish loupe.

s wail'd the *louts* in melancholy strain.  
*Gay's Past.*

To *LOUT*. *v. n.* [*blutan*, to bend, Saxon.]  
 obedience; to bend; to bow; to stoop.

It was used in a good sense.—  
 The knight saluted, *louting* low,  
 And him quitted, as that courteous was.

*Spenser.*  
 The sand bag he was seen,  
 Low, like a for'ster green.

*Ben Jonson.*  
 Palmer, grey with age, with count'nance  
 Using low,

And ev'n to the earth before the king did  
 bow.

*Drayton.*  
 To *LOUT*. *v. a.* This word seems in  
 re to signify, to overpower.—

*Shak.*  
 I louted by a traitor villain,  
 And not help the noble chevalier.

*LOUTH*, a town of Lincolnsh. one of the  
 most gayest in the country, having num-  
 erous assemblies, concerts, &c. but even  
 des. It contains about 4000 inhabitants;  
 a canal to the sea at Tilney, about 8 m.  
 A charity school for 40 children; and a free  
 school founded by Edward VI, with a large  
 and a fine steeple, 288 feet high. It has  
 on Wed. and Sat. and fairs on May 24th,  
 16th. It is 28 miles NE. of Lincoln,  
 N. of London. Lon. o. 10. E. Lat. 53.

*LOUTH*, a county in the E. part of Ireland,  
 in the form of a half-moon, on the side  
 of the sea, being much longer than it is broad.  
 It is bounded on the S. and SW. by the county  
 of Wick, on the NW. by Monaghan, on the  
 N. by the bay of Carlingford, and on the NE.  
 by the bay of Carlingford, which separates it  
 from the county of Wick. It is watered by  
 several small rivers which fall into the sea,  
 and on its S. frontiers by the river Liffey.  
 Its chief towns are Dundalk and Carlingford.  
 Besides we include Drogheda, a part  
 of this county. It is the smallest coun-  
 ty in Ireland, but very fertile; and abounds  
 with remains of antiquities, of which Mr  
 Jones has *Louthiana*, has given a very ample  
 account. It contains 111,180 Irish plantation  
 acres, 5 baronies, and 5 boroughs; and  
 12 members to the Imperial parliament. It  
 is 22 miles long and 14 broad.

*LOUTH*, a town in the above county, with  
 12 miles from Dundalk, and 19 N. by W.  
 from Drogheda.

*LOUTISH*. *adj.* [from *lout*.] Clownish;  
 y.—This *loutish* clown is such, that you  
 may see so ill-favoured a visar; his behaviour  
 is such that he is beyond the degree of ridiculous.

*LOUTISHLY*. *adv.* [from *lout*.] With the  
 same signification as the *loutish*.

*ZOVA*, a town of Russia, in Irkutsk.

*LOUAIN*, a city of the French republic, in  
 the prov. of Dyle, and ci-devant prov. of Austrian  
 Flanders, pleasantly seated on the Dyle, in a fer-  
 ry. The walls are 9 miles in circum-  
 ference, not above a third part of the ground  
 on which they stand being laid out in gardens,  
 vineyards. The castle stands on a high  
 mound surrounded with fine gardens, and has a

charming prospect all over the country. The  
 town contains 9 market places, 14 water mills,  
 126 streets, 16 stone bridges, and several hand-  
 some palaces. The town-house is a venerable old  
 building, adorned with statues on the outside;  
 and the churches are very handsome, particularly  
 the collegiate church of St Peter; but the prin-  
 cipal ornament is the university, founded in 1426  
 by John IV. duke of Brabant. In contains about  
 40 colleges, among which are 4 called *Pedagogia*;  
 and an English college of friars, preachers, estab-  
 lished by Card. Howard, brother to the duke of  
 Norfolk, who, before he was raised to the pur-  
 ple, had been chaplain to Q. Catherine, consort  
 to Charles II. The Irish have likewise a seminary,  
 erected in part under the care of Eugenius Mat-  
 theus, titular archbishop of Dublin, 1623. In  
 1743 the inhabitants amounted to 12,000. At  
 the beginning of the 14th century, under John  
 III. it had a flourishing manufacture of woollen  
 cloth: 400 houses being occupied by substantial  
 clothiers, who employed an incredible number  
 of weavers, so great it is said, that a bell was  
 rung to prevent any injuries which the children  
 in the street might receive from the crowd and  
 hurry on their returning from work. In 1382,  
 these weavers took up arms, and rebelled against  
 Duke Wenceslaus, throwing from the windows  
 of the Town-hall 17 of the aldermen and counsellors,  
 and afterwards proceeded to lay waste great  
 part of Brabant; but being besieged and reduced  
 to great extremities, they implored mercy, which  
 was granted after executing some of the ring-  
 leaders. But the weavers were banished, and the  
 greater part took refuge in England; where they  
 introduced or at least improved the woollen man-  
 ufacture. From that period the manufacture de-  
 clined, and little or no cloth of any account is  
 made there at present. This impolitic step of  
 Duke Wenceslaus sent treasures to England, by  
 those exiled people; and thus gave an important  
 lesson to governors to deal with great precau-  
 tion respecting such useful members of the community.  
 Upon the ruins of these looms was also formed  
 the cloth manufacture of LIMBOURG, which is  
 still carried on with advantage. The old drapers'-  
 hall is now converted into 4 public schools, where  
 lectures in divinity, philosophy, law, and physic,  
 are given, and the public acts are made. Adjoin-  
 ing to these is the university library; over the  
 door of the chief entrance are these words, *Sapi-  
 entia edificavit sibi domum*. The principal church  
 is collegiate, dedicated to St Peter, which had  
 formerly 3 very large towers with elevated spires,  
 one considerably higher than the 2 collateral; these  
 were blown down in the year recorded by this  
 chronogram, *oMnia CaDVnt*. Louvain was an-  
 ciently the capital of the province, long before  
 Brussels had any claim to that title. Louvain has  
 been often besieged, but seldom taken. In 1542,  
 it was besieged by the Gueldrians: in 1572, by  
 William Pr. of Orange: in 1635, by the Dutch,  
 and French united; and in 1710 by the French;  
 but on all these occasions the enemy were obliged  
 to retire with loss. In 1746, however, it was ta-  
 ken by the French; and again in 1792, by the  
 French republicans under Dumouriez, but e-  
 vacuated on the 22d March 1793. It was at last  
 retaken

retaken and annexed to the republic in 1794. It lies 13 miles NE. of Brussels, and 21 SW. of Antwerp. Lon. 4. 40. E. Lat. 51. 12. N.

LOUVE, a river of France, which runs into the Adour, near Castelnau.

LOUVEN, a river of Norway.

\* LOUVER, *n. f.* [from *Pouvert*, Fr. an opening.] An opening for the smoke to go out at in the roof of a cottage. *Spenser.*

LOUVESTEIN, or LOEVESTEIN, a fort of the Batavian republic, in the isle of Bommelwaert, and dep. of the Dommel and Scheldt, at the conflux of the Meuse and the Wahal. In this fortress, the celebrated Grotius and other Dutch patriots were imprisoned by Prince Maurice, in 1619. It lies 3 miles E. of Gorcum, and 16 of Dort. Lon. 5. 13. E. Lat. 50. 40. N.

LOUVET, Jean Baptist, a celebrated French senator, and man of letters, one of the founders of the French revolution, and a considerable sufferer during the course of the most bloody part of it. From a very interesting sketch of his life, written by himself, in the caverns of Jura in 1794, and published in 1795, our room permits only to select the few following particulars.—Every thing that a man of sensibility, whose manners were simple, could desire, was obtained by him anterior to the revolution. He lived in the country; he composed works of literature, the success of which had laid the foundation of his little fortune; and his love of independence had led him to banish luxury so completely, that 800 francs *per annum* (about L. 34 Str.) sufficed for his maintenance. The first 7 vols. of his first work, *The Adventures of the Chevalier de Faublas*, increased his income, and the publication of 6 more, in spring 1789, added to it still farther. But the profits of his next work, a novel, were diminished by the revolution, which, by the demand it produced for political writings, raised the taste for frivolous pieces. Previous to this he had been “inspired with an immortal passion,” by a young lady whom he calls *Louise*, who had been brought up with him, and had felt a mutual flame, but had been married to a rich man, in her 16th year, and was now a widow of 22. Her sentiments were so entirely the same with his own, that on the news of the capture of the Babilie, she presented him with the three-coloured cockade. This lady; whom he celebrates as possessed of every virtue, he afterwards married. Mean time Mounier having published a pamphlet in October 1789, accusing the Parisians of the crimes of the Orleans faction, Louvet wrote an answer entitled *Paris Justified*; which was so well received, that he was immediately admitted a member of the Jacobin club, which, however, he attended but seldom. But all his writings were now directed towards the revolution. Thus *Enlilic de Ferme*, was a romance intended to prove the utility and sometimes the necessity of *divorce*, as well as of the *marriage of Priests*. In the same spirit he wrote two comedies. In the one, of 5 acts, entitled *L'Amili Conspirateur, ou le Bourgeois Conjugué du 18me siècle*, he attacked the prejudices concerning nobility. The other was a pointed satire on the mummeries of the court of Rome, entitled *L'Élection et L'Audience du Grand*

*Lama Siffi*. These however, being too bold, were not performed; but his farces, *La Grand Revue des armes noire et blanche* ten in ridicule of the army of Coblenz, presented 25 times. Hitherto he had taken an active part in the revolution: “Happy” he said, “in having reformed so many ancient abuses, had, like many others, heartily promised to this emasculated constitution, hoping it alone would produce a cure to our yet raw wounds, without agitation and without rhage. Yes, I swear by that heaven, while the inward sentiments of man, that, if it had not a thousand times tried to raise *half-liberty* from us, I should never have seen our entire liberation but from time alone it became incontestable, that it conspired against, and, not content with fomenting internal dissensions, it called in foreign aid.”—Indignant at these manœuvres, Louvet presented a *petition* to the Princes to the Legislative Assembly, 25th Dec. 1791; which with other two petitions were printed by order of the assembly 1792, in the debate respecting a war which gave rise to the schism between the Girondins and Robespierre’s faction, Louvet the former, reduced Robespierre himself to silence, and from that moment was professed by him. Mean time Louvet became editor of a paper called the *Sentinel*, of which 20,000 copies were sometimes printed, and in one number which he attacked the conduct of Dumouriez. On the 10th of Aug. Louvet contributed a part of the Swiss guards. After the battle of Sept. he denounced Robespierre, and been supported by Pétion would have prevented the rise of that tyrant’s power and the horrors which followed. He however published a letter addressed to *Maximilian Robespierre and his friends*. On this occasion he was expelled the Jacobin Club, along with Roland and other Girondins. At the trial of Lewis XVI, he supported the motion of Sallé for an appeal to the people. He denounced the plot of the March 1793, in a pamphlet addressed to the *National Convention*, &c. but was not supported by his friends; on which occasion he said to his wife, “Our friends rush to the scaffold; separate from them, were not their party duty and virtue.” But the horrors of the 9th of Thermidor obliged them to separate, and he was confined. After providing for the safety of his wife, and being 5 weeks secreted by two friends, he left Paris, June 24th, and went through various adventures, which it is impossible to describe without emotion, but which it is equally impossible either to make room for or abridge. He is now in the habit of saying, that after passing sometimes for a philosopher, sometimes for a soldier, at other times for a deserter, and at all times for a violent man, or Maratist, and running a thousand risks, devoted, he at last, by the astonishing success of “a man, to whom he had done a final adieu about 10 years before, but who, during his life, had never affected to be his friend, obtained a safe and impenetrable asylum, in the caverns of Mount Jura; where he remained till the end of July 1794, when his wife

ws of the Thermidorean revolution; which he returned to Paris, was well his seat by the convention, and not lected president. After this he com- okfeller, but died in summer 1797. 5 feet 6 inches high, of a fallow com- ther harsh features, and short-sighted; ents and activity were great, his wit tyle masculine and satirical, his elo- quating but bold; daring yet correct; grity unblemished.

W. *adj.* 1. Not high.—

wand'ring courie now high, now low, hid,

e, retrograde. *Milton.*

z far upwards.—It became a spreading tature. *Ezek. xvii. 6.* 3. Not elevated local situation.—

ity Cæsar! do'st thou lye so low? y conquests, glories, triumphs, spoils, o this little measure? *Sbak.*

n days and nights, except to those be polar circles; to them day mighted shone, while the low sun, opene his distance, in their sight ded still th' horizon, and not known west. *Milton.*

er is washed away from them is car- to the lower grounds, and into the hing is brought back. *Burnet.* 4. De- downwards; deep.—

vest bottom shook of Erebus. *Milton.* as heav'd the tumid hills, so low, k a hollow bottom, broad and deep, bed of waters. *Milton.*

His volant touch rough all proportions low and high,

Fled and pursu'd transverse the resonant fugue.

*Milton.*  
5. Not deep; not swelling high; shallow: used of water.—As two men were walking by the sea- side at low water, they saw an oyster, and both pointed at it together. *L'Esrange.*—It is low ebb sure with his accuser, when such peccadillos are put in to swell the charge, *Atterbury.* 6. Not of high price: as, corn is low. 7. Not loud; not noisy.—

When in open air we blow,  
The breath, tho' strain'd, sounds flat and low.

*Waller.*  
—The theatre is so well contrived, that, from the very deep of the stage, the lowest sound may be heard distinctly to the farthest part of the audience.

*Addison.* 8. In latitudes near to the line.—They take their course either high to the north, or low to the south. *Abbot.* 9. Not rising to so great a sum as some other accumulation of particulars.—

Who can imagine, that in sixteen or seventeen hundred years time, taking the lower chronology, that the earth had then flood, mankind should be propagated no farther than Judæa? *Burnet.* 10. Late in time: as, the lower empire. 11. Dejected; depressed.—

His spirits are so low his voice is drown'd. *Dryden.*

He grows dispirited and low,  
He hates the fight, and shuns the foe. *Prior.*

12. Impotent; subdued.—

The lowest, most dejected, thing of fortune,  
Stands still in esperance. *Sbak.*

Why but to keep ye low and ignorant. *Milt.*  
—To keep them all quiet, he must keep them in greater awe and less splendor; which power he will use to keep them as low as he pleases. *Graunt.*

13. Not elevated in rank or station; abject.—  
He woos both high and low, both rich and poor. *Sbak.*

—Try in men of low and mean education, who have never elevated their thoughts above the spade. *Locke.* 14. Dishonourable; betokening meanness of mind: as, low tricks.—

Yet sometimes nations will decline so low  
From virtue, which is reason, that no wrong  
But justice, and some fatal course annexed,  
Deprives them of their outward liberty. *Milt.*

15. Not sublime; not exalted in thought or dic- tion.—He has not so many thoughts that are low and vulgar, but, at the same time, has not so many thoughts that are sublime and noble. *Speer.*—  
In comparison of these divine writers, the noblest wits of the heathen world are low and dull. *Felton.*  
16. Submissive; humble; reverent.—

I bring them to receive  
From thee their names, and pay their scalty  
With low subjection. *Milton.*

From the tree her step she turn'd,  
But first low reverence done, as to the pow'r  
That dwelt within. *Milton.*

(2.) \* Low. *adv.* 1. Not aloft; not on high.—  
There under Ebon shades and low-brow'd  
rocks,

As ragged as thy locks,  
In dark Cimmerian desert ever dwell. *Milton.*

My eyes no object met  
But low hung clouds. *Dryden.*

LOW, EAST and WEST. See LOOE.

To Low. v. a. [from the adjective.] To  
 sink; to make low. Probably misprinted for  
 lower.—The value of guineas was lowed from  
 one-and-twenty shillings and sixpence to one-and-  
 twenty shillings. Swift.

(2.) \* To Low v. a. [bloran, Saxon. The ad-  
 jective.] low, not high is pronounced lo, and would  
 rhyme to no: the verb low, to bellow lou; and is by  
 Dryden rightly rhymed to now.] To bellow as a  
 cow.—Doth the wild afs when he has grafs? or  
 loweth the ox over his fodder? Job vi. 5.—

The maids of Argos, who, with frantick  
 cries,  
 And imitated lowings, fill'd the skies. Rosc.  
 Fair lo grac'd his shield, but lo now,  
 With horns exalted stands, and seems to low.

Dryden.  
 Had he been born some simple shepherd's heir,  
 The lowing herd, or fleecy sheep his care. Prior.

(1.) \* LOWBELL. n. f. [lacye, Dutch; leg, Sax.  
 or logs, Islandick, a flame, and bell.] A kind of  
 fowling in the night, in which the birds are wakened  
 by a bell, and lured by a flame into a net.  
 Low denotes a flame in Scotland; and to low, to  
 flame.

(2.) LOW-BELL is a name given to a bell, by  
 means of which they take birds in the night, in  
 open champaign countries, and among stubble, in  
 October. The method is to go out about 9 o'-  
 clock in a still evening, when the air is mild and  
 the moon does not shine. The low-bell should be  
 of a deep and hollow found, and of such a size  
 that a man may conveniently carry it in one  
 hand. The person who carries it is to make it

toll all the way he goes, as nearly as possible  
 that manner in which the bell on the neck of  
 sheep tolls as it goes on and feeds. There must  
 so be a box made like a large lantern, about  
 foot square, and lined with tin, but with one  
 open. Two or three great lights are to be  
 this; and the box is to be fixed to the per  
 breast, with the open side forwards, so that it  
 may be cast forward to a great distance. It  
 spread as it goes out of the box; and will  
 tinctly show to the person that carries it w  
 ever there is in the large space of ground  
 which it extends, and consequently all the  
 that roost upon the ground. Two persons  
 follow him who carries the box and bell, on  
 each side, so as not to be within the reach of  
 light to show themselves. Each of these  
 have a hand net of about 3 or 4 feet square  
 tenced to a long pole; and on whichever side  
 bird is seen at roost, the person who is near  
 to lay his net over it, and take it with as  
 noise as possible. When the net is over the  
 person who laid it is not to be in a hurry to  
 the bird, but must stay till he who carries the  
 is got beyond it, that the motions may not be  
 covered. The blaze of the light and the noi  
 the bell terrify and amaze the birds in su  
 manner that they remain still to be taken; bu  
 people who are about the work must keep  
 greatest quiet and stillness in their power. S  
 people go on this scheme alone. The pe  
 then fixes the light box to his breast, and  
 ries the bell in one hand and the net in the o  
 of the net in this case may be somewhat smaller,  
 the handle shorter. When more than one ar  
 at a time, it is always proper to carry a gun  
 it is no uncommon thing to spy a hare wh  
 this expedition.

LOWDORE, a famous cataract of Cum  
 land, on the E. side of Derwent Water, in  
 vale of Keswyck; formed by the fall of the  
 ters of Watanlath, through an awful chait  
 tween two vast rocks.

'discontent sat *low'ring* on her face. *Dryden.*

LOWERING, among distillers, a term used to express the debasing the strength of any spiritu-ous liquor, by mixing water with it. The stand-ard and marketable price of these liquors is fixed in regard to a certain strength in them called PROOF; this is that strength which makes them, when shaken in a phial or poured from on high into a glass, retain a froth for some time. In this state, spirits consist of about half pure or totally inflammable spirit, and half water; and if any fore-ign or home spirits are so be exposed to sale, and are found to have that proof wanting, scarce any body will buy it till it has been distilled a- gain and brought to that strength; and if it is above that strength, the proprietor usually adds water to it to bring it down to that standard. There is another kind of lowering among the re- tailers of spirituous liquors to the vulgar, by re- ducing it under the standard proof. Whoever has the art of doing this without destroying the bubble proof, which is easily done by means of some addition that gives a greater tenacity to the parts of the spirits, will deceive all that judge by this proof alone. In this case, the best way to judge of liquors is by the eye and tongue, and especially by the HYDROMETER.

\* LOWERINGLY. *adv.* [from *lower*.] With cloudiness; gloomily.

\* LOWERMOST. *adj.* [from *low*, *lower*, and *most*.] Lowest.—Plants have their seminal parts uppermost; living creatures have them *lower- most*. *Bacon.*—The same part of the pipe which was now *lowermost* will presently become higher. *Wilkin's D. datus.*

LOWES, or LOWES WATER, a lake of Cum-berland, a mile long and  $\frac{1}{2}$  of a mile broad, situat- ed among beautiful hanging woods and groves. It runs from N. to S. into CROMACK WATER.

LOWESTOFF. See LAYSTOFF & LESTOFF. LOWICZ, a town of Poland, in Rawa, with a strong fort on the Bzura.

LOWKOW, a town of Poland, in Volhynia. \* LOWLAND. *n. f.* [*low* and *land*.] The coun-try that is low in respect of neighbouring hills; the marsh.—

His errand was to draw the *lowland* damps, And noisome vapours, from the foggy fens. *Dryd.* No nat'ral cause the found from brooks or bogs,

Or marshy *lowlands*, to produce the fogs. *Dryd.* LOWLANDERS, *n. f.* natives of low coun-tries, distinguished from Highlanders.

\* LOWLILY. *adv.* [from *lowly*.] 1. Humbly; without pride. 2. Meanly; without dignity.

\* LOWLINESS. *n. f.* [from *lowly*.] 1. Humi- lity; freedom from pride.—

*Lowliness* is young ambition's ladder, Whereto the climber upward turns his face.

The king-becoming graces, As justice, verity, temperance, staidness, Bounty, persever'ance, mercy, *lowliness*, Devotion, patience, courage, fortitude; I have no relish of them. *Shak. Macbeth.*

Eve, With *lowliness* majestic, from her seat, And grace, that won who saw to wish her stay, Rose. *Milton's Par. Lost.*

—If with a true Christian *lowliness* of heart, and a devout fervency of soul, we perform them, we shall find, that they will turn to a greater account to us, than all the warlike preparations in which we trust. *Atterb.* 2. Meanness; want of dignity; subject depression.—They continued in that *lowliness* until the division between the two houses of Lancaster and York arose. *Spenser*.—The *lowliness* of my fortune has not brought me to flatter vice. *Dryden*.

(1.) \* **LOWLY**. *adj.* [from *low*.] 1. Humble; meek; mild.—I am meek and *lowly* in heart. *Matt. xi. 29*.—We of our parts saluted him in a very *lowly* and submissive manner. *Bacon*.—

With cries they fill'd the holy fane;  
Then thus with *lowly* voice Ilioneus began. *Dryd.*  
—With how *lowly* a reverence must we bow down our souls before so excellent a Being! *Rogers. 2.*  
Mean; wanting dignity; not great.—

One common right the great and *lowly* claims. *Pope.*

3. Not lofty; not sublime.—  
For all who read, and reading not disdain,  
These rural poems, and their *lowly* strain,  
The name of Varus oft inscrib'd shall see. *Dryd.*

(2.) \* **LOWLY**. *adv.* [from *low*.] 1. Not highly; meanly; without grandeur; without dignity.—I will shew myself highly f.d., and *lowly* taught; I know my business is but to the court. *Shakefp.*—

'Tis better to be *lowly* born,  
And range with humble livers in content,  
Than to be perk'd up in a glitt'ring grief,  
And wear a golden sorrow. *Shak. Henry VIII.*  
2. Humbly; meekly; modestly.—

Be *lowly* wise:  
Think only what concerns thee, and thy being. *Milton.*

Another crowd  
Preferr'd the same request, and *lowly* bow'd. *Pope.*

\* **LOWN**. *n. f.* [*liun*, Irish; *loen*, Dutch, a stupid drone.] A scoundrel; a rascal. Not in use.—  
King Stephen was a worthy peer,  
His breeches cost him but a crown,  
He thought them sixpence all too dear,  
And therefore call'd the tailor *lown*. *Shak.*

\* **LOWNESS**. *n. f.* [from *low*.] 1. Contrariety to height; small distance from the ground.—  
They know

By th' height, the *lowness*, or the mean, if dearth,  
Or foizon follow. *Shak. Ant. and Cleop.*  
—The *lowness* of the bough where the fruit cometh, maketh the fruit greater, and to ripen better. *Bacon's Nat. Hist.*—In Gothick cathedrals, the narrowness of the arch makes it rise in height, the *lowness* opens it in breadth. *Addis.* 2. Meanness of character or condition, whether mental or external.—

Nothing could have subdu'd nature  
To such a *lowness* but his unkind daughter. *Shak.*  
Now I must

To the young man send humble treaties,  
And palter in the shift of *lowness*. *Shakefp.*

3. Want of rank; want of dignity.—The name of servants has of old been reckon'd to imply a certain meanness of mind, as *lowness* of condition. *South.* 4. Want of sublimity; contrary to loftiness of stile or sentiment.—His stile is accommo-

dated to his subject, either high or low; if his fault be too much *lowness*, that of Perflus is the hardness of his metaphors. *Dryden.* 5. Submissiveness.—The people were in such *lowness* of obedience as subjects were like to yield, who he lived almost four-and-twenty years under so potent a king as his father. *Bacon.* 6. Depressing dejection.—Hence that poverty and *lowness* of spirit to which a kingdom may be subject, as well as a particular person. *Swift.*

\* **LOWSPIRITED**. *adj.* [*low* and *spirit*.] Depressed; depressed; not lively; not vivacious; not sprightly.—Severity carried to the highest breaks the mind; and then, in the place of an orderly young fellow, you have a *lowspirited* moped creature. *Locke.*

\* **To LOWT**. *v. a.* To overpower. *Shak.*

(1.) **LOWTH**, Dr William, a learned divine, born at London in 1661, was the son of an apothecary, and took his degree of D. D. at Oxford. His learning recommended him to Dr M. W., of Winchester, who made him his chaplain, and gave him two livings in Hampshire, and conferred on him a prebend in the cathedral of Winchester. Few were more deeply versed in critical learning, there being scarcely any ancient author, Greek or Latin, profane or ecclesiastical, but what he read with accuracy, constantly accompanying his reading with critical and philological remarks. Of his collections in this way he was upon all occasions very communicative: Hence his notes on *Clemens Alexandrinus*, inserted in Potter's edition of his remarks on *Josephus*, communicated to the world for his edition; and those numerous annotations on the Ecclesiastical Historians, inserted in *Reading's* edition of them at Cambridge. He assisted the author of *Bibliotheca Biblica*, an Englishman, late Bp. of Durham, in his "Dei of Christianity." His piety, diligence, hospitality, and beneficence, rendered his life highly exemplary, and enforced his public exhortations. He married Margaret, daughter of Robert Pitt, of Blandford, by whom he had two sons and two daughters. He died in 1732. He published a vindication of the divine authority and inspiration of the Old and New Testaments; 2. Editions for the profitable reading of the Holy Scripture; 3. Commentaries on the prophets; and other works.

(2.) **LOWTH**, Robert, D. D. and F. R. S. of the preceding, (N<sup>o</sup> 1.) and bishop successively of St David's, Oxford, and London, was born the 29th Nov. 1710. He studied at Winchester college, where his exercises were distinguished by uncommon elegance; and in 1730, he went to New College, Oxford, where he continued his studies, and took the degree of M. A. June 1737. In 1741, he was elected by the university professor of Hebrew poetry, re-elected in 1745, and whilst he held that office, he read his remarkable lectures *De sacra poesi Hebraeorum*. In 1746, Bp. Hoadley appointed him rector of Ovington, in the county of Hampshire; in 1750, archdeacon of Winchester, rector of East Woodhay in 1753. In 1754 the university created him D. D. by diploma; an honour never granted but to distinguished persons. Having, in 1749, travelled with Lord George Sackville, Lord Frederick Cavendish, in 1755, the late

Lieutenant of Ireland, Dr Lowth went to London as his grace's first chaplain. Soon after he was offered the bishopric of Limerick, preferring a less dignified station in his country, he exchanged it with Dr Leslie, Bishop of Durham and rector of Sedgfield, for the bishopric of Limerick. In Nov. 1765, he was made R. S. In June 1766, he was, on the death of Dr Squire, raised to the see of St Asaph, in Oct. he resigned for that of Hereford, in April 1777, he was translated to the see of London, on the death of Bp. Terrick; and he declined the offer of the primacy of all England.

Having been long afflicted with the gout, he bore with the most exemplary patience, and he died at Fulham, Nov. 3, 1787. He was married in 1752, Mary, daughter of Laurence of Christ-church, Hants, Esq. by whom he had 2 sons and 5 daughters; of whom 2 and 3 survived him. His literary character may be judged from the value and the importance of his works. Besides his *Prelections on the Hebrew Language*, which have been read with applause at home, and the Latinity of which is that of Buchanan in classical purity, he published in 1758, *The life of William of Wykeham, Archbishop of York*, with a dedication to Bp. Hoade, which involved him in a dispute concerning the primacy of Winchester college. This controversy on both sides carried on with such acrimony, though relating to a private concern, that it will be read with pleasure and improve the life of Wykeham is drawn from the most authentic sources; and affords much information concerning the manners, and transactions of the times in which Wykeham lived, as well as revived two literary societies of which he was the founder, and in which Dr Lowth was educated. In 1762 was first published his *Short Introduction to the English Grammar*, which has since gone through many editions. It was originally designed for domestic use; but its judicious and useful method, which teaches what is right and what is wrong, has insured public approbation and very general use. In 1765, Dr Lowth was engaged with Bp. Warburton in a controversy, which made so much noise at the time, that it even attracted the notice of royalty. He published his last great work, *A Sermon on the Imitation of Christ*, which proved adequate to the expectations of the public. Several discourses were also published, worthy of the author. Among these, one on the *kingdom of Christ's religion*, and on the means of attaining these by the advancement of religion, by freedom of inquiry, by toleration, and mutual charity, has been much admired, as exhibiting a most comprehensive view of the five states of the Christian church. Of other pieces, none display greater merit than his *Genealogy of Christ*, and the *Hercules*, both written very early in his life, and applied to the alarming situation of Britain.

III. PART II.

tain in 1745; and some *Verses on the death of Frederick prince of Wales*, with a few smaller poems. Learning and taste, however, did not constitute Bp. Lowth's highest excellence. Eulogium can scarcely ascend too high, in speaking of him either as a private man or a Christian pastor. His amiable manners rendered him an ornament to his station, whilst they endeared him to all with whom he conversed; and his zeal for the interest of religion made him promote to places of and trust dignity such clergymen as he knew were best qualified to fill them. To the world he was a benefit by his splendid abilities; and whilst virtue and learning are esteemed, the memory of LOWTH will be respected.

\* **LOWTHOUGHTED**: *adj.* [*Low and thought.*] Having the thoughts withheld from sublime or heavenly meditations; mean of sentiment; narrow-minded.—

Above the smok and stir of this dim spot,  
Which men call earth, and with lowthoughted  
care;

Strive to keep up a frail and feverish being. *Milt.*  
Divine oblation of lowthoughted care! *Pope.*

(1.) **LOXA**, **LOJA**, or **LOYA**, a town of Spain, in Granada, on the Xenil; famous for its copper and salt works; 27 miles W. of Granada.

(2.) **LOXA**, a province, or jurisdiction, of Peru, in Quito, famous for fine Peruvian bark and cochineal: containing about 10,000 people.

(3.) **LOXA**, a town in the above province.

**LOXAN**, a town of China, in Ho-nan prov.

**LOXIA**, in zoology; a genus of birds of the order of passerines: the distinguishing characters are these: The bill is strong, convex above and below, and very thick at the base: the nostrils are small and round: the tongue is as if cut off at the end: the toes are 4, placed 3 before and one behind; excepting in one species, which has only two toes before and one behind. There are 93 species, besides many varieties. The following are among the most remarkable:

1. **LOXIA ABYSSINICA**, the *Abyssinian grosbeak*, is about the size of the hawfinch: the bill is black; the irides are red; the top and sides of the head, throat, and breast, are black; the upper parts of the body, belly, and thighs, pale yellow, inclining to brown where the two colours divide: the scapulars are blackish; the wing coverts brown, bordered with grey; the quills and tail brown, edged with yellow: the legs are of a reddish grey. This bird is found in Abyssinia; and makes a curious nest of a pyramidal shape, which hangs from the ends of branches. The opening is on one side, facing the east; the cavity is separated in the middle by a partition; up which the bird rises perpendicularly about half-way, when descending, the nest is within the cavity on one side. The brood is thus defended from snakes, squirrels, monkeys, and other mischievous animals, besides being secure from rain, which in that country sometimes lasts for six months together.

2. **LOXIA BENGALENSIS**, the *Bengal grosbeak*, is a trifle bigger than a house sparrow; the bill is of a flesh-colour; the irides are whitish; the top of the head is of a golden yellow; the upper parts of the body are brown, with paler edges; the sides of the head and under parts rufous white;

K k k

acrois

across the breast is a brown band, uniting to, and of the same colour with, the upper parts of the body; the legs are of a pale yellow, the claws grey. This species (thus described by Mr Latham) seems to be the same with the Indian grosbeak described as follows in the *Asiatic Researches*: "This little bird, called *bayâ* in Hindi *berbera* in Sanscrit, *bâbûi* in the dialect of Bengal, *cibû* in Persian, and *tenawawit* in Arabic, from his remarkably pendant nest, is rather larger than a sparrow, with yellow brown plumage, a yellowish head and feet, a light coloured breast, and a conic beak very thick in proportion to his body. This bird is exceedingly common in Hindostan; he is astonishingly sensible, faithful, and docile, never voluntarily deserting the place where his young were hatched, but not averse, like most other birds, to the society of mankind, and easily taught to perch on the hand of his master. In a state of nature he generally builds his nest on the highest tree that he can find, especially on the palmyra, or on the Indian fig-tree, and he prefers that which happens to overhang a well or a rivulet: he makes it of grass, which he weaves like cloth and shapes like a large bottle, suspending it firmly on the branches, but so as to rock with the wind, and placing it with its entrance downwards to secure it from birds of prey. His nest usually consists of 2 or 3 chambers; and it is the popular belief that he lights them with fire-flies, which he catches alive at night, and confines with moist clay or with cow dung. That such flies are often found in his nest, where pieces of cow dung are also stuck, is indubitable; but as their light could be of little use to him, it seems probable that he only feeds on them. He may be taught with ease to fetch any small thing that his master points out to him: it is an attested fact, that if a ring be dropped into a deep well, and a signal given to him, he will fly down with amazing celerity, catch the ring before it touches the water, and bring it up with apparent exultation and it is asserted, that if a house or any other place be shown to him once or twice, he will carry a note thither immediately on a proper signal. One instance of his docility I can myself mention with confidence, having often been an eye-witness of it. The young Hindoo women at Benares, and in other places, wear very thin plates of gold, called *ficas*, slightly fixed by way of ornament between their eye-brows; and when they pass through the streets, it is not uncommon for the youthful libertines, who amuse themselves with training bayâs, to give them a signal, which they understand, and send them to pluck the pieces of gold from the foreheads of their mistresses, which they bring in triumph to the lovers. The bayâ feeds naturally on grasshoppers and other insects; but will subsist, when tame, on pulse macerated in water: his flesh is warm and drying, of easy digestion, and recommended in medical books as a solvent of stone in the bladder or kidneys; but of that virtue there is no sufficient proof. The female lays many beautiful eggs resembling large pearls; the white of them, when boiled, is transparent, and the flavour, is exquisitely delicate. When many bayâs are assembled on a high tree, they *make a lively din*; but it is rather chirping than

singing: Their want of musical talents amply supplied by their wonderful force, which they are not excelled by any feathered inhabitant of the forest."

3. *LOXIA CERULEA*, the *blue grosbeak* size of the bullfinch: The bill is stout and the base of it surrounded with black which reach on each side as far as the whole plumage besides is a deep blue, quills and tail, which are brown, with a tinge of green, and across the wing covers a red: the legs are dusky. See *Plate CC* inhabit S. America; but are sometime found in Carolina, where they are very solitary only in pairs, but disappear in winter.

4. *LOXIA CARDINALIS*, the *cardinal* is near 8 inches in length. The bill is of a pale red colour: the irides are black; the head is greatly crested, the feathers rising to a point when erect: round the bill, throat, and breast, the colour is black; the rest of the plumage is of a fine red; the quills and tail dull red, and brownish within: the legs are of the same colour. The female differs from the male in being mostly of a reddish brown. See *Plate CC*. This species is met with in several parts of America; and has attained the name of *cardinal* from the fineness of its song, which resembles that of the nightingale and most part of the summer, it sits in the highest trees, singing early in the morning and piercing the ear with its loud piping: these birds are frequently kept in cages, and sing throughout the year, with intervals of muteness. They are fond of *maize* and *wheat*; and will get together great numbers, often as much as a bushel, which they fully cover with leaves and small twigs, leaving only a small hole for entrance into the nest. They are also fond of *bees*. They come to the beginning of April into New York country, and frequent the Magnolia swamps in summer: in autumn they depart towards the south. They are pretty tame, frequent along the road before the traveller; and are very gregarious, scarce ever more than 3 or 4 met with together. Being familiar birds, they have been made to breed them in cages with success.

5. *LOXIA CHLORIS*, the *GREEN ILLINOIS* well known bird: the general colour is green, palest on the rump and becoming white on the belly; the quills and tail-feathers are brown and stout; and the legs are of a pale yellow. This species is pretty common and flies in troops during winter. They build their nests in some low bush or hedge of dry grass, and lined with hair, wood, or moss, containing 5 or 6 greenish eggs, marked at the end with red brown; and the male takes the care of sitting. These birds soon become tame, and are very familiar almost as soon as they are taken. They live 5 or 6 years. Like the chaffinch, they are blind if exposed to the sun. This species is pretty common every where on the con-

very frequent in Russia; and is not at all found in Siberia, though it has been met with in Kamtschatka. It is sufficiently common in Cumberland and Scotland; yet is scarce ever observed in the former in winter, but the last week of March comes plentiful, and breeds as in other parts of England.

6. *LOXIA COCCOTHAUSTES*, the *HAWFINCH*, in length 7 inches; breadth, 13; the bill is funnel-shaped, strong, thick, and of a dull pale pink colour; the breast and whole under side are of a rusty flesh colour; the neck ash-coloured; the back and coverts of the wings of a deep brown, the base of the tail of a yellowish bay; the greater inner feathers are black, marked with white on the inner webs: the tail is short, spotted with white on the inner sides; and the legs are of a flesh-colour. This species is ranked among the finch birds; but they only visit these kingdoms occasionally, for the most part in winter, and never breed here. They abound more in France, being introduced into Burgundy in small flocks, about the beginning of April; and soon after making their nests, between the bifurcation of the branches of trees, about 12 feet from the ground, of small dry twigs, intermixed with liverwort, and lined with moss and other materials. The eggs are of a roundish shape, of a bluish green spotted with olive brown, with irregular black markings interspersed. They are also common in Italy, Germany, Sweden, and the West and South parts of Russia, where the wild finches grow. They feed on berries, kernels, &c.

From the great strength of its bill, it cracks the stones of the fruit of the haws, cherries, &c. with the greatest ease.

7. *LOXIA CURVIROSTRA*, the *common cross-bill*, about the size of a lark, and is known by the curvature of its bill, both mandibles of which curve opposite ways and cross each other. The natural colour of the plumage in the male is of a lead inclining to rose colour, and more or less tinged with brown: the wings and tail are brown; the legs black. The female is of a green colour, the male mixed with brown in those parts where the male is red. This species inhabits Germany, Poland, Switzerland, Russia, Siberia, where it breeds; but migrates sometimes in vast flocks into Britain and other countries, for though in some years few are met with, in others they have visited us by thousands, feeding on such spots as are planted with pines, for the sake of the seeds, which are their natural food. They hold the cone in one claw like the parrot, and have all the actions of that bird when kept in a cage. They also visit North America and Greenland; and make their nests in the highest parts of fir trees, fastening them to the branches with the resinous matter which exudes from the

8. *LOXIA ENUCLEATOR*, the *pine grosbeak*, is about the size of a lark, and weighs 2 oz. The bill is straight, dusky, and forked at the end: the head, neck, and breast, are of a rich crimson; the sides of the feathers ash colour; the quill feathers and tail dusky, their exterior edges of a white: the legs are black. This species frequents the most northern parts of this kingdom,

being only met with in Scotland, especially the Highlands, where they breed, and inhabit the pine-forests, feeding on the seeds, like the cross-bill. They also abound in the pine forests of Siberia, Lapland, and the North of Russia; and are common about St Petersburg in autumn, where they are caught in great plenty for the table. They return North in spring. They are likewise common in the North parts of America; appearing at Hudson's Bay in May, and feeding on the buds of the willow. The South settlements are inhabited by them throughout the year, but the North only in summer. Our late voyagers met with this bird in Norton Sound; it was also found at Conalshka.

9. *LOXIA MINUTA*, the *minute grosbeak*, is about the size of a wren: the bill is stout, thick, short, and brown: the upper parts of the plumage are grey brown, the under parts and rump ferruginous chestnut; the 4th, 5th, and 6th quills are white at the base: the legs are brown. It inhabits Surinam and Cayenne. It is said to keep paired to its mate the whole year; and is a lively, and not very tame bird. It mostly frequents lands which have lain for some time uncultivated; and lives both on fruits and seeds. It makes a roundish nest, the hollow of which is two inches in diameter, composed of a reddish herb, and placed on the trees which it frequents. The female lays 3 or 4 eggs.

10. *LOXIA NIGRA*, the *black grosbeak*, is about the size of a canary bird: the bill is black, stout, and deeply notched in the middle of the upper mandible; the plumage is black, except a little white on the fore part of the wing and base of the two first quills: the legs are black. It inhabits Mexico. See Plate CCIII.

11. *LOXIA ORIX*, the *grenadier grosbeak*, is about the size of a house sparrow. The forehead, sides of the head and chin, the breast and belly are black; the wings are brown, with pale edges; and the rest of the body is of a beautiful red colour: the legs are pale. These birds inhabit St Helena, and the Cape of Good Hope; frequenting watery places that abound with reeds, among which they are supposed to make their nest. If (as is supposed) this be the same with Kolben's Finch, he says that the nest is of a peculiar contrivance, made with small twigs interwoven very closely and tightly with cotton, and divided into two apartments with but one entrance (the upper for the male, the lower for the female), and is so tight as not to be penetrated by any weather. He adds, that the bird is scarlet only in summer, being in winter wholly ash-coloured. These birds, among the green reeds, from the brightness of their colours, appear like so many scarlet lilies.

12. *LOXIA PENNSILIS*, the *penfile grosbeak*, the *TODDY BIRD* of Fryer, is about the size of the house sparrow: the bill is black, the irides are yellow; the head, throat, and fore part of the neck, the same; from the nostrils springs a dull green stripe, which passes through the eye and beyond it, where it is broader; the hind part of the head and neck, the back, rump, and wing coverts, are of the same colour: the quills are black, edged with green; the belly is deep grey, and

with a long neck: made of dry grass and other materials, and suspended at the ends of the branches; the opening always to the NW. He counted fifty on one tree only; and describes the bird itself as being like a Canary bird, of a dark yellow, and chirping like a sparrow. Fryer also talks of the ingenuity of the *Tuldy Bird*, making a nest "like a scepel, with winding meanders," and tying it by a slender thread to the bough of a tree. "Hundreds of these pendulous nests may be seen on these trees." *Account of Lu- dia and Persia*, p. 76.

13. *LOXIA PHILIPPINA*, the *Philippine grass-beak*, is about the size of a sparrow: the top of the head, the hind part of the neck and back, and the scapulars, are yellow, the middle of the feathers brown: the lower part of the back is brown, with whitish margins: the fore part of the neck and breast are yellow; and from thence to the vent yellowish white: the wing coverts brown, edged with white: the quills are brown, with pale rufous or whitish edges; and the tail the same: the legs are yellowish. These birds inhabit the Philippine Islands, and are noted for making a most curious nest, in form of a long cylinder, swelling out into a globose form in the middle. This is composed of the fine fibres of leaves, &c. and fastened by the upper part to the extreme branch of a tree. The entrance is from beneath; and after ascending the cylinder as far as the globular cavity, the true nest is placed on one side of it; where this little architect lays her eggs, and hatches her brood in perfect security. A variety of this species, the *Baglascbat* (Buff. iii. 469), an inhabitant of Abyssinia, makes a very curious nest like the former, but a little different in shape; and is said to have somewhat of a spiral form, not unlike that of a nautilus. It suspends

lays them there, but bring forward: face already in a caterpillar state, the from their concealments, and make tion along the budding branches, and bably destroy every hope of fruitage, useful birds, whose young are prey by caterpillars.—The bullfinch, in it has only a plain note; but when it comes remarkably docile, and may any tune after a pipe, or to whistle at the justest manner: it seldom forgets learned; and will become so tame as call, perch on its master's shoulder command, go through a difficult mu They may be also taught to speak, an instructed are annually brought to L Germany.

15. *LOXIA SOCIA*, the *sociable grass-beak*, about the size of a bullfinch; The general of the body above is rufous brown. parts yellowish; the beak and muzzle the legs brown; and the tail is short. the interior country at the Cape of C where it was discovered by Mr P Plate CCIV. These birds live together in societies, and their mode of nidification extremely uncommon. They build in *Mimosa* which grows to an uncommon which they seem to select for that well on account of its ample head, and strength of its branches, calculated to support the extensive buildings which to erect, as for the tallness and smooth trunk, which their great enemies, tribe, are unable to climb. The method the nests themselves are fabricated, is rious. In the one described by Mr P: could be no less a number (he says

ient to satisfy me by ocular proof, that  
 d to their nest as they annually increas-  
 bers, still from the many trees which  
 n borne down with the weight, and o-  
 ich I have observed with their boughs  
 ly covered over, it would appear that  
 ily the safe; when the tree which is the  
 of this aerial city is obliged to give way  
 rease of weight, it is obvious that they  
 nger protected, and are under the ne-  
 rebuilding in other trees. One of these  
 nests I had the curiosity to break down,  
 form myself of the internal structure of  
 ound it equally ingenious with that of  
 nal. There are many entrances, each  
 forms a regular street, with nests on  
 s, at about two inches distance from  
 r. The grass with which they build is  
 e Boshman's grass: and I believe the  
 to be their principal food; though, on  
 ; their nests, I found the wings and legs  
 nt insects. From every appearance, the  
 h I dissected had been inhabited for ma-  
 and some parts of it were much more  
 than others: this therefore I conceive  
 amount to a proof, that the animals  
 it at different times, as they found ne-  
 rom the increase of the family, or ra-  
 e nation or community." *Jour. into the*  
*be Hottentots. p. 133. &c.*

RIA TRIDACTYLA, the *three-toe'd gros-*  
*guifso balito* of *Buffon*, has only three  
 before and one behind. The bill is  
 n the edges: the head, throat, and fore-  
 neck are of a beautiful red, which is  
 l in a narrow band quite to the vent;  
 part of the neck, back, and tail, are  
 wing coverts brown edged with white;  
 own, with greenish edges; and legs a  
 the wings reach half way on the tail.—  
 ies inhabits Abyssinia; where it frequents  
 nd is a solitary species. It feeds on ker-  
 ds, which it breaks with ease with its

RIA VIOLACEA, the *purple grosbeak*, is  
 : size of a sparrow: The bill is black:  
 age, violet black; except the irides, a  
 r the eye, the chin and the vent, which  
 the legs are dusky grey. This species  
 the Bahama Islands, Jamaica, and the  
 arts of America. See *Pl. CCIV.*

. See LOXA, N° 1.  
 AL. *adj.* [*loyal*, Fr.] 1. Obedient; true  
 nct.—

Of Gloster's treachery,  
 the *loyal* service of his son,

When I inform'd him, then he call'd me *foe*.  
*Shak.*

—The regard of duty in that most *loyal* nation  
 overcame all other difficulties. *Knolles.*—

*Loyal* subjects often seize their prince,  
 Yet mean his sacred person not the least offence.  
*Dryden.*

2. Faithful in love; true to a lady, or lover.—  
 Hail, wedded love! by thee  
 Founded in reason *loyal*, just, and pure. *Milt.*

There Laodamia with Evadne moves,  
 Unhappy both! but *loyal* in their loves. *Dryden.*

\* LOYALIST. *n. f.* [from *loyal*.] One who  
 professes uncommon adherence to his king.—The  
 cedar, by the instigation of the *loyalists*, fell out  
 with the homebians. *Houel.*

\* LOYALLY. *adv.* [from *loyal*.] With fide-  
 lity; with true adherence to a king; with fide-  
 lity to a lover.—

Wealthy kings are *loyally* obey'd. *Pope.*  
 \* LOYALTY. *n. f.* [*loiaute*, French.] 1. Firm  
 and faithful adherence to a prince.—

*Loyalty*, well held, to fools does make  
 Our faith meer folly. *Shak.*

—He had never had any veneration for the court,  
 but only such *loyalty* to the king as the law re-  
 quired. *Clarendon.*—

Abdiel faithful found  
 Unshaken, uneduc'd, unterrify'd,  
 His *loyalty* he kept. *Milton.*

For *loyalty* is still the same,  
 Whether it win or lose the game. *Hudibras.*

2. Fidelity to a lady, or lover.  
 LOYAT, a town of France, in the dep. of  
 Morbihan; 7½ miles E. of Joffelin.

LOYES, a town of France, in the dep. of Ain,  
 1½ miles NE. of Meximieux.

LOYOLA, IGNATIUS, the founder of the or-  
 der of the JESUITS, was born at the castle of  
 Loyola, in Giupuscoa, in 1491; and became first  
 page to Ferdinand V. king of Spain, and then an  
 officer in his army. In this last capacity, he  
 signalized himself by his valour; and had his right  
 leg broken by a cannon ball, at the siege of Pam-  
 peluna, in 1521. While he was under cure of  
 his wounds, a *Life of the Saints* was put into his  
 hands, which determined him to forsake the mi-  
 litary for the ecclesiastical profession. His first  
 devout exercise was to dedicate himself to the  
 blessed virgin as her knight. He then practised  
 the most severe mortifications for above a year;  
 after which he went a pilgrimage to the Holy  
 Land; and on his return to Europe, he continu-  
 ed his theological studies in the universities of  
 Spain, though he was then 33 years of age. In  
 1526, upon commencing preacher, he was im-  
 prisoned at Alcan, and Salamanca, and impeach-  
 ed before the inquisition. After this he went to  
 Paris, and laid the foundation of his new order;  
 the institutes of which he presented to Pope Paul  
 III. who made many objections to them, but at  
 last confirmed the institution in 1540. He died  
 at Rome, July 31, 1556, aged 66; and left his  
 disciples two famous books; 1. *Spiritual exerci-*  
*ses*; 2. *Constitutions or rules of the order*. But  
 though these avowed institutes contain many pri-  
 vileges obnoxious to the welfare of society, the  
 most

most diabolical are contained in the private rules entitled *Monita secreta*, which were not discovered till the close of the 17th century; and most writers attribute these, and even the Constitutions, to Laynez, the second general of the order. See **JESUITS**, § 2.

**LOYTZ**, a town of Pomerania, in Gutzkow.  
**LO-YUNG**, a town of China, in Quang-si.

**LOZAY**, a town of France, in the dep. of Lower Charente; 18 miles ENE. of Rochfort.

(1.) \* **LOZENGE**. *n. f.* [*lozenge*, French. Of unknown etymology.] 1. A rhomb.—The best builders resolve upon rectangular squares, as a mean between too few and too many angles; and through the equal inclination of the sides, they are stronger than the rhomb or *lozenge*, *Wotton's Architecture*. 2. *Lozenge* is a form of a medicine made into small pieces, to be held or chewed in the mouth till melted or wasted. 3. A cake of preserved fruit: both these are so denominated from the original form, which was rhomboidal.

(2.) **LOZENGE**, in heraldry. See **HERALDRY**, *Chap. III. Sect. II.* Though all heralds agree, that single ladies are to place their arms on lozenges, yet they differ with respect to the causes that gave rise to it. Plutarch says, in the life of Theseus, that in Megara, an ancient town of Greece, the tomb-stones, under which the bodies of the Amazons lay, were of that form. *S. Petra Sancta* says this shield represents a *cushion*, on which women used to sit and spin. Sir J. Ferne thinks it is formed from the shield called **TERRA**, which the Romans finding unfit for war, allowed women to place their ensigns upon, with one of its angles always uppermost.

(3.) **LOZENGES**, among jewellers, are common to brilliant and rose diamonds. In brilliants, they are formed by the meeting of the skill and star facets on the bezel; in the latter, by the meeting of the facets in the horizontal ribs of the crown. See **FACET**.

(4.) **LOZENGES**, (§ 1. *def.* 2.) in medicine, are otherwise called *trochisci*, or **TROCHES**.

(1.) **LOZERE**, a department of France, 55 m. long and 33 broad, comprehending the ci-devant prov. of **GEVAUDAN**. It is bounded on the N. by the departments of Cantal and Upper Loire; E. by that of Ardeche: S. by that of Gard; and W. by those of Aveyron and Cantal. **MENDE** is the capital.

(2.) **LOZERE**, a ridge of mountains in the above department, (to which they give name,) 16 miles from Mende.

**LOZICZE**, a town of Poland, in Biełk.

**LOZZI**, a town of Corsica, 11 miles NW. of Corte.

\* **LP**. a contraction for *lordship*.

(1.) **LU**, a town of the French republic, in the ci-devant duchy of Montferrat; 8 miles S. of Casale, and 8 W. of Alexandria.

(2.) **LU**, a town of China, in Ghan-tong.

(3.) \* **LU**. *n. f.* A game at cards.—

Ev'n mighty pain who kings and queens o'er-threw,

And mow'd down armies in the fights of *lu*. *Pope*.

**LU'A**, a river of Cuba, 25 m. NE. of Cape Cruz.

**LUANCO**, a town of Spain, in Asturia.

**LUBAT**, a town of Turkey, in Natolia.

\* **LUBBARD**. *n. f.* [from *lubber*.] A lazy fellow.—

Yet their wine and their victuals th'  
mudgeon *lubbards*

Lock up from my sight, in cellars a  
boards.

**LUBBECKE**, a city of Westphalia, in the ty of Minden, with a considerable jurisdiction. Its walls were built in 1279. Its chief trade is in yarn, linen, cattle, and beer. It was 1368, 1519, 1705, and 1734. It lies 14 m. of Minden.

**LUBBEN**, a town of Lusatia, on the 56 miles N. of Dresden.

\* **LUBBER**. *n. f.* [of this word the best opinion seems to be from *lubber*, said by J. to signify in Danish *fat*.] A sturdy drone; fat, bulky losel; a booby.—

For tempest and showers deceiveth;

And lingering *lubbars* loose many a pen

—These chase the smaller shoals of fish  
main sea into the havens, leaping up and  
puffing like a fat *lubber* out of breath. *Cd*

They clap the *lubber* Ajax on the shoulder

As if his feet were on brave Hector's tomb

And great Troy shrinking. *Shak. Troil*

A notable *lubber* thou reportest him to

Then lies him down the *lubber* fiend

Venetians do not more uncouthly rise

Thus did your *lubber* state mankind be

—How can you name that superannuated  
*Congreve*.

(1.) \* **LUBBERLY**. *adj.* [from *lubber* and bulky.—I came at Eaton to marry M. Page; and she's a great *lubberly* boy. *St*

(2.) \* **LUBBERLY**. *adv.* Aukwardly; —Merry Andrew on the low rope copie the same tricks which his master is to do performing on the high. *Dryden's Dedica*

(1.) **LUBEC**, or } a city and port of C

(1.) **LUBECK**, } in the circle of Lo

ony, and duchy of Holstein. It is feate

conflux of the Trave, with the Stecke:

Elbe, the Wackenitz, &c. 12 miles from

tic, where it has a fine harbour. By t

kenitz and the Elbe it communicates

German ocean. The city lies on the side

with the Trave, increased by the Steck

the one side, and the Wackenitz on th

and is strongly fortified with bastions

walls, and ramparts; the last of which a

ed with trees, and form an agreeable wa

bec being formerly the chief of the Hanse

was very powerful in consequence of

trade; but a great part of that trade is no

ferred to Hamburg: however, it still emp

of its own ships, and has a great share of

tic trade. It is about 2 miles long, and mo

broad. The houses are all of stone. Seven

streets have on each side rows of limetre

canals in the middle. The chief public fl

are the ancient cathedral, several other I

churches; a nunnery for 22 ladies, with;

and priores; a poors-house; an alms-houf

phan's house; an hospital dedicated to t

Ghost; a house in which poor travellers;

tained 3 days, and then sent forward wit

such as happen to be sick, are provided with all that is necessary till they recover or die; the city-argy, a grammar-school of 7 classes, a Calvinist church, and a Popish chapel. The deputies of the Hanse Towns used to meet here formerly in their own-house. An alliance still subsists between the city and Hamburg, and Bremen; and these cities, under the name of HANSE TOWNS, negotiate treaties with foreign powers. It has various manufactures. In the diet of the empire Lubec is possessed of the third seat among the Rhenish impenities; and among those of the circle, has the first.

The city is a republic within itself, and the emperor both makes and executes laws in regard to civil and criminal matters. A father and son, or brothers, cannot be in the regency at the same time. The famous league of the Hanse Towns was begun here in 1164. This city had its charter of privileges from the emperor Frederic formerly it carried on wars, both offensive and defensive, for several years, not only against the dukes of Mecklenburg, but against the kings of Sweden and Denmark; particularly in 1428, when it fitted out 250 ships of force against Eric king of Denmark. (See HANSE, § 3.) There are about 20 churches in Lubec, with lofty spires. Trade brings ships of burden into the very heart of the city; but the largest unload at Travels, i. e. the mouth of the Trave, 10 miles distant.

Formerly it employed 600 ships. In the wine cellar here, it is said there is wine 200 years old. The church of St Mary's, a lofty pile, supported by tall pillars, of one stone each, and a high spire, covered with gilt lead. The city's garrison consists of about 800 men. The residence of its Lutheran bishop, though he is a prince of the empire, is said not to exceed 3000 l. It lies 40 miles NE. of Hamburg. Lon. 10. 53. Lat. 53. 52. N.

LUBBECK, or LUBOI, an island of the Eastern Ocean, near that of Madura. Lon. 112. 5. Lat. 5. 50. S.

LUBEN, a city of Germany, in the margraviate of Lower Lusatia, situated on the Spree, capital of a small circle of the same name. It is the seat of the diets, and of the chief tribunals and officers; and has several churches with a noble land and hospital. Lon. 14. 25. E. Lat. 52. 0. N.

LUBERSAC, a town of France, in the department of the Sarthe; 7½ miles W. of Uzerche.

LUBIEN, a town of Poland, in Posenia.

LUBIENITSKI, Stanislaus, a polish gentleman, descended from a noble family, born at Lubow in 1623, and educated by his father. He became a celebrated Socinian minister; and endeavoured to obtain a toleration from the German princes for his brethren. His labours, however, were ineffectual; being himself persecuted by the Lutheran ministers, and banished from Lubow to place; until at length he was poisoned by his two daughters, his wife narrowly escaped in 1675. He wrote, 1. *A history of the reformations in Poland*; 2. *A history of Comets from the year 1 to 1665*; and other works in Latin.

LUBIN, Augustin, (according to Dr Watson *Nicholas Lubin* (according to others,) Geographer to Lewis XIV, and an Augustine monk, born in 1624. He wrote a Description of

Lapland; Sacred Geography; and several other works. He died in 1695, aged 71.

(2.) LUBIN, Eilhard, a protestant divine, born at Westersted in Germany, and educated at Leipzig. He became professor of poetry in the university of Rostock in 1595; and in 1605, professor of divinity. He wrote notes on Anacreon, Juvenal, Persius, &c. and several other works; but that which made the most noise is, a Treatise on the nature and origin of evil, entitled, *Ptolemaeus de causa prima et natura mal*, printed at Rostock in 1596; in which we have a curious hypothesis to account for the origin of moral evil. He supposed two co-eternal principles; not matter and vacuum, as Epicurus did; but God, and *Nilium* or *Nothing*. This being attacked by Grawer, was defended by Lublin; but after all, he is deemed better acquainted with polite literature than with divinity. He died in 1621.

LUBLIN, a considerable town of Poland, capital of the palatinate of the same name, with a citadel, a bishop's see, an university, a Jewish synagogue, and judicial courts. It has 3 fairs, frequented by merchants from all nations. It is seated on the Bystrzyna. Lon. 22. 31. E. Lat. 51. 26. N.

LUBLYO, a town and castle of Hungary.

LUBOW, a town of Poland, in Cracow, 50 miles SE. of Cracow. Lon. 20. 36. E. Lat. 49. 36. N.

LUBOZ, a town of Lithuania.

\* To LUBRICATE. *v. a.* [from *lubricus*, Latin.] To make smooth or slippery; to smoothe.—There are aliments which, besides this *lubricating* quality, stimulate in a small degree. *Arbutnos*.—The patient is relieved by the mucilaginous and the saponaceous remedies, some of which *lubricate*, and others both *lubricate* and stimulate. *Sharp*.

\* To LUBRICITATE. *v. n.* [from *lubricus*, Latin.] To smoothe; to make slippery.

\* LUBRICITY. *n. s.* [from *lubricus*, Latin; *lubricité*, French.] 1. Slipperiness; smoothness of surface. 2. Aptness to glide over any part, or to facilitate motion.—Both the ingredients are of a lubricating nature; the mucilage adds to the *lubricity* of the oil, and the oil preserves the mucilage from inspissation. *Ray on Creation*. 3. Uncertainty; slipperiness; instability.—The manifold impossibilities and *lubricities* of matter cannot have the same conveniences in any modification. *More*. He that enjoyed crowns, and knew their worth, excepted them not out of the charge of universal vanity; and yet the politician is not discouraged at the inconstancy of human affairs, and the *lubricity* of his subject. *Glanville's Apology*.—A state of tranquillity is never to be attained, but by keeping perpetually in our thoughts the certainty of death, and the *lubricity* of fortune. *L'Étrange*. 4. Wantonness; lewdness.—From the lechery of these fauns, he thinks that satyr is derived from them, as if wantonness and *lubricity* were essential to that poem which ought in all to be avoided. *Dryden*.

\* LUBRICK. *adj.* [from *lubricus*, Lat.] 1. Slippery; smooth on the surface.—

Short thick fobs, whose thund'ring volleys float

And roul themselves over her *lubrick* throat

In panting murmurs.

*Crazeaux*

LUCAN. See LUCANUS, N<sup>o</sup> 1.

LUCANAS, a town of Peru, near the source  
 of the Apurimac, containing some very rich silver  
 mines. It has a very extensive jurisdiction, and  
 great trade in cattle, grain, fruits, silver, &c.

LUCANI, the people of Lucania, descendants  
 of the Samnites.

LUCANIA, a country of Italy, and a part of  
 Magna Grecia; bounded on the N. by the Silarus,  
 by which it is separated from the Picentini, and by  
 the river Bradanus by which it is parted from the  
 Apuli Peucetii; on the S. by the Laus, which sepa-  
 rated it from the Bruttii; on the E. by the Si-  
 nus Tarentinus; and on the W. by the Tuscan sea.

LUCANO. See LUGANO.

(1.) LUCANUS, Marcus Annæus, a Latin po-  
 et, born at Corduba in Spain about A. D. 39. He  
 was the son of Annæus Mela, the youngest bro-  
 ther of Seneca; and was conveyed to Rome from  
 the place of his nativity at the age of 8 months;

a circumstance, as his more indulgent c-  
 serve, which sufficiently refutes the c-  
 those who consider his language as provin-  
 Rome he was educated under the Stoic C-  
 so warmly celebrated by his disciple P-  
 fatirist, who was the intimate friend of L-  
 the close of his education, Lucan is said  
 passed some time at Athens. On his  
 Rome he rose to the office of quaestor, l-  
 had attained the legal age. He was after  
 rolled among the augurs; and married;  
 noble birth, and of a most amiable  
 Lucan had for some time been admitted  
 liarity with Nero, when the emperor cho-  
 tend for poetical honours by the public  
 a poem he had composed on Niobe. L-  
 the hardness to repeat a poem an Or-  
 competition with that of Nero; and the  
 the contest were just and bold enough  
 against the emperor. Hence Nero be-  
 persecutor of his successful rival, and  
 him to produce any poetry in public.  
 known conspiracy of Piso against the ty-  
 followed; and Tacitus concludes that I-  
 gaged in the enterprize from the poetic  
 he had received. But a more probab-  
 for his conduct may be found in the get-  
 dor of his character, and his passionate  
 of freedom. Tacitus alleges a charge a  
 poet, equally injurious and improbable;  
 Lucan, when accused of the conspiracy  
 time denied the charge; but at last, un-  
 mise of impunity, accused his mother A-  
 accomplice. But from this charge Mr F-  
 fully vindicated him, in his Notes to his  
*istle on Epic Poetry*. And the fact re-  
 Tacitus himself seems decisive; for he  
 that "The information against Atilla, t-  
 of Lucan, was dissembled; and, with  
 cleared, she escaped unpunished."  
 therefore vindicate the honour of Luc-  
 firmness and intrepidity are indeed ver-  
 displayed in that picture of his death  
 citus himself has given us. He was con-  
 have his veins cut, as his uncle Seneca l-  
 him; and, "while his blood issued in  
 perceiving his feet and hands to grow  
 itiflen, and life to retire by little and lit-  
 extremities, while his heart was still be-  
 vital warmth, and his faculties nowise  
 recollected some lines of his own, which  
 a wounded soldier expiring in a manner t-  
 bled this. The lines themselves he rehe-  
 they were the last words he ever utte-  
 critics differ concerning the verses of t-  
 lia which the author repeated. Some  
 verses were v. 810 to 814, *lib. ix.* but L-  
 tends that the passage occurs in *Lib. ii.*  
 638; thus translated by Mr Rowe;  
 No single wound the gaping rupture  
 Where trickling crimson swells in flood.  
 But, from an opening horrible and wide  
 A thousand vessels pour the bursting  
 At once the winding channel's course  
 Where wand'ring life her mazy journey  
 At once the currents all forgot their  
 And lost their purple in the azure sea  
 Such was the death of Lucan before he

died his 27th year.—His wife, Polla Argentario, is said to have transcribed and corrected the 3 first books of his *Pharsalia* after his death. It is much to be regretted (Mr Hayley observes) that we possess not the poem which he wrote on the merits of this amiable and accomplished woman; but her name is immortalized by other two poets of that age. The veneration which she paid to the memory of her husband is recorded by Martial; and more poetically described in that elegant production of Statius, *Genesblacon Lucani*, a poem said to have been written at the request of Argentario. The author, after touching with great delicacy on the compositions of Lucan, pays a short compliment to the beauty and talents of Argentario; laments the cruel fate which deprived her so immaturity of domestic happiness; and concludes with an address to the shade of Lucan, which furnishes a strong presumption of Lucan's innocence, in regard to the accusation mentioned above. "Had he been really guilty of basely endangering the life of his mother (says Mr Hayley), it is not probable that his wife would have honoured his memory with such enthusiastic veneration."—"If his character as a man has been injured by the historian, continues he, his poetical reputation has been treated not less injuriously by the critics. Quintilian disputes his title to be classed among the poets; and Scaliger says, with a brutality of language disgraceful only to himself, that he seems rather to bark than to sing. But the most elevated poetic spirits have been his warmest admirers; in consequence he was idolized by Corneille, and in England translated by Rowe.—The severest censures on Lucan have proceeded from those who have unfairly compared his language to that of Virgil: but how unjust and absurd is such a comparison! How differently should we think of Virgil as a poet, if we possessed only the verses which he wrote at that period of life when Lucan composed his *Pharsalia*! In the disposition of his subject, in the propriety and elegance of diction, he is undoubtedly far inferior to Virgil: but if we attend to the bold originality of his design, and to the vigour of his sentiments; if we consider the *Pharsalia* as the rapid and uncorrected sketch of a young poet, executed in an age when the spirit of his countrymen was taken, and their taste in literature corrupted; it may be justly esteemed one of the most noble and best wonderful productions of the human mind." Lucan wrote several poems, but none remain besides his *Pharsalia*.

(2.) LUCANUS, the STAG-BEETLE, in zoology; a genus of insects of the order coleoptera. The antennae end in a club or knob, which is compressed or flattened on one side, and divided into short segments resembling the teeth of a comb; the jaws are protracted or advanced before the head, and are dentated. There are 20 species.

LUCANUS CERVUS is the largest as well as the most singular. See Plate CCIII. It has two large moveable maxillæ, resembling the horns of a stag, which project from its head, and have acquired the appellation of Stag-Beetle. Those maxillæ, broad and flat, equal to one 3d of its length, have in the middle, towards their inner end, a small branch, and at their extremity are

forked. They have also several small teeth throughout their length. The head that bears these maxillæ is very irregular, very broad and short. The thorax is something narrower than the head and body, and margined round. The elytra are very plain, without either streaks or lines. The whole animal is of a deep brown colour. It is commonly found upon the oak, but is scarce in the neighbourhood of London, and though the largest of coleopterous insects to be met with in this part of the world, it is much smaller than those of the same species that are found in woody countries. It is strong and vigorous, and its horns, with which it pinches severely, are carefully to be avoided. The jaws are sometimes as red as coral, which gives this insect a very beautiful appearance; the female is distinguished by the shortness of the jaws, which are not half so long as those of the male. The females deposit their eggs in trunks of decayed trees, such as the oak and the ash. The larvæ lodge under the bark and in the hollow of old trees, which they eat into and reduce into fine powder, and there transform themselves into chrysalids. They are common in Kent and Sussex, and are sometimes met with in other parts of England. The protracted jaws are particularly useful to these animals, in stripping off the bark from trees, and affixing themselves thereby to the tree, while they suck with their trunk the juice that oozes from it.

LUCAR, ST, 3 towns of Spain, in Andalusia: viz.

1. LUCAR, ST, DE BARAMEDA, is a handsome town with a good harbour, well defended. It was once the greatest port in Spain, before the galleons unloaded their treasure at Cadiz. It is seated at the mouth of the Guadalquivir, 13 miles N. of Cadiz. Lon. 6. 5. W. Lat. 36. 40. N.

2. LUCAR, ST, DE GUADIANA, a strong town on the confines of Algarve; seated on the Guadiana, with a harbour, 64 miles W. of Seville. Lon. 5. 59. W. Lat. 37. 32. N.

3. LUCAR, ST, LA MAJOR, a small town seated on the Guadiana, 10 m. W. of Seville. Lon. 6. 32. W. Lat. 37. 21. N.

LUCARIA, [from *lucus*, Lat. a grove.] a feast celebrated at Rome on the 18th of July, in memory of the flight of the Romans into a great wood, where they found an asylum from the Gauls. This wood was situated between the Tiber and the *Via Salaria*. On this festival, Plutarch tells us, it was customary to pay the actors, with the money arising from the felling of wood. This money was called *lucar*.

LUCARNO. See LOCARNO, N° 1, and 2.

(1.) LUCAS, Charles, M. D. a celebrated Irish patriot, born in 1713. He was a member of parliament in Ireland, and distinguished himself on the side of opposition. (See IRELAND, § 16.) He wrote several works on medical subjects, and died in 1771, aged 58. His funeral was attended by the corporation of Dublin, who settled a pension on his widow.

(2.) LUCAS, Francis, a learned divine, born at Bruges, and hence named *Brugensis*. He was well skilled in the Oriental languages, and wrote much in illustration of the Scriptures. He died in 1619.

(3.) LUCAS, Paul, a famous French traveller, born

born at Rouen, in 1644. He made several voyages to the East, and brought home a great number of curiosities, with which Lewis XV. enriched his cabinet, and made him his antiquary. His Travels make several volumes, but it is said his veracity is not always to be depended on. He went to Madrid in 1736, and died there in 1737.

(4.) LUCAS, Richard, D. D. a learned English divine, born in 1648, and educated at Oxford: after which he took orders, and was for some time master of the free school at Abergavenny. Being esteemed an excellent preacher, he became vicar of St Stephen's, Coleman street, in London, and lecturer of St Olave's in Southwark. In 1696 he was installed prebendary of Westminster. His sight began to fail in his youth; and he totally lost it in his middle age. He was greatly esteemed for his piety and learning; and published several works, particularly, 1. Practical Christianity: 2. An inquiry after happiness: 3. Several Sermons: 4. A Latin translation of the whole duty of man. He died in 1715.

(5.) LUCAS JACOBS, or } an eminent artist, call-  
LUCAS VAN LEYDEN, } ed also *Hugense*, was  
born at Leyden in 1494. He received his first in-  
structions in painting from his father Hugues Ja-  
cobs; but completed his studies under Cornelius  
Engelbrecht. He gained much money by his pro-  
fession; but being of a generous turn of mind,  
spent it freely, and lived in a superior style. A  
few years before his death, he made a tour in  
Zealand and Brabant; and during his journey, a  
painter of Flushing, envious of his great abilities,  
gave him poison at an entertainment; which,  
though slow, was fatal in its effect, and put an  
end to his life, after six years languishing under its  
cruel influence. Others, denying the story of the  
poison, attribute his death to his incessant indus-  
try. The superiority of his genius manifested it-  
self very early, for his works, at the age of 9,  
were so excellent as to excite the admiration of  
all contemporary artists; and when he was about  
15, he painted a St Hubert, which gained him  
great applause. His tone of colouring (Mr. Pilkington  
observes) is good; his attitudes are well cho-  
sen; his figures have a considerable expression in  
their faces, and his pictures are very highly finish-  
ed. He endeavoured to proportion the strength  
of his colouring to the different degrees of distance  
in which his objects were placed: for in that early  
time, the true principles of perspective were but  
little known. In the town-hall at Leyden, his  
most capital picture, *the Last Judgment*, is pre-  
served with great care; the magistrates having re-  
fused very large sums for it. Lucas painted not only  
in oil, but also in distemper and upon glass. Nor  
was he less eminent for his engraving. He car-  
ried on a friendly correspondence with Albert  
Durer; and, as regularly as Albert Durer pub-  
lished one print, Lucas published another, with-  
out the least jealousy on either side, or wish to de-  
preciate each other's merit. When Albert came  
into Holland upon his travels, he was received by  
Lucas in a most affectionate manner. His style of  
engraving, however, according to Mr Strutt, dif-  
fered considerably from that of Albert Durer,  
"and seems evidently to have been founded upon  
the works of Israel van Mechlen." His prints are

very neat and clear, but without any effect. The strokes are as delicate upon  
jects in the front, as upon those in the d  
and this want of variety, joined with th  
ness of the masses of shadow, give his en  
with all their neatness, an unfinished app  
He was attentive to the minutiae of his  
gave great expression to the heads of his  
but, in his works the same heads are r  
repeated. The hands and feet are rather  
ed than correct; and when he attempted  
the naked figure, he succeeded but ind  
He made the folds of his draperies long a  
ing; but his female figures are too often  
ly loaded with girdles, bandages, and ot  
mental trappings. He engraved on wood  
as on copper; but his works on the so  
not numerous. They are, however, ve  
ed; though not equal, upon the whole,  
of his friend Albert. Lucas's prints ar  
numerous, but seldom met with complet  
following are among the principal: 1.

*sleeping, with a priest murdered by his side,*  
*the figure stealing his sword; a middling-*  
*right plate; 1508. 2. An ecce homo, a lar*  
*lengthwise; 1510. 3. The crucifixion on M*  
*vary, ditto. 4. The wife mens offering, dit*  
*5. Return of the prodigal son, middli*  
*lengthwise; 1518. 6. The dance of Magdal*  
*lengthwise; 1519. 7. His own portrai*  
*upright; 1525. 8. David playing before*  
middling-sized, upright, very fine print  
print called *Ulespiegel*, which is the scar  
his works. It was in the collection of th  
France; and said by Marolles to be un  
Marianne had also an impression of it.  
sents a travelling bag-piper with his fam  
sisting of his wife, 7 children, a little do  
a singular groupe. This rare print is dat  
and has been sold for 16 louis d'ors. It  
7½ inches high by 4¾ broad; and has be  
copied.

LUCAU, two towns of Germany; 1.  
thia, near the Geil; 2. in Saxony, 13 m  
Leipfic.

LUCAYA ISLANDS. See BAHAMA.

(1.) LUCCA, a small republic of Italy  
coast of the Mediterranean, between the  
republic on the W. Modena on the N.  
cany on the E. According to Keysser,  
about 30 miles in circumference, but is e  
fertile and populous. It contains, besides  
(Nº 2.) 150 villages. The number of in  
are computed at 120,000. The govern  
lodged in a gosalon'er, whose power is r  
same with that of the doge of Genoa.  
sisted by 9 counsellors: but the power c  
ten continues only for two months; dur  
time they live in the state palace, and at  
lic expence. They are chosen out of t  
council, which consists of 240 nobles, an  
ged by a new election every two years.  
venues of the republic are about 400,000  
crowns. This small state has preserved it  
and independence in the midst of all the l  
lutions of ITALY.

(2.) LUCCA, the capital of the above  
is situated in a plain, terminating in most

ences, adorned with villas, summer-houses, fields, and plantations of every kind. It is about 3 Italian miles in circumference, and well lined with fortifications; and its streets, regular, are wide, well paved, and full of houses. The number of its inhabitants computed to be above 40,000; and they have large manufactures, especially of silk. Lucina has a bishop, who enjoys several extraordinary privileges; and its cathedral is

Lon. 11. 27. E. Lat. 43. 52. N.

LUCCA, a river of Asia, in Persia.

LUCIUS, Lucius, a celebrated Roman historian Cicero requested to write the history of his consulship. (*Cic. Ep. 5, 12.*) He favoured the Pompey, but experienced the clemency

LUCI, a town of Naples, in Calabria.

LUCOS, a river of Morocco, anciently called which runs into the Atlantic at Larache.

LUCER, *n. f.* [perhaps from *lypus*, Latin.] all grown.—They give the dozen white deer coat. *Shakespeare.*

LUCER, in ichthyology. See *ESOX*, N<sup>o</sup> 3.

LUCER, in geography, a river of Scotland, inshire, which runs into Luce Bay, 1½ miles from Glenluce. It abounds with salmon fish.

LUCER BAY, a large bay on the S. coast of Ireland, between the Mull of Galloway and Mull of Kintyre. Vessels of above 60 tons may ride in it.

LUCER, NEW, a parish of Wigtonshire, distant from OLD LUCE, in 1646, 10 miles long, and 5 to 6 broad. The greater part of the parish is covered with heath, moss, or rocks. There are 32 farms on the low fertile grounds on the S. of the Luce. The population, in 1793, was 1,200; it decreased 59, since 1755. About 364 sheep, 1420 sheep, and 672 stones of wool, are annually sold out of the parish.

LUCER, OLD, a parish of Wigtonsh. anciently called along with NEW LUCE, the original GLLENLUCE. It is 10 miles long, but its breadth from 2 to 7 feet, being deeply indented by Luce Bay on the one side and New Luce on the other. About one half is arable; the other half is light and fertile; the other half is reserved for cattle. Husbandry has been but little improved. Before 1780, the grain raised was sold to the inhabitants. In 1790, 800 bolls of wheat and meal were exported. About 850 sheep, 600 sheep, 50 packs of wool, and 150000 annually sold. There are about 400 farms. The population, in 1791, was 1200; decreased since 1755, owing chiefly to the emigration of farms.

LUCER, E. and W. two rivers of Jamaica.

LUCER, a town of Germany, in the circle of the Upper Rhine, 2 miles W. of Lauffen.

LUCERNA, a town of Spain, in Cordova.

LUCERNA, a town of Spain, in Valencia.

LUCENAY LES AIX, a town of France, in the department of Nièvre, 9 miles S. of Decize.

LUCENAY L'ÉVÊQUE, a town of France, in the department of the Saône; 7½ miles N. of Autun.

LUCENT, *adj.* [*lucens*, Lat.] Shining; bright;

I meant the day-star should not brighter rise;  
Nor send like influence from his *lucens* seat.

A spot like which perhaps

Astronomer in the sun's *lucens* orb,

Thro' his glaz'd optick tube yet never saw. *Milt.*

LUCENTII, } in ancient geography, a town  
LUCENTIA, or } of Hispania Citra, now called  
LUCENTUM, } Alicant.

LUCERA, a populous city of Naples, capital of the prov. of Capitanata; and a bishop's see; with 4 churches and 9 monasteries; 60 miles N. of Naples.

LUCERES, in Roman antiquity, the 3d in order of the 3 tribes into which Romulus divided the people, including foreigners; also called from the *lucus* or grove, where Romulus opened an asylum.

(1.) LUCERIA, in ancient geography, a town of Italy, in Apulia; which in Strabo's time still exhibited marks of Diomedes's sovereignty in those parts. It is called by Ptolemy NUCCERIA; now Nocera de Pagani, in Naples. Lon. 15. 0. E. Lat. 40. 40. N.

(2.) LUCERIA, and LUCERIUS, } in mythology, names given to Juno and Jupiter, as the deities which give light to the world.

LUCERNA, a town and valley of the French republic, in Piedmont; 5 miles SW. of Pignerolo, and 15 SW. of Turin. Lon. 7. 38. E. Lat. 44. 52. N.

(1.) LUCERNE, one of the 13 cantons of the Helvetic republic. It holds the 3d place among the 13; and is the head of the Catholic cantons. It is less than Zurich, and much less than Berne, but far more extensive than any of the rest, being about 16 leagues long, and 8 broad. The population is estimated at 100,000. The mountainous part abounds in wood and pasture, furnishing cattle, hides, cheese, and butter, for exportation. All the N. part is fertile in grain, fruit, and hay; supplying sufficient for the consumption of the inhabitants. Their manufactures consist in silk and cotton thread. The ci-devant government was oligarchical. The councils were chosen from among 500 citizens only. The great council of 64 members was the nominal sovereign; but the power resided in the senate, or little council of 36, having for their chiefs the two Avoyers. They threw off the Austrian yoke in 1353; and by entering into a perpetual alliance with the three ancient cantons, they gave such weight to the confederacy, as to enable it in 1386 to resist all the efforts of the enemy at the bloody battle of Sempach. During the late war this canton had its share of distress. See REVOLUTION and WAR.

(2.) LUCERNE, the capital of the above canton, is situated at the extremity of the lake (N<sup>o</sup> 3.) where the Reufs issues from it. The buildings are ancient, and the streets narrow; the population is between 3 and 4000. As this is the great passage to Italy by Mount St Gothard, and the merchandize which passes the Alps on mules, to be transported by the Reufs, Aar, and Rhine, is all deposited here, it might have a flourishing trade if manufactures were attended to. The Reufs separates the town into two unequal parts, which are connected by 3 bridges; one wide for carriages; and two narrow

narrow covered ones for foot passengers. There is also a 4th over an arm of the lake. The chief religious edifices are the cathedral of St Leger, and several convents. Of the secular buildings, the hotel de Ville is the principal. The arsenal is well furnished. What attracts most the notice of strangers is, a plan in relief of part of the cantons of Lucerne, Zug, and Berne, and the whole of Schwytz, Uri, and Unterwald, executed by Gen. Pflüger on a large scale. He has completed about 60 square leagues; the plan is 12 feet long, and 9½ broad; every mountain is accurately measured; and every object distinctly placed. Lucerne is 30 miles SW. of Zurich, and 35 E. of Berne. Lon. 8. 6. E. Lat. 47. 5. N.

(3.) LUCERNE, a lake in the above canton, exhibiting greater variety and more picturesque scenery than any other of the Helvetic lakes. It is 7 leagues long in a right line, and 3 broad, about Kuffnacht; but the shape is very irregular. The whole S. side is bordered by high mountains; but the N. exhibits hills of no great height. The narrow gulph that extends towards the W. is bordered on the N. and NW. by mount Pilat, a mountain rising more than 6000 feet above the lake; and on the S. by mount Burgenberg. Stanz-Stadt, belonging to the canton of Unterwald, is on this side; and here the lake is deepest. Kuffnacht is on the point of the other gulph, which extends towards the E. and is wider than the former.

(4.) LUCERNE, in botany. See MEDICAGO.

LUCÉY, a town of France, in the dep. of the Meurthe, 3 miles NW. of Toul.

LUCHEN, a town of Spain, in Valencia.

LUCHEUX, a town of France, in the dep. of Somme, 4½ miles NE. of Doullens, and 15 SW. of Arras.

LUCHO, a town of Lunenburg, on the Jetze, 40 miles ESE. of Lunenburg, and 54 NE. of Zell.

LUCHY, a town of France, in the dep. of the Oise, 9 miles N. of Beauvais.

(1.) LUCIA, or ST ALOUSIE, or ST LUCIA, one of the Caribbee Islands, about 22 miles long, and 11 broad, the middle of it lying in Lon. 27. e. W. Lat. 39. 14. N. It was first settled by the French in 1650; but was reduced by the English in 1664, who evacuated it in 1666. The French immediately re-settled the island, but were again driven away by the Caribbs. As soon as the savages were gone, the former inhabitants returned for a short time; but being afraid of falling a prey to the first privateer that should visit their coasts, they removed to other French settlements that were stronger, or might be better defended. There was then no regular colony at St Lucia; it was only frequented by the inhabitants of Martinico, who came thither to cut wood, and to build canoes, and who had considerable docks on the island. In 1718 it was again settled by the French; but 4 years after, it was given by the British court to the duke of Montague, who was sent to take possession of it. This occasioned some disturbance between the two courts; which was settled, however, by an agreement made in 1731, that, till the respective claims should be finally adjusted, the island should be evacuated by both nations, but that both should have wood and

water there. This agreement furnished an opportunity for private interest to exert itself. The English no longer molested the French in their habitations; but employed them as their assistants, carrying on with richer colonies a smuggling trade which the subjects of both governments thought equally advantageous to them. This trade continued more or less considerable till the treaty 1763, when St Lucia was ceded to the crown of France. After that time the colony flourished considerably. In the beginning of 1772, the number of white people amounted to 2018 four men, women, and children; that of the black to 663 freemen, and 12,795 slaves. The estate consisted of 928 horses and mules, 2070 horn cattle, and 3184 sheep and goats. There were 38 sugar plantations, which occupied 978 plots of land; 5,395,889 coffee trees; 1,321,600 coconut plants; and 367 plots of cotton. There were 706 dwelling places. The annual revenue at that time was about 175,000l. which, according to the Abbé Raynal, must have increased one third yearly for some time. It was taken by the British fleet under admirals Byron and Barrington in 1779, but restored to France at the peace 1783. It was again taken by the British troops under Sir Charles Grey and Sir John Jervis 1794; but in 1795, the French, negroes, and mulattoes rose, and were so successful, that, April 1795, they were in possession of the whole island except Morne Fortune, which surrendered in May. But on the 26th May 1796, that and the whole island were recovered by Gen. Abercrombie, after an obstinate resistance; 12000 men taken prisoners. It was ceded to the French by the treaty of peace in 1801—2. The soil of St Lucia is tolerably good, even at the side; and is much better the farther one advances into the country. The whole of it is capable of cultivation, except some high and craggy mountains which bear evident marks of old canoes. In one deep valley there are still 8 or 10 ponds, the water of which boils up in a dreadful manner, and retains some of its heat at a distance of 6000 toises from its reservoirs. The air in the inland parts is unwholesome; but comes less noxious as the woods are cleared and the ground laid open. On some parts of the coast the air is rendered still more unhealthy, by the waters of some small rivers which spring from the foot of the mountains, and not having sufficient slope to wash down the sands with which the flux of the ocean stops up their mouths, stagnate and spread into unwholesome marshes on the neighbouring grounds.

(2.) LUCIA, ST, a high and mountainous island of Africa, one of the Cape de Verd Islands, about 12 leagues long. On the ESE. side is a harbour, with a bottom and shore of white sand; but the road is opposite to St Vincent's to the SW. where there are at least 20 fathoms of water. On the W. side there is no water. It abounds with game and land fowl, tortoises, &c. Lon. 24. 8. Lat. 16° or 17° 18' N.

(3.) LUCIA, ST, a town of the French republic in the island and dep. of Corsica; 6 m. NE. of Corte.

(4.) LUCIA, ST, a town of S. America, in

of Buenos Ayres, on the E. bank of the  
 12.) 140 miles N. of Santa Fe.

5.) LUCIA, St, a town and fort of Maritime  
 Stria, in the Trevisan.

6.) LUCIA, ST, a town of Sicily, in the valley  
 Demora; 7 miles N. of Messina.

LUCIAN, or LUCIANUS, a celebrated Greek  
 rhetor in the first century, born at Samosata, in  
 the reign of Trajan. He studied law and practised  
 some time as an advocate; but afterwards com-  
 menced rhetorician. He lived to the time of  
 Marcus Aurelius, who made him register of Alex-  
 andria in Egypt; and, according to Suidas, he  
 was at last worried by dogs, in his 90th year,  
 B. C. 180. Lucian was one of the finest wits in  
 antiquity. His Dialogues, and other works,  
 were written in pure Greek. In these he has join-  
 ed the useful to the agreeable, instruction to sa-  
 tisfaction, and erudition to elegance: They abound in  
 fine and delicate railery which characterises  
 the Attic taste.—Lucian has been censured as an  
 pious scoffer at religion, but surely religion  
 admits neither in the theology of the Pagan poets,  
 nor in the extravagant opinions of philosophers,  
 such he justly ridicules; but he no-where writes  
 against an over-ruling providence, though he  
 sometimes pollutes his wit with obscenity.

LUCIANA, a town of Spain in Andalusia.

1.) LUCIANISTS, or LUCANISTS, a religi-  
 ous sect, so called from LUCIANUS, or *Lucanus*,  
 heretic of the 2d century, a disciple of Mar-  
 cion, whose errors he followed, adding some new  
 ones to them. Epiphanius says he abandoned  
 Lucian; teaching that people ought not to mar-  
 ry; and yet other authors mention that he held  
 error in common with Marcion and other  
 heretics. He denied the immortality of the soul;  
 holding it to be material.

2.) LUCIANISTS, another sect who appeared  
 some time after the Arians. They taught, that  
 the Father had been a Father always, and that he  
 was the name even before he begot the Son; as  
 being in him the power or faculty of generation:  
 and in this manner they accounted for the eter-  
 nity of the Son.

LUCIANO, a town of Spain, in New Castile.

LUCIANUS. See LUCIAN, and LUCIANISTS.

(1.) \* LUCID. *adj.* [*lucidus*, Lat. *lucide*, Fr.]  
 Shining; bright; glittering.—

Over his *lucid* arms

A military vest of purple flow'd. *Milton.*  
 It contracts it, preserving the eye from being  
 injured by too vehement and *lucid* an object. *Ray.*  
 If a piece of white paper, or a white cloth, or  
 the end of one's finger, be held at the distance of  
 about a quarter of an inch, or half inch, from  
 that part of the glass where it is most in motion,  
 the electric vapour which is excited by the fric-  
 tion of the glass against the hand, will, by dath-  
 ing against the white paper, cloth, or finger, be  
 set into such an agitation as to emit light, and  
 make the white paper, cloth, or finger, appear  
 like a glow-worm. *Newton.*—

The pearly shell its *lucid* globe unfold,  
 And Phoebus warm the rip'ning ore to gold. *Pope.*  
 Pellucid; transparent.—

On the fertile banks

Of Abbaa and Phaphar, *lucid* streams. *Milton.*

—On the transparent side of a globe, half silver  
 and half of a transparent metal, we saw certain  
 strange figures circularly drawn, and thought we  
 could touch them, till we found our fingers stop-  
 ped by that *lucid* substance. *Gulliver.* 3. Bright  
 with the radiance of intellect; not darkened with  
 madness.—The long dissensions of the two houses,  
 which, although they had had *lucid* intervals and  
 happy pauses, yet they did ever hang over the  
 kingdom, ready to break forth. *Bacon.*—

Some beams of wit on other souls may fall,  
 Strike through and make a *lucid* interval.

*Dryden.*

—I believed him in a *lucid* interval, and desired  
 he would please to let me see his book. *Tatler.*—  
 A few sensual and voluptuous persons may, for a  
 season, eclipse this native light of the soul; but  
 can never so wholly smother and extinguish it,  
 but that, at some *lucid* intervals, it will recover  
 itself again. *Bentley.*

(2.) LUCID INTERVALS, intervals of reason that  
 occur between the fits of lunatics or maniacs,  
 wherein the phrenzy leaves them for a short time.

\* LUCIDITY. *n. f.* [from *lucid*.] Splendour;  
 brightness. *Dist.*

LUCIENSTEIG, ST, a narrow pass from the  
 country of the Grisons into Germany, 3 miles  
 from Meyenfeld, defended by a fort, which was  
 taken by General Massena, on the 6th March  
 1799.

(1.) LUCIFER, in astronomy, is the bright  
 planet Venus, which either goes before the sun  
 in the morning, and is our morning star; or in  
 the evening follows the sun, and then is called  
 HESPERUS or the evening star.

(2.) LUCIFER, in the mythology, the son of  
 Jupiter and Aurora.

(3.) LUCIFER, in ecclesiastical history, a cele-  
 brated bishop of Cagliari, in Sardinia, who gave  
 rise to a schism, by not admitting the decree of the  
 council of Alexandria, A. D. 362, for receiving  
 the Arian bishops, who recanted their errors.  
 He was banished by Constantius for defending  
 the Nicene doctrine concerning the Trinity. He  
 died A. D. 370. His works were published at  
 Venice.

LUCIFERA, in mythology, a surname given  
 to Diana, under which title she was invoked by the  
 Greeks in childbed. She was represented as cov-  
 ered with a large veil, interspersed with stars,  
 bearing a crescent on her head, and holding in  
 her hand a lighted flambeau.

LUCIFERIAN, a religious sect, who adhered  
 to the schism of *Lucifer*. (See LUCIFER, N<sup>o</sup> 2.)  
 St Augustine intimates, that they believed the  
 soul, which they considered as of a material na-  
 ture, to be transmitted to the children from their  
 fathers. They increased mightily in Gaul, Spain,  
 Egypt, &c. There were but two Luciferian bi-  
 shops, but a great number of priests and deacons.  
 They bore a peculiar aversion to the Arians.

\* LUCIFEROUS. *adj.* [*lucifer*, Latin.] Giving  
 light; affording means of discovery.—The experi-  
 ment is not ignoble, and *luciferous* enough, as  
 shewing a new way to produce a volatile salt.  
*Boyle.*

\* LUCIFICK. *adj.* [*lux* and *facio*, Latin.] Mak-  
 ing light; producing light.—When made to con-

verge, and so mixed together; though their *luck* motion be continued, yet by interfering, that equal motion, which is the colorifick, is interrupted. *Green.*

LUCIGNANO, a town of Etruria, 10 miles S. of Sienna. Lon. 11. 11. Lat. 43. 0. N.

LUCILIUS, Caius, a Roman knight, and a Latin poet, was born at Suessa in Italy, about 240 B. C. He served under Scipio Africanus in the war with the Numantines; and was in great favour with that celebrated general, and with Lælius. He wrote 30 books of satires, in which he lashed several persons of quality very sharply. Some learned men ascribe the invention of satire to him; but M. Dacier insists that Lucilius only gave a better turn to that kind of poetry, and wrote it with more wit and humour than his predecessors Ennius and Pæcivius had done. His fragments have been carefully collected by Francis Donza at Leyden, in 1599, with notes.

LUCINA, a goddess among the Romans, who presided over women in labour. Some take her to be Diana, others Juno, others make her a distinct goddess, daughter of Jupiter and Juno. She is called *Lucina*, because she brought children to light; from the Latin *lux*, light. The Greeks called her *ΙΟΥΝΙΑ*.

LUCINISSA, a town of Gotitia.

LUCINO, a river of Naples.

LUCIO, ST, a town of Etruria, 14 miles ESE. of Lephorn.

LUCIPARA, an island in the E. Indian Ocean. Lon. 105. 14. E. Lat. 4. 10. S.

(1.) LUCITO, a town of Naples, in Molise.

(2.) LUCIRO, ST, a town of Naples, in Calabria.

(1.) LUCIUS, a very common prænomen among the ancient Romans.

(2.) LUCIUS, the 1st Christian King of S. Britain, succeeded his father Coilus I. A. D. 170; and died in 181.

(3.) LUCIUS I. pope and saint, succeeded Cornelius in 252, and was martyred in 253.

(4.) LUCIUS II. pope, a native of Bologna, succeeded Celestin II. in 1144, and died in 1145.

(5.) LUCIUS III. succeeded Alexander III. in 1181, but was twice compelled to fly from Rome by popular insurrections. He is infamous for having, by a constitution made in 1184, for the extirpation of heresy, laid the foundation of the bloody INQUISITION.

(6.) LUCIUS, in ichthyology. See *ESOX*, N° 3.

\* LUCK. *n. f.* [*geluck*, Dutch.] 1. Chance; accident; fortune; hap; casual event.—

He forc'd his neck into a noose,  
To shew his play at fast and loose;

And, when he chanc'd t' escape, mistook  
For art and subtlety, his luck.

—Some such method may be found by human industry or *luck*, by which compound bodies may be resolved into other substances than they are divided into by the fire. *Boyle.* 2. Fortune, good, or bad.—

Glad of such *luck* she is, that lucky maid,  
A long time with this *luck* people find,  
To gather breath in many galleries. *Spenser.*  
Farewell, good *luck* go with thee. *Shak.*

I did demand what news from Shre  
He told me, that rebellion had ill *luck*.

—That part of mankind who have had th  
or the *luck*, to pass, in common opinion  
wisest, have followed a very different scent  
—Such, how highly soever they may  
*luck* to be thought of, are far from beu  
ites indeed. *South.*—

But all, it seems, who had the *luck* t  
Swear they ne'er tasted more delicious

LUCKAU, a town of Lubtia, 49 mi  
Dresden, and 50 SE. of Francfort on the

LUCKENS, a town of Sweden, in Dr

LUCKENWALDE, a town of Saxony,  
deburg. Great part of it was burnt in 1

\* LUCKILY. *adv.* [from *lucky*.] Fort  
by good hap.—It is the pencil thrown  
upon the horse's mouth, to express th  
which the painter with all his skill could  
*Dryden.*—It happens *luckily* for the  
of a new race of kings upon the Briti  
that the first of this royal line has all th  
fications. *Addison.*

\* LUCKINESS. *n. f.* [from *lucky*.] G  
tune; good hap; casual happiness.—  
sometimes lights on truth, is in the rig  
chance; and I know not whether the  
the accident will excuse the irregular  
preceding. *Litch.*

\* LUCKLESS. *adj.* [from *luck*.] Unto  
unhappy.—

Glad of such *luck* the *luckless* lacks,  
A long time with that savage people  
Though *luckless*, yet without disgrace  
What else but his immoderate lust  
Pray'rs made and granted in a *luckless*

LUCKNOW, an ancient and extensiv  
Hindustan, capital of Oude, but mean  
The walls of the houses are chiefly built  
and covered with thatch, though some are  
The streets are crooked, narrow, unev  
dirty; and in the rainy season hardly  
There are, however, a few magnificent  
Sujah Dowlah pulled down the ancient  
and erected others. That of the Nabob  
is seated on a high bank near the Gob  
commands an extensive view of the river a  
try, on the E. Lon. 81. 25. E. Lat. 26. 3

LUCKO, a town of Poland, capital  
hymia, with a citadel and bishop's see; i  
the Ster; 75 miles NE. of Lemburg, and  
of Warsaw. Lon. 25. 30. E. Lat. 51. 13.

\* LUCKY. *adj.* [from *luck*; *geluckig*.]  
Fortunate; happy by chance.

But I more fearful, or more *lucky* wi  
Disinay'd with that deformed, dismal  
Fled fast away. *Fai.*

Perhaps some arm more *lucky* than t  
May reach his heart, and free the wor  
bondage.

LUCO, a town of Naples, in Abruzzo

(1.) LUCON, or LUZON, a town of F  
the dep. of Vendee, and late prov. of Po  
is seated in a morass, on a canal 6 mil

of Fontenay, and 50 S. of Nantes.  
N. Lat. 46. 27. N.

l pain, all anger, and all pride,  
of pow'r, the blast of publick breath,  
of *lucre*, and the dread of death. *Pope.*  
LIA, a celebrated Roman lady, the wife  
of Collatinus, and the cause of the revo-  
me from a monarchy to a republic. Be-  
l by Sextus, the eldest son of Tarquin  
ed herself, A. A. C. 509. The bloody  
ith her dead body exposed to the se-  
he signal of Roman liberty; the ex-  
he Tarquins, and abolition of the re-  
was instantly resolved on, and carried  
See ROME.

LUCIUS CARUS, Titus, a celebrated  
pended of an ancient and noble  
y. He studied at Athens, where he  
e of Epicurus's sect, and acquired  
ation by his learning and eloquence;  
ower of his age fell into a frenzy, occa-  
a philtre given him by his wife, who  
edly fond of him. Lucretius, during  
s of his madness, put Epicurus's doc-  
verse, and composed his six books *De*  
*ra*, which are still extant. It is said  
ed himself in a fit of madness, A. A. C.  
11 years old. The most correct edi-  
ucretius, is that of Simon de Coline.  
al de Polignac has retranslated Lucretius's  
rguments in his excellent Latin poem  
*ti-Lucretius*. His poem *De rerum na-*  
een translated into English by Mr

IFEROUS. *adj.* [*lucrum* and *fero*, Lat.]  
rofitable.—Silver was afterwards sepa-  
te gold, but in a small quantity,  
eriment, the cost and pains consid-  
*luciferous*. *Bapt.*

IFICK. *adj.* [*lucum* and *facio*, Latin.]  
vain.

ENESS, the ancient inhabitants of  
Italy, which lies on the banks of the  
CRINUS.

CO, a lake or rather a bay of Italy,  
s; anciently called *Lucrinus*.

LUS LUCUS, a lake of Campania, be-  
and Putcoli, famous for oysters; (*Ho-*  
*al, Juvenal*;) now a perfect bay since

the earthquake in 1538. Mr Cruttwell says it is  
now a morass, filled with rushes. Dr Oppenheim  
says, it was filled up with earth by the *Monte Nu-*  
*ovo*, or new mountain, in 1538. It was separa-  
ted by a dyke from the Tyrrhene Sea.

\* LUCTATION. *n. f.* [*luctus*, Lat.] Struggle;  
effort; contest.

\* To LUCUBRATE. *v. a.* [*lucubrar*, Lat.] To  
watch; to study by night.

\* LUCUBRATION. *n. f.* [*lucubratio*, Latin.]  
Study by candle light; nocturnal study; any thing  
composed by night.—Thy *lucubrations* have been  
perused by several of our friends. *Taylor.*

\* LUCUBRATORY. *adj.* [*lucubratorius*, from  
*lucubror*, Lat.] Composed by candle light.—You  
must have a dish of coffee, and a solitary candle  
at your side, to write an epistle *lucubratory* to your  
friend. *Pope.*

\* LUCULENT. *adj.* [*luculentus*, Lat.] 1. Clear;  
transparent; lucid. This word is perhaps not u-  
sed in this sense by any other writer.—

And *luculent* along

The purer rivers flow. *Thomson's Winter.*  
2. Certain; evident.—They are against the obsti-  
nate incredulity of the Jews the most *luculent* tes-  
timonies that the Christian religion hath. *Hooker.*

LUCULLUS, Lucius Licinius, a Roman gene-  
ral, celebrated for his eloquence, his victories,  
and his riches. In his youth he made a figure at  
the bar; and being afterwards made quaestor in  
Asia, and praetor in Africa, governed those pro-  
vinces with great moderation and justice. Scarce  
was he known as a military man, when he twice  
beat the fleet of Hamilcar, and gained two great  
victories over him. His happy genius was great-  
ly improved by study; for he employed his leisure  
in reading the best authors on military affairs.  
Being made consul with Aurelius Cotta, during  
the 3d war with Mithridates king of Pontus, he  
was sent against this prince; and this expedition  
was attended with a series of victories, which did  
him less honour than an act of generosity towards  
his colleague; who, willing to take advantage of  
his absence to signalize himself by some great ex-  
ploit, hastened to fight Mithridates; but was de-  
feated and shut up in Calcedonia; where he must  
have perished, if Lucullus, sacrificing his resent-  
ment to his patriotism, had not flown to his as-  
sistance, and disengaged him. All Pontus then  
submitted to Lucullus; who being continued in  
his government of Asia, entered the territories of  
Tigranes, the most powerful king in Asia. That  
prince marched with a formidable army against  
Lucullus: who defeated him with a handful of  
men, and killed great numbers of his forces; took  
Tigranocertes, the capital of his kingdom; and  
was ready to put an end to the war, when the in-  
trigues of a tribune got him deposed, and Pom-  
pey nominated in his room. Lucullus having  
brought home prodigious riches, now gave him-  
self up to excessive luxury; and his table was  
loaded with a profusion till that time unknown.  
He brought from the East a great number of  
books, which he formed into a library, and gave  
admittance to all men of learning, who frequen-  
ted it in great numbers. Toward the end of his  
life, he fell into a kind of madness; and Lucullus,  
his brother, was appointed his guardian. He is

tail

said to have been the first who brought cherries into Europe, having brought the rafts from Pontus.

LUCUMO, the first name of TARQUIN I. changed afterwards to LUCIUS. See ROME.

LUCUS, a wood, or grove, sacred to a deity, so called à *lucendo*, because a great number of lights were usually burning in honour of the god; a practice common with idolaters; as we learn from Scripture: hence Homer's *αγλαυκός*.

LUCY, a town of the French republic, in the dep. of Mont Blanc, (late duchy of Savoy,) on the Rhone, 16 miles NW. of Chambéry.

LUD, a British king mentioned in old chronicles, and said to have reigned about A. M. 3878. He is reported to have enlarged and built walls about *Troynewant*, or new Troy, where he kept his court, and made it his capital. The name of London is hence derived from *Lud's town*; and *Ludgate*, from his being buried near it: but other derivations are at least as probable. See LONDON, § 2.

LUDAIA, a town and district of JAVA.

LUDE, a town of France, in the department of the Sarthe, and district of Fleche.

LUDENSCHEID, or LUNSCHEDÉ, a town of Westphalia, in the county of Mark, famous for its iron works. It was almost totally burnt in 1723. It lies 28 miles NE. of Cologne.

LUDER, a town of Germany, 6 miles W. of Fulda.

LUDERSBURG, a town of Saxony, in Lawenburg, on the Elbe, 5 miles above Lawenburg.

LUDI, in Roman antiquity, shows and public games made for the entertainment of the people. See GAME, § 3. For the particular games of Greece and Rome, see ATELLANI, ISTHMIÀ, NEMEAN, OLYMPIC, &c.

\* LUDICROUS. *adj.* [*ludicr*, Lat.] Burlesque; merry; sportive; exciting laughter.—Plutarch quotes this instance of Homer's judgment, in closing a *ludicrous* scene with decency and instruction. *Broom*.

\* LUDICROUSLY. *adv.* [from *ludicrous*.] Sportively: in burlesque; in a manner that may excite laughter.

\* LUDICROUSNESS. *n. f.* [from *ludicrous*.] Burlesque; sportiveness; merry cast or manner; ridiculousness.

\* LUDIFICATION. *n. f.* [*ludificor*, Lat.] The act of mocking, or making sport with another. *Dis*.

LUDINO, a hill of maritime Austria, in Friuli.

LUDITZ, a town of Bohemia, in Saats.

LUDIUS, a celebrated painter, who lived in the reign of Augustus, and excelled in grand compositions. He was the first who painted the fronts of houses in the streets of Rome; which he beautified with great variety of landscapes, and other subjects.

(1.) LUDLOW, Edmund, son of Sir Henry Ludlow, was born at Maidenhead, and educated in Trinity college, Oxford. His father opposing K. Charles I.'s interest, he joined the same party, and was present at the battle of Edgehill as a volunteer under the earl of Essex. Upon the death of his father, he was chosen M. P. for Wilts, and obtained the command of a regiment of horse for the defence of that county. He was one of the king's judges; after whose death he was sent by parliament into Ireland, in quality of lieu-

tenant general of the horse; which employment he discharged with diligence and success till the death of the lord deputy Ireton, when he was for some time as general, though without the title; Cromwell, who knew him to be sincerely the interest of the commonwealth, always found out some pretext to hinder the conferring of that character upon him. The last stroke had been given by Ludlow to the Irish rebellion, if the usurpation of Cromwell had not prevented it. Upon him he never acted; and though Cromwell, by his utmost efforts, he remained inflexible. After Cromwell's death, he endeavoured to restore the commonwealth; but Charles II. being recalled, he concealed himself, and escaped into Switzerland, where he settled at Vevay. After the revolution, he came over into England, to be employed in Ireland against King James; but, appearing publicly in London, an address was presented to Sir Edward Seymour to King William III. in proclamation in order to apprehend Colonel Ludlow, attainted for the murder of King Charles I. Upon this he returned to Vevay, where he died in 1693. During his retirement in Switzerland he wrote his *Memoirs*; which were published in 2 vols. 8vo. and 1 vol. folio.

(2.) LUDLOW, a town of Shropshire, at the confuix of the Tame and the Corve, 18 miles from Shrewsbury, and 138 from London. It was the president of the council of the marches, established by Henry VIII. generally kept his courts in it, which the town was much benefited. But the courts were abolished in 1688. Its neighbourhood to Wales makes it a great thoroughfare, and was incorporated by Edward IV. and has the privilege of trying and executing criminals. It is one of the neatest towns in England; and has walls and 7 gates. It is divided into 4 wards, and is governed by 2 bailiffs, 12 aldermen, and 12 common council men, a recorder, town clerk, steward, chamberlain, coroner, &c. From the castle on the top of the hill on which the town stands is a most delightful prospect. In an apartment of the outer gatehouse BUTLER is said to have written the first part of his *Hudibras*. The castle was besieged and taken by K. Stephen. Some of the offices are fallen down, and a part of it turned into a bowling-green; but a part of the royal apartments and the sword of state still left. The battlements are very high and thick, and adorned with towers. It has a near church, where are the coats of arms of many Welch lords, and over the stable-doors are the arms of Elizabeth, the earls of Pembroke, &c. This castle was a palace of the prince of Wales. The Tame has a good bridge, several weirs, and turns many mills. Here is a large parish church, in the choir whereof is an inscription relating to Prince Arthur, elder brother to Henry VIII. who died here, and whose bowels were deposited. In the market-place is a conduit, with a long stone cross on it, and a niche where the image of St Laurence, to whom the church was dedicated. It has an alms-house for 301 people, and two charity schools for 50 boys and 30 girls. It has 4 weekly markets and 5 fairs, has annual horse-races, and the country round exceedingly pleasant, fruitful, and populous.

at part called the *Corvedale*, being the banks of the Corve. Ludlow lends hers to parliament.

**DOLPH**, Job, a very learned writer of century, born at Erfurt in Thuringia, 1624. He travelled much, and was manuscripter; visited libraries, searched after curiosities and antiquities every where, and conversed with learned men of all nations. He raised him to the rank of councillor of after 18 years service, to that of honorary. He died at Francfort, April 8, 1704. He published A History of Ethiopia, in 1685; an Ethiopic Grammar, and many other books.

**DOLPH**, Henry William, nephew of (1.) was born at Erfurt in 1655. He came to England as secretary to M. Lenth, in the court of Copenhagen to that of Denmark, and being recommended to Prince Denmark, was received as his secretary. He enjoyed this office for some years, until incapacitated by a violent disorder; when discharged with a handsome pension: afterwards, he travelled into Muscovy, where he was received by the Czar, and where his talents made the Muscovite priests suppose him to be a conjuror. On his return to London he was cut for the stone; and as soon as he was able to permit, in acknowledgment of the civilities he had received in Muscovy, he published a Grammar of their language, that the nation might learn their own tongue in a regular manner. He then travelled into the East, to inspect the state of the Christian church in that part; the deplorable condition of which he found, after his return, with the aid of the Bishop of Worcester, to print an edition of the Testament in the vulgar Greek, to present to the Greek church. In 1709, when great numbers of Jesuits came over to England, Mr Dolph was appointed by Q. Anne one of the commissioners to manage the charities raised for them; and died early in 1710. His collected works were published in 1712.

**LOGIA**, in botany, a genus of the monandria class, belonging to the tetrandria class, and in the natural method ranking under the order, *Calycanthemae*. The corolla tubular; the calyx quadripartite, superfluous tetragonal, quadrilocular, inferiously 4-lobed.

**DWIGSBURG**, a town of Suabia, in Germany, 5 miles NNE. of Stuttgart.

**DWIGSBURG**, a town of Pomerania.

**DWIGSBURG**, a town of Wirtemberg.

**LOGIUM**. See **LOQUENTINUM**. In medicine, is in general used for a diffusive kind; but in a more particular sense, to contagious and pestilential diseases. The *lues Gallica*, or *venerica*, signifies the venereal disease. See **MEDICINE**, *Index*.

**LOGO**, a town of Spain, in Arragon.

**LOG**, *n. f.* [In Scotland.] The palm of the hand. **LUFF**, *v. n.* [or *loof*.] To keep close. **LUG**, *v. n.* To keep close. **LUG**, *v. n.* To keep close. **LUG**, *v. n.* To keep close.

Contract your swelling sails, and luff to wind. *Dryden.*

(1.) To **LUFF** signifies to put the helm towards the lee side of the ship, in order to make the ship sail nearer the direction of the wind. Hence the pilot's orders to the steersman, *luff round*, or *luff a-lee*, is the excess of this movement, by which it is intended to throw the ship's head up in the wind, in order to tack her, &c. A ship is accordingly said to *spring her luff* when she yields to the effort of the helm, by sailing nearer to the line of the wind than she had done before. See **TO HAUL THE WIND**.

**LUFF-TACKLE**, a name given by sailors to any large tackle that is not destined for a particular place, but may be variously employed as occasion requires. It is generally somewhat larger than the jigger tackle, although smaller than those which serve to hoist the heavier materials into and out of the vessel, which latter are the main and fore tackles, the stay and quarter tackles, &c.

(1.) \* **LUG**, *n. f.* 1. A kind of small fish.—The seed on salt unmerchanted pilchards, tag worms, *lugs*, and little crabs. *Carew*. 2. [In Scotland.] An ear. 3. *Lug*, a land measure, a pole or perch.—

That ample pit, yet far renown'd  
For the large leap which Debon did compel  
Caulin to make, being eight *lugs* of ground.

(2.) **LUG**, a river of Herefordshire, which runs into the Wye, near Hereford.

(3.) **LUG** a river of Wales, which rises in Radnorshire, and runs through Salop and Monmouthshire, into the Severn, near Chepstow.

(1.) \* To **LUG** *v. a.* [*alucan*, Saxon, to pull; *luga*, Swedish, the hollow of the hand.] 1. To hale or drag; to pull with rugged violence.—

Ye gods! why this  
Will *lug* your priests and servants from your  
sides. *Shakesp.*

Thy bear is safe, and out of peril,  
Though *lugg'd* indeed, and wounded very ill.  
*Hudibras.*

When savage bears agree with bears,  
Shall secret ones *lug* saints by th' ears? *Hudib.*  
Like hounds ill coupled; Jowler *lugs* him still  
Through hedges. *Dryden.*

Whose pleasure is to see a strumpet tear  
A cynick's beard, and *lug* him by the hair.  
*Dryden.*

—Either every single animal spirit must convey a whole representation, or else they must divide the image amongst them, and so *lug* off every one his share. *Collier*. 2. To **LUG** *out*. To draw a sword, in burlesque language.—

But buff and beltmen never know these cares;  
They will be heard, or they *lug out* and cut.  
*Dryden.*

(2.) \* To **LUG**, *v. n.* To drag; to come heavily: perhaps only misprinted for *lags*.—

My flagging soul flies under her own pitch,  
Like fowl in air too damp, and *lags* along,  
As if she were a body in a body. *Dryden.*

**LUGA**, a mountain of the Italian republic, in the cis-devant county of Bormio; 10 miles N. of Bormio.

(1.) LUGANO, or LUCANO, one of four cidevant ITALIAN BAILIEWICS, formerly belonging to Switzerland, but united to the Cisalpine republic in Oct. 1797, and included in the dep. of Verbano. It is now included in the Italian republic, dept. of the Lario, and district of Varese. It is 20 miles long and 13 broad; containing 60 square miles; 106 towns and villages, and 53,000 citizens, in 1797.

(2.) LUGANO, a trading town of the Italian republic, late capital of the above bailiwick, seated on the N. side of the lake, (N<sup>o</sup> 3.) and containing about 8000 citizens: 16 miles NW. of Como, and 16 SE. of Bellinzona.

(3.) LUGANO, a lake of the Italian republic, in the centre of the above bailiwick, 25 m. long and from 2 to 4 broad; 190 feet higher than the lakes of Como and Locarno.

LUGDE, a town of Germany, in Paderborn.

(1.) LUGDUNUM, in ancient geography, the capital of the Segufiani in Gallia Celtica, situated at the conflux of the Arar and Rhodanus, on an eminence, as the Celtic term *dun* signifies; built by Manutius Plancus under Augustus, while commanding in that part of Gaul; and whither he led a colony. It is now called LYONS.

(2.) LUGDUNUM BATAVORUM, in ancient geography, a town of the Batavi in Gallia Belgica; now called LEYDEN.

(3.) LUGDUNUM CONVENARUM, in ancient geography, a town of Gallia Narbonensis, in Aquitania, at the foot of the Pyrenees. Now called ST BERTRAND. See CONVENÆ.

LUGEUS LACUS, in ancient geography, a lake of Japydia, in Illyricum, S. of the Save, near the head of the Arfia: Now commonly called the ZIRICHNITZ LAKE, from a small adjoining town. It is furrowed with mountains, from which currents run down into earthy and rocky furrows; where, the water becoming redundant, it regurgitates, returning with extraordinary celerity, and spreading itself, forms a lake, in most places 18 cubits deep. These waters afterwards retire with no less celerity than they came on, not only through the furrows, but through the whole of the bottom, as through a sieve; which when perceived by the inhabitants, they stop up the larger apertures, and thus take great quantities of fish. When the lake is dry, they cut down their harvest on the spot where they sowed, and sow again before the inundation comes on; and grass shoots so quick on it, that it may be cut down in three weeks. (*Lazius; Wernherus.*) See CZIRNITZER ZEE.

\* LUGGAGE. *n. f.* [from *lug*.] Any thing cumbersome and unwieldy that is to be carried away; any thing of more weight than value.—

Come, bring your *luggage* nobly on your back, *Shakesp.*

What do you mean

To doat thus on such *luggage*? *Shak.*

Think not thou to find me slack, or need

Thy politick maxims, or that cumbersome

*Luggage* of war these shewn me. *Milton.*

How durst thou with that fullen *luggage*

O' th'self, old ir'n, and other baggage,

T' oppose thy number against us? *Hudibras.*

—If the *luggage* be prized equally with the jew-

els, none will be cast out till all be st *Glanville.*—

A lively faith will bear aloft the r  
And leave the *luggage* of good worl

—I am gathering up my *luggage*, and  
for my journey. *Swift to Pope.*

LUGGARIS. See LOCARNO, N<sup>o</sup>

LUGGERSHALL, an ancient t  
Wiltshire, 12 miles N. of Salisbury, at  
W. of London. It is now a small ham  
forest of Chute, in a delightful count  
merly was the residence of several kin  
a castle. It is governed by a bailiff cho  
the lord of the manor's court-leet. I  
25th July, and sends two members to  
Lord George Gordon sat as one of  
GORDON, N<sup>o</sup> 2.

LUGII, or LOGIONES. See LYGI

LUGNY, a town of France, in the d  
and Loire, 6 m. NE. of Clunay, and 10 J

(1.) LUGO, a town of the Italian  
the dep. of the Lower Po, and late d  
rara; 15 miles S. of Ferrara, and 1  
Bologna. In July 1796, the inhabitants  
rose against the French, after the whol  
submitted. A bloody battle ensued,  
3 hours: 1000 of the insurgents and  
French were killed; the town was gi  
pillaged, and its name changed to Ce

(2.) LUGO, a town of Maritime Ar  
prov. of the Paduano, 10 miles E. of

(3.) LUGO, a city of Spain, in Galicia  
ho, anciently the metropolis of Spai  
are from 12 to 15 feet thick. It is a  
and contains 3 parishes, 4 convents,  
tals. It is famed for its hot baths; a  
SW. of Oviedo. Lon. 8. 52. W. La

(4.) LUGO, John, a learned Jesuit,  
drid, and educated at Salamanca. I  
fessor of divinity at Valladolid, and a  
Rome, where Urban VIII. made him  
He was the first who introduced the  
into France, in 1650. He died at Ro  
His works, on theology, were print  
in 7 vols. fol.

LUG-SAIL, a square sail, hoisted on  
the mast of a boat or small vessel  
which hangs nearly at right angles w  
These are more particularly used in t  
gas, navigated by the Spaniards in  
ranean.

\* LUGUBRIOUS. *adj.* [*lugubre*,  
Lat.] Mourful; sorrowful.—A demt  
a *lugubrious* look, a whining tone, u  
sum of many mens humiliations. *De*

LUIHE, a river of Saxony, in Lan

LUISINI, or } Francis, a learned V  
LUISINO, } in 1523, who taught  
Latin at Reggio, and was secretary  
Parma. He wrote illustrations of o  
ges in the Clashes; published in Gru  
tium. He died in 1568.

LUISTRE, a town of France, in th  
Aube, 6 miles NE. of Arcis, and 9 J

(1.) LUITPRAND, a celebrated I  
torian of the 10th century, born at Pa  
secretary to Bercngarius, who, in 9-

lor to Constantine VIII; but having affronted him, Otho I. drove Berengarius the throne, and made Luitprand bishop on a. In 968, he was sent ambassador to Nicephorus Phocas. He died in Italy. His works were printed at Antwerp, in 1640, in folio. LUITPRAND, K. of Lombardy. See LOMBARDO.

LUKE, ST, the evangelist, and the disciple of Paul, was originally of Antioch in Syria, a physician. He particularly followed himself to St Paul, and was his faithful companion in his travels and labours. He went first to Troas in Macedonia, about A. D. 51, to preach his Gospel in Achaia about 53; and then to the Acts of the Apostles, which contains a full account of his life. Of all the inspired writers of the New Testament, his works are written in the most elegant Greek. It is believed, that St Luke wrote his Gospel, or in Achaia.

LUKE, ST, THE EVANGELIST'S DAY, a festival in the Christian church, observed on the 18th of October.

LUKE, ST, THE GOSPEL OF, a canonical Gospel in the New Testament. Some think that it is the Gospel of St Paul's Gospel; and that, when the evangelist speaks of his Gospel, he means what St Luke's. Irenaeus says, that St Luke in writing what St Paul preached to the Romans; and Gregory Nazianzen tells us, that St Luke wrote with the assistance of St Paul.

LUKEWARM. *adj.* [The original of this word is *lulub*, in Saxon, is *bleoth*; in Dutch *blig*; in Dutch *lie-wete*; whence proper *luke*, to which warm may be added, to make it, by the first word, the force of the fever, *boiling hot*.] 1. Moderately warm; so warm as to give only a pleasing

heat, whose life away did pass,  
flow'd in his own yet *luke-warm* blood,  
from his wound yet welled fresh alas!

*Fairy Queen.*

you a better feast never behold,  
not of mouth friends: smoke and *luke-warm* water

perfection. *Shak. Timon of Athens.* The body in *luke-warm* water is of great use to temperate hot and sharp humours. Whence is it but from this power that water, which alone distils with *luke-warm* heat, will not distil from salt without a great heat? *Newton's Opticks.* *gentle*; not ardent; not zealous.—If some men be staid, it is an obedience to *luke-warm* languishing, that it merits not the name of *dryden*.—

sober conduct is a mighty virtue  
*warm patriots.* *Addison's Cato.*

LUKEWARMLY. *adv.* [from the adjective.] moderate warmth. 2. With indifference.

LUKEWARMNESS. *n. f.* [from *luke-warm*.] moderate or pleasing heat. 2. Indifference; ardour.—Some kind of zeal counts all moderation *luke-warmness*. *K. Charles.*—The effect of zeal is *luke-warmness*, or coldness; the excess is inordinate heat and spiciness. *Spratt.*—Go dry your chaff and stub-

ble, give fire to the zeal of your faction, and reproach them with *luke-warmness*. *Swift.*

(1, 2.) LULA, a town of Swedish Lapland; seated at the mouth of the river LULA, on the W. side of the gulph of Bothnia, 42 miles SW. of Tornea. Lon. 21. 0. E. Lat. 64. 30. N.

(3.) LULA LAPMARK, a province of Swedish Lapland; bounded by that of Tornea on the N. by the Bothnic Gulph on the E. by Pithia Lapmark on the S. and Norway on the W.

LULAND, an island of Cornwall.

\* To LULL. *v. a.* [*lulu*, Danish; *lallo*, Latin.]

1. To compose to sleep by a pleasing sound.—

A gentle stream, whose murmuring wave did play

Amongst the pumy stones, and made a sound  
To lull him soft asleep, that by it lay. *F. Queen.*

Such sweet compulsion doth in musick lie,  
To lull the daughters of necessity. *Milton.*

These lull'd by nightingales embracing slept. *Milton.*

2. To compose; to quiet; to put to rest.—

To find a foe it shall not be his hap,  
And peace shall lull him in her flow'ry lap. *Milt.*

No more these scenes my meditations aid,  
Or lull to rest the visionary maid. *Pope.*

By the vocal woods and waters lull'd,  
And lost in lonely musing in a dream. *Thomson.*

\* LULLABY. *n. f.* [*lullus*, Latin. *Quem nutricum fuisse deum contendit Turnebus, from lull: it is observable, that the nurses call sleep by, by; lullaby is therefore lull to sleep.*] A song to still babes.

Only that noise heav'n's rolling circles kept,  
Sung lullaby, to bring the world to rest. *Fairf.*

Phœmel, with melody,

Sing in your sweet lullaby. *Shakespeare.*

—Marry, Sir, lullaby to your bounty till I come again. *Shakespeare.*—Drinking is the *lullaby* used by nurses to still crying children. *Locke on Education.*

LULLI, John Baptist, the most celebrated musician that has appeared in France since the revival of learning, was born at Florence. He was taken to France when very young, and he carried the art of playing on the violin to the highest perfection. Lewis XIV. made him superintendant of music. Some time after Perinna having introduced operas into France, and quarrelling with his company, he resigned his privilege to Lulli. Operas were then carried to the utmost perfection by him, and were attended with continual applause. Lulli gave a piece of his own composition, annually till his death, in 1687.

(1.) LULLY, Raymond, a famous writer, surnamed the *Enlightened Doctor*, was born in Majorca in 1225. He applied himself with indefatigable labour to the study of the Arabian philosophy, to chemistry, physic, and divinity; and acquired great reputation by his works. He at length went to preach the gospel in Africa; and was stoned to death in Mauritania, at the age of 80. He is honoured as a martyr at Majorca, whither his body was carried. He wrote many treatises on all the sciences, in which he shows much study and subtilty, but little judgment or solidity. A complete edition of his works has been printed at Mentz.

(2.) LULLY, Raymond, surnamed *Neoplyssa*, a native of Terraca, who from being a Jew turned

Dominican friar. He maintained several opinions that were condemned by Pope Gregory XI.

(1.) \* LUMBAGO, *n. f.* [*lumbi*, Lat. the loins.] *Lumbago* are pains very troublesome about the loins, and small of the back, such as precede ague fits and fevers: they are most commonly from fullness and acrimony, in common with a disposition to yawnings, shudderings, and erratick pains in other parts, and go off with evacuation, generally by sweat, and other critical discharges of fevers. *Quincy.*

(2.) LUMBAGO. See MEDICINE, *Index*.  
LUMBALES, or } the arteries and veins which  
LUMBARES, } spread over the loins.  
LUMBAR NERVES. } See ANATOMY, *Index*.  
LUMBAR REGION. }

(1.) \* LUMBER, *n. f.* [*Uona, geloma*, Saxon, householdstuff; *loumering*, the dirt of an house, Dutch.] Any thing useless or cumbersome; any thing of more bulk than value.—

The very bed was violated  
By the coarse hands of filthy dungeon villains,  
And thrown amongst the common lumber. *Otway.*  
If to some useful art he be not bred,  
He grows mere lumber, and is worse than dead. *Dryden.*

Thy neighbour has remov'd his wretched  
store,  
Few hands will rid the lumber of the poor. *Yew.*  
—If God intended not the precise use of every  
single atom, that atom had been no better than a  
piece of lumber. *Greene.*—

The poring scholasts mark;  
Wits, who, like owls, see only in the dark;  
A lumber-house of books in every head. *Pope.*

(2.) LUMBER, a town of Spain, in Navarre.  
(1.) \* To LUMBER, *v. a.* (from the noun.) To  
heap like useless goods irregularly.—In *Rollo* we  
must have so much stuff *lumbered* together, that  
not the least beauty of tragedy can appear. *Rymer.*

(2.) \* To LUMBER, *v. n.* To move heavily, as  
burthened with his own bulk.—  
First let them run at large,  
Nor lumber o'er the meads, nor cross the wood. *Dryden.*

LUMBERTON, a post town of N. Carolina,  
capital of Robeson county.

LUMBRICALS, 4 muscles of the fingers, and  
as many of the toes. See ANATOMY, § 214, 218.

LUMBRICUS, the WORM, in zoology; a ge-  
nus of insects belonging to the order of vermes in-  
testina. The body is cylindrical, annulated, with  
an elevated belt near the middle, and a vent-hole  
on its side. There are two species of this animal.

1. LUMBRICUS MARINUS, the marine worm, or  
lug, is of a pale red colour, and the body is com-  
posed of a number of annular joints; the skin is  
fibrous, and all the rings or joints are covered  
with little prominences, which render it extreme-  
ly rough to the touch. See *Plate CCIII. Fig. 14.*  
It is an inhabitant of the mud about the sea shores,  
and serves for food to many kinds of fish: surpris-  
ing large ones are to be met with about the Boy-  
jar rocks in Sicily. The fishermen bait their  
hooks and nets with them. For the effects of  
these animals in the human body, and the method  
of expelling them, see MEDICINE, *Index*.

2. LUMBRICUS TERRESTRIS, the ear-  
worm, Mr Barbut observes, differs exte-  
riourly in colour and external appearance in the  
periods of its growth, which has occasi-  
onally little acquainted with the variation  
kind of animals to make four or five diff-  
erent species of them: The general colour is a d  
They live under ground, never quitting  
but after heavy rains or at the approach  
and in the season of their amours. The  
to force them out is, either to water the  
with infusions of bitter plants, or to traun  
The bare motion on the surface of the  
them up, in fear of being surpris'd by the  
dable enemy the mole. The winding pr  
of the worm is facilitated by the inequal  
body, armed with small, stiff, sharp-poi  
tles: when it means to insinuate itself  
earth, there oozes from its body a clam  
by means of which it slides down. It i  
mages the roots of vegetables. Its food  
portion of earth, which it has the facu  
getting. The superfluous is ejected by v  
crement, under a vermicular appearanc  
worms are hermaphrodites, and have th  
generation placed near the neck: their c  
is performed on the ground; nothing be  
usual than to see it full of holes, which  
thought to be made by those kind of v  
ming to the surface in quest of females.  
their coition they would sooner suffer t  
to be crushed than parted.

LUMELLIN, a ci-devant district in t  
of Milan, lying along the Po. Mortari  
lencia are the principal places. It was  
the duke of Savoy in 1707, and confirm  
treaty of Utrecht in 1713; but is now in  
the Italian republic, and dep. of Osona.

LUMELLO, a small town of the  
public, in the above district, formerly tho  
of the kings of Lombardy; 26 m. SW.

LUMIZZANO, a valley of the Ital-  
lie, in the dep. of the Mincio district.  
duchy of Verona, containing 2 villages &  
citizens.

\* LUMINARY, *n. f.* [*luminare*, Lat.  
Fr.] 1. Any body which gives light.—  
The great luminary

Dispenses light from far.  
2. Any thing which gives intelligence.—  
Graham, I know not upon what *lumi-  
nary* pieced in his face, dissuaded him from  
*Wotton*. 3. Any one that instructs in  
The circulation of the blood, and the v  
spring of the air, had been reserved for  
py discovery by two great *luminaries* of  
*Bacon*.

\* LUMINATION, *n. f.* [from *lumen*.  
of light. *Diſt.*

(1.) \* LUMINOUS, *n. f.* [*luminosus*, I  
Shining; emitting light.—Fire burneth  
making it first *luminous*, then black and b  
lastly, broken and incinerate. *Bacon*.—

Its first convex divides  
The *luminous* inferior orbs includ'd,  
From chaos.  
—How came the sun to be *luminous*?

sity of natural causes. *Bentley*. 2. En-  
l.—

th may, industrious of herself, fetch day,  
lling east; and with her part averfe  
the sun's beam, meet night; her other part  
*minous* by his ray. *Milton*.  
ig; bright.—The most *luminous* of the  
k colours are the yellow and orange;  
ct the senses, more strongly than all the  
ther. *Newton*.

UMINOUS EMANATIONS have been ob-  
om human bodies, as well as from those  
The light arising from currying a horse,  
g a cat's back, are well known. Similar  
have been observed on combing a woman's  
rtholin gives an account, which he entitles  
*endens*, of a lady in Italy whose body shined  
ightly touched with a piece of linen. These  
of animal bodies have many properties in  
with those produced from glass; such as  
id, snapping, and not being excited with-  
degree of friction; and are undoubtedly e-

LO, a town of Corfica, 5 m. E. of Calvi.  
SDEN, Andrew, Esq; a lite eminent  
ian and man of letters, born in Aberdeen,

He was of the family of Cushnie, in A-  
hire, and in the early period of his life,  
into Italy, and resided a considerable time  
; during which he wrote a work, enti-  
*marks on the Antiquities of Rome and its*  
; wherein he describes the venerable an-  
of that ci-devant metropolis of the world,  
al fidelity and elegance. He afterwards  
any years at Paris, where his company  
;ht after by many of the first literati  
He returned to his native country, and  
the house of John McGouan, Esq; the  
id companion of his youth, on the 26th  
of.

MEN, a town of the French republic, in  
of the Dyle, and late proy. of Austrian  
; 5 miles E. of Dieft.  
O, a town of Cuba, 25 miles SW. of Ha-

MP. *n. f.* [*lompe*, Dutch.] 1. A small  
any matter.—The weed *kal* is by the E-  
used first for fuel, and then they crush  
s into *lumps* like a stone, and so sell them  
Venetians. *Bacon*.—Without this various  
of the water, how could *lumps* of sugar  
ast into it be so perfectly dissolved in it,  
*lumps* themselves totally disappear? *Boyle*.

A wretch is pris'ner made;  
e flesh turn off by *lumps*, the rav'nous foe  
rself cut.

*Tate*.  
ry fragrant flow'r, and od'rous green,  
forted well, with *lumps* of amber laid be-  
ween.

*Dryden*.  
nceive thus of the foul's intimate union  
infinite being, and by that union receiving  
leads one into as gross thoughts, as a

country maid would have of an infinite butter-  
print, the several parts whereof being applied to  
her *lump* of butter, left on it the figure or idea  
there was present need of. *Locke*. 2. A shapeless  
mass.—

Hence, heap of wrath, soul indigested *lump*;  
As crook'd in thy manners as thy shape. *Shak*.  
—Why might there not have been, in this great  
mass, huge *lumps* of solid matter, which, without  
any form or order, might be jumbled together?  
*Keil against Burnet*. 3. Mass undistinguished.—  
All men's honours

Lie like one *lump* before him, to be fashion'd  
Into what pinch he please. *Shak*.

—It is rare to find any of these metals pure: but  
copper, iron, gold, silver, lead, and tin, all pro-  
miscuously, in one *lump*. *Woodward*. 4. The whole  
together; the gross.—If my readers will not go  
to the price of buying my papers by retail, they  
may buy them in the *lump*. *Addison*.—Other epi-  
demical vices are rise and predominant only for a  
season, and must not be ascribed to human nature  
in the *lump*. *Bentley*.—The principal gentlemen of  
several counties are stigmatized in a *lump*, under  
the notion of being papists. *Swift*.

\* To LUMP. *v. u.* To take in the gross, with-  
out attention to particulars.—The expences ought  
to be *lumped* together. *Asliffe*.—The Spaniards u-  
pon this reckoned, that if Spain of itself weighed  
so well, they could not fail of success when the  
several parts of the monarchy were *lumped* in the  
same scale. *Addison*.

(1.) \* LUMPFISH. *n. f.* [*lump* and *fish*.] A sort  
of fish.

(2.) LUMPFISH. See CYCLOPTERUS, N° 2.

(1.) LUMPHANAN, [Gael. *i. e.* a bare little  
valley.] a parish of Aberdeenshire, 9 miles long  
from S. to N. and 6 broad; mostly surrounded by  
hills. The air is dry; the soil fertile, and the crops  
of oats, barley, peate, potatoes, &c. early. The  
population, in 1792, was 621; decrease 61: num-  
ber of horses 153; sheep 1907; and black cattle,  
902. The roads are good.

(2.) LUMPHANAN, a town in the above parish,  
8 miles N. of Kincardine, and 24 from Aberdeen.

\* LUMPING. *adj.* [from *lump*.] Large; heavy;  
great. A low word.—Nick, thou shalt have a  
*lumping* pennyworth. *Arbutnot*.

\* LUMPISH. *adj.* [from *lump*.] Heavy; gross;  
dull; unactive; bulky.—Out of the earth was  
formed the flesh of man, and therefore heavy and  
*lumpish*. *Raleigh*.—

Sylvia is *lumpish*, heavy, melancholy. *Shak*.

We are too dull and *lumpish*. *Suckling*.  
—Little terrestrial particles swimming in it after  
the grossest were sunk down, which, by their hea-  
viness and *lumpish* figure, made their way more  
speedily. *Burnet*.—

How dull and how insensible a beast  
Is man, who yet wou'd lord it o'er the rest?  
Philosophers and poets vainly strove

In every age the *lumpish* mass to move. *Dryden*.

\* LUMPISHLY. *adv.* [from *lumpish*.] With  
heaviness: with stupidity.

\* LUMPISHNESS. *n. f.* [from the adjective.]  
Stupid heaviness.

\* LUMPY. *adj.* [from *lump*.] Full of lumps;  
full of compact masses.—One of the best spades to  
dig

dig hard lumpy clays but too small for light garden mould. *Mortimer.*

(1.) LUN, a town of China, in Hon-Quang.

(2.) LUN, or LUNE, a river of Germany, in Bremen, which runs into the Weser.

(3.) LUNA, in astronomy, the MOON. See ASTRONOMY, *Index*, under MOON.

(4.) LUNA, in alchemy, signifies silver; from the supposed influence of the moon upon that metal.

(5.) LUNA, in ancient geography, a forest of Germany, near the HERCYNIA; below which were the Boemi: it was therefore in Moravia, near the springs of the Marus, now March; which runs into the Danube over against Carnutum.

(6.) LUNA, or LUNNA, a town of Gallia Celtica, now called CLUGNY, in Burgundy.

(7.) LUNA, a town and port of Liguria, at the mouth of the Macra. The town was but small, but the port large and beautiful, according to Strabo. Its ruins are called *Luna Distrutta*. It was famous for its quarries of white marble, thence called *Lunense*; and for its large cheeses, each weighing 1000 lb. It lies 2 miles S. of Sarzana.

(8.) LUNA, a town of Lithuania, in Troki.

(9.) LUNA, a town of Spain, in Arragon.

(10.) LUNA, ALVARO, or ALVARES DE, the favourite of John II. king of Castile, was natural son of Don Alvaro de Luna, lord of Canete, in Arragon, by a woman infamous for unbounded lust. He was born in 1388, was introduced to court in 1408, and made a gentleman of the bed-chamber to king John, with whom he grew into high favour. In 1427 he was obliged to retire; the courtiers complaining that a man of no military skill, or virtue, should be advanced to the highest authority; and they could not bear that, by the assistance of a few upstart men, whom he had raised and fixed to his interest, he should reign as absolutely as if he were king. Accordingly Alvaro was banished from court 18 months; but this was the greatest affliction imaginable to the king; who showed every mark of distress upon his removal, and spoke of nothing but Alvaro. He was therefore recalled; and, being invested with his usual authority, revenged himself upon his enemies, by persuading the king to banish them. Of the 45 years he spent at court, he enjoyed for 30 of them so entire an ascendancy over the king, that nothing could be done without his orders. In short, he wanted nothing but the name of king; he had all the places in the kingdom at his disposal; he was master of the treasury, and by bounties had so gained the hearts of the subjects, that the king, though his eyes were now opened, and his affections sufficiently turned against him, durst not complain. At last however, he was seized, and imprisoned. During his confinement, he made several attempts to speak to the king in person; but not being able to effect this, he sent a letter to the king, in which after setting forth his services to the king, and acknowledging his sins against God, he adds—“I can no longer bear that prodigious mass of riches, which it was wrong of me to have heaped together. I should willingly resign them, but that every thing I have is in your power; and I am denied the opportunity of showing mankind,

that you have raised a person to the greatness, who can *contemn wealth* as we cure it, and give it back to him from I received it. But I desire you in the terms, that, as I was obliged by the lo the treasury to raise 10,000 or 12,000 £ *methods I ought not to have taken*, you w them to the persons from whom they sorted. If you will not grant this on a the services I have done, yet I think it to be done from the reason of the thing letter, however, produced no effect in hi for he was tried, and condemned to lose.

(11.) LUNA CORNEA. See CHEMISTRY

(12.) \* LUNACY. *n. f.* [from *luna*, the A kind of madness influenced by the moon; in general.—Love is merely madness, and as well a dark house and a whip as mad and the reason why they are not so punished is, that the *lunacy* is so ordinary, whippers are in love too. *Shak.*—

Your kindred thun your house,

As beaten hence by your strange *lunacy*—There is difference of *lunacy*; I had mad with him, that, when he had nothing all the ships that came into the haven with you, who, when you have so much in, think you have nothing. *Suckling.*

(13.) LUNACY. See LUNATIC, and M *Index.*

(14.) LUNACY, in law. See IDIOTCY, I man in his sound memory commits a offence, and before arraignment for it he mad, he ought not to be arraigned for it he is not able to plead to it with that ad caution that he ought. And if, after pleaded, the prisoner becomes mad, he be tried; for how can he make his defence after he be tried and found guilty, he senses before judgment, judgment that pronounced; and if, after judgment, he of nonsane memory, execution shall be for, peradventure, lays the humanity of lish law, had the prisoner been of sound he mighty have alledged something in judgment or execution. Indeed, in the reign of Henry VIII. a statute was made enacted, that if a person, being *compos* should commit high treason, and after madness, he might be tried in his able should suffer death, as if he were of per memory. But this savage and inhuman law repealed by the statute 1 & 2 Ph. & M. c. as is observed by Sir Edward Coke, “tition of an offender is for example, *ut paucos, metus ad omnes perveniat*: but so when a madman is executed; but the miserable spectacle, both against law, and treme inhumanity and cruelty, and can ample to others.” But if there be an whether the party be *compos* or not, this tried by a jury. And if he be so found a ocy, or absolute insanity, excuses from t and of course from the punishment, of a nal action committed under such deprivation of the senses: but if a lunatic has lucid intelligence, he shall answer for what

intervals, as if he had no deficiency. Yet, as if of absolute madmen, as they are not ble for their actions, they should not be ed the liberty of acting unles under protol; and, in particular, they ought not uffered to go loose, to the terror of the ubjects. It was the doctrine of our aw, that persons deprived of their reason e confined till they recovered their senses, : waiting for the forms of a commission or ecial authority from the crown: and now ragrant acts, a method is chalked out for ning, chaining, and sending them to their homes. The matrimonial contract like-annot take place in a state of idiocy. It merly adjudged, that the issue of an idiot itimate, and his marriage valid. A strange nation! since consent is absolutely requi- nanimony, and neither idiots nor lunatics able of consenting to any thing. And re the civil law judged much more sensibly, made such deprivations of reason a pre- npediment, though not a cause of divorce happened after marriage. And modern ons have adhered to the sense of the civil : determining that the marriage of a luna- being in a lucid interval, was absolutely But as it might be difficult to prove the ate of the party's mind at the actual cele- of the nuptials, upon this account (con- with some private family reasons), the 15 Geo. II. c. 30. has provided, that the e of lunatics and persons under phrenzies ed lunatics under a commission, or com- to the care of trustees under any act of ient) before they are declared of found y the lord chancellor, or the majority of urses, shall be totally void. Idiots and of nonseue memory, as well as infants rsons under duresis, are not totally disabled to convey or purchase, but *sub modo* only. ir conveyances and purchases are voidable, t actually void. The king, indeed, on be- an idiot, may avoid his grants or other But it hath been said, that a *non compos* ; though he be afterwards brought to a mind, shall not be permitted to allege his insanity in order to avoid such grant: for man shall be allowed to stupify himself, or his own disability. The progress of this is somewhat curious. In the time of Ed- . *non compos* was a sufficient plea to avoid s own bond: and there is a writ in the re- or the alien: r himself to recover lands alien- him during his insanity; *dam fuit non com- utitur, ut dicit*, &c. But under Edward cruple began to arise, whether a man should ritted to *blemish* himself, by pleading his insanity: and, afterwards, a defendant in having pleaded a release by the plaintiff ve last continuance, to which the plaintiff *fore tunc*, as the manner then was) that : out of his mind when he gave it, the adjourned the assize; doubting, whether plaintiff was sane both then at the com- ment of the suit, he should be permitted id an intermediate deprivation of reason; : question was asked how he came to re-

member to release, if out of his senses when he gave it? Under Henry VI. this way of reasoning (that a man shall not be allowed to disable himself, by pleading his own incapacity, because he cannot know what he did under such a situation) was seriously adopted by the judges in argument; upon a question, whether the heir was barred of his right of entry by the forfeiture of his insane ancestor? And from these loose authorities, which Fitzherbert does not scruple to reject as being contrary to reason, the maxim that a man shall not stultify himself, hath been handed down as settled law: though later opinions, feeling the inconvenience of the rule, have in many points endeavoured to restrain it. And, clearly, the next heir, or other person interested, may, after the death of the idiot or *non compos*, take advantage of his incapacity and avoid the grant. And so too, if he purchases under this disability, and does not afterwards upon recovering his senses agree to the purchase, his heir may either waive or accept the estate at his option. In like manner, an infant may waive such purchase or conveyance, when he comes to full age; or, if he does not then actually agree to it, his heirs may waive it after him. Persons also, who purchase or convey under duresis, may affirm or avoid such transaction, whenever the duresis is ceased. For all these are under the protection of the law; which will not suffer them to be imposed upon through the imbecility of their present condition; so that their acts are only binding, in case they be afterwards agreed to when such imbecility ceases. Yet the guardians or committees of a lunatic, by the statute 11 Geo. III. c. 20. are empowered to renew in his right, under the directions of the court of chancery, any lease for lives or years, and apply the profits of such renewal for the benefit of such lunatic, his heirs, or executors.

(1.) LUNÆ MORS, in ancient geography, a promontory of Lusitania, now called the *Rock of Lisbon*. Lon. 10. W. Lat. 38. 50. N.

(2.) LUNÆ MORS, a mountain of Ethiopia, from which the Nile was supposed to take its rise.

LUNÆ PORTUS, a very extensive port, or rather a bay of Liguria, between Portus Veneris and Portus Fricis, 20 miles in compass; now called, *the Gulf of SPEZIA*, on the E. coast of the Ligurian republic.

(1.) LUNAN, or INVERLUNAN, a parish of Scotland, in Forfarshire, two miles long and one broad; containing 973 acres of arable ground, and 438 acres barren. The soil is fertile, and produces excellent crops of all kinds. The population, in 1791, was 291; increase 83 since 1755: number of horses 62, and black cattle 250.

(2.) LUNAN, a village in the above parish.

(3.) LUNAN, a river of Angus-shire, which rises from a morass near Forfar, and runs into Lunan bay at Lunan.

(4.) LUNAN, a fort of China, in Yun-nan.

(5.) LUNAN BAY, a bay of the German Ocean, on the coast of the above parish, (N<sup>o</sup> 1.) 4 miles S. by W. of Montrose.

LUNAN-HEAD, a village of Angus-shire, near Forfar, at the source of the Lunan.

(1.) \* LUNAR, LUNARY, (adj. lunaire, Fr. luna- rics,

*ries*, Lat.] 1. Relating to the moon.—They that have resolved that these years were but *lunary* years, *viz.* of a month, or Egyptian years, are easily confuted. *Raleigh*.—

Then we upon our globe's last verge shall go,  
And view the ocean leaning on the sky;

From thence our rolling neighbours we shall know,

And on the *lunar* world securely pry. *Dryden*.

2. Being under the dominion of the moon.—They have denominated some herbs solar and some *lunar*, and such like toys put into great words. *Bacon*.—The figure of its seed much resembles a horseshoe, which *Baptista Porta* hath thought too low a signification, and raised the same unto a *lunary* representation. *Brown*.

(2.) LUNAR CAUSTIC. See CHEMISTRY, *Ind.*

(3.) LUNAR DIAL. See DIALLING.

(4.) LUNAR IRIS, or LUNAR RAINBOW, a rainbow formed by the reflection of the rays of light from the moon. This phenomenon is seldom observed. On Friday the 30th Oct. 1803, at 7 P. M. a beautiful Lunar Iris was seen at Edinburgh, in the western part of the horizon. The moon being near the full, and her altitude not very great, the red, yellow, and violet colours were easily distinguished, and formed nearly a complete semicircle. It continued half an hour, and presented a most beautiful spectacle to many who had never before seen this phenomenon. Aristotle is said to have been the first who observed a lunar iris, and says they are never seen but at full moon. They never appear unless the moon be near the opposition. See RAINBOW.

(5.) LUNAR MONTH. See CHRONOLOGY, *Index*; and MONTH.

(6.) LUNAR NITRE. See CHEMISTRY, *Index*.

(7.) A LUNAR YEAR consists of 354 days, or 12 synodical months. See YEAR.

LUNARE OS, in anatomy, the 2d bone in the first row of the carpus; so named, because one of its sides is in a form of a crescent.

LUNARIA, SATIN FLOWER, HONESTY, or MOONWORT, in botany, a genus of the filiculosa order, belonging to the tetradynamia class of plants; and in the natural method ranking under the 39th order, *Siliquose*. The silicula is entire, elliptical, compressed plane, and pedicelled with the valves equal to the partition, parallel and plane; the leaves of the calyx are alternately fritted at the base. This plant is famous in many places for its medicinal virtues, though it is not received in the shops. The people in the N. of England dry the whole plant in the oven, and give as much as will lie on a shilling for a dose twice a-day in hemorrhages of all kinds, particularly in the too abundant flowing of the menfes, and with great success. The Welch, among whom it is common, Dr Needham informs us, make an ointment of it, which they use externally, and say it cures dysenteries.

LUNARIUM, in ancient geography, a promontory of Hispania Citra, between Blanda and Bætilo. Commonly called *the Cap. of Palafug*, or *of Tefit*, in Catalonia, on the Mediterranean; 15 miles W. of Palafugel.

(1.) LUNARY, *adj.* See LUNAR.

(2.) \* LUNARY. *n. f.* [*lunaria*, Lat.] Moonwort.—

Then sprinkles she the juice of rue  
With nine drops of the midnight dew  
From *lunary* distilling.

(1.) LUNAS, a town of France, in Herault, 6 miles W. of Lodeve.

(2.) LUNAS, a town of Sweden, in P

\* LUNATED. *adj.* [from *luna*.] For half moon.

The method of proving a person non- sane is very similar to that of proving him an- nexed to the lord chancellor, to whom, by special commission from the king, the custody of idiots is intrusted, upon petition or infor- mation a commission in the nature of the *in- quirendo*, to inquire into the party's mind; and if he be found *non compos*, he commits the care of his person, with a allowance for his maintenance, to some one who is then called his *committee*. How- ever, in sinister practices, the next heir is permitted to be of this committee of the cause it is his interest that the party

But, it hath been said, there lies not objection against his next of kin, prob- ably not his heir; for it is his interest to preserve the lunatic's life, in order to increase the estate by savings, which he or his family afterwards is entitled to enjoy. The heir is made the manager or committee of the estate being clearly his interest by good ma- to keep it in condition: accountable, to the court of chancery, and to the party himself, if he recovers; or otherwise, to the administrators. See LUNACY, § 3.

LUNATION. *n. f.* [*lunation*, Fr. *luna*, the revolution of the moon.—If the *lu-* observed for a cycle of 19 years, which is of the moon, the same observations are repeated for succeeding cycles for ever. *Time*.

LUNATION is the period between one new moon and another; called also *synodical month*. See ASTRONOMY, *Index*; CYCLE and EPACT.

LUNCARTY, or LONCARTY, an ancient vil- lage of five miles N. from Perth. The fields here, which are now covered with linen cloths, and where the most extensive works are carried on, of any in Great Britain, were formerly the scene of one of the most important events in Scottish History. In the reign of Kenneth III. of Scotland, obtain- ing a decisive victory over the Danes in 970, re- sulting in the name of "The Uncarty." In the neighbourhood, and to the out-fields of Luncarty, stand the remains of an old village, known for many ages as the *Dunmark*; and here, the writer of the *Annals*, has been present at the opening of sepulchres, where the Danish slain were interred. The arms of pikes, spears, swords, and other instruments have been from time to time discovered, in a wonderful state of preservation, which have lain under ground, upwards of 1000 years. The Bleachfield of Luncarty is an object of attention to every inquiring traveller; only famous for extent, (1000 acres be- ing employed in bleaching) but also for the superior manner in which goods are manufactured and finished.

LUNEA. *n. f.* [*Minibus* derives it from the *HEON*.] *lou'ua*, Spanish; *Skin-ner* from the *L. PART. II.*

*kleinken*, a small piece, Teutonic. It probably comes from *clutch* or *clunch*.] As much food as one's hand can hold.—

When hungry thou stood'st staring, like an oat,  
I slic'd the *luncheon* from the barley loaf. *Gay*.

(1.) LUND, a town of Sweden, in the province of West Gothland, on Lake Wenner; 36 miles NNE. of Uddevalla.

(2.) LUND, or } a considerable town of Sweden,  
LUNDEN, } capital of the prov. of Schonen,  
with an archbishop's see and an university. It was ceded to the Swedes by the Danes in 1658. Lon. 13. 25. E. Lat. 55. 40. N.

(1.) LUNDIE, a parish of Scotland in Angus- shire, to which that of FOULIS in Perthshire is united. See FOULIS, N° 1. It is of a circular form, and contains 3258 acres, of which 2000 are arable. The air is moist, the soil fertile; the crops barley, oats, flax, and potatoes. The population, in 1790, was 334; that of both parishes 648; increase 62 since 1755. The number of horses in Lundie was 140, and of black cattle 364.

(2.) LUNDIE, [*Cacl. Linn-Di*, i. e. *the water of God*,] a lake in the above parish, to which it gives name. It is 7½ acres broad, and 60 feet deep.

LUNDY, an island of England, 50 miles off the NW. coast of Devonshire, 5 miles long and 2 broad, but so encompassed with inaccessible rocks, that it has but one entrance, so narrow that two men can scarce go abreast. It is reckoned in the hundred of Branton. It had anciently a fort and a chapel. The soil on the S. is pretty good, but barren on the N. where it has a high pyramidal rock called the *Constable*. Horses, kine, hogs, goats, sheep, and rabbits, abound in it; but the chief commodity is fowls, and their eggs are very thick on the ground at the season of breeding. No venomous creature will live in this island. In the reign of Henry VIII. one William Morisco, who had conspired to murder him at Woodstock, fled to this island, which he fortified, turned pirate, and did much damage to this coast, but was at last taken, with 16 of his gang, and put to death.

(1.) \* LUNE. *n. f.* [*luna*, Latin.] 1. Any thing in the shape of an half moon.—

A troop of Janizaries strew'd the field,  
Fall'n in just ranks or wedges, *lunes*, or squares;  
Firm as they stood. *Watts*.

2. Fits of lunacy or frenzy; mad freaks. The French say of a man fantastical or whimsical, *Il a des lunes*. *Hannet*.—

Be strew them  
These dangerous, unsafe *lunes*, i' th' king;  
He must be told on't, and he shall: the office  
Becomes a woman best. *Shakespeare*.

3. A lish: as, the *lune* of a hawk.

(2.) LUNE, LUNULA, in geometry, a plane in form of a crescent, terminated by the circumference of two circles, that intersect each other within.

(3.) LUNE, a town 2 miles N. of Lunenburg.

(4, 5.) LUNE, 2 rivers of England; 1. in West- morland, running into the Tees; 2. in Yorksh. running into the Irish sea below Lancaster.

(1, 2.) LUNEBURG. See LUNENBURG.

(1.) LUNEBURG, a town of Prussia, in Natagen. LUNEGIANA, a province of Etruria, compre- hending several fields belonging to Austria, united, in July 1801, to the Ligurian republic.

LUNEL, a town of France, in the dep. of Gard, 16 m. E. of Montpellier. Lon. 4. 19. E. Lat. 43. 40. N.

LUNEN, 2 towns of Germany, in Westphalia: 1. in the county of Mark 20 miles SW. of Munster: 2. in that of Verden, 3 miles NNW. of Rottenburg.

(1.) LUNENBURG, or LUNEBURG ZELL, a principality of Germany, bounded on the S. by that of Calenberg, the diocese of Hildesheim, and the duchy of Brunswic; N. by the duchy of Lauenburg and the Elbe, which separates it from the territory of Hamburg; on the E. by the duchy of Brunswic, the Alte Mark, and the duchy of Mecklenburg; and W. by the duchies of Bremen and Verden, the county of Hoya, and the principality of Calenberg. The soil, except along the Elbe, Aller, and Jetz, is either sand, heath, or moor. In the fertile parts are produced wheat, rye, barley, oats, pease, buck wheat, flax, hemp, hops, pulse, oak, beech, firs, pines, birch, and alder; together with black cattle and horses. The heaths abound with bees and honey, and a small species of sheep, whose wool is long and coarse. Lauenburg is well furnished with salt springs and limestone, and the forest of Gorde with venison. The Elbe, Ilmenau, and Aller, being navigable, are very advantageous to the country, independent of their fish. The general diets of this principality are convened twice a year, and held at Zell. They consist of the deputies of the nobility and citizens of Lunenburg, Uelzen, and Zell, who have the nomination of the members of the high colleges, and other officers, jointly with the sovereign. There are near 200 Lutheran churches in the country, under two general and 15 subordinate superintendants, several grammar-schools, two Calvinist churches at Zell, and an academy of exercises at Lunenburg. The manufactures are chiefly linen cloth, cottons, ribbons, stockings, hats, starch, bleached wax, refined sugar, gold and silver wares, all kinds of wooden wares, barges, boats, and ships. The exports of these to Hamburg, Lubec, and Altena, are considerable. The neighbourhood of these cities, with the facility of conveying goods and merchandize to them and other places, either by land or water, is very advantageous to this country. This principality gives the king of Great Britain a seat and voice in the college of the princes of the empire, and of the circle of lower Saxony. Its quota in the Matriculi is 20 horses and 120 foot, or 720 florins in lieu of them. The revenues of the principality arise chiefly from the demesnes, tolls on the Elbe, contributions, duties on cattle, beer, wine, brandy, and other commodities, which all together must be very considerable, some bailiwicks alone yielding upwards of 20,200 rix-dollars.

(2.) LUNENBURG, the capital of the above principality, (N° 1.) a pretty large town of Germany, on the Elmen, or the Ilmenau, which is navigable for 13 miles from this town to the Elbe. Its inhabitants are reckoned at between 8000 and 9000. Formerly this town was one of the Hanse, and an imperial city. Some derive its name from *Lina*, the ancient name of the Ilmenau; others from *Luna*, the moon, an image of which is said to have been worshipped by the inhabitants in the times of Paganism. Here were anciently 4 con-

vents, viz. of Minims, Premonstratensians, Benedictines, and Minorites. Out of the revenues of the Benedictine monastery was founded an academy for the martial exercises, where young gentlemen of Lunenburg are maintained gratis, are taught French, fencing, riding, and dancing; but foreigners are educated at a certain fixed price. A Latin school was also founded, consisting of 4 classes, and well endowed out of these revenues. The management of these, and the estates appropriated to their maintenance, belongs to the landschaft director, and the aufreiter, who are both chosen from among the Lunenburg nobles. The first came in place of the Popish abbot, as such is head of the states of the principality and president of the provincial college. He bears the title of *excellency*. The chief public edifices are 3 parish churches, the ducal palace, 3 hospitals, the town-house, the salt magazine, the anatomical theatre, the academy; the convent church of St Michael, in which lie interred the ancient dukes; and in which is the famous table 8 feet long, and 4 broad, plated over with chagold, with a rim embellished with precious stones of an immense value, which was taken from the Saracens by the emperor Otho I. and presented to this church; but in 1698, a gang of thieves stripped it of 200 rubies and emeralds, together with a large diamond, and most of the gold; that but a small part of it now remains. Here are some very rich salt springs. Formerly upwards of 120,000 tons of salt have been annually brought here, and sold; but since the commencement of the 18th century, the salt trade hath declined. The 5th part of the salt made here belongs to the king, but is farmed. It is said to excel all the other salt made in Germany. This town is well fortified; and has a garrison, which is lodged in the racks. In the neighbourhood is a good lime-quarry; and along the Ilmenau are ware-houses in which are lodged goods brought from all parts of Germany, to be forwarded by the Elmenau to Hamburg, or by the Asche to Lubec, whence other goods are brought back the same way. This town drives a considerable traffic in wax, horn-wool, flax, linen, salt, lime, and beer. Lunenburg lies 27 miles from Hamburg, 43 from Hanover, 65 from Brunswic, 76 from Bremen, and 68 from

(3.) LUNENBURG, a county of Virginia, 30 miles long and 20 broad; containing 4,627 citizens, and 4332 slaves in 1795. It is bounded on the N. by Nottaway, SE. by Brunswic; SW. by Mecklenburg, and W. by Charlotte counties.

(4.) LUNENBURG, a town in the above county, 50 miles SW. of Richmond.

(5.) LUNENBURG, a township of Massachusetts in Worcester county, 45 miles NW. of Boston, containing 1,100 citizens, and 14,000 acres of land.

(6.) LUNENBURG, a township of New York, Albany county on the W. side of Hudson's river opposite to Hudson, 30 miles S. of Albany.

(7.) LUNENBURG, a county of Nova Scotia, Mahone bay. Its chief towns are Lunenburg (N° 8.) Chester, and New Dublin.

(8.) LUNENBURG, a town in the above county inhabited chiefly by Germans; 35 miles SW. of Halifax.

NENBURG, a township of Vermont, in  
nty, on the Connecticut.

NSE MARMOR, in the natural history of  
its, a species of white marble now call-  
*u marble*, and distinguished from the sta-  
d by its greater hardness and less splen-  
is, and always was much esteemed in  
and ornamental works. It is of a very  
fine texture, of a very pure white, and  
re transparent than any other of the  
bles. It is still found in great quantities  
See LUNA, N<sup>o</sup> 5.

RA, a mountain of Italy, between Naples  
oli; abounding with sulphur, alum and  
aters.

UNETTE. *n. f.* [French.] A small half  
unette is a covered place made before  
ne, which consists of two faces that form  
wards, and is commonly raised in fos-  
water, to serve instead of a fausse braye,  
pute the enemy's passage: it is six toises  
of which the parapet is four. *Trevoux*.  
LUNETTE, in fortification, differs from  
N only in its situation. See FORTIFI-  
PART I; *Sec.* V. and VII.

NETTE, in the manege, is a half horse-  
sch a shoe as wants the sponge, *i. e.* that  
ie branch which runs towards the quar-  
: foot.

NETTE is also the name of two small  
felt, made round and hollow, to clap  
eyes of a vicious horse that is apt to  
strike with his fore feet, or that will not  
rider to mount him.

VILLE, a large and populous town of  
the dep. of the Meurthe, and ci-devant  
Lorrain, seated in a plain between the  
nd Vezouze, which unite below it. It  
ient castle now converted into barracks,  
dukes of Lorrain kept their court; as  
wards K. Stanislaus, who founded a mi-  
lemy, an hospital and a large library in  
is town the convention was held, and  
peace concluded, between the emperor  
and the French republic, in Oct. 1801.  
miles SE. of Nanci, and 62 W. of Stras-  
n. 6 35. E. Lat. 48. 36. N.

, a town of China, in Quang-si.

GED. *adj.* [from *lungs*.] Having lungs;  
: nature of lungs; drawing in and emit-  
:s the lungs in any animal body.—

mith prepares his hammer for the stroke,  
he *lung'd* bellows hissing fire provoke.

*Dryden*.

:-GROWN. *adj.* [*lung* and *grown*.] The  
etimes grow fast to the skin that lines  
within; whence such as are detained  
accident are *lung-grown*. *Harvey on Conf.*  
RO, a town of Naples, in Calabria.

UNGS. *n. f.* [*Jungen*, Sax. *lang*, Dutch.]  
; the part by which breath is inspired  
:d.—

ould I, but my *lungs* are wasted so,  
length of speech is utterly denied me.

*Shakesp.*

bellows of his *lungs* begin to swell,  
the good receive, woe bad expel. *Dryd.*

Had I a hundred mouths, a hundred tongues,  
And throats of brass inspir'd with iron *lungs*;  
I could not half those horrid crimes repeat,  
Nor half the punishments those crimes have met.

*Dryden*.

(2.) LUNGS. See ANATOMY, *Index*.

(3.) LUNGS, INSTRUMENT FOR INFLATING  
THE, an invention of M. Gorey physician to the  
military hospital at New Brifack, which appears  
to be extremely well adapted to the purpose, and  
may be used with the greatest facility. It is thus  
described in the *Journal de Medecine*, for June 1789.  
This instrument, which the inventor styles *apodo-  
pic*, that is, *restorer of respiration*, consists of a  
double pair of bellows, BCLM, *fig. 1*, Pl. CCIV.  
the two different parts of which have no commu-  
nication with each other. In the lower side BM,  
is an aperture A for a valve constructed on the  
principles of those of Mr Nairne's air-pump. It  
consists of a rim of copper, closed at one end by  
a plate of the same metal, in which plate are seven  
small holes placed at equal distances. This plate  
is covered with a piece of silk coated with elastic  
gum, in which are six transverse incisions of 2 or  
3 lines in length. Each incision is so made as to  
be situated between two of the holes, and at an  
equal distance from each: see D, *fig. 2*. The silk  
must be made very secure, by a thread passing se-  
veral times round the rim. A stream of air, ap-  
plied to that side of the plate which is opposite  
the silk, will pass through the holes, and, lifting  
up the silk, escape through the incisions. On the  
contrary, a stream of air applied to the other side  
will press the silk upon the plate, and thus close  
the holes, so that it will be impossible for it to  
pass through them. This valve opens internally,  
so as to admit the air from without. At B is ano-  
ther valve, on the same construction, but opening  
in a contrary direction, thus permitting the air to  
escape out of the lower part into the tube EF,  
but preventing its entrance. At C is another  
valve, opening internally to admit the air from  
the tube EF; and at D there is a 4th opening ex-  
ternally, to discharge the air from the upper part.  
The flexible tube EF, screwed on at the end CB,  
being introduced into one of the nostrils, whilst  
the mouth and the other nostril are closed by an  
assistant, if we separate the two handles LM,  
which were close together at the introduction of  
the tube, it is evident, that the air in the lungs  
will rush into the upper part through the valve C,  
whilst the external air will fill the lower part  
through the valve A: the two handles being again  
brought into contact, the atmospheric air will be  
forced into the lungs through the valve B, and at  
the same time the air in the upper part will be  
discharged at the valve D. Thus by the alterna-  
te play of the double bellows, the lungs will  
be alternately filled and emptied as in respira-  
tion. In using the instrument care should be  
taken not to be too violent; as the more per-  
fectly the natural motion of respiration is imita-  
ted the better. To prevent any substances from  
without injuring the valves A, D, *fig. 1*, the  
rim is made with a screw, B, *fig. 3*, in order to  
receive a cap A A, *fig. 3*, full of small holes. This  
screw has also another use. If oxygenous gas be  
preferred,

preferred, a bladder filled with it, *fig. 4.* may, by means of the screw *A.* be fastened to the valve *A.*, *fig. 1.*; and, to prevent waste, as this air may serve several times, a flexible tube may be screwed on the valve *D.*, *fig. 1.* communicating with the bladder by means of the opening *d.*, *fig. 4.*: thus it may be employed as often as the operator thinks proper. There is a handle *K.* to the partition in the middle, in order that, if it be at any time necessary to use either of the divisions alone, the other may be confined from acting. *c.*, *b.*, *fig. 5.* represent the two valves to be applied at the end of the instrument *C.*, *B.*, *fig. 1.*; and *fig. 6.* is a section of the end *C.*, *B.* showing the valves in their proper places. The capacity of the instrument should be proportioned to the quantity of air received into the lungs in inspiration, which Dr Goodwyn has ascertained to be twelve cubical inches or somewhat more. Each division of the instrument, therefore, should be capable of containing that quantity.

LUNGSARP, a town of Sweden, in W. Gothia.

(1.) \* LUNG-WORT. *n. f.* [*pulmonaria*, Lat.] A plant. *Miller.*

(2.) LUNG-WORT, in botany. See PULMONARIA.

(3.) LUNG-WORT, COW'S. See VERBASCUM.

(4.) LUNG-WORT, GOLDEN. See HIERACIUM.

(1.) \* LUNISOLAR. *adj.* [*lunisolaire*, French; *luna* and *solaris*, Latin.] Compounded of the revolution of the sun and moon.

(2.) A LUNISOLAR YEAR, in chronology, is the space of 532 common years; found by multiplying the cycle of the sun by that of the moon. See CHRONOLOGY, *Index.*

LUNKA, a town of Samogitia.

\* LUNT. *n. f.* [*lont*, Dutch.] The matchcord with which guns are fired.

LUNTZ, a town of Germany, in Austria.

LUNTA. See LUNE, § 2.

LUNZENAU, a town of Upper Saxony.

LUPANNA, an inhabited island, in the Adriatic, with a good harbour near Ragusa.

LUPARA, a town of Naples, in Molise.

LUPERCAL, in Roman antiquity, a place under mount Palatine, where the LUPERCALIA were performed.

LUPERCALIA, feasts instituted in ancient Rome, in honour of Pan. They were celebrated on the 15th of the kalends of March, or 15th of February, or 3d day after the ides. They are supposed to have been established by Evander. On the morning of this festival the LUPERCI, or priests of Pan, ran naked through the streets of Rome, striking the married women they met on the hands and belly with a thong or strap of goat's leather, which was held an omen promising them fecundity and happy deliveries. See LUPERCI. This feast was abolished in the time of Augustus; but afterwards restored, and continued in the time of the emp. Anastasius.—Baronius says it was abolished by pope Anastasius in 496.

LUPERCI, the priests of the god PAN. See LUPERCALIA. They were the most ancient order of priests in Rome; they were divided into two colleges, called *Fabii*, and *Quintilii*. To these *Cæsar* added a 3d called *Julii*.

(1.) \* LUPINE. *n. f.* [*lupin*, Fr. *lupinus*, Lat.]

A kind of pulse.—It has a papilionaceous out of whose empalement rises the pale towards turns into a pod filled with e or spherical seeds: the leaves grow like upon the foot stalks. *Miller.*—When would undertake any excellent piece, diet himself with peas and lupines, that tion might be quick and refined. *Peack*

(1.) \* LURCH. *n. f.* [This word is

*Skinner* from *Pouerbe*, a game of drau

used, as he says, among the Dutch

derives from *arca*; so that, I suppose

are lost are left in *lorche*, in the *lu*

whence the use of the word.]

(2.) \* LURCH, TO LEAVE IN THE

in a forlorn or deserted condition; to

out help. A ludicrous phrase.—

Will you now to peace incline,

And languish in the main design,

And leave us in the lurch.

But though thou'rt of a different

I will not leave thee in the lurch.

—Have a care how you keep company

n they find themselves upon a pinch, will r friends in *the lurch*. *L'Esfrange*.—It is ke advantage of their simplicity and cred *leave them in the lurch* at last. *Arbutts* about town had a design to cast us out hionable world, and *leave us in the lurch*, of their late refinements. *Addison*.

To LURCH. *v. a.* [*lurcor*, Latin.] 1. To to swallow greedily.—Too far off from ics may hinder businets; or too near ill provisions, and maketh every thing on. 2. To defeat; to disappoint. A word only in burlesque. [from the game *lurch*.]

He waxed like a sea;

the brunt of seventeen battles since,  
bt all swords o' th' garland. *Shak.*  
ver designed the use of them to be cony putting such an emptiness in them, as quickly fail and *lurch* the expectation. This is a sure rule, that will never deceive he sincere communicant. *South*. 3. To ily; to filch; to pilfer.

To LURCH. *v. n.* [*loeren*, Dutch; or ra- the noun.] 1. To shift; to play tricks. If, sometimes leaving goodness on my , and hiding mine honour in my necessi- ain to shuffle, to hedge, and to *lurch*. . To lie in wait: we now rather use *lurk*. the one was upon wing, the other stood upon the ground, and flew away with the *strange*.

LURCHER. *n. f.* [from *lurch*.] 1. One hes to steal, or to betray or entrap.— t from his play the scudding *lurcher* flies; ev'ry honest tongue Stop thief refunds.

*Gay*.

that watches for his game.—I cannot those worthies more naturally than un- hadow of a pack of dogs, made up of *lurchers*, and setters. *Taiter*. 3. [*Lurco*, glutton; a gormandizer. Not used.

LURCHER, (§ 1, *def.* 2.) a kind of hunting h like a mongrel grey hound, with prick- a shagged coat, and generally of a yel- hite colour: they are very swift runners, they get between the burrows and the ey seldom miss; and this is their common in hunting: yet they use other subtilties, imbler does, some of them bringing in ce, and those are the best. A lurcher will n a hare at stretch. See *CANIS*, § 1, vi. 6—28.

JRCY, a town of France, in the dep. of r; 7½ miles NE. of Donjon.

JRCY LEVY, a town of France, in the allier; 9 miles NE. of Cerilly, and 9 N. Bourbon L'Archambaud.

JANE, *n. f.* an idle lazy fellow. For the f this word, See *ENGLAND*, § 17; and

LURE. *n. f.* [*Uurre*, French; *lore*, Dut.] thing held out to call a hawk.—

faulcon now is sharp and passing empty, ill she stoop, she must not be full gorg'd, en the never looks upon her *lure*. *Shak.* *lure* she cast abroad, thinking that this l belief would draw, at one time or other, ds to strike upon it. *Bacon*.—A great ef-

tate to an heir, is a *lure* to all the birds of prey round about to seize on him. *Bacon*.—

This stiffneck'd pride, nor art nor force can bend,

Nor high-flown hopes to reason's *lure* descend.

*Denham*.

A falc'ner's nry is, when Emma hawks;

With her of tarsels, and of *lures* he talks. *Prior*.

2. Any enticement; any thing that promises ad- vantage.—

How many have with smiles made small ac- count

Of beauty; and her *lures*, easily scorn'd? *Milt.*

*Luxury*

Held out his *lure* to her superiour eye. *Madden*.

(2.) A LURE, in falconry, (§ 1, *def.* 1.) a device of leather, in the shape of two wings, stuck with feathers, and baited with a piece of flesh, to call back a hawk when at a considerable distance.

(3.) LURE, a town of France, in the dept. of Upper Saone, and late prov. of Franche Comté, 30 miles NE. of Besançon. Lon. 6. 33. E. Lat. 47. 38. N.

(1.) \* To LURE. *v. a.* [from the noun.] To attract; to entice; to draw.—

As when a flock

Of ravenous fowl, though many a league re- mote,

Against the day of battle, to a field

Where armies lie encamp'd, come flying, *lur'd*

With scent of living carcasses. *Milton*.

—A man spent one day in labour, that he might pass the other at ease, and *lured* on by the plea- sure of this bait, when he was in vigour he would provide for as many days as he could. *Temple*.

Should you *lure*

From this dark haunt, beneath the tangled roots

Of pendant trees, the monarch of the brook,

Behoves you then to play your finest art.

*Thomson*.

Volumes on shelter'd stalls expanded lie,

And various science *lures* the learned eye. *Gay*.

(2.) \* To LURE. *v. n.* To call hawks.—Stand- ing near one that *lured* loud and shrill, I had sud- denly an offence, as if somewhat had broken, or been dislocated in my ear, and immediately after a loud ringing. *Bacon*.

LURGAN, a flourishing town of Ireland, in Ar- magh, 67 miles from Dublin; agreeably situated in the midst of a much improved country. The inhabitants are extensively engaged in the linen manufacture. It stands on a gentle eminence, a- bout two miles from LOUGH NEAGH, of which it commands a most beautiful and extensive prospect. It has 3 fairs. Lon. 6. 31. W. Lat. 54. 35. N.

LURGAN-BAY, a town of Ireland, in the county of Leitrim and prov. of Conhaught.

LURGAN-GREEN, a post town of Ireland, in Louth, 37 miles from Dublin; a mile from a seat of lord Charlemont. It has 3 fairs.

LURI, a town of Corsica, 12 m. W. of Bastia.

\* LURID. *adj.* [*luridus*, Latin.] Gloomy; dismal. Not used.—

Slow settling o'er the *lurid* grove,

Unusual darkness broods.

*Thomson*.

LURIDÆ, the 28th order in Linnæus's Frag- ments of a natural method. See *BOTANY*.

LURIN,

**LURIN**, a town of Peru, in Lima.  
 \* **To LURK**. *v. n.* [probably *lurch* and *lurk* are the same word. See **LURCH**.] To lie in wait; to lie hidden; to lie close.—

Far in land a savage nation dwelt,  
 That never tasted grace, nor goodness felt;  
 But like wild beasts, *lurking* in loathsome den,  
 And flying fast as roebuck through the fen,  
 All naked. *F. Queen.*

—Milbrook *lurketh* between two hills, a village of some eighty houses, and borrowing his name from a mill and little brook running there through. *Carew.*—

They lay not to live by their worke,  
 But theevishly loiter and *lurke*. *Tusser.*  
 —Let us *lurke* privily for the innocent. *Prov. i. 11.*

The wife, when danger or dishonour *lurks*,  
 Safest, and seemliest by her husband stays. *Milton.*

The *lurking* gold upon the fatal tree. *Dryd.*  
 The king unseen

*Lurk'd* in her hand. *Pope.*  
 —I do not *lurk* in the dark. *Swift.*

\* **LURKER**. *n. f.* [from *lurk*.] A thief that lies in wait.

\* **LURKINGPLACE**. *n. f.* [*Lurk* and *place*.] Hiding place; secret place.—Take knowledge of all the *lurking-places* where he hideth himself. *1 Sam. xxiii. 23.*

**LURS**, a town of France, in the dep. of the Lower Alps; 16½ miles SW. of Digne.

**LURY**, a town of France, in the dep. of Cher; 13½ miles W. of Bourges.

**LUS**, a town of France, in the dep. of the Upper Pyrenees; 3 miles SW. of Bareges.

**LUSATIA**, (Sclavonic, *i. e.* a marshy, or woody country.) a marquisate of Germany, in Upper Saxony; bounded on the E. by Silesia, W. by Misnia, S. by Bohemia, and N. by Brandenburg. It is divided into **UPPER** and **LOWER LUSATIA**. The heathy and mountainous tracts are generally barren; but the lower lands are tolerably fertile, producing wheat, rye, oats, barley, pease, lentils, beans, millet, flax, hops, tobacco, wine, and manna. Of several of these articles, however, considerable quantities are imported. There are also quarries of stone, medicinal springs, bastard diamonds, agates, jaspers, earthen ware, alum, ironstone, vitriolic and copper water, cattle, fish, venison, &c. The rivers Spree, the Black Elster, and the Pulznitz, have their sources in Lusatia, which is also watered by the Neisse and Queis. The ancient inhabitants were the Saxons, who were succeeded by the Vandals, and these by the Sober-Wends, a Sclavonian people. The present inhabitants, the descendants of the Wends, have an odd dress; and the language is so inarticulate and guttural, that it hath been said, it might be pronounced without lips, teeth, or tongue; but the towns are almost wholly peopled by Germans. Both marquisates were formerly subject either to the kings of Bohemia, the archdukes of Austria, or electors of Brandenburg; but, in 1636, they were ceded to the elector of Saxony, in payment of 72 tons of gold, which he spent in assisting Ferdinand II. against the Bohemians. Christianity was first planted in Lusatia in the 7th century;

but it was several centuries before fully established. In the 11th century minsters were erected, but at the reform numbers embraced Lutheranism, that is the predominant religion; which it continues, though there are several Roman churches. The **HERNHUTTERS** possess influence here. There are considerable manufactures of woollen and linen stuffs in the Lusatia, especially the Upper. In Budissen and its vicinity enormous quantities of stockings, spat-caps, and gloves are made. The linens also flourish here, chiefly in Upper where all sorts of linens are made, printed, and dyed. There are also considerable manufactures of hats, leather, paper, gunpowder, bleached wax, &c. The exportation of commodities, particularly linens and silks, is not so great as formerly, but is still considerable and more than overbalances their imports of wool, yarn, silk, wines, spices, corn, fruits, garden stuffs, and hops. Disputes many years standing have subsisted between Saxon artificers and linen-manufacturers on this side, and the diet towns on the other; the former unjustly seeking to exclude the latter from their share in the linen trade. The natives are not so industrious as the Saxons, but they are better than they did the Bohemian. They have had much esteem and encouragement since the reformation. Progress has been brought to great perfection in this court.

1. **LUSATIA, LOWER**, is moorish and has 4 principal towns which send deputies to the land diets; 13 country towns, 10 towns, and several good schools, with stipends for the students. The land consists of prelates, lords, and knights, and the natives of the state towns, Luckau, Guben, and Kalau. Two diets are yearly held, called *voluntary diets*; but when superior causes the states to be summoned, positions to be laid before them, by deputies for that purpose, such convened a *great land diet*. The marquisate is divided into 5 circles, each of which holds a circle town in its circle town. The chief officers, either by the superior or the states, are: president of the upper office, the land captain, the land judge. The principal tribunal is the land court, and the upper office, to which appeals from the inferior judicatories. There are also officers for the several circles. Spirits are managed by a consistory, erected in 1687. The taxes are paid into the chest of the diet and consigned to the general chest, of which the upper tax-receiver is superintendant; without an annual account which is examined and passed by the deputies.

2. **LUSATIA, UPPER**, till the middle of the 15th century, was called the *Mark*, *i. e.* a marquisate, or land of *Budissin and Gortitz*. Lower only *Lusatia*. The air of Upper is hilly or mountainous, is better than that of the Lower. Both abound in wood, and turf for fuel. In Upper there are six towns which send deputies to

smaller country towns, and 4 market towns. The schools, particularly at Gorkitz, and Zittau, are distinguished for learning. The states consist, 1st, of state lords; 2dly, knights; 3dly, of the gentry and commander which are comprehended the barons, nobles and burgeses, possessors of fief-estates; and, 4thly, of the representatives of the six towns. Without the consent of the states no taxes can be imposed, nor any public importance transacted. The diets are ordinary or extraordinary. The ordinary meet every year, and the extraordinary when summoned by the sovereign upon particular emergency or ecclesiastical matters, the dean of the diocese and his consistory exercise all kinds of jurisdiction; and, among the Protestant jurisdictions belongs either to the superior office, or the patrons. The revenues consist of the subsidies granted by the states, which are reckoned capitation and estate tax, and partly of the beer tax, excise, tolls, &c. Prussia is divided into two great provinces, Pomerania and Gorkitz, which are subdivided into lesser circles.

**LUSCIOUS.** *adj.* [from *delicious*, say some; or more probably derives it from *luxuri*, properly pronounced: 1. Sweet, so as to be sweet, in a great degree.—The food which is now is as *luscious* as loches, shall shortly be as *coloquintida*. *Sbak.*—The *luscious* liquor on the ground. *Milt.* keep their *luscious* native taste. *Dryd.* ; ; delightful.—He will bait him in with his proposal of some gainful purchase.

**LUSCIOUSLY.** *adv.* [from *luscious*.] Sweet degree.

**LUSCIOUSNESS.** *n. f.* [from *luscious*.] Impurity.—Can there be a greater impurity in God, than to embitter sensualities which intoxicate us? *Decay of Piety.* feed worms by reason of the *lusciousness* of the grain. *Mortimer.*

**LUSERN.** *n. f.* [*lupus cervarius*, Latin.]

**LUSERN.** See **FELIS**, N° XI—XIX.

**LUSERN.** *H. a. f.* Of a dark, deep, full colour, so pale and faint; from *lousche*. *Hanmer.* *lusb* and *lusty* the grass looks? how green? *Sbak.*

**LUSERN,** a town of Maritime Austria, in

**LUSERN,** a town of France, in the department of Poitou, on the 2 m. SW. of Poitiers, and 200 of Paris.

**LUSITANI,** the people of **LUSITANIA**.

**LUSITANIA,** in ancient geography, one of the parts of Hispania, extending to the N. of Spain, quite to the sea of Cantabria, at least to the *Montorium Celticum*. But Augustus made it his boundary on the S. and the N. thus constituting only a part of the province of **PORTUGAL**. *Diodorus*; *Stephanus*.

**LUSITANIA,** a river of Upper Saxony.

**LUSK.** *adj.* [*luscbe*, French.] Idle; lazy; *Di&*.

(2.) **LUSK**, a town of Ireland, in Dublin.

\* **LUSKISH.** *adj.* [from *lusb*.] Somewhat inclinable to laziness or indolence.

**LUSKISHLY.** *adv.* [from *lusb*.] Lazily; indolently.

\* **LUSKISHNESS.** *adv.* [from *lusb*.] A disposition to laziness.

**LUSO**, a river of Italy, in Urbino.

\* **LUSORIOUS.** *adj.* [*luforius*, Lat.] Used in play; sportive.—Things more open to exception, yet unjustly condemned as unlawful; such as the *luforious* lots, dancing, and stage-plays. *Sanderfon.*

\* **LUSORY.** *adj.* [*luforius*, Lat.] Used in play.—There might be many entertaining contrivances for the instruction of children in geometry and geography, in such alluring and *lufory* methods, which would make a most agreeable and lasting impression. *Watts.*

(1.) **LUSS**, a parish of Scotland, in Dunbartonshire, 8½ miles long from S. to N. and from 2½ to 5 broad. The climate is temperate, and though moist, remarkably healthful, and instances of longevity are numerous. The surface is mountainous; of 17,402 Scots acres, only 1538 are arable; 880 are under natural wood, chiefly oak. The soil is light and gravelly. There are 4 rivers running into Loch-Lomond, which lies partly in this parish. See **LOMOND**, N° III. There is a great variety of wild quadrupeds, birds, fish, and reptiles in the parish; of which a particular enumeration is inserted in Sir J. Sinclair's *Stat. Acc.* Vol. xvii. p. 247—253. The population, in 1793, was 917; decrease 61, since 1755: the number of horses was 140; sheep 7500; black cattle 534; and swine 8; valued in all at 7595l. 12s. 6d. The annual produce, in oats, barley, potatoes, flax, hay, &c. is valued at 6649l. 8s. 11d.: the annual cutting of the oak woods, at 7,600l. There are two excellent slate quarries, from which about 440,000 slates are annually exported.

(2.) **LUSS**, a river in the above parish.

(3.) **LUSS**, a village in the above parish, in which a cotton manufacture was erected in 1790. It is seated on the W. side of Loch-Lomond, 10 miles NW. of Dunbarton.

(1.) **LUSSAC**, a town of France, in the department of Gironde, 6 miles ENE. of Libourne.

(2.) **LUSSAC LES CHATEAUX**, a town of France, in the department of Vienne, 18 miles SE. of Poitiers.

(3.) **LUSSAC LES EGLISES**, a town of France, in the department of Upper Vienne, 33 miles N. of Limoges.

(1.) **LUSSAN**, a town of France, in the department of Gard, 9 miles N. of Uzès.

(2.) **LUSSAN**, Margaret DE, a French romance-writer, born in 1682. The celebrated Huet gave her an education, which she improved greatly. Her works are numerous. The best is *Anecdotes de la cour de Philippe Auguste*, 6 vols. 12mo. She died in 1758.

**LUSSINGE**, a town of the French republic, in the department of Mont Blanc, 3 m. NW. of Bonne.

\* **LUST.** *n. f.* [*lust*, Saxon; *lust*, Dutch.] 1. Carnal desire.—

This our court, infected with their manners, Shews like a riotous inn; Epicurism and *lust*

Make

Make it more like a tavern or a brothel,  
 Than a grac'd palace. *Shak.*  
 Lust, and rank thoughts. *Shak.*  
 —They are immoderately given to the *lust* of the  
 flesh. *Abbot.*—When a temptation of *lust* assaults  
 thee, do not resist it by disputing with it, but fly  
 from it, that is, think not at all of it. *Taylor.*—  
 2. Any violent or irregular desire.—My *lust* shall  
 be satisfied upon them: *Exodus*, xv. 9.—The un-  
 godly, for his own *lust*, doth persecute the poor.  
*Psal.*—Virtue was represent'd by Hercules: he is  
 drawn offering to strike a dragon; by the dragon  
 are meant all manner of *lusts*. *Peacbam.*—

All weigh our acts, and whate'er seems un-  
 just,  
 Impute not to necessity, but *lust*. *Ind. Emp.*  
 The *lust* of lucre. *Pope.*  
 3. Vigour; active power; lustiness. Not used.—  
 Trees will grow greater, and bear better fruit, if  
 you put salt, or lees of wine, or blood, to the  
 root: the cause may be, the increasing of the *lust*  
 or spirit of the root. *Bacon.*

\* To LUST, *v. n.* 1. To desire carnally.—  
 Inconstant man, that loveth all he saw,  
 And *lusted* after all that he did love. *Roscommon.*  
 2. To desire vehemently.—Giving sometimes pro-  
 digally; not because he loved them to whom he  
 gave, but because he *lusted* to give. *Sidney.*—The  
 Christian captives in chains could no way move  
 themselves, if they should unadvisedly *lust* after li-  
 berty. *Knolles.* 3. To sit; to like. Out of use.  
 —Their eyes swell with fatness; and they do  
 even what they *lust*. *Psal.* lxxiii. 7. 4. To have  
 irregular dispositions, or desires.—The mixed  
 multitude fell a *lusting*. *Numb.*—The spirit that  
 dwelleth in us *lusteth* to envy. *Jam.* iv. 5.

LUSTENFELDEN, a town of Austria.  
 \* LUSTFUL. *adj.* [*lust* and *full*.] 1. Libidi-  
 nous; having irregular desires.—  
 Turning wrathful fire to *lustful* heat. *F. O.*  
 —There is no man that is intemperate or *lustful*,  
 but besides the guilt likewise stains and obscures  
 his soul. *Tillotson.* 2. Provoking to sensuality;  
 inciting to lust.—

Thence his *lustful* orgies he enlarg'd. *Milt.*  
 \* LUSTFULLY. *adv.* [from *lustful*.] With sen-  
 sual concupiscence.

\* LUSTFULNESS. *n. f.* [from *lustful*.] Libidi-  
 nousness.

\* LUSTIHED. } *n. f.* [from *lustly*.] Vigour;  
 \* LUSTIHOOD. } sprightliness; corporal abili-  
 tility. Not now in use.—

A goodly personage,  
 Now in his freshest flower of *lusthood*. *Spenser.*  
 Reason and respect

Make livers pale, and *lusthood* dejected. *Shak.*  
 I'll prove it on his body;

Despight his nice fence, and his active practice,  
 His May of youth and bloom of *lusthood*. *Shak.*

\* LUSTILY. *adv.* [from *lustily*.] Stoutly; with  
 vigour; with mettle.—

I determin'd to fight *lustily* for him. *Hen. V.*  
 Let's tunc, and to it *lustily* a while. *Shak.*

—Barbarossa took upon him that painful jour-  
 ney, which the old king *lustily* performed. *Knolles.*  
 He has fought *lustily* for her. *Southerne.*

\* LUSTINESS. *n. f.* [from *lustly*.] Stoutness;  
 sturdiness; strength; vigour of body.—

He with good speed began to take  
 Over the fields in his frank *lustiness*.  
 —Where there is so great a prevent  
 ordinary time, it is the *lustiness* of the  
*con.*—Cappadocian slaves were famous  
*lustiness*. *Dryden.*

\* LUSTLESS. *adj.* [from *lustly*.] Not  
 weak. *Spenser.*

\* LUSTRAL. *adj.* [*lustral*, French  
 Lat.] Used in purification.—

His better parts by *lustral* waves re-

(2.) LUSTRAL DAY, [*Dies Lustricus*],  
 quity, the day on which the lustrations  
 formed for a child, and its name given  
 the 9th day from the birth of a boy, and  
 from that of a girl. Over this festival the  
 NUNDINA was supposed to preside; the  
 wives, nurses, and domestics, handed  
 backwards and forwards, around a fire  
 on the altars of the gods, after which they  
 led it with water; hence this feast had  
 of *amphidromia*. The old women mix  
 and dust with the water. The whole en-  
 a sumptuous entertainment. The pare-  
 ved gifts from their friends on this occa-  
 the child was a male, the door was deck'd  
 an olive garland; if a female, with work-  
 ing the work about which women were  
 ployed.

(3.) LUSTRAL WATER was used by  
 cients in their ceremonies to sprinkle  
 the people. From them the Romanists  
 rowed the *holy water* used in their churches.

(1.) \* LUSTRATION. *n. f.* [*lustratio*  
*lustratio*, Latin.] Purification by water  
 Job's religious care,

His sons assemblies, whose united pra-  
 Like sweet perfumes, from golden censers  
 He with divine *lustrations* sanctifies.

—That spirits are corporeal seems a cog-  
 native unto himself, and such he should  
 hour to overthrow; yet thereby he  
 the doctrine of *lustrations*, amulets, and  
*Brown.*—

Should Io's priest command  
 A pilgrimage to Meroc's burning tar  
 Through deserts they would seek  
 springs,

And holy water for *lustration* bring.  
 —What were all their *lustrations* but  
 solemn purifyings, to render both them  
 their sacrifices acceptable to their gods

By ardent pray'r, and clear *lustration*  
 Purge the contagious spots of human

(2.) LUSTRATIONS, in antiquity  
 monies by which the ancients purifie  
 ties, fields, annies, or people, defiled by  
 or impurity. Some of these were pub-  
 private. There were 3 methods of  
 lustration, *viz.* by fire and sulphur, by  
 by air; which last was done by tan-  
 tating the air round the thing to be  
 Some of these could not be dispensed  
 lustrations of houses in time of a plague  
 the death of any person: others were

afure: The public lustrations at Rome were celebrated every 5th year; when they led a victim into every the place to be purified, and in the same time burnt a great quantity of perfumes. Their country lustrations, which they called *AMBARVALIA*, were celebrated before they began to reap their corn: in those of the armies, which they called *ARMILUSTRIA*, some chosen soldiers, armed with laurel, led the victims, which were a sheep, a bull, a horse, and a pig, thrice round the arrayed in battle array, in the field of Mars, whom the victims were afterwards sacrificed, uttering many imprecations upon the enemies of the Romans. The lustrations of their fields were performed thus; the shepherd sprinkled them with pure water and thrice surrounded his sheepfold with a composition of saffron, laurel, and brimstone set on fire; and afterwards sacrificed to the goddesses Pales an offering of milk, wine, a cake, and millet. Private houses were lustrated with water, a fumigation of laurel, olive-tree, saffron, and such like; and the victim commonly was a pig. Lustrations made for particular persons were commonly called *expiations*, or the victims *piacula*. See *AMBARVALIA*.—In their lustratory sacrifices, the Athenians sacrificed a man, one for the men of their city, and another for the women. Divers of these expiations were austere: some fasted; others abstained from sensual pleasures; and some, as the priests of Delos, castrated themselves. The postures of the penitents were different according to the different sacrifices: The priests changed their habits according to the ceremony to be performed; white, purple and black, were the most usual colours. They cast into the river, or at least, out of the city, the animals or other things that had been used for a lustration or sacrifice of atonement; and thought themselves threatened with some great misfortune when by chance they trod upon them. Part of these ceremonies were abolished by Constantine, and his successors: the rest subsisted till the Gothic kings were masters of Rome; after whom they expired, excepting what the priests thought proper to adopt into the church. For the lustration, or expiation, of the ancient times, see *EXPIATION*, § 4, 5.

(1.) \* *LUSTRE*. *n. s.* [*lustre*, French.] 1. Brightness; splendour; glitter.—You have one eye left that sees some mischief on him.—Lest it see more mischief; out, vile jelly! where is thy lustre now? *Shak.*

To her foul time doth perfection give,  
And adds fresh lustre to her beauty still. *Davies.*  
The scorching sun was mounted high,  
In all its lustre, to the noonday sky. *Ovid.*

Pass but some fleeting years, and these poor eyes,

Where now without a boast some lustre lies;  
No longer shall their little honours keep,  
But only be of use to read or weep. *Prior.*  
The sun's mild lustre warms the vital air. *Pope.*  
A sconece with lights.—

Ridotta sips, and dances till she see  
The doubling lustres dance as quick as she. *Pope.*  
Eminence; renown.—His ancestors continued  
at 400 years, rather without obscurity than  
any great lustre. *Wotton.*—Used to wonder how  
OL. XIII. PART II.

a man of birth and spirit could endure to be wholly insignificant and obscure in a foreign country, when he might live with lustre in his own. *Swift.*  
4. [From *lustre*, Fr. *lustrum*, Latin.] The space of five years.—Both of us have closed the tenth lustre, and it is time to determine how we shall play the last act of the farce. *Bolingbroke.*

(2.) *LUSTRE*, in commerce, denotes the gloss on any thing, particularly on manufactures of silk, wool, or stuff. It is likewise used to denote the composition or manner of giving that gloss.—The lustre of silks is given them by washing in soap, then clear water, and dipping them in alum water cold. To give stuffs a beautiful lustre: For every 8 lb. of stuff allow ¼ lb of lintseed; boil it half an hour, and then strain it through a cloth, and let it stand till it is turned almost to a jelly: afterwards put 1½ oz. of gum to dissolve 24 hours; then mix the liquor, and put the cloth into this mixture, take it out, dry it in the shade, and press it. If once, doing is not sufficient, repeat the operation. Curriers give a lustre to black leather first with juice of barberries, then with gum-arabic, ale, vinegar, and Flanders glue, boiled together. For coloured leather, they use the white of an egg-beaten in water. Moroccos have their lustre from juice of barberries, and lemon or orange. For hats, the lustre is frequently given with common water; sometimes a little black dye is added: the same lustre serves for furs; except that for very black furs they sometimes prepare a lustre of galls, copperas, Roman alum, ox's marrow, and other ingredients.

(1.) \* *LUSTRING*. *n. s.* [from *lustre*.] A shining silk; commonly pronounced *lustre*.

(2.) *LUSTRINGS*. A company was incorporated for making, dressing, and lustrating alamodes and lustrings in England, who were to have the sole benefit thereof, by stat. 4 and 5. William and Mary. And no foreign silks known by the name of *lustrings* or *alamodes* are to be imported but at the port of London, &c. Stat. 9. and 10. W. III. c. 43. See *SILK*.

\* *LUSTROUS*. *adj.* [from *lustre*.] Bright; shining; luminous.—Noble heroes, my sword and yours are kin, good sparks and *lustrous*. *Shak.*—The more *lustrous* the imagination is, it filleth and fixeth the better. *Bacon.*

*LUSTRUM*, in Roman antiquity, a general muster and review of all the citizens and their goods, which was performed by the censors every 5th year, who afterwards made a solemn lustration. See *LUSTRATION*, § 2. This custom was first instituted by Servius Tullius, about A. U. C. 180. In course of time the lustra were not celebrated so often; for we find the fifth lustrum celebrated at Rome only in A. U. C. 574.

(1.) \* *LUSTWORT*. *n. s.* [*lust* and *wort*.] An herb.

(2.) *LUSTWORT*, or *SUN-DEW*. See *DROSER*.  
\* *LUSTY*. *adj.* [*lustig*, Dutch.] Stout; vigorous; healthy; able of body.—

This lusty lady came from Persia late. *Spens.*  
If lusty love should go in quest of beauty,  
Where should he find it fairer than in *Shak.*

We yet may see the old man in a morning,  
Lusty as health, come ruddy to the field. *Otway.*

**LUTANGE**, a town of France, in the dep. of Moselle, 7½ miles SE. of Thionville, and 11 NE. of Metz.

\* **LUTANIST**. *n. f.* [from *lute*.] One who plays upon the lute.

\* **LUTARIOUS**. *adj.* [*lutarius*, Latin.] 1. Living in mud. 2. Of the colour of mud.—

A scaly tortoise-shell, of the *lutarius* kind. *Grew*.

**LUTAYA**, one of the PHILIPPINE ISLES.

(1.) \* **LUTE**. *n. f.* [*lut*, *lut*, Fr.] 1. A stringed instrument of music.—

Orpheus with his *lute* made trees,

And the mountain tops that freeze,

Bow themselves when he did sing. *Shak.*

—May must be drawn with a sweet countenance, upon his head a garland of roses, in one hand a *lute*. *Peacbam*.—

In a sadly pleasing strain

Let the warbling *lute* complain. *Pope*.

—A *lute* string will bear a hundred weight without rupture, but at the same time cannot exert its elasticity. *Arbutnot*.—

Love-whisp'ring woods, and *lute* resounding waves. *Dunciad*.

2. [From *lut*, Fr. *lutum*, Lat.] A composition like clay with which chemists close up their vessels.—

Some temper *lute*, some spacious vessels move.

*Garth*.

(2.) The **LUTE**, (§ 1. *def.* 1.) consists of 4 parts, viz. the table, the body or belly, which has 9 or 10 sides; the neck, which has 9 or 10 stops or divisions, marked with strings; and the head or cross, where the screw for raising and lowering the strings to a proper pitch of tone are fixed. In the middle of the table there is a rose or passage for the sound; there is also a bridge that the strings are fastened to, and a piece of ivory between the head and the neck, to which the other extremities of the strings are fitted. In playing, the strings are struck with the right hand, and with the left the stops are pressed. The lutes of Bologna are esteemed the best on account of the wood, which is said to have an uncommon disposition for producing a sweet sound.

(3.) **LUTE**, or **LUTING**, (§ 1. *def.* 2.) is a mixed, tenacious, ductile substance, which grows solid by drying. See **CHEMISTRY**, *Index*.

\* **To LUTE**. *v. a.* [from the noun.] To close with lute, or chemists clay.—Take a vessel of iron, and let it have a cover of iron well *luted*, after the manner of the chemists. *Bacon*.—Iron may be so heated, that, being closely *luted* in a glass, it shall constantly retain the fire. *Wilkins*.

**LUTENBURG**, a town of Austria, in Stiria, 34 m. SE. of Gratz. Lon. 16. 10. E. Lat. 46. 46. N.

**LUTETIA**, or **LUTETIA PARISIORUM**, in ancient geography, a town of the Parisii, in Gallia Celtica, situated in an island in the Sequana, or Seine. It received its name, as some suppose, from the great quantity of clay, (*lutum*,) in its neighbourhood. J. Cæsar fortified and embellished it, from which circumstance some authors call it *Julii Cævitas*. Julian the apostate resided there for some time. It is now **PARIS**, the capital of France; so called from its name *Parys* in the lower age.

† **LUTHER**, Martin, the celebrated author of the Reformation, was born at Eisleben in Saxony,

in 1483. Though his parents were perceived a learned education; during that of which, he gave many indications of genius. Being tinged with some religious melancholy, which delights and devotion, he retired into a convent of fine friars; where he acquired great for piety, knowledge and unwearied to study. The cause of this retirement have been, that he was once struck by and his companion killed by his side by flash. He had been taught the scholastic phy then in vogue, and made considerable progress in it; but happening to find a bible in the library of his monastery, he with such assiduity, as quite astonished and increased his reputation for sanctity that he was chosen professor of philology, at Wittenberg on the Elbe, a ducal elector of Saxony had founded an. While Luther continued to enjoy the reputation for sanctity and learning, Tetimican friar, came to Wittenberg, and indulgences. Luther beheld his success with great concern; and having first inveighed indulgences from the pulpit, he afterwards 95 theses, containing his sentiments on the subject. These he proposed, not as proposed, but as subjects of inquiry. He appointed a day on which they were invited to impugn them either in by writing; and to the whole he joined protestations of his high respect for the fee, and of his implicit submission to its. No opponent appeared at the time. The theses spread over Germany with astonishment, and were read with the greatest. But though he met with no opposition was not long before many zealous ch rose, to defend those opinions with wealth and power of the clergy were connected. Their cause, however, means promoted by these endeavours; began to call in question the authority non law and even of the pope himself. of Rome at first despised these new doctrines, at last the attention of the pope, Leo raised by the great success of the reform the complaints of his adversaries, Luther, in July 1518, to appear at Rome 60 days, before the auditor of the chamber of Luther's adversaries, named *Prierias*. written against him, was appointed to and decide upon his doctrines. The pope at the same time to protect a man who and profane tenets were so shocking to and enjoined the provincial of the Augustinian order, and gave offence and disturbance whole church. From these letters, a pointment of his enemy to be his judge easily saw what justice he might expect and therefore was anxious to have his in Germany, and before a more impartial He wrote a submissive letter to the pope he promised an unreserved obedience

he entertained no doubt of the divine power's authority; and, by the instance of the other professors, Cajetan the pope in Germany was appointed to hear the cause. Luther appeared without hesitation; but Cajetan thought it his dignity to dispute the point with a man much his inferior; and therefore required the virtue of the apostolic powers with which he was clothed, to retract the errors which he had been clothed with regard to indulgences and of faith, and to abstain for the future from the publication of new and dangerous opinions. This last forbade him to appear in his press, he intended to comply with what was demanded of him. This haughty and violent proceeding, with other circumstances, gave the pope's friends such reasons to suspect that Luther's safe-conduct would not be able to protect him from the legate's resentment, that he fled from him secretly to withdraw from Rome and return to his own country. But upon his departure, according to a form of which had been given some examples, he prepared a solemn appeal from the pope, ill-informed at that time of the state of his cause, to the pope, when he received more full intimation. Cajetan, upon Luther's abrupt retreat, and at the pope's appeal, wrote to the elector of Saxony, informing him, as he regarded the peace of Germany and the authority of its head, either to detain Luther as a prisoner to Rome, or to drive him out of his territories. Frederic the elector, from political motives, protected Luther, thinking he might be of use in checking the enormous power of the see of Rome; but he was not Germany refounded with his fame, had not admitted him into his presence. He had great respect and much attention for Luther, and fore-seeing how fatal a removal of Luther would be to its reputation, he only declined complying with the demands of the pope, but openly avowed great concern for the safety, whose situation became daily more alarming. If he should be obliged to leave Rome, he had no other asylum, and must submit to whatever punishment the rage of his enemies could inflict; and so they thought to condemn him, that he had been declared a heretic at Rome before the expiration of 60 days allowed him to make his appeal. Notwithstanding all this, he discovered symptoms of timidity; but continued to persevere in his conduct and opinions, and to inveigh against the errors of his adversaries, with more vehemence than ever. And, being convinced that the pope would soon proceed to the most violent measures, he appealed to a general council, as the law of the Catholic church, and superior to the pope; who being a fallible man, was not to be judged at St Peter, the most perfect of his predeceutors. In the mean time the court was assiduous to crush the author of these doctrines. A bull was issued by the pope, commanding the legate prior to Luther's appeal, in which he was forbidden to grant the virtues of indulgences, and subjected to the heaviest ecclesiastical censures all who should teach a *contrary doctrine*. Such

a clear decision of the sovereign pontiff against him might have proved fatal to Luther's cause, had not the death of the emperor Maximilian I, which happened Jan. 17th, 1550, given matters a different turn. Both the principles and interest of Maximilian had prompted him to support the authority of the pope; but by his death, the vicariate of that part of Germany, which is governed by the Saxon laws, devolved to the elector of Saxony; and, under his friendly shelter, Luther himself enjoyed tranquillity, and his opinions took such deep root in different places, that they could never be eradicated. At the same time, as the election of an emperor was a point more interesting to Leo, than a theological controversy, of which he could not foresee the consequences, he was extremely solicitous not to irritate a prince of such influence in the electoral college as Frederic; and discovered great unwillingness to pronounce the sentence of excommunication against Luther, which his adversaries continually demanded with the most clamorous importunity. A suspension, therefore, of proceedings against Luther took place for 18 months; and frequent negotiations were carried on during this interval, to bring matters to an amicable issue. The manner in which these were conducted having given our reformer many opportunities of observing the corruption of the court of Rome, its obstinacy in adhering to established errors, and its indifference about truth, however clearly proposed or strongly proved, he began, in 1520, to utter some doubts with regard to the divine origin of the papal authority, which he publicly disputed with Eccius, one of his most learned antagonists. The dispute was indecisive, both parties claiming the victory; but it must have been very mortifying to the partizans of the Romish church to hear such an essential point of their doctrine publicly attacked. Luther after this proceeded to push on his inquiries and attacks from one doctrine to another, till at last he began to shake the firmest foundations on which the wealth and power of the church were established. Leo then saw that there were no hopes of reclaiming such an incorrigible heretic; and therefore prepared to pronounce the sentence of excommunication against him. The college of cardinals was often assembled to prepare the sentence with due deliberation; and the ablest canonists were consulted how it might be expressed with unexceptionable formality. At last it was issued on the 15th of June 1520. Forty-one propositions, extracted out of Luther's works, were therein condemned as heretical, scandalous, and offensive to pious ears; all persons were forbidden to read his writings, upon pain of excommunication; such as had any of them in their custody were commanded to commit them to the flames; he himself, if he did not, within 60 days, publicly recant his errors, and burn his books, was pronounced an obstinate heretic, excommunicated, and delivered to Satan; and all secular princes were required, under pain of incurring the same censure, to seize his person, that he might be punished as his crimes deserved. Luther was not in the least disconcerted by this sentence, which he had for some time expected. He renewed his appeal to a general council; declared the pope to be

be that *Antichrist*, or man of sin, whose appearance is foretold in the New Testament; declaimed against his tyranny with greater vehemence than ever; and at last, by way of retaliation, having assembled all the professors and students in the university of Wittemberg, in the presence of a vast multitude of spectators, he cast the volumes of the canon law, together with the bull of excommunication, into the flames. The manner, in which this action was justified, gave still more offence than the action itself. Having collected from the canon law some of the most extravagant propositions with regard to the plenitude and omnipotence of the pope's power, as well as the subordination of all secular jurisdiction to his authority, he published these with a commentary, pointing out the impiety of such tenets, and their evident tendency to subvert all civil government. On the accession of Charles V. Luther found himself in a very dangerous situation. Charles, to secure the pope's friendship, had determined to treat him with great severity. His eagerness to gain this point, rendered him not averse to gratify the papal legates in Germany, who insisted, that, without any delay or formal deliberation, the diet, then sitting at Worms, ought to condemn a man, whom the pope had already excommunicated as an incorrigible heretic. Such an abrupt proceeding, however, being deemed unprecedented and unjust by the members of the diet, they made a point of Luther's appearing in person, and declaring whether he adhered or not to those opinions, which had drawn upon him the censures of the church. Not only the emperor, but all the princes through whose territories he had to pass, granted him a safe conduct; and Charles wrote to him at the same time, requiring his immediate attendance on the diet, and renewing his promises of protection from any injury or violence. Luther did not hesitate one moment about yielding obedience; and set out for Worms, attended by the herald who had brought the emperor's letter and safe-conduct. While on his journey, many of his friends, whom the fate of John Huss, under similar circumstances, filled with solicitude, advised and intreated him not to rush wantonly into the midst of danger. (See Huss.) But Luther, superior to such terrors, courageously replied, "I am lawfully called to appear in that city; and thither will I go in the name of the Lord, though as many devils as there are tiles on the houses were there combined against me." The reception, which he met with at Worms, was such as might have been reckoned a full reward of all his labours, if vanity and the love of applause had been his motives. Greater crowds assembled to behold him than had appeared at the emperor's public entry; his apartments were daily filled with princes and persons of the highest rank; and he was treated with an homage more sincere, as well as more flattering, than any which pre-eminence in rank or birth can command. At his appearance before the diet, he behaved with great decency and firmness. He readily acknowledged an excess of acrimony and vehemence in his controversial writings; but refused to retract his opinions unless he were convinced of their falsehood, or to consent to their being tried by any other

rule than by the word of God. Some ecclesiastics proposed to imitate the example of the council of Constance, and, by punishing the author of this pestilent heresy, who was their power, to deliver the church at such an evil. But the members of the diet refused to expose the German integrity to reproach by a second violation of public faith. Charles being unwilling to stain the beauty of his administration by such an ignominious departure, Luther was permitted to depart in safety. A few days after he left the city, a severe edict was published in the emperor's name, and by the authority of the diet, depriving him, as an obnoxious and excommunicated criminal, of all the rights and privileges which he enjoyed as a subject of the empire, bidding any prince to harbour or protect him, and requiring all to seize his person as soon as he should be within the term specified in his protection should be. But this decree had no effect; the execution being prevented, partly by the multiplicity of occupations which the commotions in Saxony, the wars in Italy and the Low Countries, and partly by a prudent moderation employed by the elector of Saxony, his faithful patron. As Luther, on his return to Worms, was passing near Altenstein, a number of horsemen in masks rushed suddenly out of a wood, where they had pointed them to lie in wait for him, surrounding his company, carried him, and sending all his attendants, to Wortburg, a town not far distant. There the elector ordered to be supplied with every thing necessary for his retreat; but the place of his retreat was concealed, until the fury of the violence against him began to abate, upon a change in the political system of Europe. In Saxony, where he remained nine months, and frequently called his *Paradisus*, after that which St John was banished, he exerted his vigour in defence of his doctrines, and refutation of his adversaries; publishing sermons, which revived the spirit of his followers, which were diminished and disheartened at the disappearance of their leader. Luther appeared publicly again at Wittemberg, on the 6th of January 1522. He appeared indeed without a safe-conduct; but immediately wrote him to prevent his taking it ill. The edict of the emperor had given little or no check to Luther for the emperor was no sooner gone, than his edict was despised, and the doctrine spread faster than before. Carolus Luther's absence, had pushed things further than his leader; had attempted to remove images, to set aside confession, invocation of saints, and abstention from meats; had allowed the monks to desert their monasteries, to despise their vows, and in short, had quite changed the discipline of the church at Wittemberg: though not against Luther's sentiments, which were blamed by him, as rashly and unseasonable. Lutheranism was still confined to Germany; had not got to France; and Henry VIII. the most rigorous acts to hinder it from spreading into England. Nay, to show his zeal for the

his skill in theology, he wrote a treatise *Of the seven sacraments*, against Luther's book *Of the city of Babylon*; which he presented to Leo Oct. 1521. The pope was so well pleased with the king of England, that he complimented him with the title of *Defender of the Faith*. Luther, however, paid no regard to his kingship: but treated him with great sharpness, treating both of person and performance in the most contemptuous manner. Henry complained of Luther's effects to the princes of Saxony: and Fisher, of Rochester, replied in behalf of Henry's interest: but neither the king's complaint, nor the pope's reply, were attended with any visible effect. Luther now made open war with the pope's bishops; and that he might make the people despise their authority as much as possible, he wrote a book against the pope's bull, and against the order falsely called the *order of bishops*. The same year, 1522, he wrote a letter dated July 29th, to the assembly of the States general in Worms; in which he assured them, that he laboured to establish their doctrine in Germany, and exhorted them not to return to the union of the church of Rome; and he published, this year, a translation of the New Testament in the German tongue, which was afterwards corrected by himself and Melancthon. A translation having been printed several times, and lying in every body's hands, Ferdinand arch-duke of Austria, the emperor's brother, made a severe edict, to hinder the farther publication of it; and forbade all the subjects of his imperial majesty to have any copies of it, or of Luther's other books. Some other princes followed the example; whereupon Luther wrote a treatise *Of the secular power*, in which he accuses the pope of tyranny and impiety. The diet of Worms, which was held at Nuremberg, at the end of the year 1521, to which Adrian VI. Leo's successor, sent a legate, dated Nov. 25th, wherein he observes, that Martin Luther, after the sentence of the diet of Worms, continued to teach the same doctrine, and daily to publish books full of heresies, that it appeared strange to him, that so large a religious nation could be seduced by a wicked apostate friar: that nothing, however, could be more pernicious to Christendom: and therefore he exhorts them to use their utmost endeavours to make Luther, and the authors of such tumults, return to their duty; or, if they were obstinate, to proceed against them according to the laws of the empire, and the severity of the last edict. The resolution of this diet was published in the form of an edict, on the 6th of March 1523; but it had no effect in checking Lutherans, who still went on in the same triumphant manner. This year Luther wrote many sermons, particularly one upon *the dignity and office of the supreme magistrate*; which Frederic elector of Saxony is said to have been highly pleased with. About the same time, a writing in the Bohemian language to the Waldenses, or Pickards, in Bohemia and Moravia, who had applied to Luther, "about worshipping the body of Christ in the Eucharist." He wrote also another book, which he dedicated to the senate and people of

Prague, "about the institution of ministers of the church." He drew up a form of saying mass. He wrote a piece, entitled, *An example of popish doctrine and divinity*; which Dupins calls a *satire against nuns, and those who profess a monastic life*. He wrote also against the vows of virginity, in his preface to his commentary on 1 Cor. viii. which was soon followed with effects: for 9 nuns, among whom was Catharine de Bore, (see BORE, N<sup>o</sup> 1.) eloped from the nunnery at Nimptschen, and were brought, by the assistance of Leonard Coppen, a burgher of Torgau, to Wittemberg. This act was highly extolled by Luther; who, in a book written in the German language, compares the deliverance of these nuns from the slavery of a monastic life, to that of the souls which Jesus Christ has delivered by his death. This year Luther had occasion to canonize two of his followers, who, as Melchior Adam relates, were burnt at Brussels in July, and were the first who suffered martyrdom for his doctrine. He wrote also a consolatory epistle to three noble ladies at Misnia, who were banished from the duke of Saxony's court at Friburg, for reading his books. In the beginning of 1524, Clement VII. sent a legate into Germany to the diet, which was to be held at Nuremberg. Adrian VI. a little before his death, had canonized Benno, who was bishop of Meissen in the time of Gregory VII. and a most zealous defender of the holy see. Luther wrote a piece entitled *Against the New Idol and Old Devil set up at Meissen*; in which he treats the memory of Gregory and Adrian with great freedom. Clement VII.'s legate represented to the diet of Nuremberg the necessity of enforcing the execution of the edict of Worms, which had been strangely neglected by the princes of the empire: but, notwithstanding his pressing solicitations, the decrees of that diet were thought so ineffectual, that they were condemned at Rome, and rejected by the emperor. This year the dispute between Luther and Erasmus, about free-will, began. Erasmus had been much courted by the Papists to write against Luther; and tired out at length with their importunities, and desirous at the same time to clear himself from the suspicion of heresy, he resolved to write against Luther, though, as he tells Melancthon, it was with reluctance, and chose free-will for the subject. His book was entitled, *A Diatribe, or Conference about Free-will*; and was written with much moderation, and without personal reflections. He tells Luther in the preface, "That he ought not to take his dissenting from him in opinion ill, because he had allowed himself the liberty of differing from the judgment of popes, councils, universities, and doctors of the church." Luther answered Erasmus's book in a treatise *De Servo Arbitrio, or Of the Servitude of Man's Will*; and though Melancthon had promised Erasmus, that Luther should answer him with moderation, yet Luther never wrote any thing sharper. He accused Erasmus of being careless about religion, and little solicitous what became of it, provided the world continued in peace; and that his notions were rather philosophical than Christian. Erasmus immediately replied to Luther, in a piece called *Hyperaspistes*; in the first part of which he answers his arguments, and in the

ad his personal reflections. In Oct. 1524 Luther threw off the monastic habit; which, was a very proper preparative to his marriage with Catharine de Bore, on the 13th June 1525. This conduct of his was blamed not only by the Catholics, but, as Melancthon says, by those of his own party. He seemed even for some time ashamed of it himself, on account of the circumstances of the time, when Germany was groaning under the miseries of a war, which was said to be owing to Lutheranism. But Luther soon assumed his former intrepidity, and boldly defended what he had done. "I took a wife (says he), in obedience to my father's commands; and hastened the consummation, to prevent impediments, and stop the tongues of slanderers." He also says, that he did it partly as concurring with his grand scheme of opposing the Catholic corruptions. Luther found himself extremely happy in his new state and especially after his wife had brought him a son. "My rib Kate (says he) desires her compliments to you, and thanks you for the favour of your kind letter. She is very well, through God's mercy. She is obedient and complying with me in all things; and more agreeable, I thank God, than I could have expected." He was heard to say (Seckendorf tells us), that he would not exchange his wife for the kingdom of France, nor for the riches of the Venetians; and that for 3 reasons; 1st, Because, she had been given him by God, at the time when he implored the assistance of the Holy Ghost in finding a good wife. 2dly, Because, though she was not without faults, yet she had fewer than other women; and, 3dly, Because she religiously observed the conjugal fidelity she owed him. His marriage, however, did not retard his activity in the work of reformation. He revised the Augsburg confession of faith, and apology for the Protestants, when the Protestant religion was first established on a firm basis. See PROTESTANTS and REFORMATION. After this, Luther had little else to do than to sit down and contemplate the mighty work he had finished; for, that a singular monk should have given the church such a shock, that there needed but such another entirely to overthrow it, may well be stiled a mighty work. He did indeed little else; for the remainder of his life was spent in exhorting princes, states, and universities, to confirm the reformation; and in publishing such pieces as might encourage, direct, and aid them in doing it. The emperor threatened temporal punishment with armies, and the pope eternal with bulls and anathemas; but Luther disregarded their threats. His friend and coadjutor Melancthon was not so indifferent; for Melancthon had a great deal of softness, moderation, and diffidence, which made him very uneasy, in the existing disorders. Hence we find many of Luther's letters written on purpose to comfort him under these distresses and anxieties. In 1533, Luther wrote a consolatory epistle to the citizens of Oschatz, who had suffered some hardships for adhering to the Augsburg confession. He had also about this time a controversy with George duke of Saxony, who had such an aversion to Luther's doctrine, that he obliged his subjects to take an oath that they would never embrace it. However, 60 or 70 citizens of Leipsh

had deviated from the Catholic system point, on which they had consulted Lut on which George complained to the elect that Luther had not only abused his pe preached up rebellion among his subject elector ordered Luther to be acquainted this; and to be told that if he did not el self of the charge, he could not escape ment. But Luther easily refuted the ac and proved that, so far from stirring up jects against him, on the score of religio exhorted them rather to undergo the hardships, and even suffer banishment. the Bible translated by him into German printed, as the privilege under the elect shows; and it was published in 1535. published this year a book against mass consecration of priests, in which he relafence he had with the devil upon thof for in Luther's whole history, he never conflicts within, but the devil was a antagonist. In February 1537, an was held at Smalkald about matters of to which Luther and Melancthon we At this meeting Luther was seized wit vious an illness, that there were no hope very. He was afflicted with the stone, a stoppage of urine for 12 days. In th condition he insisted on travelling, notwit all that his friends could say to prevent resolution, however, was attended wit effect; for the night after his departure to be better. As he was carried along, his will, in which he bequeathed his d of Popery to his friends and brethren; ag what he often used to say: *Pessis eram: ricens ero mors tua, papa*; that is, "I plague of the Pope in my life, and in I shall be his death." This year the court of Rome, finding it impossib with the Protestants by force, began to course to stratagem. They affected the think, that though Luther had indee things on with a high hand and to a v treme, yet what he had pleaded in d these measures was not entirely without tion. They talked with a seeming show ration; and Pius III. proposed a reform among themselves, and even went so fa a place for a council to meet at for tha But Luther treated this farce as it dese masked and detected it immediately; a dicule it the more strongly, caused a pic drawn, in which was represented the pe on high upon a throne, some cardinals a with foxes tails on, and seeming to eva wards and downwards (*sursum deorsum* as Melchior Adam expresses it). This over against the title-page, to let the reaz once the scope and design of the boo was, to expose that cunning and arti which those subtle politicians affected t and purify themselves from their errors; sitions. Luther published about the f A Confutation of the pretended Gran stantine to Sylvester, Bp. of Rome; and letters of John Huss, written from his Constance to the Bohemians. Thus w

ill his death, in 1546. That year, according to Melancthon, he paid a visit to his country, which he had not seen for many years, and returned again in safety. But soon afterwards he was called thither again by the earls of Saxony, to compose some differences which had arisen about their boundaries. Luther had been used to such matters; but because he was at Ilsleben, a town in the territory of Saxony, he was willing to do his country what he could, even in this way. Preaching his usual course there at Wittemberg, upon the 21st of January, he set off on the 23d; and at Saxony lodged with Justus Jonas, with whom he staid three days, because the waters were so good. Upon the 28th, he passed over the river Elbe, with his three sons and Dr Jonas; and being in great danger, he said to the Doctor, "Do not think it would rejoice the devil exceedingly, if you, and my three sons, should be drowned here; but if he entered the territories of the earls of Saxony, he was received by 100 horsemen, and conducted in a very honourable manner; but was at the same time so very ill, that he could hardly have lived." He said, that these attacks often came upon him when he had business to undertake: of this, however, he recovered; but died on the 18th of February, at the age of 55. A little before he expired, he admonished those that were about him to God for the propagation of the Gospel; his body was put into a leaden coffin, and with great funeral pomp to the church at Ilsleben. Dr Jonas preached a sermon upon the occasion.

The earls of Mansfeldt desired that his body should be interred in their territories; but the earls of Saxony insisted upon his being carried back to Wittemberg: which was accordingly done: and there he was buried with the same pomp that perhaps ever happened to any man. Princes, earls, nobles, and students in great number, attended the procession; and the duke of Saxony made his funeral oration. A thousand were invented by the Papists about Luther's death. Some said that he died suddenly; that the devil strangled him; &c. Nay, some invented about his death, even while he was alive. Luther, however, put forth an advertisement of his being alive; and, to be even more convincing, wrote a book to shew that the papacy was founded by the devil; his works were collected after his death, and printed at Wittemberg in 7 vols folio. His death survived him a few years and continued to be celebrated at Wittemberg. She went thence in 1552, when the town was surrendered to the emperor. Before her departure, she had received of 50 crowns from Christian III. king of Denmark; and the elector of Saxony, and the duke of Mansfeldt, gave her tokens of their love.

With these additions to what Luther had said, she maintained herself and her family. She returned to Wittemberg, and the town was restored to the elector; where she lived in a very pious manner, till the plague carried her to leave it again in 1552. She sold her house at Wittemberg; and retired to Torgau in her journey thither, the horses grow-

ing unruly, and attempting to run away, she leaped out of the vehicle, and got a fall, of which she died within 3 months, on the 10th Dec. 1552. She was buried in the great church there, where her tomb and epitaph are still to be seen; and the university of Wittemberg, (then at Torgau because the plague raged at Wittemberg,) made a public programme concerning the funeral pomp.

**LUTHERANISM**, *n. s.* the sentiments of Martin Luther with regard to religion. See **LUTHER**. Lutheranism has undergone some alterations since the time of its founder. Luther rejected the epistle of St James, as inconsistent with the doctrine of St Paul, in relation to justification; he also set aside the Apocalypse: both which are now received as canonical in the Lutheran church. Luther reduced the number of sacraments to two, viz. baptism, and the eucharist: but he believed the **IMPANATION**, or **CONSUBSTANTIATION**, that is, that the matter of the bread and wine remain with the body and blood of Christ; and it is in this article that the main difference between the Lutheran and English churches consists. Luther maintained the mass to be no sacrifice; exploded the adoration of the host, auricular confession, meritorious works, indulgences, purgatory, the worship of images, &c. which had been introduced in the corrupt times of the Romish church. He also opposed the doctrine of free-will, maintained predestination, and asserted our justification to be solely by the imputation of the merits and satisfaction of Christ. He also opposed the fastings in the Romish church, monastical vows, the celibacy of the clergy, &c.

**LUTHERANS**, the Christians who follow the opinions of Martin Luther. See **LUTHER**. The Lutherans, of all Protestants, differ least from the Romish church; as they affirm, that the body and blood of Christ are materially present in the sacrament of the Lord's supper, though in an incomprehensible manner; and likewise represent some religious rites and institutions, as the use of images in churches, the distinguishing vestments of the clergy, the private confession of sins, the use of wafers in the administration of the Lord's supper, the form of exorcism in the celebration of baptism, and other ceremonies of the like nature, as tolerable, and some of them as useful. The Lutherans maintain, with regard to the divine decrees, that they respect the salvation or misery of men, in consequence of a previous knowledge of their sentiments and characters, and not as free and unconditional, and as founded on the mere will of God. Towards the close of the 17th century, the Lutherans began to entertain a greater liberality of sentiment than they had before adopted; though in many places they persevered longer in severe and despotic principles than other Protestant churches. Their public teachers now enjoy an unbounded liberty of dissenting from the decisions of those creeds, which were once deemed almost infallible rules of faith and practice, and of declaring their dissent in the manner they judge most expedient. Mosheim attributes this change in their sentiments to the maxim which they generally adopted, that Christians were accountable to God alone for their religious opinions; and that no individual could be

justly punished by the magistrate for his erroneous opinions, while he conducted himself like a virtuous and obedient subject, and made no attempts to disturb the peace and order of civil society.

**LUTHERN**, in architecture, a kind of window over the cornice, in the roof of a building; standing perpendicularly over the naked of a wall, and serving to illuminate the upper story. Lutherens are of various forms; as square, semicircular, round, called *bull's eyes*, *flat arches*, &c.

**LUTKENBURG**, a town of Holstein, 30 m. N. of Lubeck, and 55 NE. of Hamburg.

**LUTON**, a town of Bedfordshire among hills, famous for its manufactures of straw: 20 miles S. of Bedford, and 34 N. of London. Lon. 0. 25. W. Lat. 52. 27. N.

**LUTRA**, in zoology. See **MUSTELA**.

**LUTRI**, a town of the Helvetic republic, in the country of Vand, on the N. coast of the Lake of Geneva, 2½ miles E. of Lausanne.

**LUTSCHINEN**, a river of the Helvetic republic, in the canton of Bern and bailiwick of Interlaken, which flows through a romantic narrow valley, for many miles, till it falls into the lake of Brienz. It has a bridge, which, being badly joined together, presents a most terrific appearance to strangers.

**LUTTENBERG**, 2 towns of Stiria.

(1.) **LUTTER**, a town of Brunswick, famous for a battle fought between Christian IV. K. of Denmark, and the imperialists under Gen. Tilly, in 1626. It is 8 miles NW. of Goslar, and 13 SE. of Hildesheim. Lon. 10. 25. E. Lat. 52. 4. N.

(2, 3.) **LUTTER**, 2 rivers of Germany; 1. in Saxony, running into the Lachte, 12 miles NE. of Zell: 2. in Westphalia, running into the Aa, 2 miles S. of Hervorden.

**LUTTERBERG**, a town of Hanover, formerly a county under its own lords: 15 m. S. of Goslar.

**LUTTERHAUSEN**, a town of Holstein, taken by Gen. Tilly in 1627; 2 miles from Hamburg.

**LUTTERWORTH**, a town of Leicestershire, seated on the Swift, with a handsome church, and lofty steeple, containing above 1600 inhabitants. The celebrated **WICKLIFF**, the first reformer, was rector here in the 14th century. It has a market on Monday and is 14 miles S. of Leicester, and 88 NNW. of London. Lon. 1. 10. W. Lat. 52. 26. N.

**LUTTI**, Benedict, an eminent painter, born at Florence in 1666. He was the disciple of Antonio Dominico Gabiani, and was judged equal to his master: he painted easel pieces, and his works were much valued in England, France, and Germany. The emperor knighted him; and the elector of Mentz sent him a cross set with diamonds. Lutti was never satisfied in finishing his pictures; yet though he often retouched them, they never appeared laboured. He died in 1724.

\* **LUTULENT**. *adj* [*lutulentus*, Latin.] Muddy; turbid.

**LUTZELSTEIN**, **LUTZENSTEIN**, or **PETIT-PIERRE**, a town of France, in the dep. of the Lower Rhine, with a fort on a mountain: 24 miles NW. of Strasbourg. Lon. 7. 17. E. Lat. 48. 55. N.

**LUTZEN**, a town of Upper Saxony, for a battle fought in 1632, wherein Gustolphus king of Sweden was killed. It lies on the Elster, 9 miles ESE. of Merseb. 10 WSW. of Leipzig. Lon. 12. 37. E. 20. N.

**LUVINO**, a town of the Italian rep. dep. of the Lario, and district of Varese E. bank of Lake Maggiore.

\* **To LUX**. } *v. a.* [*luxur*, French  
\* **To LUXATE**. } Lat.] To put out to disjoint.—Consider well the *luxated* joint way it slipped out; it requireth to be ret in the same manner. *Wise man*.—

Descending carelessly from his couch,  
*Lux'd* his joint neck.

(1.) \* **LUXATION**. *n. f.* [from *luxa*  
1. The act of disjoining. 2. Any thing ed.—The undue situation, or connexion in fractures and *luxations*, are to be red chiralurgical means. *Flayer*.

(2.) **LUXATION**, in surgery, is when a moved out of its place, so as to impesstroy its proper motion. See **SURGERY**.

\* **LUXE**. *n. f.* [French, *luxuria*, Lat.] voluptuousness. Not used.—

The pow'r of wealth I try'd,  
And all the various *luxes* of costly pride

(1.) **LUXEMBURG**, one of the ci-devinces of the Netherlands. It was bou the E. by the archbishopric of Treves; by Lorrain; on the W. by Champagne bishopic of Liege, which with part of I bounded it on the N. It lies in the fore dennes: in some places it is covered w tains and woods; but in general it is corn and wine, and has a great number mines. The principal rivers are, the Sour, Ourte, and Semoy. In 1795, it v run by the French; in 1796 annexed to public; and now forms the departmen **RETS**, or *the Forests*.

(2.) **LUXEMBURG**, a city of the Franc lic, in the dep. of Forets, and late prov Austrian Netherlands. It was the capit duchy, as it now is of the departmen seated partly on a hill, and partly on a p is very strong both by art and nature. indifferently built, though there are so stone houses in it. The Jesuits church is some edifice, in the modern taste. The taken by Lewis XIV. in 1684; who au the fortifications, and made it one of the towns in Europe. It was ceded to Spai treaty of Ryfwick; but the French took in 1701, and gave it up to the house of by the treaty of Utrecht, in 1715. It was besieged by the French for several in February it was bombarded, and the afterwards turned into a blockade; but garrisoned by 10,000 men under Marl. and in no want of provisions, it was rendered on the 7th of June. It is 25 m of Treves, and 100 W. of Mentz. Lon W. Lat. 49. 52. N.

(3.) **LUXEMBURG**, Francis Henry de Rrenci, duke of, and marshal of France, a ed general in the service of Louis XIV.

e was with the prince of Conde at the  
crocy, in 1643; and in 1668. distinguish-  
at the conquest of Franche Compté.  
commanded in chief the French army  
; when he defeated the enemy near  
nd Bodegrave, and was universally ad-  
he fine retreat he made in 1673. He  
rshal of France in 1675; gained the  
leurus in 1690, that of Steenkirk in  
that of Nerwind in 1693. He died at  
1695.

EMBURG, FRENCH, a ci-devant prov.  
comprehending part of the ancient  
o r.) ceded to France in 1659, by the  
e Pyrenées, and including the districts  
of Thionville, Montmedy, Marville,  
Carignan, and Damvilliers. It now  
lepartment of the MOSELLE.

IL, a town of France, in the dep. of  
saone, near some warm baths and cha-  
ings, at the foot of Mount Vosge, 15  
Vesoul. Lon. 6. 24. E. Lat. 47. 50. N.

RD, LAKE, a lake or arm of the sea  
t of Dorsetshire, near Pool.

N, a town of Somersetsshire, between  
nd Uphill.

LAN, a town of Cornwall, W. of Left-

RIANCE. } n. f. [from *luxurians*, Lat.]  
RIANCY. } Exuberance; abundant or  
enty or growth.—A fungus prevents  
y by its *luxuriancy*. *Wise man*.—Flowers  
the garden in the greatest *luxuriancy*  
on. *Speclator*.—

thro' the parting robe th' alternate breast  
xuriance rose. *Thomson's Summer*.

LIANS FLOS, a LUXURIANT or double  
a flower, some of whose parts are in-  
umber, to the diminution or entire ex-  
others. The parts that are augmented  
d in luxuriant flowers, are the flower-  
tals; the parts that are diminished, or  
cluded, are the stamina or chives. See  
*Index*. Many natural orders of plants  
any circumstances produce luxuriant  
f this kind are the masked flowers of  
, excepting calve's-snout; the rough-  
belliferous, stary plants, and such as  
ie joints, of Ray: some umbelliferous  
wever, are *prolific*. The pea bloom,  
r-shaped flowers, are rarely rendered  
me instances, however, of luxuriance,  
d in a species of ladies-finger, coronilla,  
.

All luxuriant flowers are vegetable  
Such as are perfectly full cannot be  
by seeds; because these, for want of  
on, cau never ripen. Full flowers  
re denominated by Linnæus *eunuchs*.  
t degree of luxuriance is very common  
l, lychnis, anemone, stock, Indian cress,  
marigold, ranunculus, violet, pœony,  
is. Flowers which do not exclude all  
, perfect their seeds. Of this kind are  
nel-flower, campanula, and some o-  
ie flowers, as those of the water-lily,  
l, and cactus, have many rows or se-  
s, without the number of stamina be-  
I. PART II.

ing in the least diminished. Such flowers are by  
no means to be reckoned luxuriant. See *PLANTS*  
*FLOS*.

\* LUXURIANT. *adj.* *luxurians*, Lat.] Exuber-  
rant; superfluously plenteous.—A fluent and *luxu-*  
*riant* speech becomes youth well, but not age.  
*Bacon's Essays*.—

The mantling vine gently creeps *luxuriant*. *Milt.*  
—If the fancy of Ovid be *luxuriant*, it is his cha-  
racter to be so. *Dryden*.—

Prune the *luxurians*, the uncouth refine,  
But show no mercy to an empty line. *Pope*.

\* To LUXURIATE. *v. n.* [*luxurior*, Lat.] To  
grow exuberantly; to shoot with superfluous plenty.

\* LUXURIOUS. *adj.* [*luxuriæus*, Fr. *luxuriosus*,  
Lat.] 1. Delighting in the pleasures of the table.  
2. Administring to luxury.—

Those whom thou saw'st  
In triumph, and *luxurious* wealth, are they  
First seen in acts of prowess eminent,  
And great exploits; but of true virtue void. *Milt.*  
The *luxurious* board. *Anon*.

3. Lustful; libidinous.—

She knows the heat of a *luxurious* bed:  
Her blush is guiltiness, not modesty. *Shakespeare*  
I grant him bloody,  
*Luxurious*, avaricious, false, deceitful. *Shak.*

4. Voluptuous; enslaved to pleasure.—

*Luxurious* cities, where the noise  
Of riot ascends above their loftiest tow'rs. *Milt.*

5. Softening by pleasure.—

Repel the Tuscan foes, their city seize,  
Protect the Latians in *luxurious* ease. *Dryden*.

6. Luxuriant; exuberant.—

The work under our labour grows  
*Luxurious* by restraint. *Milt. Par. Lost*.  
\* LUXURIOUSLY. *adv.* [from *luxurious*.] De-  
liciously; voluptuously.—

Hotter hours you have  
*Luxuriously* pick'd out. *Shak.*  
Where mice and rats devour'd poetick bread,  
And with heroick verse *luxuriously* were fed.  
*Dryden*.

He never slept in solemn state;  
Nor day to night *luxuriously* did join. *Dryden*.

(1.) \* LUXURY. *n. f.* [*luxuræ*, old Fr. *luxuria*,  
Lat.] 1. Voluptuousness; addictedness to pleasure.  
Egypt with Assyria strove  
In wealth and *luxury*. *Milton*.

—Riches expose a man to pride and *luxury*, and a  
foolish elation of heart. *Addison's Speclator*.—

2. Lust; lewdness.—

Urge his hateful *luxury*,  
His bestial appetite in change of lust. *Shak.*

3. Luxuriance; exuberance.—Young trees of se-  
veral kinds set contiguous in a fruitful ground,  
with the *luxury* of the trees will incorporate.

*Bacon*. 4. Delicious fare.—He cut the side of the  
rock for a garden, and by laying on it earth, fur-  
nished out a kind of *luxury* for a hermit. *Addison*.

(2.) LUXURY may be defined an extravagant in-  
dulgence in diet, dress, and equipage. *Luxury*,  
among the Romans, prevailed to such a degree,  
that several laws were made to limit it. The ex-  
travagance of the table began about the time of  
the battle of Actium, and continued in great ex-  
cess till the reign of Galba. Peacocks, cranes of  
Malta.

Malta, nightingales, venison, wild and tame fowl, were considered as delicacies. A profusion of provisions was the reigning taste. Whole wild boars were often served up, and filled with various small animals, and birds of different kinds: this dish they called the *Trojan horse*, in allusion to the wooden horse filled with soldiers. Fowls and game of all sorts were served up in whole pyramids, piled up in dishes as broad as moderate tables. Lucullus had a particular name for each apartment; and in whatever room he ordered his servants to prepare the entertainment, they knew by the direction the expence to which they were to go. When he supped in the Apollo, the expence was fixed at 50,000 *drachms*, that is 1250 l. M. Antony provided 8 boars for 12 guests. Vitellius had a large silver platter, said to have cost a million of *sesterces*, called *Minerva's buckler*. In this he blended together the livers of gilt-heads, the brains of peacocks and peacocks, the tongues of phenicopters, and the milts of lampreys. Caligula served up to his guests pearls of great value dissolved in vinegar; the same was done also by Clodius, the son of Ætop the tragedian. Apicius laid aside 90,000,000 of *sesterces*, besides a mighty revenue, for no other purpose but to be sacrificed to luxury. (See *APICIUS*.) The Roman laws to restrain luxury were *Lex Orestia*, *Fannia*, *Didia*, *Licina*, *Cornelia*, and many others: but these were ineffectual; for as riches increased amongst them, so did sensuality. Instances of luxury in eating are recorded by English historians, surpassing even the extravagance of the Romans. As to *dress*, luxury in that article seems to have attained a great height as early as the reign of Edward III. when there were no fewer than 7 sumptuary laws passed in one session of parliament to restrain it. Concerning the utility of luxury to a state, there is much controversy among political writers. Baron Montelucien says, that luxury is necessary in monarchies; but ruinous to democracies. With regard to Britain, whose government is a compound of both, it is a dubious question, how far private luxury is a public evil, or cognizable by public laws. Formerly there were a number of penal statutes to restrain excess in apparel, chiefly made in the reigns of Edward III, IV. and Henry VIII. But all of them it appeared expedient to repeal afterwards. In fact, although luxury will of necessity increase according to the influx of wealth, it may not be for the general benefit of commerce to prohibit it; yet for the good of the public, it might be proper that such as go beyond due bounds in eating, drinking, and dressing, should be taxed accordingly. This is, however, a point which would require deliberation; and, in mercantile countries, such restraints would be found prejudicial, most likely impracticable, especially where true liberty is established.

LUZ, a sea port in the isle of CANARY.

LUZARA, a town of the Italian republic, in the dep. of the Mincio, and district (late duchy) of Mantua, near the influx of the Crostolo into the Po. A battle was fought near it, between the French and Spaniards in 1702, when both sides claimed the victory. It is 16 miles S. of Mantua. Lon. 10. 50. E. Lat. 45. 0. N.

LUZARCHES, a town of France, in the dep. of Seine and Oise; 23 miles N. of Paris.

LUZECH, a town of France, in the dep. of Lot, 71 m. N.W. of Cahors, and 15 S. of Cahors.

LUZERNE, a county of Pennsylvania, long from N. to S. and 75 broad from E. to W. It contains 12 townships, 4,893 citizens, and 1,000 slaves, in 1795. It is bounded on the N. by York, E. and SE. by Northampton, and on the S. by Lycoming and Northampton counties. It is rich in iron ore and iron works are erected. Wilkesbarre is the capital.

LUZILLE, a town of France, in the dep. of Indre, 9 miles S. of Amboise.

LUZON. See *LUÇON* and *MANILLA*.

LUZY, a town of France, in the dep. of Nievre, 17 miles SW. of Autun.

LUZZANA, a town of the Italian republic, in the dep. of the Mincio, and district (late duchy) of Mantua; 22 miles S. of Mantua.

LUZZARA. See *LUZARA*.

LUZZI, a town of Naples, near the city.

\* *LY. v. n.* [A very frequent termination of names of places and of adjectives and verbs when *ly* terminates the name of a place, derived from *leag*, Saxon, a field. *Gibson*—ends an adjective or adverb, it is contracted, like *z*: as, *beastly*, *beastlike*; *plainly*, *plainly*.]

LYBIA, or *LIBYA*, a name anciently given to all that part of Africa lying between the river Nile and the river Triton; and coming in the dep. of *CYRENAICA*, *MARMARICA*, and *SYRIA*. See these articles, and *LYBIA*, § 1—4.

LYCÆA. See *LYCÆUS*.

LYCÆUM [*Λυκαίων*] in antiquity, a school or academy at Athens, where Aristotle taught his philosophy. The place was composed of porticoes, and trees planted in a circular form, where the philosophers disputed. Hence *philosophy of the Lycæum* is said to signify the philosophy of Aristotle, or the Peripatetic philosophy. Suidas observes, that the Lycæum took its name from its having been originally a temple of Apollo Lycæus; or a portico or gallery built by Lycæus the son of Apollo: but others mention it to have been built by Pisistratus or Pericles.

LYCÆUS, in ancient geography, a mountain of Arcadia, sacred to Jupiter; whence *Lycaeus* (*Πίνυς*): Sacred also to Pan (*Φυλίσκος*); hence *LYCÆA*, the rites performed to Pan on this mountain; which, Evander carrying to Latium, were called *LUPERCALIA*.

\* *LYCANTHROPY. n. f.* [*λυκάνθρωπος* and *άνθρωπος*.] A kind of madness, in which men have the qualities of wild beasts, like a man in his sleep, and grows as insensible as the man that dreamt of a *lycant* was for ever after wary not to come near a wolf. (*Taylor*.)

(1.) LYCAON I, in fabulous history, king of Arcadia, son of Pelasgus and Phylis. He built a town called Lycaonia, on the mountain Lycæus, in honour of Jupiter. He had many wives, by whom he had a daughter Callisto, and 50 sons. He was succeeded by his eldest son. He lived about A. C. 1000.

ON II. king of Arcadia, celebrated for  
He was changed into a wolf by  
ause he offered human victims on the  
her Pan. Some attribute this meta-  
another cause. The sins of man-  
y relate, were become so enormous,  
visited the earth to punish wicked-  
pity. He came to Arcadia, where  
nanced as a god, and the people be-  
proper adoration to his divinity.  
ever, who used to sacrifice all stran-  
ranton cruelty, laughed at the pious  
is subjects; and to try the divinity of  
served up human flesh on his table.  
y so irritated Jupiter, that he im-  
roved the house of Lycaon, and  
into a wolf.

IES, the people of LYCAONIA.

IONIA, in ancient geography, a small  
he Hither Asia, bounded by Pamphi-  
Cappadocia on the N. Pisidia and  
the W. and Armenia Minor on the  
ountry, though situated very near  
us, and part of it on it, yet the Ro-  
ed it in *Asa intra Taurum*.

ONIA, an ancient name of ARCADIA.  
ONIA, an island in the Tiber, joined  
a bridge, and to the land by an-  
e Celsus, and Fabricius.

I, or LYFCHAM, a town of Norfolk;  
of Norfolk, and 92 NNE. of Lon-  
50. E. Lat. 52. 45. N.

DUS, in ancient geography, a city of  
*iv.* 27. 32.) now called GIUSTANDEL.  
S, in botany, the CAMPION, BAGHE-  
OS, CATCH-FLY, &c.; a genus of  
in order, belonging to the pentandria  
ts; and in the natural method rank-  
ne 22d order, *Car. 2: phyllæ*. The ca-  
phyllous, oblong, and smooth; there  
uncultivated petals; with the segments  
almost blind; the capsule quinquelo-

IS CHALCEDONICA, the *Cisalcedonian*  
hath a fibrated perennial root; up-  
t, hairy, annual stalks, rising three or  
h; garnished with long, spear-point-  
ing leaves, by pairs opposite; and the  
d by a large, compact, flat bunch of  
rlet or flame-coloured flowers, ap-  
une and July. Of this there are va-  
single scarlet flowers, with large  
et flowers of great beauty and ele-  
pale-red flowers, and with white  
these varieties, the double scarlet  
erior to all for size and elegance;  
eing large, very double, and collected  
arge bunch, exhibit a charming ap-  
e single scarlet kind is also very pret-  
others effect an agreeable variety with  
inds.

IS DIOECIA, the *dioecious lychnis*, com-  
l *Lucifer's button*, hath fibrated per-  
; upright stalks, branching very dis-  
gular, 2 or 3 feet high; having oval,  
d, rough leaves, by pairs opposite;  
branches terminated by clusters of  
ers of different colours and proper-

ties in the varieties; flowering in April and May.  
The varieties, are the common single red-flowered  
bachelors button, double red, double white, and  
single white-flowered. The double varieties are  
exceedingly ornamental; the flowers large, very  
double, and continue long in blow; the single  
red fort grows wild by ditch sides and other moist  
places in many parts of England; from which the  
doubles were accidentally obtained by culture in  
gardens. The flowers are often dioecious, *i. e.*  
male and female on distinct plants.

3. LYCNIS FLOS CUCULI, the *cuckoo-flower*  
*lychnis*, hath fibry perennial roots; upright, branch-  
less, channelled stalks, near two feet high; gar-  
nished with long, narrow, spear-shaped leaves, in  
pairs opposite; and terminated by branchy foot-  
stalks, sustaining many purple, deeply quadrifid  
flowers; appearing in May. The flowers having  
each petal deeply quadrifid in a torn or ragged  
like manner, the plant obtained the name  
of *Ragged Robin*. There are varieties with single  
and double flowers. The double fort is large,  
very multiple, fair flower; it is an improved va-  
riety of the single, which grows wild in most  
of our moist meadows, and is rarely cultivated;  
but the double, being very ornamental, merits  
culture in every garden.

4. LYCHNIS VISCARIA, the *viscous German lychnis*,  
commonly called *catch-fly*, hath fibry per-  
ennial roots; crowned by a tuft of long grassy  
leaves close to the ground; many erect, straight,  
single stalks, rising 1½ or 2 feet high, exuding  
from their upper part a viscous or clammy mat-  
ter; garnished with long narrow leaves, by pairs  
opposite; and terminated by many reddish pur-  
ple flowers, in clusters one above another, form-  
ing a sort of long loose spike; all the flowers with  
entire petals; flowering in May. There are va-  
rieties with single red flowers with double red  
flowers, and with white flowers. The double  
variety is considerably the most eligible for general  
culture, and is propagated in plenty by parting  
the roots. All the varieties of this species emit-  
ting a glutinous liquid matter from their stalks,  
flies happening to light thereon sometimes stick  
and entangle themselves, whence the name *Catch-  
Fly*. All the 4 species and respective varieties are  
very hardy; all fibrous-rooted, the roots peren-  
nial; but are annual in stalks, which rise in spring,  
flower in summer, succeed in the singles by  
plenty of seed in autumn, by which all the single  
varieties may be raised in abundance, but the  
doubles only by dividing the roots, and some by  
cuttings of the flower-stalks.

LYCIA, a country of Asia Minor, bounded by  
the Mediterranean on the S. Caria on the W.  
Pamphylia on the E. and Phrygia on the N. It was  
anciently called *Milyas*, and *Tremile*, from  
the *Milyæ*, or *Solyms*, a people of Crete, who  
came to settle there. It was named *Lycia* from  
Lycus the son of Pandion, who established him-  
self there. The inhabitants have been greatly  
commended by the ancients for their sobriety and  
justice. They were conquered by Cræsus king  
of Lydia, and afterwards by Cyrus. Though they  
were subject to the power of Persia, yet they were  
governed by their own kings, and only paid a  
yearly tribute to the Persian monarchs. They be-  
came

came part of the Macedonian empire when Alexander came into the east, and afterwards were ceded to the house of the Seleucids. The country was reduced into a Roman province by Claudius.

**LYCIUM**, in botany, a genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 28th order, *Luride*. The corolla is tubular, having its throat closed up with the beard of the filaments; the berry is bilocular. There are 8 species natives of various countries.

**LYCODONTES**, in natural history, the petrified teeth of the *lupus piscis*, or wolf-fish, frequently found fossil. They are of different shapes; but the most common kind rise in a semiorbicular form, and are hollow within, somewhat resembling an acorn-cup; this hollow is found sometimes empty, and sometimes filled with the stratum in which it is immersed. Many of them have an outer circle, of a different colour from the rest.

**LYCOMEDES**, in fabulous history, a king of Scyros an island in the Ægean sea. He was son of Apollo and Parthenope. He was secretly entrusted with the care of young Achilles, whom his mother Thetis had disguised in women's cloaths, to remove him from the Trojan war, where she knew he must unavoidably perish. He is infamous for his treachery to Theseus, who had implored his protection when driven from his throne, by the usurper Menætheus. Lycomedes, either envious of the fame of his illustrious guest, or bribed by Menætheus, led Theseus to an elevated place, on pretence to show him the extent of his dominions, and perfidiously threw him down a precipice, where he was killed.

**LYCON**. See **LYCOPOLIS**.

**LYCOPERDON**, in botany, a genus of the natural order of fungi, belonging to the cryptogamia class of plants. The fungus is roundish, and full of farinaceous seeds. There are 10 species; the following are the most remarkable:

1. **LYCOPERDON BOVISTA**, the common puff ball, is frequent in meadows and pastures in the autumn. It varies exceedingly in size, figure, superficies, and colour. In general, it consists of a sack or bag, having a root at its base, and the bag composed of three membranes, an epidermis, a tough white skin, and an interior coat which adheres closely to the central pith. The pith in the young plants is of a yellowish colour, at first firm and solid, but soon changes into a cellular spongy substance, full of a dark dull-green powder, which discharges itself through an aperture at the top of the fungus, which aperture is formed of lacerated segments, in some varieties reflexed. The powder is believed to be the seeds, which through a microscope appear of a spherical form, and to be annexed to elastic hairs. (See *Haller's Hist. Helvet. n. 2172.*) Among the numerous varieties of this fungus, the *glabrum* is most remarkable. It is a smooth sessile kind, of a nearly spherical form, puckered or contracted at the root. This sometimes grows to an enormous size. It has been found in England as big as a man's head; and at Carraria, near Padua in Italy, specimens have been gathered, weighing 25 lb. and measuring two yards in circumference; but its more ordinary size is that of a walnut or an apple. The varieties of this species have no ill-

mits, being frequently found to run together; the scaly, warty, and echinate ing smooth as the plants grow old, of the fungus having no determinate natural colour of the puff-ball is either or ash-coloured; but sometimes yellow and brownish. The internal spongy plied to wounds, is esteemed good ings. Pressed and dried in an oven, becomes a kind of tinder, the smoke said to intoxicate bees. (See *Gen 1766.*) Masfigli says the Italians fry triety, and indeed any of the others and eat them with salt and oil.

2. **LYCOPERDON TUBER**, *TRUFFI raneous puff-balls*, a native of woods land and England. It grows generally 3 or 4 inches under ground, without root. The figure of it is nearly spher that of a potatoe; the exterior coat afterwards black, and studded with or polyhedrous tubercles; the interior solid and callous, of a dirty white colour, grained like a nutmeg with lines; in which, according to Miched minute oval capsules, containing 2 to 4 round warted seeds. The tru Britain seldom exceed 3 or 4 oz. in in Italy, and some other parts of t they are said to have been found of weight of from 8 to 14 lb. They are ble, either fresh and roasted like pot ed and sliced into ragouts. They h and somewhat urinous smell, and ar be aphrodisiacal. Dogs are with taught to hunt for them by the f scratch up the ground under which t

**LYCOPERSICON**. See **SOLANUM**

**LYCOPHRON**, a famous Grec grammarian, born at Colchis in Eube rished about A. A. C. 304, and, acc vid, was killed by an arrow. He w dies; but all his works are lost, ex entitled *Cassandra*, which contains a predictions, which he supposes to ha by Cassandra, Priam's daughter. T extremely obscure. The best editio of Dr Potter, printed at Oxford in 1

**LYCOPODIUM**, **CLUB MOSS**; a natural order of musci, belonging to gamia class of plants. The anther and sessile; there are no calyptra. species; the following are the most r

1. **LYCOPODIUM CLAVATUM**, the *moss*, abounds in dry and mountainou fir forests. The stalk is prostrate, b ereeping, from a foot to 2 or 3 yar radicles woody. The leaves are nu row, lanceolated, acute, often incur tremity, terminated with a long wh every where surround the stalk. cles are erect, firm, and naked (excep ly set with lanceolate scales), and ar ends of the branches. They are gen inches long, and terminated with tw yellowish spikes, imbricated with oval finely lacerated on the edges, and en hair. In the *ala* or bosom of the scale

aped capsule, which bursts with elasticity when ripe, and throws out a light yellow powder, which falls down into the flame of a candle, flashes with a small explosion. The Swedes make mats of this moss to rub their shoes upon. In Russia and some other countries, the powder of the capsules is used in medicine to heal galls in children, chops in the face, and other sores. It is also used to powder over medicinal pills, and to make artificial lightning at theatres. The Poles make a decoction of the plant, and, dipping a linen cloth into it, apply it to the heads of persons afflicted with the disease called *hepatica polonica*, which is said to be cured by this mentation.

1. *LYCOPodium SELAGO*, FIR CLUB MOSS, is common in the Highland mountains of Scotland, and in the Hebrides. The stalk at the base is simple and reclining; but a little higher is divided into upright dichotomous branches, from 2 to 6 inches high, surrounded with 8 longitudinal oblique ribs of lanceolate, smooth, rigid, imbricated leaves. Near the summits of the branches, in the axils of the leaves, are placed single kidney-shaped capsules, consisting of two valves, which open horizontally like the shells of an oyster, and cast out a fine yellow powder. These capsules Linnæus supposes to be *anthers*, or male parts of fructification. In the axils also of many of the leaves, near the tops of the branches, are often found what he calls *female flowers*, but which Haller esteems to be only gems or buds of a future plant. They consist, first, of 4 stiff, lanceolate, incurved, minute leaves, one of the outermost longer and larger than the rest. These are supposed to correspond to the styles in regular flowers. Again, at the bottom of the calyx are five small pellucid substances, resembling leaves, visible only by a microscope, which are supposed analogous to pistils. These, in time, grow up into three large broad leaves, two of the two united together like the hoof of an ox; with a third narrower one annexed at the base, and two other minute ones opposite to the other three. These five leaves are joined at the base; and in autumn, falling from the calyx, vegetate, and produce a new plant. See a dissertation *De feminebus muscorum*, *Amenit. Academ.* II. p. 261. In the island of Raafay, near Sky, in Ross-shire, and some other places, the inhabitants make use of this plant instead of alum, to fix the colours in dyeing. The Highlanders also sometimes take an infusion of it as an emetic and cathartic: but it operates violently; and, unless taken in a small dose, brings on giddiness and convulsions. Linnæus informs us, that the Swedes use a decoction of it to destroy lice on swine and other animals.

*LYCOPOLIS*, or *LYCON*, in ancient geography, so called from the worship of wolves, two towns of Egypt, viz. 1. in the Delta, or Lower Egypt, near the Mediterranean; 2. in the Thebais, or Higher Egypt, in the N. part, W. of the Nile.

*LYCOPOLITÆ*, the people of *LYCOPOLIS*.

*LYCOPOLITES*, a district of Egypt.

*LYCOPSIS*, in botany, a genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 41st order, *Asperifolia*. The corolla has an incurved tube.

*LYCOPUS*, in botany, a genus of the monogynia order, belonging to the diandria class of plants; and in the natural method ranking under the 42d order, *Verticillata*. The corolla is quadrisid, with one of the segments emarginated; the stamens standing asunder, with 4 retuse seeds.

*LYCURGIA*, a festival observed by the Spartans, in memory of their lawgiver *LYCURGUS*, whom they honoured with a temple and anniversary sacrifice.

*LYCURGUS*, the celebrated legislator of the Spartans, was the son of Eunomes king of Sparta. He travelled to Greece, to the isle of Crete, to Egypt, and even to the Indies, to converse with the sages and learned men of those countries, and to learn their manners, their customs, and their laws. After the death of his brother Polydectes, king of Sparta, his widow offered the crown to Lycurgus, promising that she would make herself mistress of the child of which she was pregnant, provided he would marry her; but Lycurgus nobly refused her offers, and afterwards contenting himself with being tutor to his nephew Charillus, restored to him the government when he came of age; but notwithstanding this regular and generous conduct, he was accused of a design to usurp the crown. This calumny obliged him to retire to the island of Crete, where he studied the laws and customs of nations. On his return to Lacedæmon, he reformed the government; and, to prevent the disorders occasioned by luxury and the love of riches, he prohibited the use of gold and silver; placed all the citizens in a state of equality; and introduced the strictest temperance, the most exact discipline, and those admirable laws which (a few excepted) have been celebrated by all historians. It is said, that, to engage the Lacedæmonians to observe them inviolably, he made them swear not to change any part of them till his return; and that he afterwards went to the island of Crete, where he killed himself, after ordering his ashes to be thrown into the sea, lest, if his body should be carried to Sparta, the Lacedæmonians should think themselves absolved from their oath. He flourished about A. A. C. 870.

(1.) *LYCUS*, in ancient geography, a river of Phrygia, which disappears near Colossæ, and rises again about 4 stadia from it, after which it falls into the Mæander.

(2—5.) *LYCUS*, the name of other 4 rivers, in Armenia, Assyria, Paphlagonia, and Sarmatia.

*LYD*, or *LID*. See *LID*, N° 1.

*LYDD*, a town of England in Kent, 2½ miles SW. of Romney, of which town and port it is a member, and 71 miles from London. It is a populous town with a market on Thursday and fair on July 24th. It is incorporated by the name of a bailiff, elected 22d July, jurats, and commonalty. In the beach near Stone-end, is a heap of stones, fancied to be the tomb of Crispin and Crispianus. And near the sea is a place called *Holm-stone*, consisting of beach and pebble-stones, which abounds nevertheless with holm trees. Here is a charity school.

*LYDDA*, in ancient geography, a town and district of Judæa, 14 miles NE. of Joppa and 32 W. of Jerusalem, originally belonging to the *Ephraimites*.

phraimites, but afterwards to the Benjamites. In the time of the Maccabees it was taken from Samaria. It is famous for Peter's cure of Æneas; and for a college of the Jews, which produced many celebrated Rabbis.

LYDDON, a river of Dorsetshire which runs into the Stour, near Sturminster.

LYDGATE, John, called the *Monk of Bury*; not, as Cibber conjectures, because he was a native of that place, for he was born about 1380, in the village of Lydgate, but because he was a monk of the Benedictine convent at St Edmund's-Bury. After studying some time in the English universities, he travelled to France and Italy; and, having acquired a competent knowledge of the languages of those countries, he returned to London, where he opened a school, in which he instructed the sons of the nobility in polite literature. At what time he retired to the convent of St Edmund's-Bury, does not appear; but he was there in 1415, and was living in 1446, aged about 66; but when he died is not known. Pitts says, he was an elegant poet, a persuasive rhetorician, an expert mathematician, an acute philosopher, and a tolerable divine. He was a voluminous writer; and his language is less obsolete, and his versification much more harmonious, than those of Chaucer, who wrote about 50 years before him. He wrote, 1. History of the Theban war, printed at the end of Chaucer's works, 1561, 1602, 1687. 2. Praemiation of good counsel; *Ibid.* 3. The life of Hector; London 1594, fol. printed by Gros de dedicated to Henry V. 4. Life of the Blessed Virgin; printed by Caxton. 5. The proverbs of Lydgate upon the fall of princes; printed by Wink. Word. Lond. 4to. 6. Dispute of the horse, the sheep, and the goose, Caxton; 4to. 7. The temple of Truth; among the works of Chaucer. 8. London Tick-penny; see Stowe's history, &c. Besides an incredible number of other poems and translations preserved in various libraries, and of which the reader will find a catalogue in Bishop Tanner.

(1.) LYDIA, in ancient geography, a celebrated kingdom of Asia Minor.—All the ancient writers tell us, that Lydia was first called ΜΑΩΝΙΑ or ΜΕΩΝΙΑ, from Meon king of Phrygia and Lydia; and that it was known under no other denomination till the reign of Atys, when it began to be called *Lydia* from his son Lydus. Bochart finding in his learned collection of Phœnician words the verb *lud*, signifying *to wind*, and observing that Lydia is watered by the Mæander, so famous for its winding, concludes that it was thence named *Lydia* or *Ludia*. The ancient name Μεωνια, he takes to be a Greek translation of the Phœnician word *lud*; wherein he agrees in some measure with Stephanus, who derives the name of Μεωνια from *Meon*, the ancient name of the Mæander. Some take the word *meonia* to be a translation of a Hebrew word signifying *metal*, because that country, say they, was in former times enriched with mines. Though Lydia and Μεωνια are by most authors indifferently used for the same country, yet they are sometimes distinguished; that part where mount Tmolus stood, watered by the Pactolus, being properly called *Meonia*; and the other, lying on the coast, *Lydia*. This distinction is used by Homer, Callimachus,

Dionysius, and other ancient writers. In after ages, when the Ionians, who had planted a colony on the coast of the Ægean Sea, began to make some figure, that part was called *Ionis*, and the name of *Lydia* given to the ancient Μεωνια—Lydia, according to Pliny, Ptolemy, and other ancient geographers, was bounded by Mysia Major on the N. by Caria on the S. by Phrygia Major on the E. and Ionis on the W. lying between 39° and 39° Lat. N. The kingdom of Lydia was not confined within these narrow boundaries, but extended from Halys to the Ægean sea. Pliny's description includes *Æolia*, lying between the Helmus and the Caucasus.

(2.) LYDIA, HISTORY OF. Josephus, and after him all the ecclesiastical writers, derive the origin of the Lydians from Lud Shem's 4th son, from the similitude of the names. Some will have the Lydians to be a mixed colony of Phrygians, Moesians, and Carians. Others finding some conformity in religious ceremonies between the Egyptians and Tuscans who were a Lydian colony, conclude them to have been originally Egyptians. All we know for certain is, that the Lydians was a very ancient nation, as is manifest from their very fables; for Atys, Tantalus, Pelops, Niobe, and Arachne, are all said to have been the children of LYDUS. And Zaphus in his *Lydians*, quoted by Stephanus, informs us, that the ancient city of Alicalon, one of the five satrapies of the Philistines, mentioned in the books of Joshua and the Judges, was built by one Alicalon a Lydian, whom Achæmus king of Lydia had appointed to command a body of troops which he sent into Syria. The Heraclidæ, or kings of Lydia descended from Hercules, began to reign before the Trojan war; and had been preceded by a long series of sovereigns sprung from Atys, and hence styled *Atyadæ*: a strong proof of the antiquity of that kingdom. The Lydians began very early to be ruled by kings whose government seems to have been despotic and the crown hereditary. They had 3 distinct races of kings, viz. the *Atyadæ*, the *Heraclidæ*, and the *Mermnadæ*. The *Atyadæ* were so called from Atys the son of Cotys and grandson of Manes the first Lydian king. But the history of this family is obscure and fabulous. They were succeeded by the *HERACLIDÆ*, or descendants of Hercules. For Hercules being, by the direction of the oracle, sold as a slave to Omphale, queen of Lydia, and relict of K. Tmolus, to expiate the murder of Iphitus, had, during his captivity, by one of her slaves, a son named *Cleolus*, whose grandson Argon, was the first of the *Heraclidæ* that ascended the throne of Lydia. Others say, that Omphale herself, astonished at the valour of Hercules, fell in love with him, married him, and had two sons by him, named *Agelaus* and *Lamon*; the eldest of whom succeeded her, and gave rise to the new royal race. This race is said to have reigned 505 years, the son succeeding the father for 23 generations. They began to reign about the time of the Trojan war. The last of the family was *CANDAULES*, who was contemporary with Romulus, and who lost both his life and kingdom by his imprudence. For, according to Herodotus and Justin, he was so vain of his wife's beauty, that he

d her naked to Gyges, his favourite minister, which enraged the queen so much, that she red with, or rather ordered Gyges, to murder; which he accordingly did, while Canis was asleep, married the queen, and took possession of the kingdom, in which he was con- firmed by the oracle at Delphi. Gyges showed gratitude, by sending many rich presents to the oracle, particularly 6 cups of gold weighing talents. He made war on Miletus and Smyrna, Colophon, and subdued the whole coun- try of Troas. In his reign, and by his permission, the city of Abydos was built by the Milesians. Rich and other writers relate his accession to the crown in a different manner, and tell us, without mentioning the queen, that Gyges rebelled against Candaulus and slew him in an engagement. (See **GYGES**.) In Gyges began the 3d race called the **IONIAN**; who were also Heraclidæ, being descended from the other son of Hercules by Omphale.

Gyges reigned 38 years, and was suc- ceded by his son Ardyes, who carried on the war against the Milesians, and possessed himself of Sardis, in those days a strong city. In his reign the Lydians invaded and over-run all Asia Mi- nor. Herodotus informs us, that they even took the metropolis of Lydia, but could never enter the castle. Ardyes reigned 49 years, and was succeeded by his son Sadyattes, who reigned 23 years, and warred most part of his reign with the Milesians. To him succeeded his son Alyattes, who for 5 years continued the war against the Milesians, ravaging their country, and about the same time carrying away all their corn yearly, or to oblige them, for want of provisions, to surrender their city, which he could not receive any other way, the Milesians being then masters of the sea. In the 12th year of this war the Lydians having set fire to the corn in the field, the flames were carried by a violent wind, to the temple of Minerva at Apollonia, and burnt it to the ground. Not long after, Alyattes sent a deputation to consult the oracle at Delphos; but refused to return any answer till the king had rebuilt the temple of Minerva. Alyattes then sent ambassadors to Miletus, to conclude a peace with the Milesians till the temple should be rebuilt. On the arrival of the ambassadors, Alyattes commanded the corn in the city to be brought into the market-place, ordering the citizens to banquet in it, and revel as if the city were plentifully supplied with provisions, that the ambassadors might acquaint their master with their affairs, and divert him from pursuing the war. Alyattes had the desired effect, for Alyattes, hearing this account from his ambassadors, changed the war into a lasting peace, and ever after lived in friendship with Thrasybulus and the Milesians. He was succeeded, after a reign of 23 years, by his son Croesus, whose uninter- rupted prosperity, in the first years of his reign, reflected the glory of all his predecessors. He made war on the Ephesians, whose city he be- sieged and took, notwithstanding their consecra- tion to Diana, and fastening the walls by a rope

to her temple, which was 7 stadia distant from the city. After this he attacked the Ionians and Aeolians, obliging them, and all the other Greek states of Asia, to pay him a yearly tribute. Having met with such extraordinary success by land, he resolved to render his power equally conspicu- ous by sea; but was dissuaded from this enter- prise by Bias of Priene, or as others say by Pitta- cus of Mytilene. He therefore determined peace- ably to enjoy the laurels which he had won, and began now to consider himself as the happiest of men. (See **CROESUS**.) But his happiness was soon allayed by the death of his favourite son Atys, who was unfortunately killed at the chase of a wild boar. For this loss he continued discon- solate for two years and in a state of inaction, till the conquests of Cyrus, and growing power of the Persians again roused his martial spirit. He apprehended that the success, which attended Cyrus in all his undertakings, might at last prove dangerous to himself, and therefore resolved to put a stop, if possible, to his progress. In this resolution, he was encouraged by the oracle of Apollo at Delphi; to whom he sacrificed 3000 oxen, and adorned his shrine with dedications equally valuable for the workmanship and for the materials; precious vessels of silver, ewers of iron beautifully inlaid and enamelled; various orna- ments of pure gold, particularly a gold lion weighing ten talents, and a female figure 3 cubits or near 5 feet high. In return for these magni- ficent presents, the oracle, in ambiguous lan- guage, flattered Croesus with obtaining an easy victory over his enemies, and with enjoying a long life and a prosperous reign; enjoining him to contract an alliance with the most powerful of the Grecian states; and assuring him that *if he crossed the Helles, he would overthrow a great em- pire*, which he concluded to be that of Persia. Elevated with these favourable predictions, he formed an alliance with the Lacedæmonians, then the most powerful state in Greece; to whom he had formerly made a present of a large quantity of gold for a statue of Apollo, in return for which they now sent him a large brazen vessel capable of containing 300 amphoras (above 12 hogheads) elegantly carved. Croesus had formerly made an alliance with Amasis king of Egypt, and Lab- yntus or Balthazza, king of Babylon; and having now obtained the friendship of the most warlike nation of Europe, the newly raised power of Cy- rus and the Persians seemed incapable of resisting such a formidable confederacy. Elevated with these ideas, Croesus waited not to attack the Persian dominions until he had collected the strength of his allies. The impetuosity of his temper precipitated him into measures no less ruinous than daring. Attended only by the arms of Lydia, and a band of mercenaries, he marched toward the Helles; and having crossed it that deep and broad stream, entered Cappadocia, the western frontier of Media. That unfortunate country soon experienced all the calamities of invasion. The Persian plain, the most beautiful and the most fertile district of Cappadocia, was laid waste; the ports of the Helles, a wealthy and inland city, were plundered; and the inhabitants were either put to the sword or dragged into captivity.

Meanwhile, the approach of Cyrus afforded the Lydian king an opportunity of bringing the war to a speedy issue. Such was the rapidity of his movement, after being informed of the ravages of Cappadocia, that he arrived from the shores of the Caspian to those of the Euxine Sea before the army of Cræsus had provided necessaries for their journey. That prince, when apprised of the neighbourhood of the Persians, encamped on the Pterian plain; Cyrus likewise encamped at no great distance; and a general engagement was fought with equal fury and perseverance, and only terminated by the darkness of night. The loss on both sides hindered a renewal of the battle. The numbers, as well as the courage of the Persians, much exceeded the expectation of Cræsus. As they discovered no intention to harass his retreat, he determined to move back towards Sardis, to spend the winter in his palace, and after summoning his numerous allies to his standard, to take the field early in spring with such increase of force as seemed sufficient to overpower the Persians. But this design was defeated by the vigilance of Cyrus, who waited until Cræsus had re-entered his capital, and had disbanded the foreign mercenaries, who composed the most numerous division of his army. Cyrus then put his Persians in motion, and such was his celerity, that he brought the first news of his own arrival in the plain of Sardis. Cræsus's firmness was not shaken by this unforeseen danger; though his mercenaries were disbanded, his own subjects served him from attachment, had been long accustomed to victory, and were animated with a high sense of national honour. The Lydians in that age fought on horseback, armed with long spears; the strength of the Persians consisted in infantry. They were so little accustomed to the use of horses, that camels were almost the only animals which they employed as beasts of burden. As the troops on both sides approached to join battle, the Lydian cavalry, terrified at the unusual appearance of the camels, mounted with men in arms, were thrown into disorder, and endeavoured to escape. Cræsus, who perceived the confusion, was ready to despair of his fortune; but the Lydians, abandoning their horses, prepared with uncommon bravery to attack the enemy on foot. Their courage deserved a better fate; but unaccustomed to this mode of fighting, they were received and repelled by the Persian infantry, and obliged to take refuge in Sardis. The walls of that city bid defiance to the art of attack, then practised by the most warlike nations. If the Persian army should invest it, the Lydians had provisions for several years; and they expected that in a few months, or even weeks, they would receive such assistance from Egypt, Babylonia, and Sparta, as would oblige the Persians to raise the siege. The valour of the Spartans might have saved the sinking empire of Lydia, but before their argument could fail, Cræsus was no longer a sovereign. Notwithstanding the strength of Sardis, that city was taken by storm on the 20th day of the siege; the walls having been scaled in a quarter which, appearing altogether inaccessible, was too carelessly guarded. Hyreades a Mede accidentally observed a Lydian

centinel descend part of the rock to helmet. Hyreades, being accustomed to pass this rocky country, tried to pass this rock, and accomplished it. The bravest of his countrymen followed his example, and were in greater numbers of their countrymen. The king of Sardis was surpris'd; the city was taken; and the rich capital of Lower Lydia fell to the rapacity of an indignant victor. Lydia continued subject to the Persians till they were conquered by the Macedonians.—For the Lydian monarch, see **CRÆSUS**.

**LYDIAT**, Thomas, a learned Englishman, born in 1572, and educated at Oxford, in 1609, he became acquainted with Dr. James Ussher, afterwards Abp. of Armagh, who took him to Dublin college two years. He returned to England; and the rectory of Alkington becoming vacant, he was appointed to it; but at length, being engaged for a near relation, which he was unwilling before spent his patrimony in printing books, he was sent to prison; and at Oxford, in the King's Bench, until Sir William Boswell, a generous and learned man, Dr Robert Pink, was his college, Bp. Usher, and Dr Laud, discharged him. In the civil wars, he suffered the rectory of Alkington from the parliament was 4 times pillaged to the value of 1000*l*. and was forced for 3 months to borrow money to shift himself. He died in 1646. He wrote several pieces in English, and many works in Latin, concerning chronology and natural history.

**LYDIUS LAPIS**, in the natural history of the ancients, the touch-stone for trying silver, called by some *Heraclius lapis*, which names were also applied by the ancients to the load-stone; and hence has an ambiguity in their works, as Pliny has observed. The true *lapis Lydius*, or **TOUCHSTONE**, is anciently found only in the river Tmolus, afterwards found in many other places, and now very common in many of the mountains. The ancients give us very remarkable and circumstantial accounts of the uses of it; and it is plain they were able to separate the alloys of gold by means of it with great exactness. Several different stones are mentioned under this name, for this purpose. A green marble called *verdello*, is most commonly used; and with us, very frequently of the *basaltic*, the same with that which the ancients called the *Giant's Cauldron*. See **BASALTES**; **GIANT'S CAULDRON**; **ICELAND**, § 7; **STAFFA**; and **VOLCANO**. **LYE**, Edward, M. A. a learned Englishman, born at Totness in Devonshire, and died in 1769. He published, 1. *An Anglo-Gothic Dictionary*; in 2 vols fol. 1762: 2. *Mar of these languages: and other*

**LYGEUM**, in botany; a genus of the gymnia order, belonging to the triandria class; and in the natural method ranked under the fourth order, *Gramina*. The spath

ylous; there are a pair of corollæ upon the germen; the nut is bilocular.

**LYGII**, **LIGII**, **LUGII**, or *Logiones*, in ancient geography, a people of Germany, W. of the Vistula, where it forms a bend like a crescent. (*Strabo, Zofimus.*) Their name *Lugii* is derived from their close confederacy. The Vistula was their boundary on the N., E., and S. Mount Asciburgius on the W. The whole of that country now lies in Poland, on this side Vistula.

**LYGUM**, a town of Denmark, in Sleswick.

(1.) \* **LYING**. *participial noun*, from *lie*, when it signifies to be recumbent, or to speak falsely, otherwise.—They will have me whipt for speaking true, thou wilt have me whipt for lying, and sometimes I am whipt for holding my peace. *Sbak.* Many tears and temptations beset me by the way in wait of the Jews. *AB.*, xx. 19.

(2.) **LYING IN**. See **MIDWIFERY**.

(3.) **LYING TO**, or **LYING BY**, the situation of a ship when she is retarded in her course, by arranging the sails in such a manner as to counteract each other with nearly an equal effort, and render the ship almost immoveable, with respect to her progressive motion, or head way. A ship is usually brought to by the main and fore top-sails, one of which is laid aback, whilst the other is set, so that the latter pushes the ship forward, and the former resists this impulse by forcing her stern. This is particularly practised in a general engagement, when the hostile fleets are drawn up in two lines of battle opposite each other. It is also used to wait for some other ship, to avoid approaching or expected; or to avoid pursuing a dangerous course, especially in dark or stormy weather, &c.

**LYKE**. *adj.* for *like*. *Spenser.*

**LYL**. See **LILLY**, N° 1.

(1.) **LYME**, a river of England, which runs between Dorset and Devon shires, into the Sea near Lyme Regis. See N° 2.

(2.) **LYME**, or **LYME**, a sea port town of England, in Dorsetshire, near the sea, on the western side of Devonshire, in a cavity between two hills, which makes it difficult of access. It is about 5 furlongs long, and contains about 200 houses. As it lies on the declivity of a hill, the houses make a good appearance; some of them are built of free stone, and covered with blue slate.

The corporation consists of a mayor, (who is just sworn to peace during his mayoralty and 2 years after), a recorder, 15 burgeses, and a town clerk. This place had formerly a very flourishing trade with France, Spain, the Straits, Newfoundland, and the West Indies; during which, the customs amounted in some years to 16,000 l. But it stands upon such a high steep rock, that the merchants are obliged to load and unload their goods at a place about a quarter of a mile off, called the *Cobb*, originally built in the reign of Edward III. which costs a great sum to maintain, but forms such a harbour which perhaps is not to be equalled in the world, the place being sheltered by a high thick stone wall, and in the main sea a good way from the shore, and deep enough for carriages and ware-houses, the custom-house officers have one upon it. The cellars of the low part of the town, near the

**Vol. XIII. PART II.**

sea, are however often overflowed by the spring tides 10 or 12 feet. There are guns planted for defence of the Cobb and the town. The custom-house stands on pillars, with the corn-market under it. There are an alms-house, a Presbyterian and an Anabaptist meeting-house. The church stands at the east end of the town on a rising ground. The market is on Friday, and there are two fairs. In 774, the Saxon king Kinwulf gave land hereabouts to the church of Sherborn, for boiling of salt. At this place the duke of Monmouth landed in 1685. A few years ago above 2000 l. worth of gold and silver coins of Charles I. and II. were discovered by some labourers. It is 28 miles E. by S. of Exeter, and 143 WSW. of London. Lon. 2. 56. W. Lat. 50. 39. N.

**LYMINGTON**, a borough of Hampshire, about a mile from the channel, between the main land and the isle of Wight; with a harbour for vessels of considerable burden. The tide flows near a mile above the town. It has a market on Saturday, and two fairs; and sends two members to parliament. It is 17 miles SW. of Southampton, and 97 of London. Lon. 1. 33. W. Lat. 50. 43. N.

(1.) \* **LYMPH**. *n. f.* [*lymphe*, Fr. *lympba*, Lat.] Water; transparent colourless liquor.—When the chyle passeth through the mesentery, it is mixed with the *lymph*, the most spirituous and elaborated part of the blood. *Arbutnot.*

(2.) **LYMPH** is separated in the body from the mass of blood, and contained in peculiar vessels called *lymphatics*. See **ANATOMY**, § 333; and **BLOOD**, § 7.

\* **LYMPHATED**. *adj.* [*lymphatus*, Lat.] *Mad. Dist.*

**LYMPHATI**, a name given by the Romans to such as were seized with madness; supposed to be used for **NYMPHATI**, because the ancients imagined that every person who had the misfortune to see a nymph was instantly struck with phrenzy. *Lymphati* may indeed signify *madmen*, as derived from *lympba*, water, over which element the nymphs were thought to preside. But it appears most likely, that distracted people were called *lymphati*, from the circumstance of madmen being affected with the *hydrophobia* or dread of water after the bite of a mad dog; for this peculiarity, in cases of canine madness, was not unknown to the Romans.

(1.) \* **LYMPHATIC**. *n. f.* [*lymphatique*, Fr. from *lympba*, Lat.] The *lymphatics* are slender pellucid tubes, whose cavities are contracted at small and unequal distances; they are carried into the glands of the mesentery, receiving first a fine thin lymph from the *lymphatic* ducts, which dilutes the chylous fluid. *Cbeyn's Phil. Principles.*—Upon the death of an animal, the spirits may sink into the veins, or *lymphatics*, and glandules. *Floyer.*

(2.) **LYMPHATIC VESSELS**. See **ANATOMY**, *Ind.*

\* **LYMPHEDUCT**. *n. f.* [*lymphica* and *ductus*, Lat.] A vessel which conveys the lymph.—

The glands,  
All artful knots, of various hollow threads,  
Which *lymph ducts*, an art'ry, nerve, and vein,  
Involv'd and close together wound, contain.

*Blackmore.*

(1.) **LYNCEUS**, in fabulous history, the only

of Ægyptus who was saved by the 50 daughters of Danaus and DANAEUS. This is the son of Aphareus, one of the gods of great use, by enabling him to sink banks and rocks in their way, that he had so piercing a power, that it only penetrates the earth, and not the sea, but even to hell. This fable is taken from Lyncurium the stars, and discovering silver concealed in the earth. It is found in S. Carolina, 11 miles S. of

ARG, a town of Virginia, in Bedford county. It was a printing office, a weekly gazette, and several mills. It is 150 miles W. by N. of Richmond.

LYNCURIUM, a stone thought to be the same with the TOURMALIN. The name is derived from *lynx*, and *urine*. See ELECTRICITY, *Index*, under TOURMALIN.

LYNCURIUS LAPIS, a stone capable of producing mushrooms. In the *Ephemerides of the Curious* mention is made of a stone so called by Dr John George Wolckamerus, who saw one in Italy, which never ceases to produce in a few days mushrooms of an excellent flavour by the most simple and easy process imaginable. "It is (says he) of the bigness of an ox's head, rough and uneven on its surface, and on which also are perceived some clefts and crevices. It is black in some parts, and in others of a lighter and greyish colour. Internally it is porous, and nearly of the nature of the pumice stone, but much heavier; and it contains a small piece of flint, which is so incorporated with it as to appear to have been formed at the same time the stone itself received its form. This gives room to judge, that those stones have been produced by a fat and viscid juice, which has the property of indurating whatever matter it filtrates into. The stone, when slightly covered with earth, and sprinkled with warm water, produces mushrooms of an exquisite flavour, which are usually round, sometimes oval, and whose borders, by their inflexions and different curvities, represent in some measure human ears. The principal colour of these mushrooms is sometimes yellowish, and sometimes of a bright purple; but they are always distinguished with different spots of a deep orange colour, or red brown; and when these spots are recent, and still in full bloom, they produce a very agreeable effect to the sight. But what appears admirable is, that the part of the stalk which remains adhering to the stone, when the mushroom has been separated from it, grows gradually hard, and petrifies in time; so that it seems that this stinging retters to the stone the nutritive juice it received from it, and that it thus contributes to its increase." John Baptist Porta says, that this stone is found in several parts of Italy; and that it is not only to be met with at Naples, taken out of mount Vesuvius, but also on mount Pantherus, in the principality of Arellino; on mount Garganus, in Apulia; and on the summit of some other high mountains. He adds, that the mushrooms which grow on those sorts of stones, and are usually called fungi

*lyncurii*, have the property of dissolving and melting the stone of the kidneys and bladder that, for this purpose, nothing more is than to dry them in the shade, and being reduced to powder, to make the patient, fasting sufficient quantity of this powder in a white wine, which will cleanse the excretory of the urine, that no stones will ever afterwards lodge in them. As to the form of the stones, their root is stony, uneven, dividing into its longitudinal direction, and consisting of fibres as fine as hairs, interwoven one with another. Their form, on first shooting out, resembles a small bladder, scarce larger than the end of a vine; and if in this state they are squeezed between the fingers, an aqueous subacid liquor comes out. When at their full growth, they are of a finger's length, larger at top than at bottom, and becomes insensibly slenderer in proportion as it is nearer the earth. These mushrooms are formed in an umbella, and variegated with infinity of little specks situated very near the surface. They are smooth and even on the top part, but underneath leafy like the common mushrooms. Their taste is likewise very agreeable, and the sick are not debarred from eating them when dressed in a proper manner. Some philosophers and physicians submitted these stones to chemical analysis, in order to be more fully acquainted with the judges of the uses they might be put to; when there first came forth, by distillation, an insipid water, and afterwards a spirit. The retort having been heated to a certain degree there arose an oil, which had nearly the taste of that of guaiacum; and a very acrid matter extracted from the ashes.

(1.) \* LYNDEN TREE. *n. f.* (*Silia*), a plant.

(2.) LYNDEN TREE. See TILIA.

(1.) LYNE, a river of Scotland, in the shire, which runs into the Tweed at Lincolnton.

(2.) LYNE, a village in Peebles-shire, in the flux of the Lyne and the Tweed, 3 m. from Peebles.

(3.) LYNE, a river of England, which runs into the Trent, near Nottingham.

(1.) LYNN, a maritime town of Massachussetts in Essex county, 15 miles NE. of Boston, famous for the largest manufactory of shoes in the States; 200,000 pairs being annually made.

(2.) LYNN, a river of England, which runs into the Ouse at Lynn Regis.

(1.) LYNS, or LYNS REGIS, a large well built town in the county of Norfolk, which sends 12 members to parliament. It was a borough by prescription in 1298. King John, on account of his hereditary enmity to him against the barons, made it a borough, with extensive privileges; and gave him a silver cup of 73 oz. doubly gilt and enamelled, and a large silver sword, that is carried by the mayor; though some say, this last is the sword which he gave to the town by exchange with the bishop of Norwich, which it was called *Lynn Regis* or *Regis*, the head of *Bishop's Lynn*. Henry III. made it a town for serving him against the barons, and had 15 royal charters; and is governed by a mayor, 2 stewards, recorder, 12 aldermen,

council men. It has tv o churches, be- nicholas's chapel; a prebysterian and a ceting-house, with a bridewell, several , and a free school. In Sept. 1741 the both its churches were blown down by nd that of St Margaret, which was 193 having beat down the church, it was ward which king George II. gave 1000. obert Walpole, 5ool. This church was n abbey. The town-house, called *Tri-* nd the exchange are noble fabrics. The has a bell-tower of free-stone, and an spire over it, 170 feet from the ground. library in it, and another at St Marga- : Grey-friars steeple is a noted sea-mark- ion of this town, near the mouth of the it a commercial communication with ; by which Peterborough, Ely, Stam- ord, Huntingdon, Northampton, Cam- Edmundsbury, the N. part of Bucks, and parts of Norfolk and Suffolk, are sup- heavy goods. Of coals and wine, this is a port for importation of any place on coast of England. In return Lynn re- the corn exported from these counties, more of it abroad than any port except foreign trade is great, to Holland, Nor- Baltic, Spain, and Portugal. The har- fe, but difficult to enter by reason of and shoals in the passage; but good always ready. The town consists of a- houses; and appears to have been an- y strong from its ruins. St Ann's plat- e N. end has 12 great guns, and com- the ships passing near the harbour; and e land there are a wall and a ditch. Four through the town; and the tide of the ch is about as broad as the Thames at idge, rises 20 feet perpendicular. In the ct-place a statue was erected in 1686 l. In another market place is a statue l III. and a fine cross with a dome and ported by 16 pillars. The market free-stone, supported by 16 columns; feet high, erected on 4 steps, neatly a- th statues, &c. On the 1st Monday of nth, the mayor, aldermen, preachers, o settle all matters amicably, and pre- nits. This was established in 1588, and *be Feast of Reconciliation*. The markets ef. and Sat. and there are 2 fairs; one Feb. 14, lasts 14 days, and is called *Lynn* other is a cheese fair on Oct. 6. Du- vil wars this town hold out for Charles ined a siege by 18,000 men for above nt was obliged to surrender, and to pay d for every inhabitant, and a month's : soldiers, to save it from plunder. It o much with provisions, that Spelman es and Bacchus seem to have establish- gazines at it." The king's quay, where ed wines are chiefly landed, is a hand- re, with brick buildings, and a statue s I. in the centre. Lynn Regis lies 44 . of Cambridge, and 106 N. of London.

. E. Lat. 52. 45. N.

(NX. *n. f.*; Latin.) A spotted beast, re- or speed and sharp sight.—He that has

an idea of a beast with spots, has but a confused idea of a leopard, it not being thereby sufficiently distinguished from a *lynx*. *Locke*.—

What modes of light betwixt each wide ex-  
treme,

The moles's dim curtain, and the *lynx's* beam.

*Pope*.

(2.) LYNX. See FELIS, N<sup>o</sup> XI.—XII.

LYCENA, a strong town of Algiers.

(1.) LYON, a river of Perthshire, which rises from Loch Lyon, runs through Fortingal, and falls into the Tay, 2 miles ENE of Kenmore.

(2.) LYON, a town of N. Carolina, 4 miles ESE. of Fayetteville.

(3.) LYON KING OF ARMS, FOR SCOTLAND, is the 2d King at arms for Great Britain. He is invested and crowned with great solemnity; and to him belongs the publishing royal proclamations, marshalling funerals, reversing arms, &c. This office is of great antiquity and respect in Scotland; and although the precise time of its institution is unknown, yet it must have been as early as the introduction of armorial figures as hereditary marks of gentility and distinction into this country, which was in the 12th century. His regalia are, a crown of gold, with a crimson velvet cap, a gold tassel, and an ermine lining; a velvet robe reaching to his feet, with the arms of the kingdom embroidered thereon before and behind in the proper tinctures; a triple row of gold chain round his neck, with an oval gold medal pendent there- to, on one side of which is the royal bearing, and on the other St Andrew with his cross enamelled in proper colours, and a baton of gold enamelled green, powdered with the badges of the kingdom. The Lord Lyon's rank is superior to that of any other king of arms, as he holds his office immediately from the sovereign, by commission under the great seal; whereas the kings of arms in England are deputies to the Earl Marshal, and act under his authority. Formerly Scotland was divided into two provinces, the one on the N. and the other on the S. side of the Forth; and these provinces were under the management of two deputies appointed by the Lord Lyon to superintend the execution of all the business of his office. Before the revolution, the Lord Lyon, at his admission into office, was solemnly crowned by the sovereign or his commissioner, in presence of the nobility, the officers of state, and other great men, after a suitable sermon preached in the royal chapel; and his crown was of the same form with the imperial crown of the kingdom. On solemn occasions he wears the regalia above described; at all other times, he wears the oval gold medal or badge on his breast, suspended by a broad green ribbon. He has the absolute disposal of all the offices in his own court, and of the heralds and pursuivants places. The messengers at arms throughout Scotland are also created by him, and are amenable to his jurisdiction. And the powers vested in him by his commission are the same with those of the sovereign in all matters relative to the marks of gentility. See LAW, PART III; Chap. I; Sect. III, § 16.

LYONESE, the inhabitants of LYONS.

LYONET, Peter, F. R. S. &c. an ingenious na- turalist, born at Maastricht, and descended from

of candidate in divinity, he studied law, with such success, that he was promoted at the end of the first year. At the Hague, he studied the art of decyphering; and became secretary of the cyphers, translator of the Latin and French languages, and patent master, to their High Mightinesses. Meanwhile he undertook an historical description of such insects as are found about the Hague; collected materials for several volumes; and having invented a method of drawing adapted thereto, he enriched this work with a great number of plates, universally admired by all who had seen them. In 1742 was printed at the Hague a French translation of a German work, *the Theology of Insects*, by Mr Lefser. Mr Lyonet having deferred the publication of his work, made some observations on that of Lefser, to which he added two beautiful plates, engraved from his designs, which made his merit universally known. The celebrated Reaumur had Lefser's translation reprinted at Paris, chiefly on account of Mr Lyonet's observations; on which he bestowed the highest encomiums. Lyonet afterwards executed drawings of the fresh-water polypus for Mr Trembley's beautiful work, 1744. The ingenious Wandelaar had engraved the first five plates; when Lyonet, who had never seen this operation, having experienced difficulties in getting the remaining 8 finished in the superior style he wished, resolved to perform the task himself. He accordingly took a lesson of an hour from Mr Wandelaar, engraved 3 or 4 small plates, and immediately began upon the work itself; which he performed in such a manner as procured the highest praise, both from Mr Trembley and the celebrated Van Gool; who declared that the performance astonished the most experienced artists. In 1748 he was chosen F. R. S. of London. In

560 articles; among which are many of the first Dutch masters. He also wrote pieces of Dutch poetry. He died of inflammation in his breast, at the Hague, in aged 83, leaving a most estimable character.

LYONNOIS, a large ci-devant province of France, now included in the dep. of Loire. It was bounded on the N. by E. by Dauphiny, Bresse, and the province of Dombes; S. by Vivarais and Velay; and Auvergne and a part of Bourbonnois comprehended Lower Lyonnais, Beau Forez. It produces corn, wine, fruit, excellent chestnuts. The principal rivers are Soane, Rhone, and Loire. Lyons was

(1.) LYONS, a large, rich, ancient town of France, capital of the province of Rhone and Loire. It has an academy of sciences and belles lettres, and an academy of sciences. It is seated in the centre at the conflux of the Rhone and Saone. On the N. side of it are two high mountains; and the town of St Sebastian serves as a bulwark against N. winds, which often blow with great violence. It contains about 160,000 inhabitants. The houses, in general, are high and well built. It has 6 gates, and as many suburbs. The cathedral, the arsenal, the amphitheatre built by the ancient Romans, the hospital, the cathedral, the numerous palaces, are worthy of a particular attention. It is a place of great trade, extended not only through France, but into Switzerland, and Spain; and it has 4 fairs, which are well frequented. It was founded by L. Manutius Plancus, and peopled by the Burgundians, about 10 years B. C. In the 5th century, it was taken by the Burgundians, but was recovered by the sons of Clovis. In 1792, an

LYONS, a town of N. York in Ontario co.  
 4) LYONS, Israel, an eminent botanist and  
 mathematician, the son of a learned Polish Jew,  
 was a Jeweller, and published a Hebrew  
 grammar, and observations on Scripture History.  
 He was born at Cambridge in 1739. In 1758,  
 he published a Treatise on Fluxions: in 1763,  
*Observations on the plants which grow in the  
 neighbourhood of Cambridge*. He gave several  
 public lectures at Oxford; and in 1773, accom-  
 panied Capt Phipps, (afterwards Lord Mulgrave,)  
 to the North pole, by order of the Board of Lon-  
 don, who rewarded several of his inventions.  
 He received a salary of 100 l. a-year, for calculating  
 the *Nautical Almanack*. He married, and died  
 in London in 1775.

 the northern hemisphere. See ASTRONOMY, §

LYRA, in ichthyology. See CALLIONIMUS  
 N° 3.

LYRE. *n. f.* [*lyre*, Fr. *lyra*, Lat.] A harp;  
 a musical instrument to which poetry is, by poets  
 and writers, supposed to be sung.—  
 With other notes than to th' Orphean lyre.

Milton.

My softest verse, my darling lyre,  
 on Euphelia's toilet lay.  
 never touched his lyre in such a truly chro-  
 nic manner as upon that occasion. *Arbutnot.*

The LYRE, was an instrument of the string-  
 ed, much used by the ancients.

LYRE, INVENTION AND IMPROVEMENTS  
 12. All ancient authors agree that the Lyre  
 was invented by Mercury; but they differ much  
 respecting the number of strings with which it  
 was furnished. Some assert it was only 3; that  
 the 2d and 4th were acute, and the 3d was an  
 intermediate one a mean between

Others assert that the lyre had 4 strings;  
 that the 2d was a fourth from the first,  
 and the 4th the same distance from the 3d,  
 and the 3d was a tone. Others

assert that the lyre of Mercury had 7 strings.  
 Ptolemy, a follower of Pythagoras, says,  
 that the lyre made of the shell was invented by Mer-  
 cury, and the knowledge of it, as it was trans-  
 mitted to Orpheus, was transmitted to Orpheus  
 by Hermes, who taught the use of it to Thamyris and  
 Amphion the Theban, who built the Lyres of  
 Thebes to the 7 strings of the lyre.

That Orpheus was afterwards killed  
 by Thracian women; that they cast his lyre  
 into the sea, which was afterwards thrown up at  
 Lesbos, a city of Lesbos; that certain fishers  
 found it, they brought it to Terpander, who  
 carried it to Egypt, exquisitely improved, and  
 presented it to the Egyptian priests, as a  
 sacrifice to the honour of their deity. The dis-  
 agreement among authors seems to have arisen from  
 confounding together the Egyptian and the  
 Grecian Mercuries. The invention of the  
 lyre with 3 strings was due to the first  
 Mercurius. The lyre attributed to the

Grecian Mercury is described by almost all the  
 poets to be an instrument of 7 strings. (See MER-  
 CURY.) Vincent Galili has collected the vari-  
 ous opinions of the Greek writers, who have men-  
 tioned the invention of the chelys or testudo;  
 and Mr Spence has done the same in a very cir-  
 cumstantial but ludicrous manner. The sub-  
 stance of the legend he quotes, is "that Mer-  
 cury, after stealing some bulls from Apollo, retired  
 to a grotto, at the foot of a mountain in Arca-  
 dia; found a tortoise feeding at the entrance,  
 killed and eat the flesh of it; and as he was di-  
 verting himself with the shell, observed the noise  
 it gave from its concave figure; on which he cut  
 several thongs out of the hides he had stolen,  
 fastened them as tight as he could to the shell,  
 and, thus invented a new kind of music with  
 them." The most ancient representations of this  
 instrument agree very well with this account of  
 its invention: the lyre, on the old celestial globes,  
 was represented as made of one entire shell of a  
 tortoise; and that of Amphion in the celebrated  
 group of the Dirce or Toro, in the Farnese pa-  
 lace at Rome, which is of Greek sculpture, and  
 very high antiquity, is figured in this manner.  
 There have, however, been many other claimants  
 to the seven-stringed lyre. For though Mercury  
 invented this instrument, Homer says, he after-  
 wards gave it to Apollo, (who was the first that  
 played upon it with method, and accompanied it  
 with poetry,) as a peace-offering for the oxen he  
 had stolen from him. Diodorus informs us, that  
 Apollo, repenting of the cruelty with which he  
 had treated Mariyas, (see MARSYAS,) broke the  
 strings of the lyre, and put a stop for a time to  
 any further progress in the practice of that new  
 instrument. "The Muses (adds he) afterwards  
 added to this instrument the string called *mesé*;  
 Linus, that of *lichanos*; and Orpheus and Tha-  
 myras, those strings which are named *hypate* and  
*parhypate*. Many ancient authors tell us, that,  
 before the time of Terpander, the Grecian lyre  
 had only 4 strings. Suidas says, it remained in  
 this state 856 years, from the time of Amphion,  
 till Terpander added to it 3 new strings, which  
 extended the musical scale to a heptachord, and  
 supplied the player with two conjoint tetrachords.  
 About 150 years after this, Pythagoras added an  
 8th string to the lyre, to complete the octave,  
 which consisted of two disjoint tetrachords. Boe-  
 thius tells us, that the system did not long re-  
 main in such narrow limits as a tetrachord.  
 Choraëbus, the son of Atys, king of Lydia, ad-  
 ded a 5th string; Hyagnis, a 6th; Terpander, a  
 7th; and Lycaon of Samos, an 8th. But all these  
 accounts are irreconcilable with Homer's hymn  
 to Mercury, where the chelys, or testudo, the  
 invention of which he ascribes to that god, is said  
 to have had 7 strings. There are many claimants  
 among the musicians of ancient Greece to the  
 strings that were afterwards added to these, by  
 which the scale, in the time of Aristoxenus, was  
 extended to two octaves. Athenæus speaks of  
 the *nine-stringed* instrument; and Ion of Chios, a  
 tragic and lyric poet, who recited his pieces in  
 the 82d olympiad, 452 B. C. mentions, in some  
 verses quoted by Euclid, the *ten-stringed* lyre; a  
 proof that the 3d conjoint tetrachord was added.

te, which was about 50 years  
fracted the octachord. The  
the same musical discoveries  
sic was cultivated in different  
the inhabitants of each im-  
ow, instruments, some of which  
... of those of other parts of  
ns to attribute the same in-  
t persons. Thus the single  
Minerva and to Mariyas; the  
to Pan and to Cybele; and the  
lyre or  
Linc  
Orpheus.

(4) ...S, VARIOUS FORMS OF. With respect  
to the form of the ancient lyre, as little agreement  
is to be found among authors as about the number  
of strings. The best evidences concerning it are the  
representations of that instrument in the hands of  
ancient statues, bas-reliefs, &c. *Plate CCIV. Fig. 1.*  
is a representation of the *TESTUDO*, or lyre of  
*phion*, in front, as it appears, on the  
celebrated *Toro Farnese* at Rome  
able work, consisting of 4 figur  
life, besides the *toro* or bull, w  
Callia's baths, where the *Farnese*  
discovered: and, except the *Laocoon*, is the  
piece of Greek sculpture mentioned by Pliny  
is now remaining. The two projections near the  
bottom seem to have been fastenings for the  
strings, and to have answered the purpose of tail-  
pieces in modern instruments. *Fig. 2.* The lyre  
held by *Terpsichore*, in the picture of that *Muse*,  
dug out of *Herculanum*. *Fig. 3.* The *Abyssin-  
ian testudo*, or lyre, used at present in the pro-  
vince of *Tigre*, from a drawing of *Mr Bruce*, com-  
municated to *Dr Burney*. "This instrument  
(*lyre*) has sometimes 5, sometimes 6, but most  
frequently 7 strings, made of the thongs of raw  
sheep or goat skins, cut extremely fine, and twist-  
ed: they rot soon, are very subject to break in dry  
weather, and have scarce any sound in wet. From  
the idea, however, of this instrument being to ac-  
company and sustain a voice, one would think  
it was better mounted than formerly. The *A-  
byssinians* have a tradition, that the *sistrum*, *lyre*,  
and *tambourine*, were brought from *Egypt* into  
*Ethiopia*, by *Thoth*, in the very first ages of the  
world. The *flute*, *kettle-drum*, and *trumpet*, they  
say, were brought from *Palestine*, with *Menelek*,  
the son of their queen of *Seba* by *Solomon*, who  
was their first *Jewish* king. The lyre in *Ambaric*  
is called *beg*, the *sheep*; in *Ethiopic*, it is called  
*mesako*; the verb *shako* signifies to strike strings  
with the fingers: no *plectrum* is ever used in *A-  
byssinia*; so that *mesako*, being literally inter-  
preted, will signify the 'stringed instrument  
played upon with the fingers.' The sides, which  
constitute the frame of the lyre, were anciently  
composed of the horns of an animal of the goat  
kind, called *agazam*, about the size of a small cow,  
and common in the province of *Tigre*. I have  
seen several of these instruments very elegantly  
made of such horns, which nature seems to have  
shaped on purpose. Some of the horns of an *A-  
frican* species of this animal may be seen in *M.  
Buffon's* history of the King of France's cabinet.  
They are bent, and less regular than the *Abyssin-  
ian*; but after the *mus* became common in the

province of *Tigre*, and the woods were  
this animal being more scarce, the *lyre*  
made of a light red wood; however, it  
cut into a spiral twisted form, in imita-  
ancient materials of which the lyre was  
The drawing I send you was one of the  
ments made of wood. The lyre is gen-  
3 feet to 3 feet 6 inches high; that is  
drawn through the point of the lower  
horns, to the lower part of the base of  
ing board. It is exceedingly light, and  
riage, as an instrument should natural  
rugged and mountainous a country.  
consider the parts which compose the  
cannot deny it the earliest antiquity.  
first state was a hunter and a fisher, and  
instrument was that which partakes in  
state. The lyre, composed of two princ-  
owes the one to the horns of an animal  
to the shell of a fish." See *HARP*, §  
4. *An Etruscan lyre*, with 7 strings, in the  
of *Etruscan*, *Greek*, and *Roman* antiq  
lified from the cabinet of *Sir William*  
*Vol. I. Naples 1766. Pl. cix.* Though  
upon which it is represented is of suc-  
able and remote antiquity, the tail pie-  
belly, and sound holes, have a very re-  
pearance, and manifest a knowledge of  
struction of musical instruments, among  
cans, superior to that of the *Greeks* at  
in much later times. The lower part  
strument has much the appearance of a  
viol, and displays more than the emb-  
whole violin family. The strings lie  
intended to be played on with a bow;  
the cross lines on the tail piece are  
frequently seen on the tail pieces of old  
*The Tripodian lyre* of *Pythagoras* the *Z-*  
from a bas-relief in the *Massei* palace at  
presenting the whole choir of the *Mu-*  
*neus* gives the following account of the  
dinary instrument, *lib. xiv. cap. 15. p. 63*:  
ancient instruments are recorded (says  
of which we have so little knowledge  
can hardly be certain of their existence  
the tripod of *Pythagoras* the *Zacynthi-*  
on account of its difficulty, continued  
a short time. It resembled in form the  
tripod, whence its name. The legs were  
tant, and fixed upon a moveable base  
turned by the foot of the player; the feet  
placed between the legs of the stool; the  
the top served for a sound board, and the  
the 3 sides of the instrument were tuned  
ferent modes, the *Doric*, *Lydian*, and  
The performer sat on a chair made on  
striking the strings with the fingers of the  
and using the *plectrum* with the right, at  
time turning the instrument with his foot  
ever of the 3 modes he pleased: so that  
practice he was enabled to change the *mus*  
such velocity, that those who did not  
imagined they heard 3 different perform-  
ing in 3 different modes. After the death  
admirable musician, no other instrument  
same kind was ever constructed." *Fig.*  
*CCV.* represents a lyre in the famous anti-  
ture dug out of *Herculanum*, upon wh

Manis Pentadaetyla or short-tailed.

is teaching young Achilles to play. See IRON.

**LYRICAL.** } *adj.* [*Lyricus*, Lat. *lyrique*, Fr.]  
 (1.) \* **LYRICK.** } Pertaining to an harp, or to  
 es or poetry sung to an harp; singing to an  
 P.—

All his trophies hung and acts enroll'd  
 In copious legend, or sweet *lyrick* song. *Milt.*  
 Somewhat of the purity of English, somewhat  
 more equal thoughts, somewhat of sweetness  
 he numbers; in one word, somewhat of a finer  
 n, and more *lyrical* verse, is yet wanting.  
*Pden.*—

The lute neglected, and the *lyrick* muse. *Pope.*  
 2.) \* **LYRICK.** *n. f.* A poet who writes songs  
 the harp.—The greatest conqueror in this na-  
 t, after the manner of the old Grecian *lyricks*,  
 not only compose the words of his divine  
 s, but set them to music himself. *Addison.*

3.) **LYRIC POETRY**, such as the ancients sung  
 the lyre or harp.—It was originally employed  
 celebrating the praises of gods and heroes, and  
 characteristic was sweetness. Who was the  
 or of it is not known. It was much culti-  
 ed by the Greeks; and Horace was the first  
 attempted it in the Latin language. Ana-  
 n, Alcæus, Sthenichorus, Sappho, and Horace,  
 = the most celebrated lyric poets of antiquity.

**LYRIST.** *n. f.* [*lyristes*, Latin.] A musician  
 plays upon the harp.—

His tender theme the charming *lyrist* chose  
 Enerva's anger, and the direful woes  
 Which voyaging from Troy the victors bore.

*Pope.*  
**LYRODI**, among the ancients, musicians who  
 ed on the lyre and sung at the same time.  
 s appellation was also given to such as made  
 their employment to sing lyric poems com-  
 ed by others.

LYS, or LIS, a river of France, which rises  
 Lisburg, in the dep. of the Straits of Calais,  
 by Aire, St Venant, Armentieres, Comines,  
 and runs into the Scheldt at Ghent.

LYS, a department of the French republic,  
 comprehending part of the ci-devant prov. of  
 Flandres. Bruges is the capital.

LYS, or LIS. See LIS, N° 1.

LYS, a measure used by the Chinese in es-  
 timating distances: 200 lys make 60 geographical  
 or one degree.

LYSANDER, a famous Spartan general,  
 conquered the Athenians at ÆGOSPOTA-  
 and subjected their city to 30 tyrants. See  
 CA, § 13, 14; and SPARTA.

LYSANDER, a military township of New  
 in Onondago county, comprehending the  
 of Hannibal and Cicero; 16 miles SE. of lake  
 Erie.

LYSANDRIA, a Samian festival, celebrated  
 games and sacrifices in honour of the Lace-  
 dæmonian general Lysander. It was anciently cal-  
 led *Lyria*: but this name the Samians abolished  
 public decree.

LYSIARCHI, *n. f.* an ancient magistrate, who  
 intended the sacred games, and presided in  
 acts of religion in the province of Lycia. He  
 created in a council consisting of deputies  
 the 23 provincial cities. The lysarchs were

both heads of the council and pontiffs of the pro-  
 vince.

LYSIAS, an ancient Grecian orator, born at  
 Syracuse in the 80th olympiad. At 15, he went  
 to Thurion, a colony of the Athenians; and when  
 grown up, assisted in the administration of the go-  
 vernment many years. When about 47 years of  
 age, he returned to Athens; whence, being after-  
 wards banished by the 30 tyrants, he went to Me-  
 gara. He was very familiar with Socrates, and  
 other illustrious philosophers. He taught oratory,  
 though he did not plead at the bar, but he sup-  
 plied others with speeches. "Fuit *Lysias* in cau-  
 sis forensibus non versatus," (says Cicero), "*sed*  
*egregie subtilis scriptor atque elegans*," &c. Quin-  
 tilian gives him a similar character. Plutarch  
 and Photius relate, that 425 orations were for-  
 merly exhibited under the name of Lysias; of  
 which only 34 are now extant. The best edition  
 is by Dr John Taylor at London, 1739, 4to; Cam-  
 bridge, 1740, 8vo.

LYSIMACHIA, LOOSESTRIFE, in botany, a ge-  
 nus of the monogynia order, belonging to the  
 pentandria class of plants; and in the natural me-  
 thod ranking under the 20th order, *Rotaceæ*. The  
 corolla is rotaceous; the capsule globular, beak-  
 ed, and ten valved. There are 10 species, but  
 only 4 are commonly cultivated in gardens. These  
 hardy herbaceous perennials and biennials, rising  
 with erect stalks from 18 inches to 2 or 3 feet high;  
 garnished with narrow entire leaves; and termi-  
 nated by spikes and clusters of monopetalous, ro-  
 tated, five parted spreading flowers of white and  
 yellow colours.—They are easily propagated by  
 seeds, and thrive in any soil or situation.

LYSIMACHIUS, one of Alexander the Great's  
 generals and successors. See MACEDON, § 14-17.

LYSIPPUS, a celebrated Greek statuary, born  
 at Sicyone. He was first a locksmith, afterwards  
 a painter; but at last applied himself entirely to  
 sculpture; in which he acquired an immortal re-  
 putation, and made a great number of statues that  
 were the admiration of the people of Athens and  
 Rome. His grand statue of the sun represented  
 in a car drawn by 4 horses, was worshipped at  
 Rhodes. He made several statues of Alexander  
 and his favourites, which were brought to Rome  
 by Metellus, after he had reduced the Macedo-  
 nian empire; and the statue of a man wiping and  
 anointing himself after bathing, being particu-  
 larly excellent, was placed by Agrippa before his  
 baths in that city. He lived in the time of Alex-  
 ander the Great, about 334 B. C.; and left 3 sons,  
 all famous statuaries.

LYSSIE OSTROVA. See FOX ISLANDS, § 2.  
 The principal of these islands are named *Atchak*,  
*Amuck*, *Sungarama*, *Yunaklan*, *Umnak*, and  
*Unakaska*; but there are also many small ones in  
 clusters.

LYSTON, a town of Devonshire, seated on  
 the Lyd, 4 miles from Newport.

(1.) LYSTRA, in ancient geography, a town  
 of Lycania, famous for being the birth-place of  
 Timothy, and the scene of a miracle performed  
 by Paul and Barnabas. Acts xiv, 6-18. and xvi, 1.

(2.) LYSTRA, a town of Kentucky, in Nelson Co.

LYTHRUM, PURPLE LOOSESTRIER, in botany,  
 a genus of the monogynia order, belonging

to the decandria class of plants; and in the natural method ranking under the 17th order, *Calycanthemae*. The calyx is cleft in 12 parts; and there are six petals inserted into it; the capsule is bilocular and polyspermous. There are 10 species, of which the most remarkable are,

1. *LYTHRUM HISPANUM*, the *Spanish loosestrife*, with an hyssop leaf, grows naturally in Spain and Portugal. It hath a perennial root. The stalks are slender, not more than 9 or 10 inches long, spreading out on every side. The lower part of the stalks is garnished with oblong oval leaves placed opposite. The flowers come out singly from the side of the stalks at each joint; they are larger than those of the common sort, and make a fine appearance in July when they are in beauty. It is propagated by seeds brought from those countries where it is native.

2. *LYTHRUM SALICARIA*, the common purple loosestrife, with oblong leaves, is a native of Britain, and grows naturally by the sides of ditches and rivers. It hath a perennial root, from which come forth several upright angular stalks, rising from 3 to 4 feet high, garnished with oblong leaves placed sometimes by pairs; but sometimes there are 3 leaves at each joint standing round the stalk. The flowers are purple, and produced in a long spike at the top of the stalk: so make a fine appearance. This species is propagated by parting the roots in Autumn, in a moist soil.

(1.) *LYTTLETON*, Edward, lord Lytton, keeper of the great seal in the reign of Charles I. was eminent for his probity and his moderation at the commencement of that monarch's disputes with his subjects. Without forfeiting his fidelity to the king, he preserved the esteem of the parliament till 1644, when he was made colonel of a regiment in the king's army at York. He died in 1645. Besides several speeches which have been printed, he wrote reports in the common pleas and exchequer, printed at London in 1683, in folio; several arguments and discourses, &c.

(2.) *LYTTLETON*, George, lord, eldest son of Sir Thomas Lytton, bart. descended from the great judge Littleton, (See *LITTLETON*, N<sup>o</sup> 5.) was born in 1706, at 7 months; and the midwife, supposing him to be dead, threw him carelessly into the cradle; where, had not some signs of life been observed by one of the attendants, he might never have recovered. He received the elements of his education at Eaton school, where he showed an early inclination to poetry. His pastorals and some other light pieces were originally written in that seminary; whence he was removed to the university of Oxford, where he sketched the plan of his *Persian Letters*, a work which afterwards procured him great reputation, not only from the elegance of their style, but from the excellent observations they contain on the manners of mankind. In 1728, he set out on the tour of Europe; and, on his arrival at Paris, became acquainted with Mr Poyntz, then minister at the court of Versailles; who was so struck with his extraordinary capacity, that he employed him in many political negotiations, which he executed with great judgment and fidelity. Mr Lytton, while on his travels, instead of lounging away his hours at the coffee-houses and adopting the fashi-

onable follies and vices of France and Italy, his time alternately in his library and in the society of men of rank and literature. About this time he wrote this poetical epistle to Dr Ayscough and Mr Pope, which show singular taste and rectness. After continuing a considerable time in Paris with Mr Poyntz, he proceeded to London and Geneva; and thence to Turin, where he was honoured with great marks of friendship from the Sardinian majesty. He then visited Milan, Genoa, and Rome, where he applied himself to the study of the fine arts; and was in that celebrated metropolis, allowed to be a perfect judge of painting, sculpture, and architecture. During his continuance abroad, he constantly corresponded with his father. Several of his letters are extant, and place his filial affection in a very distinguished light. He soon returned to his native country, and was elected M. P. for Okehampton in Devonshire; and he was so much to the satisfaction of his constituents that they several times re-elected him for the same place without putting him to the least contest. About this period, he received great marks of friendship from Frederic prince of Wales, who, in 1737, appointed his principal secretary, and continued in the strictest intimacy with him till his death. His attention to public business did not, however, prevent him from exerting his poetical talent. A most amiable young lady, Miss Fortescue, daughter of Hugh Fortescue of Pilleigh, in Devonshire, inspired him with a passion, which produced a number of little poems remarkable for their tenderness and elegance. He had a happy facility of striking out an epigram or a couplet, which obtained him a reputation. In 1742, he married this lady, whose exemplary conduct, and uniform practice of religion and virtue, established his conjugal happiness upon the most solid basis. In 1744, he was elected one of the lords commissioners of the treasury, which gave him an opportunity of exerting his influence in rewarding merit and ability. He was the friend and patron of the late Henry I. James Thomson, author of the Seasons, Mr Lett, Dr Young, Mr Hammond, Mr West, Mr Pope, and a correspondent of M. Voltaire. After the death of Thomson, who left his affairs in a very embarrassed condition, Mr Lytton supported that poet's sister under his protection. He wrote the tragedy of *Coriolanus*, which that writer did not put the last hand to; and brought it to the theatre royal, Covent-garden, with a preface of his own writing, in which he so pathetically lamented the loss of that delightful bard, that not only Mr Quin, who spoke the lines, but the whole audience, burst into tears. In the beginning of 1746, his wife died, in the 25th year of her age; leaving one son, (see *N<sup>o</sup> 1.*) a daughter, Lucy, who married lord Viscountess. Her remains were deposited at Okehampton in Worestershire; and an elegant monument erected to her memory in the church of Okehampton, which contains a beautiful poetical inscription written by her husband; who also wrote an elegy on her death, which will be admired where the conjugal affection and pathetic poetry are both esteemed. His masterly *Essay on the Character*

perianthium of the male is triand; that of the female is as in the male; the fruit is a plum two-celled superior.

**MABERLA**, a lake of Negroland, which runs into the Senegal. Lon. 7. 40. E. Lat. 14. 40. N.

**MABILLON**, John, a learned French writer born at Pierre-monte, on the frontiers of Champagne, in 1632. He was educated in the university of Rheims, and afterwards entered into the abbey of the Benedictines of St Remy. In 1663, he was appointed keeper of the monuments of France at St Dennis. Next year he went to Paris; and assisted F. D'Acheri, in compiling his *Spicilegium*. See **ACHERI**. This made him known. Soon after he revised from the MSS. and published an edition of St Bernard, and many other works, which are evidences of his vast capacity and industry. In 1683, Mr Colbert sent him into Germany, to search the archives and libraries of the ancient abbeys, for what was most proper to illustrate the history of the church. He published an account of this journey. In 1685, he undertook another journey into Italy, by order of the king of France; and returned in 1686 with a collection for the king's library of above 3000 volumes of rare books, printed and in MSS. He composed two volumes of the pieces which he had discovered in that country. He was highly esteemed for his virtues as well as his learning.

**MABRA**, a town of Algiers, 10 miles W. of Bona.

**MACACO**, or **MACAUCCO**. See **LEMUR**.

(1.) **MACAO**, a town of China, in Canton, on an island at the mouth of the Tac. The Portuguese have been in possession of the harbour for 150 years. Formerly they had a great trade here; but now they have only a post with a small garrison. The houses are built for the European manner; and there is Chinese manturin, as well as a Portuguese governor to take care of the town and district. Lon. 112. 15. E. Lat. 22. 12. N.

(2.) **MACAO**, an ornithogon. See **PERITACUS**.

**MACARIA**, *Myrica*, the Hippocyst; in mythology, daughter of Hercules and Deianira. Her story is the same as that of Hippocyst and the Heracleidae, who were supported by the Athenians, the hero whom it is said, to insure victory to his party, was conducted to the repose of the oracle. The Athenians therefore, decreed divine honours to her, and worshipped her as the goddess of language. See **HERACLES**.

**MACARIUS**, a celebrated history, the follower of the apostle, an Egyptian monk, who was of an ardent temper, the close of the 4th century, for his great virtue. In his writings there are many singular tenets, and ecclesiastical and civil laws of Origines.

**MACARIUS**, the name of flowers of **MACARIUS**, a native of Italy, who, about the close of the 9th century, passed into France, the great at-tention he paid to the Averrhoes, that one opinion that the medicinal performed the opinion of the effect of the words all the names.

**MACARIUS**, the name of **MACARIANS**, N. 1 and 2.

(1.) **MACARIUS**, a fop, a fable, one who has been made of dials. *Abb.*

(2.) **MACARONI**. See **POLENGIO**, and the next article.

**MACARONIAN**, or } *adj.* a kind of be  
**MACARONIC**, } poetry, consist

jumble of words of different languages words of the vulgar tongue Latinized, or words modernized. Some derive the word *Macaron*, Fr. or *Macaroon*; (see **MAC** § 2.) which, from their being composed of various ingredients, occasioned this kind of which consists of Latin, Italian, Spanish, English, &c. to be called by their name. **MACARIO**, a Benedictine monk, was the first who invented this kind of verse. See **POLENGIO** best pieces of this kind are, the *Baldus*, *MACARIO*, and *Macaronis Fortis* by Stefano among the Italians; and the *Reatus veris* among the French. Rabelais first transferred *macaronic* style out of the Italian verse into prose, in his *Pantagruel*. We have little left in the *macaronian* way, but some preserved in Camden's remains. But the and Netherlanders have had their *macaron* *Certamen Catholicum cum Calvinistis*, by Hamiconius Frius, contains about 1200 the words whereof began with C. Our co Drummond of Hawthornden's *Polemo* is superior to any thing written in this st

"*Nymphæ quæ colitis bigibissima monti*  
 &c.

\* **MACAROON**. *n. f.* [*macaron*, Italian] coarse, rude, low fellow; whence *macaron*, in which the language is purposely ed.—

I sigh and sweat,

To hear this *macaron* talk on in vain  
2. [*Macaron*, French.] A kind of sweet made of flower, almonds, eggs, and sic

**MACARSKA**, a town of Maritime Dalmatia, capital of the *polovina*, or of Vergoraz and Narenta. It is a bishop's see a pretty good harbour on the gulph of Lon. 15. 57. E. Lat. 45. 42. N.

**MACIAS**, a town and district of Peru, formerly very rich, and still fertile; produced cotton, sugar, the florax, and many other trees.

(1.) **MACASSAR**, or **CELEBES**, an island, in the E. India Ocean; E. of Batta, Philippines, and W. of the Moluccas; the heat of the climate would be intolerable, not moderated by the N. winds, and which regularly fall in the months of January, and during two months that it nearly ceases. The N.W. point of it lies in Lon. 121. 6. E. Lat. 1. 22. N.

(2.) **MACASSAR**, a commercial king's above island. The inhabitants of it are reptiles at all seasons. great numbers of monkeys, who are dangerous serpents; four of which are that they will swallow one of these animals.

(3.) **MACASSAR**, a large, strong, and town, capital of the above king's country. It is a city, and is built upon a steep, and is surrounded by thick woods, and is built up into them, which they draw up as they have entered. The roofs are covered with large leaves, which prevent the sun from entering. It is seated near the mouth of

which runs through the kingdom from N. to S. Lon. 117. 55. S. Lat. 5. 0. E.

**MACASSAR POISON**, in natural history, called *ppo* in the Macassar and Malayan tongue, is the gum of a certain tree, shining, brittle, black, every way like stone pitch, growing in the island (N<sup>o</sup> 1.), with which the natives arm themselves, having a long hollow trunk of a hard wood like brazil, accurately bored, and at one end is fixed a large lance-blade of iron. They use a small arrow, very straight, and somewhat finer than a large wheaten straw; at one end they fix it into a round piece of white, light, soft, and like cork, about the length of the little fin-ger fit for the bore of the trunk, to pass clear the force of one's breath, and to fill it so exactly, that the air may not pass by, but against it, in order to carry it with the greater force. At the other end they fix in it either a small fish-bone for that purpose, or make a blade of wood of the bigness of the point of a lancet about  $\frac{1}{4}$  of an inch long, and making a little notch in the end of the arrow, they strike it firm therein, which is anointed with poison. The poisonous gum, when gathered, is put into hollow canes, stopp'd very close, and thus brought to Macassar. When they fit it for use, they take a piece of the turtle-shell, and a stick cut flat and smooth at one end: when they take green galangal root, and with the addition of a little fair water press the juice into a clean china dish: then with a knife scraping a little of the poison upon a shell, dip the end of the stick in the forcement liquor, and with this dilute the poison to the consistence of a syrup: when this is done, they dip the fish-tooth or wooden blade with the stick, and lay it in the sun, so that it may be dried hard. The pointed arrows thus prepared, put in hollow bambous, close shut, and in this they retain their virtue for a month.

**MACASSAR STRAITS** OR, the narrow sea between Celebes and Borneo.

**MACASSARS**, the people of MACASSAR. They are robust, courageous, and greatly addicted to the Mahometans.

**MACAU**, a town of France, in the depart. of Gironde, 10 miles N. of Bourdeaux.

**MACAULAY**, Catherine, a celebrated female philosopher, daughter of John Sawbridge, Esq. of High, in Kent, and sister of the late Alder-Sawbridge, M. P. She was married June 1770, to George Macaulay, M. D. who left her a widow with one daughter. In 1778, she had a younger brother of the famous empiric, John Graham. (See GRAHAM, N<sup>o</sup> 3.) She wrote, *the History of England from the Accession of King I. to the Revolution*; the 1st vol. of which was published in 1763, 4to. and the 8th and last in 1790.

This work was very popular, and is preserved by the late lord Gardenstone, to that of the late HUME, N<sup>o</sup> 1. 2. A modest plea in property of Copy-Right. 3. Observations on the pamphlet, entitled, "Thoughts on the Causes of the present Discontents," 1770, 8vo. 4. Remarks on Hobbes's *Rudiments of Government and Society*. 5. Address to the people of England, France, and Ireland, on the present important

crisis of affairs, 1755. 6. History of England, from the Revolution to the present time, in a series of letters to the rev. Dr Wilson; 1778, 4to. 7. Treatise on the Inmutability of Moral Truth, 1782, 8vo. and 8. Letters on Education, 8vo. 1790. She was a keen republican. Dr Wilson made her a present of a handsome house, called *Alfred House*, in Bath; and erected a statue of her, in the character of *Liberty*, in his parish church of Walbrook. She died at Binfield, in Berks, 23d June, 1791.

(1.) \* **MACAW**. *n. f.* A bird in the West Indies, the largest species of parrot.—

(2.) **MACAW**. See PSITTACUS, N<sup>o</sup> 4.

(1.) \* **MACAW-TREE**. *n. f.*—A species of the *palm-tree*, very common in the Caribbee islands, where the negroes pierce the tender fruit, whence issues a pleasant liquor; and the body of the tree affords a solid timber, supposed by some to be a sort of ebony. *Miller*.

(2.) **MACAW TREE**. See PHOENIX, N<sup>o</sup> 3.

**MACBETH**, a Scots nobleman of the blood royal, who murdered Duncan I. king of Scotland, A. D. 1046; and, chasing Malcolm Canmore, his son and heir into England, usurped the crown. Sward earl of Northumberland, whose daughter Duncan had married, undertook, by order of Edward the Confessor, the protection of the fugitive prince; marched with an army into Scotland; defeated and killed Macbeth; and restored Malcolm to the throne of his ancestors. Shakespeare has made this transaction the subject of one of his best tragedies, though against all the rules of the ancient drama.

**MACBRIDE**, Dr David, an eminent physician and philosopher, descended from an ancient Scots family in the county of Galloway. His grandfather and father were Presbyterian clergymen in Ireland; the father at Belfast; the latter at Ballymony in Antrim, where he married, and where our author was born in April 1725. After the usual education, and having studied some time under an eminent surgeon in his native place, he was sent to the university of Glasgow, and afterwards to that of Edinburgh. He then went on board the navy as a surgeon's mate, and after some time was raised to the rank of surgeon. Although, in this situation, he acquired a great deal of practical experience, yet, having been rather young when he first attended the classes, he returned to Edinburgh, and again entered on the career of academical pursuits, under Dr Monro, and those other teachers, whose abilities raised the fame of the medical school at this metropolis. The celebrity of the medical teachers in London led him also to visit that capital, where he studied under Dr Hunter and Dr Smellie, and acquired a knowledge of the best practice, by attending the public hospitals. Thus qualified for the exercise of his profession, about the end of 1749 he fixed his residence in Dublin. His success, however, was at first greatly retarded by an uncommon degree of modesty, so that for several years he was employed by few people either of rank or fortune. But this eventually promoted the cause of science; for the leisure this afforded him was employed in researches, which

as an ingenious philosopher and able practitioner, his name was enrolled with honour in the lists of many learned societies; and the university where his studies had commenced, conferred upon him the degree M. D.—Nor were his talents confined to the advancement of medicine alone. Having discovered a considerable improvement in the art of tanning, he published first, *An Account of a New Method of Tanning*; and afterwards, *Instructions for carrying on the New Method of Tanning*. As a testimony of respect for his ingenuity, prize medals were conferred upon him by the Societies of Arts both in London and Dublin. His last and most extensive publication was, *A Methodical Introduction to the Theory and Practice of Medicine*. Most, if not all of these publications, went through various editions, and were translated into different languages. Mean time his employment increased so rapidly, that he had more business than he could transact either with ease or safety. This having kept him in perpetual agitation both of body and mind, at last induced an almost total incapacity of sleeping. In this situation, he was attacked with a fever, which put an end to his life on the 13th December 1778, in the 53d year of his age. During his residence in Dublin he was twice married, and had children by both his wives, none of whom survived him. After his death, several of the playful trinkets of his infants, with the signature of *dulces exuvia*, were found in his repositories, a proof, that in him the great mind of the philosopher was conjoined with the feeling heart of the affectionate father. And if his conduct was exemplary as an husband and parent, his manners were no less amiable as a companion and friend.

MACCABÆUS, Judas. See JUDAS and JAWS, § 6.

Cyrene, who wrote in Greek the *1* das Maccabeus and his brethren, against Antiochus Epiphanes, and *Et* book does not equal the accuracy of contains a history of about 15 years execution of Heliodorus's commission by Seleucus to carry away the the temple, to the victory obtained Maccabeus over Nicanor; that is 328, to the year 383, or A. A. C are in the Polyglot bibles, both of I don, Syriac versions of both these they, as well as our English version from the Greek. There is also a 5 Maccabees, containing the history of tion of the Jews in Egypt, by Pto tor, and their sufferings under it. have been written by some Alexan Greek, soon after the time of Jes Sirach. It is in most of the ancient of the Greek Septuagint, particular andrian and Vatican, but was never the vulgar Latin version of the Bib quently into any of our English copies Iphus's history of the martyrs that der Antiochus Epiphanes, is found Greek Bibles, under the name of *t of the Maccabees*.

(2.) MACCABEES, the followers cabæus. The name was generally who suffered in the cause of the truder the Egyptian and Syrian tyrant MACCARY BAY, a bay on the MACCAYE, a town of France, the Lower Pyrenees; 7 miles SE. of MACCHIA, 2 towns of Naples, provinces of Capitanata and Calabria ( MACCLESFIELD, a large and h.

break the bones, and make the armour

end.

*Dryden.*

1, Latin.] A kind of spice.—The nut-  
closed in a threefold covering, of which

id is *mace*: it is thin and membranace-  
oleaginous, and a yellowish colour: it

xtremely fragrant, aromatick, and agree-  
ll, and a pleasant, but acrid and oleagi-

te. *Hill's Mat. Med.*—Water, vinegar,  
y, is a most excellent sudorifick: it is

ectual with a little *mace* added to it.

be MACE, (§ 1, *def.* 2.) was anciently much  
the cavalry of all nations. It was com-  
ade of iron; its figure much resembles a

e-mill; many specimens may be seen in  
er. It was with one of these that Wal-

ayor of London knocked the rebel Wat

in off his horse in Smithfield, for approach-

ing king Richard II. in an insolent man-  
l as he fell, he dispatched him with his

be MACE, (§ 1, *def.* 1.) in modern times  
ged its form; and being no longer a war

nt, is made of copper or silver gilt, orna-  
with a crown, globe, and cross, and is

chief ensign of authority throughout  
Britain. Similar to the ancient maces,

ose staves at the end of which iron or  
balls armed with spikes were suspended

is: they were till lately carried by the pi-  
f the trained bands or city militia.

MACE, (§ 2, *def.* 3.) in the materia medica,  
nd coat or covering of the kernel of the

is a thin and membranaceous substance,  
aginous nature, and a yellowish colour;

ret with in flakes of an inch or more in  
which are divided into a multitude of

tions. It is of an extremely fragrant, a-  
and agreeable flavour; and of a plea-

it acrid oleaginous taste. It is carmina-  
matick, and astringent; and possesses all

es of nutmeg, but has less astringency.—  
s of mace and nutmeg, whether prepared

by distillation or expression, are so much of the  
same nature, that they may be indiscriminately

used for one another on all occasions. They give  
ease in cholics, and often in nephritic cases, ta-

ken internally from one drop to five or six of the  
distilled oil, or an equal quantity of the express-

ed; and externally, they are of use to rub para-  
lytic limbs: they also assist digestion; and will

often stop vomitings and hiccoughs, only by be-  
ing rubbed on the region of the stomach. Nurses

apply oil of mace by expression to children's na-  
vils to ease their gripes, and often with success;

and we are assured, by authors of credit, that  
when rubbed on the temples, it promotes sleep.

\* MACEALE. *n. f.* [*mace* and *alc.*] Ale spiced  
with mace.—I prescribed him a draught of *mace-*

*ale*, with hopes to dispose him to rest. *Wifeman.*

who carries the mace before persons in authority.

—I was placed at a quadrangular table, opposite  
to the *macebearer*. *Spektor.*

MACEDA, a town of Spain, in Galicia.

(1.) MACEDON, or MACEDONIA, a celebra-  
ed kingdom of antiquity, bounded on the E. by

the Ægean sea; on the S. by Thessaly and Epi-  
rus; on the W. by the Ionian sea or Adriatic;

and on the N. at first by the Strymon and the Scar-  
dian mountains, but afterwards by the Nessus.

(2.) MACEDON, ANCIENT EXTENT, DIVISIONS,  
NAMES, &c. OF. The kingdom of Macedonia, ex-

tended in a direct line only 150 miles in length;  
but the windings of the coast lengthened it out

to 3 times that extent; in which almost every  
convenient situation was occupied by a Grecian

sea-port. The country was naturally divided by  
the Thernaic and Strymonic gulphs, into the

provinces of Pieria, Chalcis, and Pangæus. The  
middle region, which took its name from a city

of Eubœa whence it was originally peopled, was  
very fertile and pleasant; the inland country, be-

ing diversified by lakes, rivers, and arms of the  
sea, was extremely convenient for inland naviga-

tion, while the towns of Amphipolis, Potidæa,  
Acanthus, and many others, afforded marts for

the commerce of the republics of Greece, as well  
as of Thrace and Macedon. On one side of this

district were the mountains of Pangæus, and on  
the other the plains of Pieria. The Pangæan

mountains, which extended 90 miles towards the  
E. on the river Nessus, though proper neither

for corn nor pasture, produced plenty of timber  
for ship-building; while the southern branches of

the mountain contained rich veins of gold and  
silver; but these, though wrought successively by

the Thasians and the Athenians, were only brought  
to perfection by K. Philip II. who extracted from

them gold and silver to the value of 200,000 l.  
Sterling annually. Pieria extended 50 miles a-

long the Thernaic gulph, to the confines of  
Thessaly and mount Pindus. The inland part of

the country was beautifully diversified with shady  
hills and fountains; and so admirably calculated

for solitary walks and retirement, that the an-  
cients looked upon it to be the favourite haunt of

the Muses, and accordingly bestowed upon them  
the title of PIERIDS. In the most early times

this country was called *Emathia*, from *Emathius*  
one of its princes. The name of Macedon is said

from MACEDO a descendant others suppose it to have of MYGONIA, a district of remote ages, Macedon, at number of petty principalities even the names are now

CEDEON, ANCIENT HISTORY OF, FROM TO ALCEIAS. All authors agree, that was the first who established any permanent in Macedon. He was an Argive, ant of Hercules, and about 814 years B. C. led a small colony of his countrymen inland district of Macedon, then called . This territory was about 300 miles in extent. On the S. it was separated from by a number of Greek republics, of which considerable were those of Olynthus and and on the N. E. and W. was surrounded by kingdoms of Thrace, Pæonia, and according to the traditions of those having consulted the oracle on his intended expedition, was commanded by the goats in the establishment of empire. For some time he proceeded, without knowing what to make of answer; but happening to enter the of *Emathia*, at that time governed by *Idas*, he observed a herd of goats running *Edeja* the capital. Recollecting then the of the oracle, he attacked and took the surprise, soon after making himself master of the whole kingdom. In memory of this remarkable event he called the city *Agea*, and the

*Ægates*, from the goats who conducted him, and made use of the figure of a goat in his standard. This fable accounts for the figure of a goat on the coins of Philip and his successors. The little colony of Argives led into *Emathia* by *Caranus* would soon have been overwhelmed by the barbarous nations who surrounded it, had not this prince and his subjects taken care to ingratiate themselves with their neighbours, rather than to attempt to subdue them. They instructed them in the Grecian religion and government, and in the knowledge of many useful arts; adopting themselves, in some degree, the language and manners of the barbarians; imparting to them in return some part of the Grecian civilization and polite behaviour. Thus they gradually associated with the fierce and warlike tribes in their neighbourhood; and this prudent conduct, being followed by succeeding generations, may be looked upon as one of the causes of the Macedonian greatness. *Caranus* dying after a reign of 28 years, left the kingdom to his son *Cœnus*, in 786, who having considerably enlarged his dominions, was succeeded by *Thurymas*, in 774; and he by *Perdiccas I.* in 727. This last prince is by *Thucydides* and *Herodotus* accounted the founder of the Macedonian monarchy; but his history is so obscured by fable, that nothing certain can now be known concerning it. In process of time, however, the good understanding which had subsisted between the Macedonians and their barbarous neighbours began to be interrupted; and in 673 B. C. the kingdom was for the first time invaded by the

rians. At first they did considerable damage by their ravages; but *Argæus* the son and successor of *Perdiccas I.* having decoyed them into an ambush, cut off great numbers, and obliged the remainder to leave the kingdom. In the reign of his successors, however, they returned, and often proved very troublesome enemies. *Argæus* was succeeded by his son *Philip I.* in 640 B. C. and he by his son *Æropas*, in 602; who left the kingdom to his son *Alcetas*, in 576.

(4.) MACEDON, HISTORY OF, FROM ALCEIAS TO ALEXANDER I. *Alcetas* ascended the throne about the time that the Persian monarchy was founded; and had the dexterity to preserve his dominions from the encroachments of the Greeks on the one hand, and of the Persians on the other; but in the reign of his son *Amyntas I.* was succeeded him in 547, a formal demand was made of submission to the great King *Darius*, by sending him a present of earth and water. Seven ambassadors were sent on this errand by *Megabyzus* the officers of *Darius*. They were sumptuously entertained by *Amyntas*; but having dared to take some indecent liberties with the Macedonian women, *Alexander* the king's son had them all to be murdered. This rashness had almost proved the ruin of the kingdom; but *Alexander* pacified *Babaris*, the general sent to him by *Megabyzus*, by showing him *Isidrygæa*, a very beautiful woman, with whom a Persian fell in love, and afterwards married her. From this time the Macedonians were counted the faithful allies of the Persians; and *Amyntas* obtained the country in the neighbourhood of mount *Hæmus* and *Olympus*, at the same time that the city of *Alabanda* in *Phrygia* was given to *Amyntas* the nephew of *Alexander*. The Macedonians distinguished themselves in the time of the Persian invasion of Greece, by furnishing their allies with 200,000 recruits; though some cities, particularly *Podidra*, *Olynthus*, and *Delium*, adhered to the Grecian interest. The last were taken and rased, and the inhabitants massacred by the Persians; but *Podidra* escaped by reason of the sea breaking into the Persian camp, which it did great damage. *Alexander*, however, afterwards thought proper to court the favour of the Greeks by giving them intelligence of the time when *Mardonius* designed to attack them. The remaining transactions of this reign are entirely unknown further than that he enlarged his dominions to the river *Nessus* on the E. and the *Axius* on the W.

(5.) MACEDON, HISTORY OF, FROM ALEXANDER I. TO ALEXANDER II. *Alexander I.* was succeeded in 454, by his son *Perdiccas II.* whose reign was a series of unsuccessful intrigues for the destruction of the Athenian influence in *Olynthus*, and the establishment of that of Macedon in its stead. *Perdiccas II.* was succeeded about 415 B. C. by his son *Archelaus*, who enlarged his dominions by the conquest of *Pydna*, and other places in *Pieria*, though his ambition seems rather to have been to improve his dominions than greatly to extend them. He facilitated the communication between the principal towns of Macedon, by cutting straight roads through the country; he built walls and fortresses in such places as

afforded

ordered favourable situations; encouraged agriculture and the arts, particularly those subservient to war; formed magazines of arms; raised and disciplined a considerable body of cavalry; and in short, says Dr Gillies, added more to the solid grandeur of Macedon than had been done by all his predecessors. Nor was he regardless of the arts of peace. His palace was adorned by the works of Grecian painters. Euripides was long entertained at his court; Socrates and other men of merit and genius, were invited to reside in Macedonia, and treated with distinguished regard by the monarch attentive to promote his own glory and the happiness of his subjects. This great monarch died after a reign of six years, but according to others of 41, a space by far too short to accomplish the magnificent projects he had formed. After his death the kingdom fell under the power of several pretenders, and usurpers. A number of competitors appeared for the throne; and these by and by called in to their assistance the Thracians, Thessalians, the Olynthian confederates, Athens, Sparta and Thebes. Bardyllis, an brave and daring chief, who, from being head of a gang of robbers, had become sovereign of the Thracians, entered Macedon at the head of a numerous army, deposed Amyntas II. the grandson of Alexander I. and set up in his place one Argæus, who consented to become tributary to the Illyrians. Another candidate for the throne, named Ptolemæus, was supported by the Thracians; but, with the assistance of the Thessalians and Olynthians, Amyntas was restored in 397. After his restoration, however, the Olynthians refused to deliver several places of importance belonging to Macedonia, which Amyntas had either entrusted to their care, or which they had taken from his enemies. Amyntas complained to Sparta; and the republic sent him 2000 men under Eudamidas, and afterwards a powerful reinforcement under his brother Phœbidas; but these last were defeated till the season for action was past. Eudamidas, however, with his small army performed great service. The appearance of a Spartan encouraged the subjects and allies of the Olynthians to revolt; and the city of Potidra surrendered soon after his arrival. But being too related with his niece, Eudamidas approached to near Olynthus, that he was attacked, defeated, and killed in a rally of the citizens. He was succeeded by Teleutias the brother of Argæus, who commanded a body of 10,000 Spartans, and was assisted by K. Amyntas and Dardas his brother, the governor of the most westerly province of Macedon, which abounded in cavalry. By the formidable troops the Olynthians were defeated in a number of battles, and obliged to shut themselves up in their city; on which Teleutias proceeded with his hostilities to invest Olynthus. His exclusive design was to destroy his enemies and establish his rule. A body of Olynthian horse passed the mountains in sight of the allied army, though so superior in numbers. Teleutias ordered his subjects to attack them; the Olynthians, having retreated across the mountains, were closely pursued by the Macedonians, most part of whom also passed the river; but the Olynthians suddenly turned upon them, killed upwards of 100, with Tele-

monidas their leader. Teleutias, exasperated at this disaster, ordered the remainder of the targeteers and cavalry to pursue; while he himself advanced at the head of the heavy armed foot with such celerity that they began to fall into disorder. But the Lacedæmonians imprudently advancing just under the battlements of the city, the townsmen on the walls, discharged upon them a shower of missile weapons, while the flower of the Olynthian troops sallied forth and attacked them with such violence, that Teleutias was slain, the Spartans defeated, and the whole army at last dispersed with great slaughter, and obliged to shelter themselves in Acanthus, Apollonia, Spartolus, and Potidæa. The Spartans, undismayed by this terrible disaster, continued their operations under their King Agesipolis, and after his death under Polybiades, an experienced general, with so much success, by sea and land, that the Olynthians; after holding out for 10 months, at last submitted on very humiliating conditions. They formally renounced all claim to the dominions of Chalcis; they ceded the Macedonian cities to their ancient governor; and in consequence of this Amyntas left the city of *Ægæa* or *Edessa*, where till now he had held his royal residence, and fixed it at *PELLA*, a city of great strength and beauty, situated on an eminence, which together with a plain of considerable extent was defended by impenetrable morasses, and by the rivers *Anus* and *Lydias*. It was about 15 miles from the *Ægean* sea, with which it communicated by these rivers. It was originally founded by Greeks, who had lately conquered and peopled it; but in consequence of the misfortunes of Olynthus, it now became the capital of Macedon, which it continued ever after to be. Amyntas, thus fully established in his dominions, continued to enjoy tranquillity during the rest of his life, and was succeeded by his son Alexander II. in 371 B. C.

(6.) MACEDON, HISTORY OF, FROM ALEXANDER II. TO THE DEPOSITION OF AMYNTAS III. AND USURPATION OF PERDICA II. The reign of Alexander II. was short, and disturbed by invasions of the Illyrians; from whom he was obliged to purchase a peace. His two brothers, Perdicas and Philip, being both very young, Pausanias again usurped the throne; but was soon deprived of it, by the exertions of Iphicrates the Athenian; who, in gratitude for some favours he had formerly received from Amyntas and his queen Eurydice, expelled the usurper, and got Perdicas the eldest son established on the throne. During the minority of Perdicas, however, his bustling brother, Ptolemæus Arrabæus, who was his guardian, usurped the kingdom; but was deposed by the Theban general Pelopidas, who reinstated Perdicas in his dominions, in 368 B. C. and to secure the dependence of Macedonia upon Thebes, carried along with him 20 Macedonian youths as hostages; among whom was Philip the king's younger brother. Ptolemæus was expelled by the protection of such powerful allies, as got Iphicrates and the Athenians, and even obtained the right to Amyntas's kingdom, which was then decreed to them by the general assembly of Greece. He also refused to send Pelopidas the tribute which the Macedonians had agreed to pay him, which

occasioned

recovering Amphipolis, easily induced them to support his claims; in consequence of which they fitted out a fleet, with 3000 heavy armed soldiers, which they sent to the coast of Macedon. Philip, the late king's brother, no sooner heard of his defeat and death, than he set out privately from Thebes; and on his arrival at Macedon found matters in the situation above described. Naturally ambitious, he had acquired, during the time he was an hostage, a high degree of that knowledge of men and manners, which was most suited to insure his success. To him that period was a period of improvement. From the age of 15 he had been much in the family of EPAMINONDAS; and in his travels through Greece he had cultivated an acquaintance with Plato, Isocrates, Aristotle, and other great philosophers. His appearance in Macedon instantly changed the face of affairs. In the name of his nephew Amyntas III. he treated with the Pæonians and Thracians; whom, by bribery and fair promises he prevailed upon to abandon Pausanias, and withdraw their forces, as the Illyrians had already done. And having thus got rid of these barbarians, he was now at liberty to oppose the Athenians, who supported Argæus, and threatened a very formidable invasion. The appearance, however, of the Athenian fleet before Methone, with that of Argæus at the head of a numerous army in Pieria, having filled the whole country with consternation, Philip took the opportunity of getting Amyntas set aside and himself declared king; for which indeed the danger of the times afforded a very plausible pretext.

(7.) MACEDON, HISTORY OF, FROM PHILIP II'S USURPATION TO HIS CONQUEST OF AMPHIPOLIS. Argæus, in the mean time, having advanced with his Athenian allies towards Edessa, Philip,

gan to circumscribe the power of his chief especially in the more remote province by little regard to the authority of the Macedon. To counteract their ambitious choice a body of the bravest Macedonians whom he entertained at his own table honoured with many testimonies of his giving them the title of his *companions*, obliging them constantly to attend him in hunting. Their intimacy with the king, which was considered as an indication of merit, obliged them to superior diligence the severe duties of military discipline. young nobility, eager to participate in honours, vied with each other in their desire to gain admission into this distinguished order; that while on the one hand they served as pages, on the other they formed an nursery for future generals, by whom both Alexander were afterwards greatly assisted in conquests. About this time Philip instituted the Macedonian Phalanx; but as put by Dr Gillies. (See PHALANX.) this, Philip, according to our author, introduced arms, horses, and other necessaries for war, produced a more severe and exact military discipline than had formerly been known in Greece. While he thus took the best methods to secure himself at home and formidable to his Pæonians again began to make incurious incursions into his kingdom. The death of Agis their king who was a man of great military skill and of almost every power of resist them if they were attacked. Philip, of consequence, reduced their country with little opposition to the state of tributaries. No sooner was this accomplished than he undertook a winter's campaign against

ly of infantry, but with only 400 horse. They some time made a gallant resistance, but were at last defeated with the loss of 7000 men, among whom was Bardyllis, who fell at the age of 90. The consequence was the cession of a considerable part of their territory, and subjection to an annual tribute. Philip now began to put in execution his other designs than any he had yet attempted. The rich coasts to the S. of Macedon, inhabited by Greeks, presented a strong temptation to his ambition and avarice. The confederacy of OLYNTHUS, after having thrown off the yoke of Athens, was become more powerful than ever, and could send into the field an army of 10,000 foot troops, besides a number of cavalry. Most of the towns in Chalcidice were become its allies and subjects; so that this populous province, with Pangaon on the right and Pieria on the left, formed a barrier against any incursions of the Macedonians. But Philip, anxious to establish a navy, considered the conquest of Amphipolis as more immediately necessary, as besides its naval and commercial advantages, it would open a road to the woods and mines of Pangaeus. The Amphipolitans, alarmed at the hostile designs of Philip, themselves under the protection of the Olynthians, who readily received them into the confederacy, and sent ambassadors to Athens, requesting their assistance against Philip. But the Macedonians sent his agents to Athens, with such expenses, that they arrived before any thing could be concluded with the Olynthian deputies. Haggard over the popular orators, he flattered and seduced in such an artful manner, that a negotiation was set on foot, by which Philip engaged to conquer Amphipolis for the Athenians, upon condition that they surrendered to him the fort of Amphipolis. Thus the Athenians, deceived by their magistrates, and outwitted by the policy of Philip, rejected the offers of the Olynthians. The ambassadors of Olynthus returned highly disgusted at their reception, but had scarce communicated their news to their countrymen, when Philip's ambassadors arrived at Olynthus; and pretending to be with them on the affront they had received from Athens, expressed their surprize that they should neglect the assistance of that distant and haughty republic, when they could avail themselves of the strength of Macedon, which wished to enter into alliance with their confederacy. As a proof of his sincerity, Philip offered to put them in possession of Amphipolis, an important town in the vicinity, and a base for them the cities of Pydna and Potidæa. He prevailed upon the Olynthians not only to surrender Amphipolis, but even to assist him; which he pressed that city so closely, that, unable to defend itself alone against so powerful an enemy, it surrendered at discretion, A. A. C. 357.

**OF MACEDON, HISTORY OF, FROM THE CONQUEST OF AMPHIPOLIS TO THAT OF OLYNTHUS.** Though the obstinate defence of the Amphipolitans might have furnished a pretence for Philip, he contented himself with diminishing the influence of the popular leaders from whom he had to expect the most dangerous opposition, treating the rest of the inhabitants with great clemency; but took care to add Amphipolis to his own dominions, notwithstanding his promises to the Athenians.

PL. XIII. PART II.

finding it against his interest at this time to fall out with the Olynthians, he cultivated the friendship of that republic with great assiduity; took the cities of Pydna and Potidæa, which he readily yielded to the Olynthians, though they had given him but little assistance in the reduction of these places. Potidæa had been garrisoned by the Athenians, and these the artful king sent back without ransom. He next took possession of the gold mines of Thrace, by the conquest of Crenida, which he made a Macedonian colony, and named PHILIPPEA; and drew annually from its gold mines near 1000 talents, or 200,000 l. sterling. The coins struck here were likewise called *Philippi*. Philip next took upon him to settle the affairs of Thessaly, where every thing was in confusion. This country had been greatly oppressed by Alexander tyrant of Pheræ, as well as by Tisiphornus, Pitholaus, and Lycopyron, his brothers-in-law, who had murdered him. By the united efforts of the Thessalians and Macedonians, these usurpers were easily overthrown, and the Thessalians, out of a mistaken gratitude, surrendered to Philip all the revenues arising from their fairs and towns of commerce, as well as all the conveniences of their harbours and shipping. Having thus not only established his sovereignty, but rendered himself very formidable to his neighbours, he formed an alliance with Arybbas king of Epirus, and in A. A. C. 357, married Olympias, his sister, a match thought the more equal as the kings of Epirus were descended from Achilles, as those of Macedon were from Hercules. The nuptials were solemnized at Pella with great pomp, and several months were spent in shows and diversions; during which Philip showed such proneness to vice of every kind, as disgraced him in the eyes of his neighbours, and probably laid the foundation of his domestic unhappiness. So much was his behaviour taken notice of by the neighbouring states, that the Pæonians and Illyrians threw off the yoke, and engaged in their schemes Cotys K. of Thrace. But Philip, giving up his dissipation, early in the spring of 356, took the field with the flower of his troops, and, marching in person against the Pæonians and Thracians, dispatched Parmenio into Illyria. Both enterprises proved successful; and while Philip returned victorious from Thrace, he received an account of Parmenio's victory; a 2d messenger informed him of a victory gained by his chariot at the Olympic games; and a 3d that Olympias had been delivered of a son at Pella. This was the celebrated ALEXANDER, to whom the diviners prophesied the highest prosperity and glory, from his being born in such auspicious circumstances. Soon after Alexander's birth, Philip wrote the following letter to Aristotle; "Know that a son is born to us. We thank the gods not so much for their gift, as for bestowing it at a time when Aristotle lives. We assure ourselves that you will form him a prince worthy of his father, and worthy of Macedon." Pæonia was now one of his provinces; on the E. his dominions extended to the sea of Thasos, and on the W. to the lake Lychnidus. The Thessalians were in effect subject to his jurisdiction, and Amphipolis secured him many commercial advantages; he had a numerous and well disciplined army, with plentiful

resources for supporting such an armament, and carrying through his other ambitious schemes; but his deep and impenetrable policy rendered him more formidable than all these put together. His first scheme was the reduction of Olynthus, the most populous and fertile country on the borders of Macedon; after which his ambition prompted him to acquire the sovereignty of all Greece. He had deprived the Athenians gradually of several settlements in Thrace and Macedon; but he took care always to give such appearance of justice to his actions, that his antagonists, could hardly find a plausible pretext for engaging in war against him. He perceived that the affairs of the Greeks were drawing to a crisis, and he determined to wait the issue of their dissensions. The Phocians plowed up the lands consecrated to Apollo, and the Amphictyons fulminated a decree against them, commanding the sacred lands to be laid waste, and imposing a heavy fine upon the community. Their resistance to this decree involved all Greece in a new war. Philip, at the beginning of this *Phocian or sacred war*, (as it was called) was engaged in Thrace, where a civil war had taken place among the sons of Cotys. Philip interfered, and his encroachments at length became so enormous, that Kerobletes, the most powerful of the contending princes, ceded the Thracian Chersonesus to the Athenians; who sent Chares with a powerful armament to take possession of it. He took Sestos by storm, and treated the inhabitants cruelly; while Philip reduced Methone in Pieria, but during the siege lost his right eye. All this time the Phocian war raged with fury, and involved in it all the states of Greece. Lycophron, one of the Thessalian tyrants, whom Philip had deprived of his authority, had again resumed it; and his countrymen having taken part with the Phocians, Lycophron called in Onomarchus the Phocian general to protect him against Philip; who, however, defeated Phyalus the brother of Onomarchus, whom the latter had sent into the country with a detachment of 7000 men. After this he besieged and took the city of Pegasæ, driving the enemy towards the frontiers of Phocis. Onomarchus then advanced with the whole army; and Philip, being inferior in numbers, was at first repulsed; and his troops harassed in their retreat by rocks rolled down from precipices. But returning soon with 20,000 foot, and 600 horse, whom he encouraged by reminding them, that they were fighting in the cause of the gods against sacrilegious wretches, the Phocians were utterly defeated; upwards of 6000 perished in the battle and pursuit, and 3000 were taken prisoners. The body of Onomarchus being found among the slain, was hung up on a gibbet as a mark of infamy, on account of his having polluted the temple; and those of the rest were thrown into the sea. After this victory, Philip set about the settlement of Thessaly; and having detached Kerobletes from the interest of the Athenians, he established him in the sovereignty of Thrace; with a view to destroy him when a proper opportunity offered. Were he once possessed of the dominions of that prince, the way to Byzantium was open to him, and to pave the way for this conquest, he attacked the fort of Heræum, a small and unim-

portant place; but valuable by its neighbourhood to Byzantium. The Athenians at last perceived the designs of Philip, and determined to counteract them; but too readily giving credit to a report of his death, they discontinued their preparations, and directed their whole attention to the sacred war, which, instead of being ended by the death of Onomarchus, now raged with more fury. Phyalus, above-mentioned, under the influence of the Phocians; and his affairs becoming every day more desperate, he converted into money the most precious materials below the temple at Delphi, and with this he doubled the pay of his soldiers. By this piece of sacrilege, he purchased the assistance of 1000 Lacedæmonians, 2000 Achæans, and 2000 Athenian foot, with 400 cavalry, which he took the field with great prospect of success. Philip now thought it time to throw off the mask entirely, for which the proceedings of the Achæans, particularly their league with the Corinthians, furnished him with a plausible pretext; revenging such horrid sacrilege as had been committed at Delphi seemed to give him a right to march at the head of an army into Greece. The superstition of the Greeks, however, had blinded them to such a degree, but they could not believe that Philip's piety was a mere pretence; that his real design was to conquer the country. The Athenians no sooner heard of the march of the Macedonian army, than they dispatched a strong guard to secure the pass of Mopylæ; so that Philip was obliged to retreat, and was greatly chagrined and disappointed. His first step was to call an assembly to deliberate on the measures proper to be taken to resist Philip's ambition; and this assembly is made famous by the first appearance of Demosthenes as an orator against Philip. Athens for some time had been in a very alarming situation. The city was deeply involved in the sacred war; their possessions were plundered by Philip; and mercenary partisans drew off the public funds to such a degree, that, instead of taking measures to counteract that ambitious prince, they themselves about the designs of the Persian monarch, who was preparing for war against the Greeks, Egyptians, and Phœnicians. The orator, and Phocion the statesman, sought to divert the multitude, from a state of the unsteady of the Athenians; who, they were sure to contend with so active a prince as Philip, therefore exhorted them to cultivate his friendship. Their arguments were violently opposed by Demosthenes, who, in his addresses to the assembly, exhorted them to awake from their inactivity, and assume the direction of their own affairs; to abandon all romantic schemes of ambition, and instead of carrying their arms into remote countries, to prepare for repelling the attacks which might be made upon their own dominions. He insisted upon a better regulation of their finances, and an equal distribution of the public burthens, upon retrenching many superfluous expenses. He told them, that they were not yet prepared to meet Philip in the field; they must begin by prosecuting Olynthus and the Chersonesus, which it would be necessary to raise 100

and troops, with a due proportion of cavalry, ought to be transported to the islands of Thasos, Thasos, and Sciathos, in the neighbourhood of Macedon. But all his rhetoric could not avail upon the indolent Athenians to provide their own safety. They appear, indeed, at times, to have been desperately sunk in effecy and dissipation; which disposition Philip care to encourage. There was an assembly in the city called the *Sixty*, who met expressly for purposes of extinguishing all care about public affairs, and to intoxicate themselves with excess of pleasure. To this assembly Philip sent to support their extravagancies; and so effectually did they answer his purposes, that all eloquence of Demosthenes could not counter the speeches of orators much his inferiors, backed by Macedonian gold. The destruction of Olynthus soon followed. This city, which the balance of power betwixt Athens and Macedon, was taken and plundered, and the inhabitants sold for slaves.

**M A C E D O N, HISTORY OF, FROM THE CONQUEST OF OLYNTHUS TO THE DEATH OF PHILIP AND ACCESSION OF ALEXANDER III.** Philip's hopes now depended on putting an end to the present war. For this purpose he affected a neutrality, that he might thereby become the arbiter of peace. His hopes were well founded; for the Athenians, who were at the head of the league against the Phocians solicited him on the one side, and the Phocians confederated with the Phocians did the same on the other. He answered neither, yet held them in dependence. In his heart he favoured the Phocians, or rather placed his hopes of favouring the Phocians in that state; for he well knew, that the Athenians, Spartans, and other states allied with Phocis, would never allow him to enter Thermopylae, and lead an army into their country. So much respect, however, did he pay to the ambassadors from these states, particularly Ctesiphon and Phrynon, from Athens, that he believed and reported him to be in their interest.

The Athenians, therefore sent ten plenipotentiaries to treat of peace, among whom were Demosthenes and Æschines, but though they were treated with the utmost civility, by Philip, they returned, after being put off for 3 months, without coming to any conclusion. In the mean time he took from the Athenians such places in Thrace as might best cover his frontiers; giving plenipotentiaries, in their stead, abundance of promises, and the strongest assurances that he would be as beneficial to them as ever his colonies had been. At last a peace was concluded, but the ratification was deferred till he had possessed himself of Pheræ, and saw himself at the head of a numerous army: He then treated the plenipotentiaries with assurances, that he would be ready at all times to give the Athenians proofs of his friendship. On their return Demosthenes, Demosthenes gave it as his opinion, that the promises of Philip ought not to be relied upon; Æschines however, was of an opposite opinion. The rest of the plenipotentiaries concurred with Æschines; and the people, desirous of quiet, and addicted to pleasure, decreed that the peace should be kept. Phocion, the worthiest man in

the republic, did not oppose Philip, as he considered that the Athenians of those times were nothing like their ancestors; and therefore, he was desirous, since they could not be at the head of Greece themselves, that they would at least be upon good terms with that power which would be so. Philip, while the Athenians were in this good humour, passed Thermopylae, and entered Phocis with an air of triumph; which so terrified the Phocians, that they gave up all thoughts of defence, and submitted to his mercy. Thus the Phocian war, which had so long employed all Greece, was ended without a stroke; and the judgment on the Phocians remitted to the Amphictyons, who decreed the walls of 3 Phocian cities to be demolished, the people to pay a yearly tribute of 60 talents, and never to use either houses or arms till they had repaid to the temple of Apollo the money they had sacrilegiously carried from thence; their arms to be broken to pieces, and burnt; and their double voice in the council to be taken from them, and given to the Macedonians. Other orders were also made for settling the affairs both of religion and state throughout Greece: all of which were executed with great exactness and moderation by Philip, who paid the most profound respect to the council; and, when he had performed its commands, returned peaceably with his army to Macedon, which gained him great reputation. At Athens alone, the justice and piety of Philip was not understood. The people began to see, though rather too late, that they had been deceived by those who had negotiated the late peace. They saw, that, through their acceptance of it, the Phocians were destroyed; that Philip was now master of Thermopylae, and might enter Greece when he pleased; that, in abandoning their allies, they had abandoned their own interest; and that, in all probability, they might soon feel the weight of his power, whom they had so foolishly trusted: they therefore began to take new and hostile measures; to repair their walls and forts, &c. But the influence of Demosthenes prevented them from entering into such an unequal contest, as he persuaded them rather to think of raising Philip by degrees, as by degrees they had raised him. Notwithstanding this resolution Diopithes, who had the command of the Athenian colonies in Thrace, observed that Philip kept his army in exercise, by taking several places in Thrace, which terribly incommoded the Athenians, and perceiving well what end he had in view, did not stay for instructions from home; but having raised with much expedition a considerable body of troops, taking advantage of the king's absence with his army, entered the adjacent territories of Philip, and wasted them with fire and sword. The king, who, on account of the operations of the campaign in the Chersonese, was not at leisure to repel Diopithes by force, nor indeed could divide his army without imminent hazard, chose, like an able general, rather to abandon his provinces to insults, which might be afterwards revenged, than, by following the dictates of an ill-timed passion, to hazard the loss of his veteran army, whereon lay all his hopes. He contented himself, therefore, with complaining to the Athenians of

ferable. He quarrelled with his wife Olympias such a degree, that he divorced her and married other woman named *Cleopatra*. This produced a quarrel between him and his son Alexander; which also came to such a height, that Alexander retired into Epirus with his mother. Some time afterwards, however, he was recalled, and a reconciliation took place in appearance; but in the mean time a conspiracy was formed against the king's life, the circumstances and causes which are very much unknown. Certain it is, however, that it took effect, during an exhibition public shows in honour of his daughter's marriage with the king of Epirus. Philip, having given a public audience to the ambassadors of Greece, was proceeding in state to the theatre, when he was stabbed at the door, by one Pausanias; who, endeavouring to escape, was overtaken, and instead of being secured, to discover his accomplices, was killed on the spot. As to the character of Philip, he was certainly one of the greatest monarchs, that ever sat on a throne. Had he lived longer, he would in all probability have subdued the Persians. "Yet, even on this supposition, (as Dr Gillies observes) there is not any man of sense and probity, who would purchase his imagined grandeur and prosperity at the price of artifices and his crimes; and to a philosopher, who considered either the means by which he obtained his triumphs or the probable consequences of his dominion over Greece and Asia, the very ambition of this mighty conqueror would appear but a deceitful scene of splendid misery." PHILIP II.

(10.) MACEDON, HISTORY OF, FROM THE DEATH OF PHILIP II. TO THE DESTRUCTION OF PEBES. No sooner did the news of Philip's death reach Athens, than, as if all danger had in past, the inhabitants showed the most extravagant signs of joy. The affairs of Macedonia were in a very distracted state on the accession of Alexander: for all the neighbouring nations were at war with the Athenians, that the young king was a giddy boy; and being irritated by the usurpations of Philip, immediately revolted; while the states of Greece entered into a confederacy against him. The Persians had been contriving to transfer the war into Macedonia; but as soon as the news of Philip's death reached them, they supposed all danger was over. At the same time Calanus, one of the Macedonian generals aspired to the crown, and sought to draw off the soldiers from their allegiance. In the councils held on this occasion, Alexander's best friends advised Calanus rather to make use of dissimulation than force, and to cajole those whom they thought he could subdue. These advices were ill-suited to the temper of their monarch, who thought vigorous measures only proper, and therefore immediately led his army into Thessaly. Here he harangued the princes so effectually, that he thoroughly convinced them over to his interest, and was by them declared general of Greece; upon which he returned to Macedonia, where he caused Attalus to be put to death. In the spring of the next year (335 B. C.) Alexander resolved to subdue the Triballians and Illyrians, who inhabited the countries now called *Bulgaria* and *Sclavonia*, and

had been very formidable enemies to the Macedonian power. In this expedition he discovered, though then but 20 years of age, a surprising degree of military knowledge. Having advanced to the passes of Mount Hæmus, he found that the barbarians had posted themselves in the most advantageous manner. On the tops of the cliffs, and at the head of every passage, they had placed their carriages and waggons in such a manner as to form a kind of parapet with their shafts inwards, that when the Macedonians should have half ascended the rock, they might be able to push these heavy carriages down upon them. They reckoned the more upon this contrivance, because of the close order of the phalanx, which, they imagined, would be terribly exposed by the soldiers wanting room to stir, and thereby avoid the falling waggons. But Alexander, having directed his heavy-armed troops to march, gave orders, that, where the way would permit, they should open to the right and left, and suffer the carriages to go through; but that, in the narrow passes, they should throw themselves on their faces with their shields behind them, that the carts might run over them. This had the desired effect; and the Macedonians reached the enemy's works without the loss of a man. The dispute was then quickly decided; the barbarians were driven from their posts with great slaughter, and left behind them a considerable booty. The next exploits of Alexander were against the Getæ, the Taulantii, and other nations inhabiting the country on the other side of the Danube. Them he also overcame, showing in all his actions the most perfect skill in military affairs, joined with the greatest valour. In the mean time, however, almost all the states of Greece were put in commotion, by a report which had been confidently spread abroad, that the king was dead in Illyria. The Thebans, on this news, seized Amyntas and Timolaus, two eminent officers in the Macedonian garrison which held their citadel, and dragged them to the market place, where they were put to death without form of process, or any crime alleged against them. Alexander did not suffer them to remain long in their mistake. He marched with such expedition, that in 7 days he reached Pallene in Thessaly; and in six days more he entered Bœotia, before the Thebans had intelligence of his passing the straits of Thermopylæ. Even then they would not believe that he was alive; but insisted, that the Macedonian army was commanded by Antipater, or by one Alexander the son of Æropus. The rest of the Greeks, however, were not so hard of belief; and therefore sent no assistance to the Thebans, who were thus obliged to bear the consequences of their own folly. The city was taken by storm, and the inhabitants were for some hours massacred without distinction of age or sex; after which the houses were demolished, all except that of Pindar the famous poet, which was spared out of respect to the merit of its owner, and because he had celebrated Alexander I. king of Macedonia. The lands, excepting those destined to religious uses, were shared among the soldiers, and 30,000 prisoners sold for slaves; by which 440 talents were brought into the king's treasury. In this

Thebans perished; but the posterity and those who had entertained his were saved.

EDON, HISTORY OF, FROM THE OF THEBES, TO THAT OF TYRE.

The rest of the Grecian states were humbled, that they thought no

stance, and Alexander had nothing to

is favourite project of invading preparation was necessary for

monarch, who went out as to an reckoned upon being sup-

of his enemies. Historians is to the number of his army;

that he had not above 30,000, 4,000 foot, and 5000 horse. He had

month's provisions, but it is not known had any money, though Aristobu-

had 70 talents. To prevent distur-

ripator was left in Macedon with and 1500 horse. The army having

Amphipolis, he marched thence to of the Strymon; then crossing mount

he took the road to Abdera. Crossing us, he proceeded through the country of

id in 20 days reached Sestos; thence he Eleus, where he sacrificed on the

rotefilaus, because he was the first a- Greeks who, at the siege of Troy, set

e Asiatic shore. The greatest part of under Parmenio, embarked at Sestos,

a fleet of 160 galleys of 3 benches of is small craft. Alexander himself sailed

; and when he was in the middle of the Hellespont, offered a bull to Neptune and

the Nereids. When he drew near the shore, he lanced a javelin, which stuck in the earth: then,

in complete armour, he leaped upon the strand; and having erected altars to Jupiter, Minerva,

and Hercules, he proceeded to Ilium, where he sacrificed to Minerva; and taking down some

arms which had hung in her temple since the Trojan war, consecrated his own in their stead.

He sacrificed also to the ghost of Priam, to avert his wrath on account of his own descent from

Achilles. In the mean time the Persians had assembled a great army in Phrygia; among whom

was one Memnon a Rhodian, the best officer in the service of Darius. Alexander, after perform-

ing his usual ceremonies, marched directly towards the enemy. Memnon gave it as his opi-

on that they should burn and destroy all the country round, that they might deprive the Greeks

of the means of subsistence, and then transport a part of their army into Macedon. But the Per-

sians, depending on their cavalry, rejected this salutary advice; and posted themselves along the

river Granicus, to wait the arrival of Alexander. In an engagement which happened on the banks

of that river, the Persians were defeated, (see GRANICUS,) and Alexander became master of all the

neighbouring country. The city of Sardis was immediately delivered up; and Alexander built a

temple in it to Jupiter Olympius. After this, he restored the Ephesians to their liberty; ordered

the tribute which they formerly paid to the Persians to be applied towards the rebuilding of the

magnificent temple of Diana; and having settled

the affairs of the city, marched against Miletus.

This place was defended by Memnon with a considerable body of troops who had fled thither af-

ter the battle of Granicus, and therefore made a vigorous resistance. The city, however, was

soon reduced, though Memnon with part of the troops escaped to Halicarnassus. After this, A-

lexander dismissed his fleet, probably to show his army that their only resource now lay in subvert-

ing the Persian empire. Almost all the cities between Miletus and Halicarnassus submitted as

soon as they heard that the former was taken; but Halicarnassus, where Memnon commanded

with a very numerous garrison, made an obstinate defence. Nothing, however, was able to resist

the Macedonian army. Memnon was at last obliged to abandon the place; upon which Alexander

took and rased the city of Tralles in Phrygia; received the submission of several princes tributary

to the Persians; and having destroyed the Marmarians, a people of Lycia who had fallen

upon the rear of his army, put an end to the campaign; after which he sent home all the

married men; which endeared him more to his soldiers than any other action of his life. As soon

as the season would permit, Alexander quitted the province of Phaselus; and, having sent part of

his army through the mountainous country to Perga, continued his march towards Gordium, a

city of Phrygia; the enemy having abandoned the strong pass of Telmissus, through which

was necessary for him to march. When he arrived at Gordium, he expressed a desire of seeing

K. Gordius's chariot, and the famous knot in the harness, of which such strange stories had been

published to the world. (See GORDIAN KNOT; and GORDIUS N<sup>o</sup> I.) Most of authors say he cut

the knot, but Aristobolus assures us, that he wrested a wooden pin out of the beam of the waggon,

which held it up, and so took the yoke from under it. Be this as it will, Arrian informs us, that a great

tempest of thunder, lightning, and rain, happening the succeeding night, it was held declarative

of the true solution of this knot, and that Alexander should become lord of Asia. He next

marched towards Cilicia; the Persians abandoning all the strong passes as he advanced. As soon

as he entered the province, he heard that Artabanes, whom Darius had made governor of Tarsus, was

about to abandon it, and that the inhabitants were afraid he would plunder them before he withdrew.

To prevent this, Alexander marched incessantly, and arrived just in time to save the city. But his

saving it had well nigh cost him his life, for, either through the excessive fatigue of marching, as some

say, or, according to others, by his plunging when very hot into the Cydnus, he fell into such a dis-

temper as threatened his immediate dissolution. His soldiers and physicians were equally alarmed;

but PHILIS the Acaruanian gave him a potion, which restored him to his usual health. After his

recovery, he received the agreeable news, that Ptolemy and Alexander had defeated the Persian

generals, and made great conquests on the Hellespont; and soon after, he met the Persian army at

Ilium, commanded by Darius himself. A bloody engagement ensued, in which the Persians were

defeated with great slaughter. (See ISSUS.) The consequences

Consequences of this victory were very advantageous to the Macedonians. Many governors of provinces and petty princes submitted to the conqueror; and such as did so were treated, not as newly conquered people, but as his old hereditary subjects; being neither burthened with soldiers nor oppressed with tribute. Among the number of those places, which, within a short space after the battle of Issus, sent deputies to submit to the conqueror, was the city of Tyre. Azelicus, the king, was absent in the Persian fleet; but his son was among the deputies, and was very favourably received by Alexander; who told the deputies, that he would come and sacrifice to the Tyrian Hercules, the patron of their city. But the Tyrians were too suspicious, to think of admitting such an enterprising prince with his troops within their walls. They sent therefore their deputies again to him, to inform him, that they were ready to do whatever he should command them; but, as to his coming and sacrificing to their city, they could not consent to that, but were determined not to admit a single Macedonian within their gates. Alexander immediately dismissed their deputies in great displeasure; and assembled a council of war, wherein the siege of Tyre was resolved on. The town was not taken, however, without great difficulty, after a siege of six months; which provoked Alexander to a degree, that he treated the inhabitants with the greatest cruelty; 6000 armed men were slain in the town; 2000 were crucified on the sea shore; and all the rest of the inhabitants were massacred without distinction, except such as took refuge in the temples, and 15,000 who were conveyed to Sidon by the Sidonians, who served in Alexander's army.

(See.) MACEDON, HISTORY OF, FROM THE DESTRUCTION OF TYRE TO THAT OF PERSEPOLIS. After the reduction of Tyre, Alexander, though the season was far advanced, resolved to make an expedition into Syria; and in his way thither proposed to chastise the Jews, who had highly offended him during the siege of Tyre: for when he sent to them to demand provisions for his soldiers, they answered, That they were the subjects of Darius, and bound by oath not to supply his enemies. The king, however, was pacified by their submission; and not only pardoned them, but conferred many privileges upon them. (See *GEN.* § 3.) From Jerusalem Alexander marched directly to GAZA, the only place in that part of the world which still held out for Darius. This was a very large and strong city, situated on a hill, about 5 miles from the shore. One of his officers, *Batis*, an eunuch, had the government of the garrison, and having made every preparation for sustaining a long siege, defended it with great valour, and several times repulsed his enemies; but at last was taken by storm, and all the garrison slain but one man. This secured to Alexander an entrance into Egypt, which having before been very impatient of the Persian yoke, admitted the Macedonians peaceably. Here he laid the foundations of the city of ALEXANDRIA, which for many centuries after was the capital of the country. While he remained here, he also formed the extraordinary design of visiting the temple of Jupiter Ammon.

In this expedition, he hazarded himself and his troops in the highest degree, first by the want of water, which, in the sandy deserts surrounding the temple, is no where to be found; and, secondly by the uncertainty of the road from the fluctuation of the sands; which changing their situation every moment, leave neither a road nor mark to march by. These difficulties, however, Alexander overcame; and having consulted the oracle, and received a favourable answer, returned to pursue his conquests. Having settled the government of Egypt, he appointed the general rendezvous of his forces at Tyre. Here he met with ambassadors from Athens, requesting him to pardon such of their countrymen as he found serving the enemy. Desirous to oblige such a famous state, he granted their request, and sent a fleet to the coast of Greece, to quell some commotions which had lately happened in Peloponnesus. He then directed his march to Thapsacus; and having passed the Euphrates and Tigris, met with Darius near Arbela, where the Persians were again overthrown with prodigious slaughter, and Alexander in effect became master of the Persian empire. (See ARBELA, § 2.) After this important victory, Alexander marched directly to Babylon, which was immediately delivered up; the inhabitants being greatly disaffected to the Persian interest. After 30 days stay in this country, he marched to Susa, which had already surrendered to Philoxenus; and here he received the treasures of the Persian monarch, amounting, according to the most generally received account, to 50,000 talents. Having received also at this time a supply of 6000 foot and 500 horse from Macedon, he set about reducing the nations of Media, among whom Darius was retired. He first reduced the Uxians; and having forced a passage to Persepolis the capital of the empire, he, like a barbarian, destroyed the stately palace there, a pile of building not equalled in any part of the world; (See PERSEPOLIS;) after having given up the city to be plundered by his soldiers. In the palace he found 120,000 talents, which he appropriated to his own use, and caused immediately to be carried away upon mules and camels; for he had such an extreme aversion to the inhabitants of Persepolis, that he determined to leave nothing valuable in the city.

(I.) MACEDON, HISTORY OF, TILL THE DEATH OF DARIUS III, AND THE CONQUEST OF PERSIA. While Alexander remained at Persepolis, he received intelligence that Darius remained at Ecbatana, the capital of Media; upon which he pursued him with the greatest expedition, marching at the rate of near 20 miles a-day. In 15 days he reached Ecbatana, where he was informed, that Darius had retired from thence five days before, with an intent to pass into the remotest provinces of his empire. This put some stop to the rapid progress of the Macedonian army; and the king perceiving that there was no possibility of hurrying him self and his soldiers, turned his attention to other affairs. The Thessalian horse, who had deserved exceedingly well of him in all his battles, he dismissed according to his agreement; gave them their whole pay, and ordered 2000 talents more and above to be distributed among

 as, he, at the head of a choice body of  
 asled through certain craggy roads, and  
 arrival of Craterus, who took an open  
 path, struck the whole provinces with  
 terror, that all the principal places were im-  
 mediately put into his hands, and soon after the  
 province of Aria also submitted, and the king  
 continued Satibarzanes the governor in his em-  
 ployment.—The reduction of this province finish-  
 ed the conquest of Persia.

(14.) MACEDON, HISTORY OF, TILL THE EX-  
 PEDITION OF ALEXANDER TO INDIA. The ambi-  
 tion of Alexander to become master of every  
 nation of which he had the least intelligence, in-  
 duced him to enter the country of the MARDI,  
 merely because its rocks and barrenness had hither-  
 to hindered any body from conquering, or indeed  
 attempting to conquer it. This conquest, how-  
 ever, he easily accomplished. But in the mean  
 time disturbances began to arise in Alexander's  
 new empire, and among his troops, which all his  
 activity could not thoroughly suppress. He had  
 scarcely left the province of Aria, when he receiv-  
 ed intelligence, that the traitor Bessus had caused  
 himself to be proclaimed king of Asia by the name  
*Artaxerxes*; and that Satibarzanes had joined  
 him, after having massacred all the Macedonians  
 who had been left in the province. Alexander  
 appointed one *Arifanes* governor in the room of  
 Satibarzanes; and marched thence with his army  
 against the ZARANGÆ, who, under the command  
 of Barzaentes, one of the conspirators against Da-  
 rius, had taken up arms, and threatened to make  
 an obstinate defence. But their numbers daily  
 falling off, Barzaentes being afraid they would  
 purchase their own safety at the expence of his,  
 privately withdrew from his camp, and, crossing  
 the Indus, sought shelter among the nations be-

yond it. But they, either detesting his treachery,  
 or dreading the power of Alexander, delivered  
 him up to Alexander, who caused him immedi-  
 ately to be put to death. The immense treasure  
 which the Macedonians had acquired in the con-  
 quest of Persia began now to corrupt them. The  
 king himself being of a generous disposition, lib-  
 erally bestowed his gifts on those around him; but  
 they made a bad use of his bounty, and indulged  
 in those vices by which the former possession of  
 that wealth had lost it. Alexander did all in his  
 power to discourage the lazy pride which now be-  
 gan to appear among his officers; but with little  
 effect. His courtiers at last proceeded to censure  
 his conduct, and to express themselves with fine  
 bitterness on his long continuance of the war, and  
 his leading them constantly from one labour to  
 another. This came to such an height, that the  
 king was at last obliged to use some severity in or-  
 der to keep his army within the limits of their  
 duty. From this time forward, however, Alex-  
 ander himself began to alter his conduct; and by  
 yielding a little to the customs of the Orientals,  
 endeavoured to secure that obedience from his  
 new subjects which he found so difficult to be pre-  
 served among his old ones. He likewise endeav-  
 oured to blend the customs of the Asiatics and  
 the Greeks. The form of his civil government  
 resembled that of the ancient Persian king; in  
 military affairs, however, he preserved the Mac-  
 donian discipline; but he made choice of 30,000  
 boys out of the provinces, whom he caused to be  
 instructed in the Greek language, and brought up  
 in such a manner, as that from time to time he  
 might with them fill up the phalanx. The Mac-  
 donians saw with great concern these extraordi-  
 nary measures, which suited very ill with their  
 gross understandings; for they thought, after all  
 the victories they had gained, to be absolute lords  
 of Asia, and to possess not only the riches of all  
 inhabitants, but to rule the inhabitants themselves;  
 whereas they now saw, that Alexander meant to do  
 such thing; but that, on the contrary, he introduc-  
 ed governments, offices at court, and all other  
 marks of confidence and favour, indiscriminately  
 both on Greeks and Persians.—From this time  
 the king seems to have given instances of a cruelt-  
 y he had never shown before. Philotas his most  
 intimate friend was seized, tortured, and put to  
 death, for a conspiracy of which it could never be  
 proved that he was guilty; and soon after Parme-  
 nio and some others were executed, without any  
 crime at all real or alleged. These things very  
 much disturbed the army. Some of them wrote  
 home to Macedonia of the King's suspicions of his  
 friends, and his disposition to hunt out enemies  
 at the very extremities of the world. Alexander  
 having intercepted some of these letters, and procur-  
 ed the best information he could concerning  
 their authors, pick'd out these dissatisfied people,  
 and having disposed them into one corps, gave  
 the title of the *turbulent battalion*; hoping thus  
 to prevent the spirit of dissatisfaction from pervad-  
 ing the whole army. As a farther precaution against  
 any future conspiracy, Alexander appointed his  
 phalition and Clytus generals of the auxiliary  
 horse: being apprehensive, that if this authority  
 was lodged in the hands of a single person, it  
 might

ight tempt him to dangerous undertakings, and  
 wife furnish him with the means of carrying  
 on into execution. To keep his forces in ac-  
 ceptance, he suddenly marched into the country of  
*Euergetæ*, i. e. *Benefactors*; and found them  
 of that kind and hospitable disposition for  
 which that name had been bestowed on their an-  
 cestors: he therefore treated them with great re-  
 spect; and at his departure added some lands to  
 his dominions, which lay contiguous to them.  
 Turning then to the E. he entered Arachosia, the  
 inhabitants of which readily submitted. While  
 he passed the winter in these parts, he received  
 intelligence, that the Arians, whom he had so lately  
 subdued, were again up in arms, Satibarzanes be-  
 lieved returned into that country with 2000 horse  
 raised him by Bessus. Alexander instantly dis-  
 patched Artabazus the Persian, with Erigyus and  
 others, two of his commanders, and a consi-  
 derable body of horse and foot: he likewise or-  
 dered Phrataphernes, to whom he had given the  
 government of Parthia, to accompany them. A  
 general engagement ensued, wherein the Arians  
 fought bravely till their commander Satibarzanes  
 was killed by Erigyus; whereupon the Arians fled,  
 leaving an easy conquest of the rest of the country  
 to Alexander. Alexander, notwithstanding the incle-  
 mency of the season, advanced into the country  
 of Propamisus, and, having crossed it in 16 days,  
 he found an opening leading into Media;  
 upon finding of a sufficient breadth, he directed  
 his army to be built there, which he called *ALEX-  
 ANDRIA*, as also several other towns about a day's  
 journey distant: and in these places he left 7000  
 soldiers, part of them such as had hitherto fol-  
 lowed his camp, and part of the mercenary sol-  
 diers, who, weary of continual fatigue, were con-  
 sidered to dwell there. Having thus settled things  
 in this province, sacrificed to the gods, and ap-  
 pointed Proexes the Persian president, with a  
 considerable body of troops under the command of Ni-  
 chomachus to assist him, he resumed his former de-  
 sign of penetrating into Bactria. Bessus, who had  
 assumed the name of *Artaxerxes*, when he was as-  
 sured that Alexander was marching towards him,  
 endeavoured to waste all the country between Paropa-  
 misus and the Oxus; which river he passed with  
 his forces, and then burnt all the vessels he had  
 made use of, for transporting them, retiring to  
 Mervaca, a city of Sogdia; fully persuaded, that,  
 by the precautions he had taken, Alexander would  
 be compelled to give over his pursuit. This con-  
 sideration, however, disheartened his own troops, and  
 he was obliged to lie to all his pretensions; for he had cen-  
 sured Darius's conduct, and charged him with  
 injustice, in not defending the Euphrates and  
 Tigris, whereas he now quitted the banks of the  
 Oxus, a defensible river perhaps in the world. Alex-  
 ander, continuing his march, notwithstanding all  
 the hardships his soldiers sustained, reduced all  
 the provinces under his obedience, particularly the ca-  
 pital, and the strong castle Aornus: in the latter  
 he placed a garrison under Archelaus; but the  
 government of the province he committed to Ar-  
 tabazus. He then continued his march to the  
 Oxus, at which when he arrived, he found it three  
 leagues of a mile over, its depth more than pro-  
 portionable to its breadth, its bottom sandy, its

stream so rapid as to render it almost unnavigable,  
 and neither boat nor tree in its neighbourhood,  
 so that the ablest commanders in the Macedonian  
 army were of opinion that they should be obliged  
 to march back. The king, however, having first  
 sent away, under a proper escort, all his infirm  
 and worn out soldiers, that they might be con-  
 ducted safe to the sea-ports, and thence to Greece,  
 devised a method of passing this river without ei-  
 ther boat or bridge, by causing the hides which  
 covered the soldiers tents and carriages to be stu-  
 fied with straw, and then tied together, and thrown  
 into the river. Having crossed the Oxus, he  
 marched directly towards the camp of Bessus,  
 where when he arrived, he found it abandoned;  
 but received, at the same time letters from Spita-  
 menes and Dataphernes, who were the chief com-  
 manders under Bessus, signifying, that, if he would  
 send a small party to receive Bessus, they would  
 deliver him into his hands; which they did ac-  
 cordingly, and the traitor was put to death. See  
*PERSLA*. A supply of horses being now arrived,  
 the Macedonian cavalry were remounted. Alex-  
 ander continued his march to Maracanda the ca-  
 pital of Sogdia, from whence he advanced to the  
 river Iaxartes. Here he performed great exploits  
 against the Scythians; from whom, however,  
 though he overcame them, his army suffered  
 much; and the revolted Sogdians being headed  
 by Spitamenes, gave him a great deal of trouble.  
 Here he married Roxana the daughter of Oxyar-  
 tes, a prince of the country whom he had sub-  
 dued. But during these expeditions, he greatly  
 disgusted his army by the murder of his friend  
 Clytus in a drunken quarrel at a banquet, and by  
 his extravagant vanity in claiming divine honours.  
 At last he arrived at the Indus, where Hephæstion  
 and Perdicas had provided a bridge of boats for  
 the passage of the army. Alexander, having cross-  
 ed that river, appointed Philip governor of Taxila,  
 and put a Macedonian garrison into the place, as  
 he intended to erect an hospital there for the  
 cure of his sick and wounded soldiers: after which  
 he set out on his Indian expedition, as related un-  
 der the article *INDIA*, § 4.

(15.) *MACEDON, HISTORY OF, TO THE DEATH  
 OF ALEXANDER THE GREAT.* Alexander upon  
 his return to Caramania, redressed the injuries  
 of his people, who had been grievously oppressed  
 by their governors during his absence. He also he  
 was joined by his admiral Nearchus, who brought  
 him an account that all under his command were  
 in perfect safety, and in excellent condition; with  
 which the king was pleased, and after having be-  
 stowed on him singular marks of his favour, sent  
 him back to the navy. Alexander next set out  
 for Persia, where great disorders had been commit-  
 ted during his absence. These also he redressed,  
 and caused the governor to be executed; appoint-  
 ing in his room Peucestas, who saved his life when  
 he fought singly against a whole garrison as relat-  
 ed under *INDIA*, § 4. The new governor was no  
 sooner invested with his dignity, than he laid aside  
 the Macedonian garb, and put on that of the  
 Medes; being the only one of Alexander's captains,  
 who, by complying with the manners of the peo-  
 ple he governed, gained their affection. While  
 Alexander visited the different parts of Persia, he

took a view, among the rest, of the ruins of Persopolis, where he is said to have expressed great sorrow for the destruction he had formerly occasioned. From Persopolis he marched to Susa, where he gave an extraordinary loose to pleasure; resolving to make himself and his followers some amends for the difficulties they had undergone; purposing at the same time so effectually to unite his new conquered with his hereditary subjects, that the jealousies and fears, which had hitherto tormented both, should no longer subsist. With this view he married two wives of the blood royal of Persia; viz. Barfine, or Statora, the daughter of Darius, and Parysatis the daughter of Ochus. Drypetis, another daughter of Darius, he gave to Hephæstion; Amastine, the daughter of Oxyartes, the brother of Darius, married Craterus; and to the rest of his friends, to the number of 80, he gave other women of the greatest quality. All these marriages were celebrated at once, Alexander himself bestowing fortunes upon them; he directed likewise to take account of the officers and soldiers who had married Asiatic wives; and tho' they amounted to 10,000, yet he gratified each of them according to his rank. He next resolved to pay the debts of his army, and thereupon issued an edict directing every man to register his name and the sum he owed; with which the soldiers complying slowly, from an apprehension that there was some design against them, Alexander ordered tables heaped with money to be set in all quarters of the camp, and caused every man's debts to be paid on his bare word, without even making any entry of his name; though the whole sum came to 20,000 talents. On such as had distinguished themselves in an extraordinary manner, he bestowed crowns of gold. Peucestas had the first; Leonatus the 2d; Nearchus the 3d; Onesicritus the 4th; Hephæstion the 5; and therest of his guards had each of them one. After this he made other dispositions for conciliating the differences among all his subjects. He reviewed the 30,000 youths, whom at his departure for India he had ordered to be taught Greek and the Macedonian discipline; expressing high satisfaction at the fine appearance they made, which rendered them worthy of the appellation he bestowed on them, viz. that of *Epigoni*, i. e. successors. He promoted also, without any distinction of nation, all those who had served him faithfully and valiantly in the Indian war. When all these regulations were made, he gave the command of his heavy armed troops to Hephæstion, and ordered him to march directly to the banks of the Tigris, while in the mean time a fleet was equipped for carrying the king and the troops he retained with him down to the ocean. Thus ended the exploits of Alexander; the greatest conqueror that ever the world saw, at least with respect to the rapidity of his conquests. In 12 years he had brought under his subjection Egypt, Libya, Asia Minor, Syria, Phœnicia, Palestine, Babylonia, Persia, with part of India and Tartary. Still, however, he meditated greater things. He had now got a great taste in maritime affairs; and is said to have meditated a voyage to the coasts of Arabia and Ethiopia, and thence round the whole continent of Africa to the Straits of Gibraltar. Of this

however there is no great certainty; but intended to subdue the Carthaginians is more than probable. All these designs, however, were frustrated by his death, which happened at Babylon A. A. C. 323. He never after 8 days illness, without nameless sufferings; having only given his ring to Hephæstion and left the kingdom, *is the most uncharacteristic* character of this great prince has been represented; (See ALEXANDER III.) Historians seem to have looked upon him as an illustrious madman, than one who merited the epithet *Great*. From a careful observation of his conduct, however, it must appear, that he possessed not only a capacity to plan, but also to execute, the greatest enterprises that ever entered into the mind of any of the monarchs of the world. From whatever cause the notion originated, plain that he imagined himself a deity, and born to subdue the whole world. His schemes were as vague and impracticable as this idea. It does not appear, it cannot at all be looked upon as the same light in the time of Alexander. The Greeks were in his time the most powerful people in the world in respect to their skill in the arts, and the Persians were the most powerful in respect to wealth and numbers. The Carthaginians, Gauls, and Romans were the most powerful people in the world in respect to arms. In the series of wars which the Carthaginians carried on in Sicily, it appeared that they were capable of contending with the Greeks. In the wars they had an immense superiority over the Romans; much less then could they have sustained a successful attack from the whole power of Greece united. The Gauls and Romans were very brave, and of a martial disposition; but they were barbarous, and could not be taught to form regular and disciplined armies well disciplined and under the command of such a skillful leader as Alexander. Thus it appears, that the scheme of Alexander cannot be accounted that of a madman, who projects great things without any means to execute them. If we consider the end which most probably he had in view, could his scheme have been accomplished, he would find it not only the greatest but the most just and possibly be imagined. He conquered, he destroyed, he enslaved, or oppressed; but to civilize the whole world as one nation. No province conquered, than he took care to have had been part of his paternal inheritance. He allowed not his soldiers to oppress and plunder the Persians, which they were very much disposed to do; on the contrary, by giving into their hands the customs of the Persians, he strove to extinguish the mutual hatred which had so long existed between the two nations. In the several provinces which he subdued, he pursued a most excellent plan. His courage and military skill, which he never was excelled, were directed with a view to rapine or desultory conquest, to civilize and induce the barbarous to employ themselves in a more profitable and useful life. "Amidst the hardships of a military life," (says Dr Gillies), "obstinate sieges, battles, and dear bought victories, he still maintained the rights of mankind, and practised the

humanity. The conquered nations enjoyed their laws and privileges; the rigours of despotism were softened; arts and industry encouraged, the proudest Macedonian governors compelled by the authority and example of Alexander, to observe the rules of justice towards their mean subjects. To bridle the fierce inhabitants of Scythian plains, he founded cities and established colonies on the banks of the Iaxartes and Oxus; and those destructive campaigns usually ascribed to his restless activity and blind ambition, appeared to the discernment of his extraordinary mind not only essential to the security of the conquest which he had already made, but necessary to the more remote and splendid expeditions which he still proposed to undertake, and which he performed with singular boldness and unexpected success."—"He was of a low stature, and somewhat deformed; but the activity and elevation of his mind animated and enobled his frame. His life of continual labour, and by an early and assiduous practice of the gymnastic exercises, he hardened his body against the impressions of cold and heat, hunger and thirst, and prepared his mind for the exertions of strength and activity, as have appeared incredible in the undisciplined softness of modern times. In the profuse and in prowess, he rivalled the greatest heroes of antiquity; and in the race of glory, he finally outstripped all competitors, became victorious to surpass himself. His superior skill in the art of war, and his uninterrupted success to his arms; and his natural humanity, enlightened by the philosophy of Greece, taught him to improve his conquests to the best interests of mankind. In his vast dominions, he built or founded not less than 70 cities; the situation of which being chosen with consummate wisdom, tended to facilitate communication, to promote commerce, and to diffuse civility through the greatest nations of the earth. It may be suspected, indeed, that he looked the extent of human power, when in the person of one reign he undertook to change the face of the world; and that he miscalculated the stubbornness of ignorance and the force of habit, when he attempted to enlighten barbarism, to soften ferocity, and to transplant the improvements of Greece into an African and Asiatic soil, where they have never been known to flourish. Yet let us consider the designs of Alexander he too hastily accused of extravagance. Whoever seriously considers what he actually performed before his 33d year, will be cautious of determining what he might have accomplished had he reached the ordinary term of human life. His resources were peculiar to himself; and such views as well as actions became him as would have become none besides. In the language of a philosophical historian, "he was to have been given to the world by a peculiar dispensation of Providence, being a man to none other of the human kind."

16.) MACEDON, HISTORY OF, TO THE FUNERAL OF ALEXANDER THE GREAT. By the death of Alexander fell the glory of the Macedonians; they very soon relapsed into a situation as bad, or worse, than that in which they had been before the reign of Philip. This was occasioned principally by his not having distinctly named a succes-

for, and having no child come to the years of discretion, to whom the kingdom might seem naturally to belong. The ambition and jealousy of his mother Olympias, his queen Roxana, and especially of the great commanders of his army, not only prevented a succession from being ever named, but occasioned the death of every person, in the least related to Alexander. To have a just notion of the origin of these disturbances, it is necessary in the first place to understand the situation of the Macedonian affairs at the time of Alexander's death. When Alexander set out for Asia, he left Antipater, in Macedon, to prevent any disturbances that might arise either there or in Greece. The Greeks, even during the lifetime of Alexander, bore the superiority which he exercised over them with great impatience; and, though nothing could be more gentle than the government of Antipater, yet he was exceedingly hated, because he obliged them to be quiet. One of the last actions of Alexander's life set all Greece in a flame. He had, by an edict, directed all the cities of Greece to recal their exiles; which edict, when published at the Olympic games, created much confusion. Many of the cities were afraid, that, when the exiles returned, they would change the government; most of them doubted their own safety if the edict took place; and all of them held this peremptory decree to be a total abolition of their liberty. No sooner therefore did the news of Alexander's death arrive than they prepared for war. In Asia the state of things was not much better; not indeed through any inclination of the conquered countries to revolt, but through the dissensions among the commanders. In the general council which was called soon after the death of Alexander, after much confusion and altercation, it was at last agreed, or rather commanded by the soldiers, that Aridæus the brother of Alexander, who had always accompanied the king, and had been wont to sacrifice with him, should assume the sovereignty.—This Aridæus was a man of very slender parts and judgment, not naturally, but by the wicked practices of Olympias, who had given him poisonous draughts in his infancy, lest he should stand in the way of her son Alexander or any of his family; and for this, or some other reason, Perdicas, Ptolemy, and most of the horse-officers, resented his promotion to such a degree, that they quitted the assembly, and even the city. However, Meleager, at the head of the phalanx, vigorously supported their first resolution, and Aridæus was made king by the name of Philip. The Macedonians besides their regard for the deceased king, soon began to entertain a personal love for Philip III. on account of his moderation. It is remarkable, that notwithstanding all the favours which Alexander had conferred upon his officers, and the fidelity with which they had served him during his life, only two of them were attached to the interests of his family after his death. These were Antipater and Eumenes the Cardian, whom he had appointed his secretary. Antipater, being embroiled with the Greeks, could not assist the royal family who were in Asia; and Eumenes had not as yet sufficient interest to form a party in their favour. In a short time, however, Perdicas got Meleager murdered; by which means

the supreme power for a time fell into his hands. His first step was to distribute the provinces of the empire among the commanders in the following manner, in order to prevent competitors, and to satisfy the ambition of the principal generals of the army. Aridæus, and Alexander the son of Roxana, born after the death of his father, were to reign in Macedon. Antipater had the government of the European provinces. Craterus had the title of *protector*. Perdicas was general of the household troops in the room of Hephæstion. Ptolemy Lagus, the natural son of Philip, had Egypt, Libya, and that part of Arabia which borders upon Egypt. Cleomenes, a man of infamous character, whom Alexander had made receiver general in Egypt, was made Ptolemy's deputy. Leonædon had Syria; Philotas, Cilicia; Pithon, Media; Eumenes, Cappadocia, Euphratonia, and all the country bordering on the Euxine Sea, as far as Trapezus; but these were not yet conquered, so that he was a governor without a province. Antigonus had Pamphylia, Lycia, and Phrygia Major; Cassander, Caria; Menander, Lydia; Leonatus, Phrygia on the Hellespont. In the mean time, not only Alexander's will, but Alexander himself, was so much neglected, that his body was allowed to remain 7 days before any notice was taken of it, or any orders given for its being embalmed. The orders he left for building a fleet of 1000 stout galleys, for the reduction of the sea-coasts of Africa and Spain; for making a regular high-way along the coast of Africa; for erecting six temples of extraordinary magnificence; with castles, arsenals, havens, and yards for building ships; for building a number of new cities in Europe and Asia; and for raising a pyramid, equal in bulk and beauty to the biggest in Egypt, in honour of his father Philip, were all referred to a council of Macedonians, to be held nobody knew when or where. The government, in the hands of Perdicas and Roxana, quickly degenerated. Alexander was scarce dead when the queen sent for Statira and Drypetis, the two daughters of Darius, the former of whom had been married to Alexander and the latter to Hephæstion; but as soon as they arrived at Babylon, caused them both to be murdered, that no son of Alexander by any other woman, or of Hephæstion, might give any trouble to her or her son, Alexander. Syngambis, the mother of Darius, no sooner heard that Alexander was dead, than she laid violent hands on herself, being apprehensive of the calamities which were about to ensue. In the year 321 B. C. the Greeks confederated against Antipater, who was defeated, with the army under his command; and Leonatus being sent from Asia, with a considerable army, to his assistance, both were overthrown with great loss, and Leonatus killed. Soon after, however, Craterus arrived in Greece with a great army, which when joined to that of Antipater, amounted to no fewer than 40,000 foot, 3000 archers, and 5000 horse: while that of the confederates amounted only to 3000 horse, and 2500 foot. The Greeks were therefore defeated, and forced to sue for peace; which they obtained on condition of their receiving Macedonian garrisons into their chief cities. At Athens also the democratic government was abrogated; and such a

dreadful punishment did this seem to the Athenians, that 22,000 of them left their country retired into Macedon. Disturbances began to arise in Asia and Thrace. The Greek mercenaries, dispersed through the inland parts of Asia, despairing of ever being allowed to return home by fair means, determined to attempt force. For this purpose, they assembled a number of 20,000 foot and 3000 horse; but all cut off by the Macedonians. In Thrace Machus was attacked by one Scuthes, a prince that country who claimed the dominions of his ancestors, and had raised an army of 20000 and 8000 horse. But though the Macedonian commander was forced to engage this army with 4000 foot and 2000 horse, yet he kept the battle, and could not be driven out of the country. Perdicas, in the mean time, by pretending friendship to the royal family, had gained over them entirely to his interest; and at last put himself in possession of the province of Cappadocia by the feat of Ariarathes king of that country, who afterwards cruelly caused to be crucified his ambition, however, now began to lead him to difficulties. At the first division of the province to Perdicas, to strengthen his own authority, he proposed to marry Nicæa the daughter of Antipater; and so well was this proposal received by her brethren Jollas and Archias conducted him, in order to be present at the nuptials. Perdicas now had other things in view. He had been solicited by Olympias to marry her daughter Cleopatra, the widow of Alexander king of Macedonia, and who then resided at Sardis in Lydia. Eumenes promoted this match to the utmost of his power, because he thought it would be to the interest of the royal family; and his success had such an effect on Perdicas, that he sent to Sardis to compliment Cleopatra, and carry presents to her in name of her nephew. In the absence of Eumenes, however, Alcibiades brother of Perdicas, persuaded him to marry Nicæa; but, in order to gratify his ambition, he resolved to divorce her immediately after the marriage, and marry Cleopatra. By this marriage, he hoped to have a pretence for the government of Macedon; and, as a measure preparative to these, he laid plot for destroying Antigonus. But all his schemes were ruined by his own jealousy and precipitancy. Cynane, the daughter of Philip by his first wife, had brought her daughter *Adæa*, afterwards named *Eurydice*, to court, in hopes that Perdicas might marry her. Perdicas, from political motives, had conceived such an antipathy against Cynane, that he caused her to be murdered. This raised a commotion in the army, which alarmed Perdicas to such a degree, that he promoted the match between Aridæus and Eurydice; to prevent which, he had murdered his mother. But, in the mean time, Antigonus, seeing the designs of Perdicas against him, fled with his son Demetrius to Greece, there to shelter under Antipater and Craterus, who were formed of the ambition and cruelty of the Macedonians. A civil war was now kindled. Antipater, Craterus, Neoptolmus, and Antigonus, were all united against Perdicas; and it was the

me of the empire in general, that Eumenes, the most able general, as well as the most virtuous of all the commanders, was on the side of Perdiccas, because he believed him to be in the interest of Alexander's family. Ptolemy, in the mean time, remained in quiet possession of Egypt; but without the least intention of owning any person for his superior. However, he acceded to the league formed against Perdiccas; and thus he only person in the whole empire who considered the interest of the royal family was Eumenes. It was now thought proper to inter the body of Alexander, which had been kept for two years, during all which time preparations had been making for it. Aridæus, to whose care it was committed, set out from Babylon for Damascus, in order to carry the king's body to Egypt. This was much against the will of Perdiccas; for there was a superstitious report, that wherever the body of Alexander was laid, that country should flourish most. Perdiccas, therefore, out of regard to his native soil, would have conveyed to the royal sepulchres in Macedonia; but Aridæus, pleading the late king's express direction, was determined to carry it into Egypt, whence to be conveyed to the temple of Jupiter Ammon.—The funeral was accordingly conducted with all imaginable magnificence. Ptolemy came to meet the body as far as Syria; but, instead of burying it in the temple of Jupiter Ammon, erected a stately temple for it in Alexandria; and, by the respect he showed for his dead father, induced many of the Macedonian veterans to join him, who were afterwards of the greatest service to him.

17.) MACEDON, HISTORY OF, TO THE TOTAL EXTIRPATION OF ALEXANDER'S FAMILY. Sooner was the funeral over, than both parties were to blows. Perdiccas marched against Ptolemy, but was slain by his own men, who, after the death of their general submitted to his antagonist; and thus Eumenes was left alone to contend against all the other generals who had served under Alexander. In this contest, however, he would by no means have been over-matched, if his soldiers been attached to him; but as they had been accustomed to serve under those very generals against whom they were now to fight, they were on all occasions ready to betray and desert Eumenes. However, he defeated and killed Neoptolemus and Craterus, but was still obliged to contend with Antipater and Antigonus. Antipater was now appointed protector of the empire, with sovereign power; and Eumenes was declared a public enemy. A new division of the empire took place. Egypt, Libya, and the parts adjacent, were given to Ptolemy because they could not be taken from him. Syria was confirmed to Leomedon. Philoxenus had Cilicia. Media and Arbelitis were given to Amphimachus. Babylon was bestowed on Seleucus. Suezell to Antigones, who commanded the Median ARGYRASPIDÆ, or *Silver Shields*, because he was the first who opposed Perdiccas. Iasus held Persia. Tlepolemus had Caramania. Pithon had Media as far as the Caspian Sea. Stasander had Aria and Drangia; Philip II. Stasenor, Bactria and Sogdia; Sybir-

tius, Aracopa; Oxyartes, the father of Roxana, Parapomifus. Another Pithon had the country between this province and Indja. Porus and Taxiles held what Alexander had given them. Cappadocia was assigned to Nicanor. Phrygia Major, Lycaonia, Pamphylia, and Lycia, were given to Antigonus. Caria to Cassander, Lydia to Cilytus, Phrygia the Less to Aridæus. Cassander was appointed general of the horse; while the command of household troops was given to Antigonus, with orders to prosecute the war against Eumenes.—Antipater having thus settled every thing as well as he could, returned to Macedonia with the treasures, to the great joy of his countrymen, having left his son Cassander to be a check upon Antigonus in Asia. Affairs now seemed to wear a better aspect than they had yet done; and, had Eumenes believed that his enemies really consulted the interest of Alexander's family, there is not the least doubt that the war would have been immediately terminated. He saw however, that the design of Antigonus was only to set up for himself, and therefore he refused to submit. From this time, therefore, the Macedonian empire ceased in Asia; and an account of the transactions of this part of the world fall to be recorded under the article SYRIA. The Macedonian affairs are now entirely confined to the kingdom of Macedonia itself, and to Greece. Antipater had not long been returned to Macedonia, when he died; and the last action of his life completed the ruin of Alexander's family. Out of a view to the public good, he had appointed Polyperchon, the eldest of Alexander's captains at hand, to be *protector* and *governor* of Macedonia. This failed not to disgust his son Cassander; who thought he had a natural right to these offices, and of course kindled a new civil war in Macedonia. This was indeed highly promoted by his first actions as governor. He began with attempting to remove all the governors appointed in Greece by Antipater, and to restore democracy wherever it had been abolished. The immediate consequence of this was, that the people refused to obey their magistrates; the governors refused to resign their places, and applied for assistance to Cassander. Polyperchon also had the imprudence to recal Olympias from Epirus, and allow her a share in the administration; which Antipater, and even Alexander himself, had always refused her. The consequence of all this was, that Cassander invaded Greece, where he prevailed against Polyperchon: Olympias returned to Macedonia, where she cruelly murdered Aridæus and his wife Eurydice; she herself was put to death by Cassander, who afterwards caused Roxana and her son to be murdered, and Polyperchon being driven into Etolia, first raised to the crown Hercules the son of Alexander by Statira, and then by the instigation of Cassander murdered him, by which means the line of Alexander the Great became totally extinct. Cassander having thus destroyed all the royal family, assumed the regal title, as he had for 16 years before had all the power. He enjoyed the title of *king of Macedonia* only three years; after which he died, about 298 B. C. By Thessalonica, the daughter of Philip II. he left three sons, Philip, Antipater, and Alexander.

Cassander. See ALEXANDER, V.

(18.) MACEDON, HISTORY OF, UNTIL ITS CONQUEST BY THE ROMANS. In 287 B. C. Demetrius was driven out by Pyrrhus, who was again driven out by Lysimachus two years after, who was soon after killed by Seleucus Nicator; and Seleucus, in his turn, was murdered by Ptolemy Ceraunus, who became king of Macedon about 280 B. C. The new king was in a short time cut off, with his whole army, by the Gauls; and Antigonus Gonatas, the son of Demetrius Poliorcetes, became king of Macedon in 278 B. C. He proved successful against the Gauls, but was driven out by Pyrrhus king of Epirus; who, however, soon disobliged his subjects to such a degree, that Antigonus recovered a great part of his kingdom. But in a little time, Pyrrhus being killed at the siege of Arros, Antigonus was restored to the whole of Macedon; but scarcely was he seated on the throne, when he was driven from it by Alexander the son of Pyrrhus. This new invader was, in his turn, expelled by Demetrius the son of Antigonus; who, though at that time but a boy, had almost made himself master of Epirus. In this enterprize, however, he was disappointed; but by his means Antigonus was restored to his kingdom, which he governed for many years in peace. By a stratagem he made himself master of the city of Corinth, and from that time began to form schemes for the thorough conquest of Greece. The method he took to accomplish this was, to support the petty tyrants of Greece against the free states: which indeed weakened the power of the latter; but involved the whole country in so many calamities, that these transactions could not redound much to the reputation either of his arms or his honour. About 242 B. C. he died, leaving the kingdom to

Perseus now put all upon the general engagement; and Æmilius, with his courage and experience, would have defeated, had the Macedonians been commanded by a general of any courage or conduct. Light armed Macedonians charged with vigour, that after the battle, some of them were found within two furlongs of the camp. When the phalanx came to the points of their spears striking into the shields, kept the heavy armed troops fixing any motion; while, on the other hand, Perseus's light armed men did terrible execution. Æmilius was ready to give up all hope, perceiving, that, as the phalanx gained, he lost its order in several places, he caused his light-armed troops to charge in the places whereby the Macedonians were soon in confusion. Perseus fled, with his horse infantry at last did the same, but not till they had lost their lives. This battle determined the fate of Macedonia, which immediately fell into the hands of the Romans.

(19.) MACEDON, HISTORY OF, UNTIL ITS CONQUEST BY THE TURKS. The country was at last obliged to surrender to the Romans, by whom he was carried to Rome in triumph, and afterwards most barbarously executed. Some pretenders to the throne appeared afterwards; but being unable to defend themselves against the Romans, the country was reduced to a Roman province in 148 B. C. It continued subject till A. D. 1375, when it was reduced by the Turkish sultan Bajazet I. and remained in the hands of the Turks till 1517, when it was taken by the Sultan Selim I. and remained in the hands of the Turks till 1912, when it was taken by the Greeks. SALONICHI, the ancient THESSALONICA, was the capital.

(20.) MACEDONIANS, the natives of

that Pope Leo X. caused it to be acted at Rome. He was secretary, and afterwards historiographer to the republic of Florence. The house of Medicis procured him this last office, with a handsome salary, to pacify his resentment for having suffered the torture upon suspicion of being an accomplice in the conspiracy of the Soderini against that house, when Machiavel bore his sufferings heroically without making any confession. The great encomiums he bestowed upon Brutus and Cassius, both in his conversations and writings, made him strongly suspected of being concerned in another conspiracy against cardinal Julian de Medicis, afterwards pope by the name of Clement VII. However, they carried on no proceedings against him; but from that time he turned every thing into ridicule, and gave himself up to irreligion. He died in 1539, of a remedy which he had taken by way of prevention. Of all his writings, that which has made the most noise, and has drawn upon him the most enemies, is a political treatise, entitled the *Prince*; which has been translated into several languages, and written against by many authors. The world is not agreed as to his motives in writing this work; some think he meant to recommend tyrannical maxims; others, that he only delineated them to excite abhorrence. He also wrote, *Reflections on Titus Livius*, which are curious; *The History of Florence*, from 1205 to 1494; and a 4to. volume of *Poems*, &c. Mr Harrington considers him as a superior genius, and as the most excellent writer on politics and government, that ever appeared.

\* MACHINAL. *adj.* [from *machina*, Latin.] Relating to machines. *Dist.*

\* To MACHINATE. *v. a.* [*machinor*, Lat. *machiner*, Fr.] To plan; to contrive.

\* MACHINATION. *n. f.* [*machinatio*, Lat. *machination*, French; from *machinatus*.] Artifice; contrivance; malicious scheme.—

If you miscarry,

Your business of the world hath to an end,

And *machination* ceases. *Shak.*

O from their *machinations* free,

That would my guiltless soul betray; *Sandys.*

Be frustrate all ye stratagems of hell,

And devilish *machinations* come to nought.

*Milton.*

—How were they zealous in respect to their temporal governors? Not by open rebellion, not by private *machinations*; but in blessing and submitting to their emperors, and obeying them in all things but their idolatry. *Spratt.*

(1.) \* MACHINE. *n. f.* [*machina*, Latin; *machine*, French. This word is pronounced *masheen*.]

1. Any complicated work in which one part contributes to the motion of another.—We are led to conceive this great *machine* of the world to have been once in a state of greater simplicity, as to conceive a watch to have been once in its first materials. *Burns.*—

In a watch's fine *machine*,

The added movements which declare

How full the moon, how old the year,

Derive their secondary power

From that which simply points the hour.

*Prior.*

2. An engine.—

With inward arms the dire *mach*  
load,

And iron bowels stuff the dark abode.

3. Supernatural agency, in poems.—The lous fable includes whatever is supernatural especially the *machines* of the gods. *Pope.*

(2.) MACHINE, in general, signifies an that serves to augment or to regulate powers: Or it is any body destined to motion, so as to save either time or force word comes from the Greek *μηχανη*, *mechanē* art: And hence, in strictness, a machine is thing that consists more in art and invention in the strength and solidity of the materials which reason the inventors of machines are *ingenieurs* or *engineers*. Machines are either simple or compound. The simple ones are mechanical powers, viz. lever, balance, axis and wheel, wedge, screw, and inclined. See MECHANICS. From these the compound ones are formed by various combinations serve for different purposes. See HYDRAULICS and MECHANICS; also BURROUGHS, NON, CENTRIFUGAL, FIRE, FURNACE, DEN, RURAL OECONOMY, STEAM, &c.

(3.) MACHINES USED IN WAR, among Greeks, were principally these: 1. *Κλίμα* scaling ladders; 2. The battering ram; 3. *Λεπίς* lepolis; 4. The *χελών* or tortoise, called by mans *testudo*; 5. The *χόμα* or *agger*, which faced with stone, and raised higher than the Upon the *χόμα* were built *παργύρι* or towers; 6. *Γέφυρα*, or other hurdles; 8. *Καταπέτασμα*, from which they threw arrows mazing force; and, 9. The *λιθόβλας*, *πετροβόλον*, from which stones were cast with velocity. The principal warlike machine used by the Romans were, the ram, the wolf, the *testudo* or tortoise, the *ballista*, the puita, and the *scorpion*.

(1.) \* MACHINERY. *n. f.* [from *machinaria*, Latin; *machinery*, French.] Engine; complicated workmanship; self engines. 2. The *machinery* signifies that which the deities, angels, or demons, use in poems. *Pope.*

(2.) MACHINERY, (§ 1. *def.* 2.) in epic dramatic poetry, is when the poet brings a supernatural being upon the stage, to solve a difficulty, or perform some exploit out of reach of human power. The ancient poets never made use of machines, unless there was an absolute necessity for so whence the precept of Horace;

*Nec Deus interfit, nisi dignus vindice nudus*  
*Interditi.*

It is quite otherwise with epic poets, who introduce them in every part of their poems.

ton's Paradise Lost, the greater part of the are supernatural personages: Homer and do nothing without them; and, in Voltaire's *Henriade*, the poet has made excellent use of Lewis. As to the manner in which the machines should act, it is sometimes invidious simple inspirations and suggestions; sometimes actually appearing under some human form lastly, by dreams and oracles, which part the other two. But all these should be managed so as to keep within the bounds of probability.

\* MACHINERY

MINIST. *n. f.* [*machiniste*, Fr. from at.] A constructor of engines or ma-

EN, a town of the French republic, of Escaut, and late prov. of Austrian miles S. of Deinf.

MHLIN, a parish of Scotland, in Ayr- 7½ miles long, and from 2 to 4 broad; 5,400 acres. The air is mild, the sur- cept one hill, (N<sup>o</sup> 3.) and the soil ish. The population, in 1791, was 2631 since 1755: number of horses, lack cattle 1080. There are several red and white stone, lime stone, and

HLIN, a town in the above parish, 1000 inhabitants in 1791. It has fairs 5, June, July, Sept. Nov. and Dec.

MILN HILL, a hill chiefly in the above sh affords a very extensive prospect o- part of Ayrshire and part of Galloway. IS. See CERVUS, § I. N<sup>o</sup> 1, 2.

M, an instrument of music among s. Kircher apprehends that the name s two kinds of instruments, one of the other of the pulsatile kind. See Fig. 3 and 4.) That of the former chords; though there is great reat- whether an instrument requiring the air-bow, and so much resembling the o ancient. The latter was of a cir- made of metal, and either hung round ells, or furnished with iron rings sus- rod or bar that passed across the cir- supposes that it was moved to and dle fixed to it, and thus emitted a kind of murmur.

NETH, an ancient town of N. Wales, 19½ mile; from London, and Montgomery. It has a market on Mon- 15, on May 16, June 26, July 9, Sept. 19, 25, for sheep, horned cattle, and is seated on the Donay, over which 18 stone bridge, leading into Meri-

Here Owen Glyndowr exercised the his royalty in 1401: here he accepted f Wales, and attended a parliament; fe wherein they met remaining, but di- nements. Lon. 1. 46. W. Lat. 52. 24. N. ENCY. *n. f.* [from *maucient*.] Lean-

ENT. *adi.* [*maucilentus*, Latin.] Lean- NZELL, a town of Germany, in the Fulda, 9 miles NE. of Fulda.

KENZIE, Dr George, the learned us compiler of *The Lives of the most ters of the Scots Nation*, resided in of Rosemarkie, in Rose-shire, "in an longing to the Earl of Sutherland, and in the tomb of that family, in the ca- *Sir J. Sinclair's Stat. Acc.* Vol. XI. p. s all the notice we find taken of this uthor, a piece of negligence which at ungrateful in succeeding "writers nation," towards an author who ex- f so much to perpetuate the me- rits of his learned countrymen.

ENYR, James, M. D. author of "the . PART II.

*Art of Preserving Health*, is said to have been for some time employed in teaching the grammar school of the burgh" of Rosemarkie. (*Sir J. Sinclair's Stat. Acc.* XI. 248.) Neither of these authors are taken notice of in *Dr Watkins's Univ. Biog. Dict.*

(3.) MACKENZIE, Sir George, of Rosehaugh, an able lawyer, a polite scholar, and a celebrated wit, born at Dundee, in 1636. He studied at the universities of Aberdeen and St Andrew's; after which he applied himself to the civil law, travel- led into France, and prosecuted his study in that faculty for about three years. At his return to his native country, he became an advocate in the city of Edinburgh; and soon gained the character of an eminent pleader. He did not, however, suffer his abilities to be confined entirely to that province. He had a good taste for polite litera- ture; and he gave the public, from time to time, incontestable proofs of an uncommon proficiency therein. He had practised but a few years, when, in 1674, he was made king's advocate, a lord of the privy council in Scotland, and a judge in the criminal court. He was also knighted. In these stations he met with a great deal of trouble, on account of the rebellions and persecutions for reli- gious opinions which happened in his time. His office of advocate requiring him to act with fever- rity, he did not escape censure, as having, in the prosecution of many persons who were executed, stretched the laws too far. This rendered him so unpopular, that his monument, in the Grayfriars Churchyard at Edinburgh is still called *Bloody Mackenzie's Tomb*. But his defenders insist, that he only did his duty, and that he acquitted him- self like an able and upright magistrate. Upon the abrogation of the penal laws by king James II, though he had always been remarkable for his loyalty, and censured for his zeal against traitors and fanatics, he resigned his post; being convinced, that he could not discharge the duties of it with a good conscience. But he was soon after restor- ed, and held his offices till the revolution; an event which he did not approve. He had hoped that the prince of Orange would have returned to his own country, when matters were adjusted between the king and his subjects; and upon its proving otherwise, he quitted all his employments in Scot- land, and retired into England, resolving to spend the remainder of his days in the university of Ox- ford. He arrived there in Sept. 1689, and profes- sed his studies in the Bodleian library, being ad- mitted a student there June 2, 1690. In spring 1691 he went to London, where he fell into a disorder, of which he died in May. "The politeness of his learning, and the sprightliness of his wit, were (says the rev. Mr Granger) conspicuous in all his pleadings, and shone in his ordinary conversa- tion." He wrote several pieces of history and an- tiquities; Institutions of the laws of Scotland; Essays upon various subjects, &c. His works were printed at Edinburgh in 1716, in 2 vols folio.

(4.) MACKENZIE, Sir George, of Royston, F. R. S. first Earl of Cromarty, and eldest son of Sir John Mackenzie of Tarbat, by Margaret, daugh- ter of Sir George Esline, lord Innertell, was born in 1630. His father dying in 1654, he raised some

troops and joined lord Middleton to attempt the restoration of K. Charles II. but being defeated by Col. Morgan, he made an honourable capitulation. After the restoration he was employed by Middleton, in several public offices. In 1678, he was appointed Lord Justice General; in 1681, he was made a Lord of Session, and Lord Register. He now purchased Roystoun, and continued to have the chief rule in Scotland, during the reigns of Charles II. and James II. by whom, in 1685, he was created lord Viscount Tarbat; but, by his arbitrary proceedings, rendered himself very unpopular; notwithstanding which, he was, in 1691, restored by William III. to his office of Lord Register; wherein he acted a very double part, as appears from Pr. Carstairs's *State Papers*. In 1695, he resigned upon a pension of 4000. a-year; but upon Q. Anne's accession he was appointed Secretary of State; and, in 1703, created Earl of Cromarty. In 1704, he resigned, and was made Lord Justice General, which he held till 1710. He promoted the Union by his vote, speeches, and publications. He died at New Tarbat on the 17th Aug. 1714. He was an original and useful member of the Royal Society, and wrote many valuable papers in the *Philos. Transf.* He also published, 1. A vindication of K. Robert III. Edinburgh, 4to. 1695; 2. and 3. Two Letters on the Union; 4. A short explication of Daniel's prophecy, and St John's Revelation, Edin. 1706, 4to. 5. Historical Account of the Conspiracy of the E. of Gowrie, and R. Logan of Restalrig, against James VI. Edin. 1713, 8vo. and some other tracts.

MACKERAN, a town and prov. of Persia.

(1.) \* MACKEREL. *n. f.* *mackerel*, Dutch; *maquerreau*, Fr. A sea-fish.—Some fish are gutted, split, and kept in pickle; as whiting and *mackerel*. *Carew*.—

Law order'd that the Sunday should have rest;

And that no nymph her noisy food should sell,  
Except it were new milk or *mackerel*. *King*.

Sooner shall cats disport in water clear,  
And speckled *mackerels* graze the meadows fair,  
Than I forget my thepherd's wont'd love. *Gay*.

(2.) MACKEREL. See SCOMBER, N<sup>o</sup>. 1.

(3.) \* MACKEREL GALE seems to be, in *Drayden's* cant, a strong breeze; such, I suppose, as is desired to bring *mackerel* fresh to market.—

They put up every fish,

The wind was fair, but blew a *mackerel* gale.

*Drayden*.

MACKERMORE, one of the Western Islands of Scotland, 5 miles E. of Jura.

MACKEY, John, an Englishman, employed by the government as a spy upon James II. after the revolution, was author of *Memoirs of James's court at St Germaine, and of the court of England in the reigns of William III. and queen Anne*; in which are many curious anecdotes not to be met with in any other work. He died in 1726.

MACKINTOSH, a county of Georgia, between Liberty and Glynn counties, on the Altamaha.

MACKLIN, Charles, a late celebrated actor and dramatic writer, born in the N. of Ireland, in 1698. His original name Maclaughlin. He be-

came a performer in Lincoln's Inn 1706; and not long after was tried brother comedian in a quarrel, and of manslaughter. His features were harsh, that Quin rather profanely "If God writes a legible hand, th villain." He was, notwithstanding t humanity and extensive liberality. I plays, which are esteemed, viz. *Lo* and *The Man of the World*. He died principal character was *Shylock*, wh to so much perfection, that Pope sa "This is the Jew—That Shakeape

MACKNIGHT, James, D. D. a and learned clergyman of the chu land, one of the ministers of Edinbu thor of several valuable works on t 1772, he was appointed minister of l Church; and in 1779, one of the mi Old Church, Edinburgh. He publiche *mory of the Four Gospels*, in 4to. 1 *Truth of Gospel History*, 1764: 3. 7 and *Commentary on*, the Epistles to nians, 1787. He died Jan. 13th 180

MACKUM, a town of the Batav in the dep. of the Eems, and late pro land, 5 miles W. of Bolfwaert.

MACLAS, a town of France, in the Rhone and Loire, 15 miles E. of

(1.) MACLAURIN, Colin, F. R. mment mathematician and philosop son of a clergyman, and born at l Scotland, in 1698. He was sent to of Glasgow in 1709; where he studi

His great genius for mathematics ap ply as at 12 years of age; when, havin met with an Euclid, he became in a ter of the first six books without a in his 16th year he had invented ma positions, afterwards published und *Geometria Organica*. In his 15th ye degree of M. A. when he composed a thesis *On the power of Gravity*, w plume. After this he retired to a c his uncle, where he spent 2 or 3 ye rents were dead. In 1717, he flood the professorship of mathematics in college of Aberdeen, and obtained days trial with a very able competit he went to London, where he becar with Dr Hoadly, then Bp. of Bang; Sir Isaac Newton, and other crum was admitted T. R. S. In anothe 1721, he contracted an intimacy Folkes, Esq. P. R. S. which lasted In 1722, lord Polwarth, plenipate congress of Cambrai, engaged him tor and companion to his eldest son. After a short stay at Paris, and visit in France, they fixed in Lorraine; w rin wrote his piece *On the Perception of* gained the prize of the royal academ for 1724. But his pupil dying soon afte lie, he returned immediately to Ab he was hardly settled, when he reco tation to Edinburgh, to supply the James Gregory. He had some disc cewater, arising from competitors, &

er, were all surmounted, principally by Sir Isaac Newton; and in Nov. 1725, he was introduced to the university. In 1733, he married Anne, daughter of solicitor Stewart, by whom he had seven children, of whom five and his wife survived him. In 1734, Berkeley, bishop of Cloyne, published a piece called *The Analyst*; in which he took occasion, from some disputes that had arisen concerning the grounds of the fluxionary method, to explode the method itself, and to charge mathematicians in general with infidelity in religion. Maclaurin thought himself included in this charge, and began an answer to Berkeley's book; but, as he proceeded, so many new theorems and problems occurred to him, that instead of a vindicatory pamphlet, he published *A complete system of Fluxions, with their application to the most considerable problems in geometry and natural philosophy*: at Edinburgh, in 1742, 2 vols 4to. He also published many useful tracts in the 5th and 6th vols. of the *Medical Essays*, at Edinburgh; as well as in the *Philos. Trans.*; as, 1. Of the construction and measure of curves, N<sup>o</sup> 356. 2. A new method of describing all kinds of curves, N<sup>o</sup> 359. 3. On equations with impossible roots, May 1726, N<sup>o</sup> 394; On ditto, March 1729, N<sup>o</sup> 408. 5. On the description of curves, with farther improvements, Dec. 1732; N<sup>o</sup> 439. 6. A rule for finding the meridional parts of a spheroid, with the same exactness as of a sphere, Aug. 1741, N<sup>o</sup> 461. 7. On ditto, and March 10, 1742; N<sup>o</sup> 467, and 469. 9. Of the basis of the cells wherein the bees deposit their honey; Nov. 3, 1734, N<sup>o</sup> 471. In the midst of these studies, he was ready to lend his assistance promoting any scheme for the service of his country. Under his direction the geography of the Orkney and Shetland islands was first accurately ascertained in 1739. He had another scheme for the improvement of geography and navigation, of a more extensive nature; which was the opening a passage from Greenland to the South Sea to the north pole. That such a passage might be found, he was so fully persuaded, that he used to say, if his situation could admit of such adventures, he would undertake the voyage at his own charge. In 1745, having been very active in fortifying the city of Edinburgh against the rebel army, he was obliged to fly to the north of England; where he was invited by Abp. Herring, to reside with him during his stay; but being in this expedition exposed to cold and hardships, he contracted an illness which put an end to his life, in June 1746, at the age of 48. Mr Maclaurin was not only a great but a good man. His peculiar merit as a philosopher was, that all his studies were accommodated to general utility; and we find, in many places of his works, an application even of the most abstruse theories, to the perfecting of mechanical arts. He revised Dr David Gregory's *Practical Geometry*, and published it with additions, in 1745. On various occasions he served his friends and his country by his great skill. Frequent disputes having arisen concerning the gauging of vessels, he presented to the commissioners of excise two elaborate memorials, with their demonstrations, containing rules by which the officers now

act. He made also calculations relating to the provision, established by law, for the children and widows of the Scots clergy, and of the professors of the universities, entitling them to certain annuities, upon the voluntary annual payment of a certain sum by the incumbent. He gained the prize of the royal academy of sciences in 1724; and in 1740, the academy adjudged him a prize, for solving the motion of the tides from the theory of gravity; a question which had been given out the former year, without receiving any solution. He had only ten days to draw up this paper in. He afterwards revised the whole, and inserted it in his *Treatise of Fluxions*; as he did also the substance of the former piece. Since his death, two vols. more have appeared; his *Algebra*, and his *Account of Sir Isaac Newton's Philosophical Discoveries*.

(2.) MACLAURIN, John, Esq. of Dreghorn, one of the Senators of the College of Justice, and F. R. S. E. was the eldest son of the Professor, N<sup>o</sup> 1. He was born at Edinburgh, in 1734; and was educated first at the high school, and afterwards at the university there. In 1756 he was admitted a member of the faculty of Advocates, and in 1788 was promoted to the bench, by the title of *Lord Dreghorn*. His works were collected and published in 2 vols 8vo, 1792, and consist of Miscellanies in prose and verse.

MACMILLANITES, a name given to the CAMERONIANS, from Mr John Macmillan, Minister of Balmaghie, who, though he was deposed for adhering to their tenets, was so popular, that he retained possession of the church, manse, and congregation for 12 years; after which he retired voluntarily; and became an itinerant preacher, and founder of the sect of *Macmillanites*, or *Modern Cameronians*, who assume the title of the Reformed Presbytery. (*Sir J. Sinclair's Stat. Acc.* Vol. xiii. 643—9.) See CAMERONIANS and CARGILLITES.

MACCOIG, or MACCOIG, Malcolm, an ingenious young botanist, who with great labour and personal exertion, composed a work of considerable merit, entitled *Flora Edinburgensis*, the MS. of which is still unpublished, in the hands of Mr Andrew Fife, anatomist, Edinburgh. (See *FLORES*, § 2.) Mr Maccoig was born in Argyleshire, in 1764, and at 16 years of age hardly knew a word of English. He soon, however, made himself master of it, and having been bred to gardening, he was employed by Dr Hope and his successor Dr Rutherford to superintend the botanic garden between Edinburgh and Leith; and under these celebrated professors became so complete a botanist, that he attempted and accomplished the arduous task of compiling the above work. But the uncommon exertions he made, and the fatigue he underwent, in traversing and travelling over a circuit of 15 miles round the metropolis, in all directions, and in all weathers, to discover every genus and species of plants that grow spontaneously within that circumference, and his total neglect of diet during these fatiguing excursions, together with a cold caught in consequence of them, brought on a phtisis pulmonalis, which cut him off in Dec. 1788, just when his favourite work

was completed and transcribed for the press. So great was his botanical enthusiasm, that he assured the writer of this article, a short time before he died, that he had often walked 12 or 13 miles from Edinburgh and back again, between 4 in the morning and 10 at night, clambering over hills, rocks, and precipices, in search of rare plants, without taking any aliment whatever. As the work contains the most particular directions where to find a number of very rare plants, which are hardly known to exist in Scotland, it would certainly, if published, be an acceptable present to every lover of botany, as well as a most useful assistant to students in that science. He was married in 1786, but left no children.

MACON, a town of France, in the dep. of Saone and Loire; on the Saone, 35 miles N. of Lyons.

MACONNOIS, a ci-devant county of France, now included in the dep. of Saone and Loire. Maçon was the capital.

MACPHERSON, James, Esq. M. P. a Scottish writer of considerable celebrity, born in 1737. His first and most celebrated work was his translation of Ossian's Poems; the authenticity of which was attacked by Dr Johnson and others, and their merit of consequence, ascribed to Macpherson himself; who, instead of taking this as a compliment, wrote a threatening letter to the Doctor, which he answered in terms equally indignant. See OSSIAN. In 1773, he published a translation of the Iliad into heroic prose. He also wrote A History of Great Britain from 1660 to the accession of the House of Hanover, in 2 vols, 4to; and an Introduction to the history of Great Britain and Ireland. He also published some pamphlets in defence of Lord North's administration, on which side he voted in the house of Commons. He died in Feb. 1796, aged 59.

(1.) MACQUER, Peter Joseph, was born at Paris, 9th Oct. 1718. He was descended of a respectable family, and was a member of the academy of sciences, and professor of pharmacy. He was engaged in the *Journal des Sçavans*, for the articles, MEDICINE and CHEMISTRY; and had a share in the *Pharmacopœia Parisiensis*, published in 1758, in 4to. His other works are, 1. *Elémens de Chimie théorique*; Paris, 1749, 1753, 12mo; which have been translated into English and German. 2. *Elémens de Chimie pratique*, 1751, 2 vols. 12mo. These two works were re-published together, in 1756, in 3 vols 12mo. 3. *Plan d'un cours de Chimie expérimentale & raisonnée*, 1757, 12mo; in which he was associated with M. Beaumé. 4. *Formulae Medicamentorum Magistratum*, 1763. 5. *L'Art de la Teinture en Soie*, 1763. 6. *Dictionnaire de Chimie, contenant la théorie & la pratique de cet art*, 1766, 2 vols 8vo; which has been translated into German, with notes; and into English, with notes, by Mr Keir. Macquer, by his labours and writings, contributed very much to the improvement of chemistry. He died at Paris, Feb. 16, 1784.

(2.) MACQUER, Philip, brother to the above, (N° 1.) was born at Paris in 1720, and became advocate of the parliament of Paris. A weakness in his lungs having prevented him from pleading, he dedicated himself to literary pursuits. His works are, 1. *L'Abregé Chronologique de l'Histoire Ecclesi-*

*astique*, 3 vols 8vo. 2. *Les Annales* 1756, 8vo: a very judicious compilation *brève Chronologique de l'Histoire d'Espagne Portugal*, 1765; 2 vols 8vo. He died on Jan. 1770, aged 50. He had a correct and an eager thirst for knowledge. He had the Dictionary of Arts and Professions, 8vo, and in the Translation of the Syphil castor published by Lacombe.

(1.) MACRINUS, one of the best Latin poets of the 16th century, was born at Loudun, his real name was *John Salmon*; but he took the name of *Macrin*, from his being frequently so caressed by Francis I. on account of his extraordinary leanness. He was preceptor to Clément Savoy, count Tende; and to Honorius his brother; and wrote several pieces of lyric verse, which were so admired, they called *the Horace of his time*. He died at Loudun, in 1555.

(2.) MACRINUS, Charles, son to the above, his brother according to Dr Watkins, was inferior to him as a poet, and surpassed him in knowledge of the Greek tongue. He was married to Catherine of Navarre, the sister of the Great; and perished in the massacre of Bartholomew's day, in 1572.

MACRIS. See CHIO, N° 1.

MACROBII, (from *μακρος* *βίος*, long life) people of Ethiopia, celebrated for their innocence of their manners, as well as their uncommon longevity. See ETHIOPIA, people in the island Merœ. 3. The Hæmians were also called Macrobian.

MACROBIUS, Ambrosius Aurelius Tertullianus, an ancient Latin writer, who flourished at the end of the 4th century.—His country and his name are uncertain. Erasmus, in his *Ciceronis*, thought he was a Greek; and he himself says in the preface to his *Saturnalia*, that he was a Roman, but laboured under the inconvenience of writing in a language which was not his own. Barthius reckons him a Christian; but Hem and Fabricius suppose him to have been a Pagan. It is however certain, that he was of consular dignity, and one of the favourites of Theodosius. He wrote a Comment on Cicero's *Somnium Scipionis*, and 7 books of *Saturnalia*, which treat of various subjects, and are an agreeable mixture of criticism and antiquity. He made great use of other people's works, using not only their materials, but even their language, for which he makes an apology in the preface of his work. "I shall here (says he) imitate the bees, who suck the best juices from various sorts of flowers, and afterwards work them to various forms and orders, with form of their own proper spirit." The *Somnium* and *Saturnalia* have been often printed, which has been added, in the later editions, a piece entitled, *De Differentiis & Sæcularibus Verbis*.

MACROCEPHALUS, (from *μακρος*, great, and *κεφαλή*, head,) denotes a person with a head or longer than the common size. Macrocephalus, or Long-heads, is a name given to a certain kind of people, according to the accounts of authors, famous for the uncommon length of their

custom so far habituated them to it, that instead of looking on it as a deformity, they esteem it a beauty, and as soon as the child was born, it was dressed and fashioned its head to as great a roundness as possible, and afterwards used all such ornaments and bandages as might seem most likely to preserve its growing long. The greater part of the people in the Archipelago, some of the people of Asia, and even some of Europe, still press their children's heads out lengthwise. The Epimany people of America, &c. are all born with some singularity in the conformation of their heads; either a flatness on the top, two extraordinary protuberances behind, or one on each side; or a curvature which are the effects of an ancient usage, which at length is become a custom in the nation. According to the report of many travellers, the operation of compressing the head of a child lengthwise, while it is yet soft, has the effect to enlarge the interval between the two eyes, so that the visual rays fall more to the right and left, the sight would consequently see a much larger portion of the horizon; and the advantages of which they are well acquainted with, in hunting, and on a thousand other occasions.

Ever since the 16th century, the missionaries established in the countries inhabited by the natives of America, have endeavoured to abolish this custom; and we find in the sessions of the 3d Council of Lima, held in 1585, a canon which expressly prohibits it. But if it has been repressed among the Caribs, solely with the view of diminishing their children, which are born from those who are born in slavery. The Guanas, a people of South America, according to Le Veigh, press the heads of their children so that they become sharp at the top, and flat before and behind. They say they do this to give their heads a greater resemblance to the moon.

**MACROCERCI**, a class of animalcules which have tails longer than their bodies.

**MACROCNEMUM**, in botany, a genus of the Magnoliaceae order, belonging to the pentandria order of plants; and in the natural method ranked under the 30th order, *Contorta*.

**MACROCOLLUM**, or } [from *μακρος*, large,  
**MACROCOLUM**, } and *κόλλω*, I join.]  
The Romans, the largest kind of paper then known. It measured 16 inches, and often 24.

**MACROCOSM**. *n. f.* [*macrocosmos*, French; and *κοσμος*.] The whole world, or visible universe, in opposition to the microcosm, or world within.

**ACRONISI**, an island in the Archipelago, in the Livadia, anciently called *Helena*, from Queen Helena.

**MACROOM**, or } a town of Ireland, in the  
**MACROOMP**, } barony of Muskerry, and  
is 17 miles from Cork, 142 miles from Dublin; situated on the highest hills, in a dry gravelly limestone soil. It is named from an old crooked oak, so called *Macroom*, which grew here. The castle was first built in King John's time, soon after the English conquest, (according to Sir Richard Cox) by the lords of the Daltons. It was repaired and

beautified by Teague Macarty, who died in 1565, and was father to the celebrated Sir Cormac Mac-Teague, mentioned by Camden, as an active person in Q. Elizabeth's time. It was burnt down in the wars of 1641, but rebuilt by Earl Glancarty. Opposite to the bridge, is the parish church, dedicated to St Colman. Here is a barrack for a foot company, a market-house, and handsome Roman Catholic chapel. A considerable number of persons have been employed in combing wool and spinning yarn, and some salt-works have been erected here. Half a mile distant is a spa, that rises on the brink of a bog; its waters are a mild chalybeate, useful in hypochondriacal cases, and in cutaneous eruptions. There are 4 fairs.

**MACROPYRENIUM**, in natural history, a genus of fossils consisting of crustated septaria, with a long nucleus standing out at each end of the mass.

**MACROTELOSTYLA**, in natural history, a genus of crystals, composed of two pyramids joined to the end of a column; both pyramids and column being hexangular, and the whole body consequently composed of 18 planes.

(1.) \* **MACTATION**. *n. f.* [*μακταω*, Latin.] The act of killing for sacrifice.

(2.) **MACTATION**; [*MACTATIO*, Lat.] was performed either by the priest himself, or some of his inferior officers, called *popæ*, *agones*, *cultrarii*, and *victimarii*; but, before the beast was killed, the priest turning himself to the E. drew a crooked line with his knife, from the forehead to the tail. Among the Greeks, this ceremony was performed most commonly by the priest, or, in his absence, by the most honorable person present. If the sacrifice was offered to the celestial gods, the victim's throat was bent up towards heaven; if to the infernal, or to heroes, it was killed with its throat towards the ground. The manner of killing the animal was by a stroke on the head, and after it was fallen, thrusting a knife into its throat. Much notice was taken, and good or ill success predicted, from the struggles of the beast, or its quiet submission to the blow, from the flowing of the blood, and the length of time it lived after the fall, &c.

(1.) \* **MACULA**. *n. f.* [Latin.] 1. A spot. —And lastly, the body of the sun may contract some spots or *macule* greater than usual, and by that means be darkened. *Burnet's Theory*. 2. [In physick.] Any spots upon the skin, whether those in fevers or scorbutick habits.

(2.) **MACULÆ**, in astronomy, dark spots appearing on the luminous surfaces of the SUN and MOON, and even some of the PLANETS. See *ASTRONOMY, Index*.

\* **MACULATE**. *v. a.* [*maculo*, Latin.] To stain; to spot.

\* **MACULATION**. *n. f.* [from *maculate*.] Stain; spot; taint.—

I will throw my glove to death himself,  
That there's no *maculation* in the heart. *Sbat.*

\* **MACULE**. *n. f.* [*macula*, Latin.] A spot; stain.

**MACUNA**, one of the NAVIGATOR'S ISLANDS, in the S. Pacific Ocean; where M. De La Peyrouse, with his captain, several officers and men,

were

were massacred by the inhabitants. Lon. 169. 0. W. Lat. 14. 19. S.

(1.) \* MAD. *adj.* [*gemaad* Saxon; *mattio*, Italian.] 1. Disordered in the mind; broken in the understanding; distracted; delirious without a fever.—

Alack, Sir, he is *mad*. *Shak.*

This musick mads me, let it sound no more;  
For though it have help'd madmen to their wits,  
In me, it seems, it will make wise men *mad*.  
*Shak.*

Cupid, of thee the poets sung,  
Thy mother from the sea was sprung;

But they were *mad* to make thee young. *Dent.*  
—We must bind our passions in chains, lest like  
*mad* folks they break their locks and bolts, and  
do all the mischief they can. *Taylor.*—A bear, en-  
rag'd at the stinging of a bee, ran like *mad* into  
the bee-garden, and over-turn'd all the hives. *L'Est.*

Madmen ought not to be *mad*;  
But who can help his frenzy? *Dryden.*

But some strange graces and odd flights she  
had,

Was just not ugly, and was just not *mad*. *Pope.*

2. Expressing disorder of mind.—  
His gestures fierce  
He mark'd, and *mad* demeanour when alone.

*Milton.*  
3. Over-run with any violent or unreasonable de-  
sire: with *on*, *after*, *of*, perhaps better *for*, before  
the object of desire.—It is the land of graven im-  
ages, and they are *mad upon* their idols. *Jer.* l. 28.  
—The world is running *mad after*, *farce.* *Dryden.*  
—The people are not so very *mad of* acorns, but  
that they could be content to eat the bread of ei-  
vil perions. *Rym.* 4. Enraged; furious.—Holy  
writ represents St Paul as making havock of the  
church and persecuting that way unto the death,  
and being exceedingly *mad* against them. *D. Picty.*

(2.) \* MAD. *n.s.* [*madia*, Sax.] An earth-worm.  
*Antwort.*

(3.) MAD, a town of Hungary, 5 miles N. of  
Tokay.

(1.) \* To MAD. *v. a.* [from the adjective.] To  
make mad; to make furious; to enrage.—O vil-  
lain! cried out Zelmane, *madd*ed with finding an  
unlooked-for rival. *Sidney.*

This will witness outwardly,  
As strongly as the conscience does within,  
To the *madding* of her lord. *Shak.*

This *mads* me, that perhaps ignoble hands  
Have overlaid him, for they cou'd not conquer. *Dryden.*

(2.) \* To MAD. *v. n.* To be mad; to be fu-  
rious.—

The *madding* wheels  
Of brazen chariots rag'd. *Milton.*

She, mixing with a throng  
Of *madding* matrons, bears the bride along. *Dryden.*

(1.) MADAGASCAR, the largest of the Afri-  
can islands, is situated between 43° and 51° of  
Lon. E. and between 12° and 26° Lat. S. extend-  
ing in length near 1000 miles from NNE. to SSW.  
and about 300 in breadth where broadest.

(2.) MADAGASCAR, ANCIENT AND MODERN  
NAMES, AND DISCOVERY OF. This island, ac-  
cording to many learned geographers, is the

CERNE of Pliny, and the MEXUTHIAS  
Iemy. It was discovered in 1506 by  
Ahmeyda; but the Persians and the Arabians  
acquainted with it from time immemorial  
the name of *Serandib*. Alphonzo Albu-  
querque Ruy Pereira dy Conthinto to visit  
parts, and that general intrusted Tristram  
with the survey. The Portuguese call  
the island of *St Lawrence*; the French, who  
in the reign of Henry IV. named it *Ile*  
its proper name is MADEGASSE, now  
commonly called, *Madagascar*.

(3.) MADAGASCAR, CLIMATE, RIVE-  
RAINS, SOIL, PRODUCE, &c. OF. T  
of this island is uncommonly fine. T  
where watered by rivers and rivulets  
from a long chain of mountains that ru-  
ns its whole extent from E. to W. The  
promontories are called *Vicogora* and  
These mountains, according to the Arabians,  
contain a variety of precious mineral  
fossils. They are covered with pre-  
cious summits of which are crowned with  
trees, that seem coeval with the v  
interperfed with grand cascades, tho'  
to which is generally inaccessible. Th  
so sublimely picturesque, rural scenes f  
the hills, gently rising grounds, and  
vegetation of which is never represses  
temperance or the vicissitude of  
Vast savannas nourish numberless be-  
locks and of sleep; and the soil is fo  
the inhabitants scarce need to stir the  
a rake. They scrape little holes at  
distance from each other, into which th  
few grains of rice, and cover them wit  
and so great is the fertility, that the  
in this careless manner produce an he  
The forests present a prodigious variety  
useful and beautiful trees; ebony, w  
ing, bamboos of an enormous thickne  
trees of every kind. The timber u  
building is as common as those lin  
prized by the cabinet-maker. The Fi-  
nor Flacourt, in his history of this island  
that in 1650 he sent to France 52,000  
aloes of an excellent quality. All t  
trees and shrubs are surrounded by a nu-  
ber of parasitical plants: mushrooms  
kinds and colours are met with eve  
the woods; and the inhabitants know  
to distinguish those which are prejudi-  
collect large quantities of useful gu-  
sins; and out of the milky sap of a  
minated by them *sanguiore*, the inha-  
means of coagulation, make that fi-  
stance known to naturalists by the nar-  
*latic*. See JATROPHA, N° 2; and RESIN.

Besides the aromatic and medicinal h  
abound in the forests, the island produ-  
hemp of a length and strength which  
in Europe. Sugar, wax, honey, toba-  
white pepper, gum-lac, ambergis, fil-  
ton, would long since have been ob-  
metre, if the Europeans had furnish-  
bitants with the necessary instrum-  
ments for preparing and improving th-  
tious. The sugar-canes (says Mr. W

- to India, p. 14.) are much larger and finer than in the West Indies; being as thick as a man's fist, and so full of juice, that a foot of them will weigh two pounds. One of them will support a weller for 2 or 3 days. Here are also plenty of marinds; and such quantities of limes and oranges, that very large casks may be filled with their juices at a trifling expence, as they may be purchased for iron pots, muskets, powder, ball, &c. While Adm. Watson's squadron laid here in 1754, 15000 Ives preserved about half a hoghead of those roots, which proved afterwards of great service to the ship's crews. But no good water is to be had at Augustine, in the SW. part of the island, where they usually touch, unless boats are sent for it 4 or 5 miles up the river. There are great abundance of a variety of provisions of every kind, which a moderate climate and fertile soil can produce. The oxen are large and fat, and have each a protuberance between the shoulders, weighing about 20 lb. Their flesh is greatly esteemed by Europeans, and sent to India, and ships are sent to Madagascar for purpose to kill and salt them on the island. The sheep differ little from the goats; being equal in size, only that their heads are somewhat larger: their necks resemble that of a calf, and their weight at least ten pounds. Vast quantities of locusts rise here from the low lands in thick swarms, extending sometimes to an incredible extent and breadth. The natives eat these insects, and even prefer them to their finest fish. Their method of dressing them is to strip off their legs and wings and fry them in oil. Crocodiles, chameleons, &c. are also numerous.

4.) MADAGASCAR, GOVERNMENT, ORDERS, &c. OF. In the 2d vol. of Count Benyowsky's memoirs, we have the following account of the government of this island: "The Madagascar people have always acknowledged the line of Ranaivos, as that to which the rights of *Ampansacobe* sovereign belongs. They have considered this line as extinct since the death of Dian Ramini Lazon, which happened 66 years ago, and whose body was buried upon a mountain, out of which the river Manangouou springs; but having acknowledged the heir of this line on the female side, they re-established this title in 1776. The right of the *Ampansacobe* consists in nominating the *Rohandrians* to assist in the cabars, at which all those who are cited are bound to appear, and the judgment of the *Ampansacobe* in his cabar is decisive. Another prerogative is, that each *Rohandrian* is obliged to leave him by will a certain portion of his property, which the successors usually purchase by a slight tribute or fine. Thirdly, the *Ampansacobe* has a right to exact from each *Rohandrian* one tenth of the produce of his land, and a number of horned cattle and slaves, in proportion to the riches of the country possessed by each *Rohandrian*." The count next describes the different orders of the people, for which, See Appendix, § 2.—"Having made inquiries (adds he) from Bombetoki passing to the northward, and from Kar as Itapere, the result proved that there are *Rohandrians* actually reigning, and 287 *Voadziris*. These orders preserve a regular gradation, respecting which it would be very difficult to give a

detailed account. They live in the manner of the ancient patriarchs. Every father of a family is priest and judge in his own house, though he depends on the *Lohavohit*, who superintends his conduct. This last is answerable to his *Voadziri*, and the *Voadziri* to the *Rohandrian*. The Madagascar people, having no communication with the main land of Ethiopia, have not altered their primitive laws; and the language throughout the whole extent of the island is the same. It would be a rash attempt to determine the origin of this nation; it is certain that it consists of three distinct races, who have for ages past formed intermixtures which vary to infinity. The first race is that of Zafé Ibrahim, or descendants of Abraham; but they have no vestige of Judaism, except circumcision, and some names, such as Isaac, Reuben, Jacob, &c. This race is of a brown colour.—The 2d race is that of Zaféramini: with respect to this, some books, which are still extant among the *Ombiasies*, affirm, that it is not more than six centuries since their arrival at Madagascar.—With respect to the 3d race of Zafé Canambou, it is of Arabian extraction, and arrived much more lately than the others from the coasts of Ethiopia; hence it possesses neither power nor credit, and fills only the charges of writers, historians, poets," &c.

(5.) MADAGASCAR, HISTORY OF. The French attempted to conquer and take possession of this island, by order of Lewis XIII. and XIV. and they maintained a footing on it from 1642 to 1657. During this period, by the most cruel treachery, they taught the native princes the barbarous traffic in slaves, by villanously selling to the Dutch governor of Mauritius a number of innocent people, who had assisted them in forming a settlement at Fort Dauphin. Of their expulsion from it, a general account is already given under ANOSTI, § 3. We shall therefore only add the following particulars: La Case, one of the French officers employed by the governor of Fort Dauphin against the natives, was so successful in all his enterprises, that they called him *Deaan Pons*, the name of a chief who had formerly conquered the whole island. The French governor, jealous of his renown, treated him harshly, and refused to allow him the honours due to his valour. The sovereign of the province of Amboville, called *Daan Pafsitat*, taking advantage of his discontent, prevailed on him to become his general. Five Frenchmen followed him. *Daan Nong*, the daughter of *Rafesitat*, captivated by the person and heroism of La Case, offered him her hand with the consent of her father. The chief, grown old and infirm, wished to secure the happiness of his subjects, by appointing his son-in-law master of the rich province of Amboville. (See AMBOVILLE: La Case, however, refused the titles and honours attached to the sovereign power; and he would accept of no other character, than that of the father subject of his wife, who was declared sovereign at the death of her father. Scarcely in the affection of this princess, who was possessed of great qualities as well as of personal charms, he was beloved and respected by her family, and by all the people of Amboville, who revered him as a father; and yet, how much sooner he wished to

to make peace with La Cate and his sovereign spouse. This peace, however, was of short duration; the French, restless and insolent to the neighbouring nations, again drew on them the vengeance of the natives. Even the few friends whom they had acquired by means of La Cate, were rendered hostile by the tyrannic zeal of the missionaries; who, not contented with being allowed to make converts, insisted on Deaan Manang sovereign of Mandrarey, a powerful, courageous, and intelligent chief, well disposed to the French, to divorce all his wives but one. This prince assured them that he was unable to change his habits and way of living, which were those of his forefathers. Brother Stephen, the French priest, threatened to take his wives from him by military force, if he would not repudiate them all but one. To free himself from the persecution of this priest, he removed with his family 80 miles up the country; but he was soon followed by F. Stephen and another missionary, with their attendants. Manang still received them civilly; but he intreated them no longer to insist on the conversion of him and his people, as it was impossible for them to quit the customs and manners of their ancestors. The only reply which Stephen made was by tearing off the *olis*, the amulets and charms, which the chief wore as sacred badges of his own religion; and, throwing them into the fire, he declared war against him and his nation. This violence instantly cost him and his followers their lives; they were all massacred by order of Manang." See ANOSSE, § 3. "Our yoke (says the Abbé Rochon) was become odious and insupportable. Historians, for the honour of civilized nations, should bury in oblivion the afflicting narratives of the atrocities exercised on these people, whom we are pleased to call barbarous, treacherous, and deceit-

ful, but belong to those who are apt of cultivating them. These islanders have no locks nor keys; the principal part of their diet consists in rice, fish, and flesh; their rice is seasoned with a soup which is seasoned with pepper, ginger, saffron, and aromatic herbs. They display great address in catching birds, which are unknown in Europe; they hunt for larks, partridges, quails, pintadoes, and teal of 5 or 6 different kinds, blue herons, paroquets, and turtle-doves, in great plenty of a monstrous size, which are much prized on account of their exquisite flavour. The natives are so hideous in their appearance, that they first terrify the European sailors; but they have vanquished their repugnance to taste their flesh before that of the pull of their own country. The Melagaches also catch a immense quantity of sea fish; such as the sole, the herring, the mackerel, &c. with oysters, crabs, &c. They catch excellent eels and mullets of an exquisite flavour. The inhabitants near St Augustine's bay are able to exchange their provisions for European articles. These, on the part of the Melagaches, are cattle, poultry, milk, fruit, porcelain, potatoes, yams, fish, lances, &c. From the Europeans they receive muskets, bullets, flints, *clouties*, (including chiefs, and liners of all kinds) beads, &c.—Silver, which they call *Manila*, they esteem with them, and is made into ornaments for their wives. That part of the island which the English squadron touched, belongs to *Raba*, who, by the account of Mr Irvine, greatly to affect to be an Englishman. The people, like those of Joanna, seemed fond of

OF THE PEOPLE OF. The Madecasses are a good natured people, but easily provoked, apt to show their resentment when they think themselves injured. Another characteristic is, the high notions of dignity they entertain of their who resides in a town built with mud, 12 miles up from St Augustine's Bay. : physiognomy displays the appearance of ness and satisfaction: they are desirous only rning such things as may administer to their sities; that species of knowledge which de- s reflection is indifferent to them; sober, a- ctive, they spend the greatest part of their in amusement. In fine, according to the , they are equally devoid of vice and of vir- the gratifications of the present moment sole- rny their reflections; they possess no kind eught, and have no idea that there are men : world who trouble themselves about the e- f futurity. But such a description of any n beings is hardly credible. All the women adagascar, excepting the very poorest, wear ring over their breasts and shoulders, orna- ed with glass beads, and none go without a about their loins. They commonly walk a long slender rod or stick. The men mar- many women as they can support. The Rochon gives the following description of eople in the S. division of the island: "That of Madagascar in which Fort Dauphin is si- is very populous. When the chiefs go a- b, they are always provided with a musket tuck armed with iron, and adorned at the pity with a little tuft of cow's hair. They a bonnet of red wool. It is chiefly by the f of their bonnet that they are distinguished their subjects. Their authority is extreme- ed: however, in the province of Carca- the lands by custom belong to their chiefs, ttribute them among their subjects for the es of cultivation; they exact a trifling quit- return, which in their language is called .—The people of Carcanossi are not alto- rignorant of the art of writing; they even b some historical works in the Madagascar e; but their learned men, whom they term es, use the Arabic characters alone. They eatifies on medicine, geomancy, and judi- rology; the most renowned live in the pro- of Matatane: in that district magic still re- in all its glory; the Matanes are actually led by the other Madecasses on account eir excellence in this delusive art. The asses have public schools in which they egeomancy and astrology. The natives have ably learned the art of writing from rrahians, who made a conquest of this about 300 years since. The people of u, near fort Dauphin, are lively, gay, e, and grateful; they are passionately of women; are never melancholy in their ay; and their principal occupation is ase the sex: indeed, whenever they meet rives, they begin to sing and dance. The o, from being happy, are always in good r. Their lively and cheerful character is eely pleasing to the Europeans. I have of- . XIII. PART II.

ten been present at their assemblies, where affairs of importance have been agitated; I have observed their dances, their sports, and their amusements, and I have found them free from those excesses which are but too common among polished nations."—"If the people of Madagascar (adds the Abbe) have sometimes availed themselves of treachery, they have been forced to it by the tyranny of the Europeans. The weak have no other arms against the strong. They are uninformed and helpless; and we avail ourselves of their weakness, to make them submit to our covetousness and caprice. They receive the most cruel and oppressive treatment, in return for the hospitality which they generously bestow on us; and we call them traitors and cowards, when we force them to break the yoke with which we load them."

(8.) MADAGASCAR, MANUFACTURES AND ARTS IN. "In regard to arts and trades, (says Count Benyowsky,) the Madagascar nation are contented with such as are necessary to make their moveables, tools, utensils, and arms for defence; to construct their dwellings, and the boats which are necessary for their navigation; and lastly, to fabricate cloths and stuffs for their clothing. They are desirous only of possessing the necessary supplies of immediate utility and convenience. The principal and most respected business, is the manufacture of iron and steel. The artists in this way call themselves *ompanfa vite*. They are very expert in fusing the ore, and forging utensils, such as hatchets, hammers, anvils, knives, spades, sagaves, razors, pincers, or tweezers for pulling out the hair, &c. The 2d class consists of the goldsmiths (*ompanfa vola mena*): they cast gold in ingots, and make up bracelets, buckles, ear-rings, drops, rings. The 3d are called *ompanvilianga*, and are potters. The 4th are the *ompanevatta*, or turners in wood, who make boxes called *vatta*, plates, wooden and horn spoons, beehives, coffins, &c. The 5th *ompan cacafou*, or carpenters. They are very expert in this business, and use the rule, plane, compasses, &c. The 6th are the *ompaniavi*, or rope-makers. They make their ropes of different kinds of bark of trees, and likewise of hemp. The 7th *ompan lamba*, or weavers. This business is performed by women only, and it would be reckoned disgraceful in a man to exercise it. The *ombiaffis* are the literary men and physicians, who give advice only. The *berawitz* are comedians and dancers.

(9.) MADAGASCAR, QUADRUPEDS, INSECTS, &c. IN. See § 5.

(10.) MADAGASCAR, RELIGION OF THE PEOPLE OF. Count Benyowsky, in his *Memoirs and Travels*, already quoted, gives the following account of the religion of the people. "The Madagascar nation believe in a Supreme Being, whom they call ZANHARE, which denotes *Creator of all things*. They honour and reverence this Being; but have dedicated no temple to him, and much less have they substituted idols. They make sacrifices, by killing oxen and sheep, and they address all these libations to God. It has been asserted, that this nation likewise makes offerings to the devil; (See ANOSI, § 3.) but in this there is a

deception; for the piece of the sacrificed beast, which is usually thrown into the fire, is not intended in honour of the devil, as is pretended. This custom is very ancient. With regard to the immortality of the soul, the Madagascarian people are persuaded, that, after their death, their spirit will return again to the region in which the Zanhare dwells; but they by no means admit that the spirit of man, after his death, can suffer any evil. As to the distinction of evil or good, they are persuaded that the good and upright man shall be recompensed; in this life, by a good state of health, the constancy of his friends, the increase of his fortunes, the obedience of his children, and the happiness of beholding the prosperity of his family; and they believe that the wicked man's fate shall be the contrary to this. The Madagascarian people, upon this conviction, when they make oaths, add benedictions in favour of those who keep them, and curses against those who break them. In this manner they appeal to the judgment of Zanhare, in making agreements; and it has never been known, or heard of, that a native of Madagascar has broken his oath, provided it was made in the usual manner, which they say was prescribed by their forefathers. Mr Ives gives a similar account of the religion of this people, and a particular description of their manner of sacrificing, which greatly resembles that of the ancient Jews.

(II.) MADAGASCAR, TOWNS, VILLAGES, HOUSES, &c. IN. The Madagascarian people live in towns and villages. Almost all the towns and villages in the S. part of the island are placed on eminences, and surrounded with two rows of strong palisadoes, somewhat in the manner of such of our fences as are composed of hurdles and turf. Within is a parapet of solid earth about 4 feet in height; large pointed bamboos placed 5 feet from each other, and sunk in a pit, form a kind of loopholes, which contribute towards the defence of these villages. Some of which are besides fortified with a ditch 10 feet broad and 6 deep. The dwelling of the chief is called a *donac*. At the extremity of the town a guard of from 12 to 20 men is kept. The houses of private people consist of a convenient enclosure, surrounded by several walls; the master of the house dwells in the largest, and his women or slaves lodge in the smaller. These houses are built of wood, covered with leaves of the palm tree or straw. The houses of the great men of the country are very spacious; each house is composed of two walls and four apartments; and about the principal house other smaller habitations are built for the accommodation of the women, and the whole family of the chief; but the slaves cannot pass the night within them. Most of the houses inhabited by the Kalandrians are built with taste and admirable symmetry.

\* **MADDER.** *n. f.* [*maler*, Saxon.] The of the *madder* consists of one single leaf, is cut into 4 or 5 segments, and expanded top; the flower-cup afterwards becomes a composed of two juicy berries closely joined together, containing seed for the most part, ed like a navel; the leaves are rough, and and the stalks in whorles. *Miller.*—*Madder* vated in vast quantities in Holland: what itch send over for medicinal use is the root, is only dried; but the greatest quantity is ry the dyers, who have it sent in coarse r. *Hill.*

**MADDER.** See RUBIA. M. Macquer ob- that the Hollanders are obliged to the re- from Flanders for the knowledge of manu- the root of madder; and that they ge- cultivate it in fresh lands which have not sloughed. The commodity, when manu- ed, is distinguished into different kinds, as *madder*, *bunch madder*, &c. The grape r is the heart of the root; the other, s the heart, consists also of the bark all fibres proceeding from the principal

For the *grape madder*, the finest roots are l out, the bark separated at the mill, and side root kept moist in casks for 3 or 4 years, makes it mor. fit for dyeing than otherwise ld be. Unless madder be kept close in this r, it is apt to spoil, and loses its bright col- a great measure. It is yellow at first, but red and dark with age. It should be chosen ine saffron colour, in very hard lumps, and brong though not disagreeable smell. The r used for dyeing cottons in the East Indies, ome respects different from that of Europe. e coast of Coronandel it has the name of and grows wild on the coast of Malabar. ultivated kind is imported from Vaour and rin, but the most esteemed is the Persian called also *dumaz*. Another plant, called *é chaze*, or colour-root, is also gathered on est of Coronandel; but this, though sup- to be a species of madder, is a kind of *ga- lore albo*, which, however, gives a tolerable colour to cotton. Another species of mad- called *chive-boya*, and *chine-kazala*, is cul- d at Kunder near Smyrna, and some other ries of Turkey in Asia. It is more esteemed the best Zealand madder imported by the 1; and experiments have shown that it is or to any other kind as a dyeing ingredient. odern Greeks call this kind of madder *li-* and the Arabs *fenzy*. The fine colour of madders, however, are by Macquer attri- to their being dried in the air, and not in . Another kind of madder is produced in a, where it is called *tyssie-voyana*; its quali- e nearly the same with those of the Euro- ind. The root of madder impregnates wa- h a dull red colour, and spirit of wine with a bright red. This root, when eaten by an- along with their food, tinges their urine, air most solid bones, of a deep red. Wool ussy boiled in a solution of alum and tartar, s from a hot decoction of madder and tar- very durable but not a very beautiful red . Mr Margraf (Berlin Mem. 1771), shows

how a very durable lake of a fine colour, fit for painting, may be obtained from madder. This process is as follows: "Take 2 oz. of the purest Roman alum, and dissolve it in 3 French quarts of distilled water that has boiled in a clean glazed pot. Set the pot on the fire; and when the wa- ter begins to boil withdraw it, and add 2 ounces of the best Dutch madder. Boil the mixture once or twice; then remove it from the fire, and filter it through a double filter of paper not coloured. Let the liquor thus filtrated stand a night to set- tle, and pour off the clear liquor into the glazed pot previously well cleaned. Make the liquor hot, and add to it gradually a clear solution of salt of tartar in water, till all the madder is pre- cipitated. Filtrate the mixture; and upon the red precipitate which remains upon the filter pour boiling distilled water, till the water no longer acquires a saline taste. The red lake is then to be gently dried. No other water, neither rain nor river water, produces so good a colour as that which has been distilled, and the quantity requir- ed of this is considerable. The colour of the a- bove precipitate is deep; but if two parts of mad- der be used to one part of alum, the colour will be still deeper; one part of madder and 4 of alum produce a beautiful rose colour." See DYEING, Part III. Sect. iii. and x.

(3.) **MADDER, LITTLE FIELD.** See SHERARDIA.

(4.) **MADDER, PETTY.** See CRUCIANELLA.

**MADDERTY**, a parish of Scotland, in Perth- shire. The climate is cold and wet; the soil a stiff clay, and husbandry little improved; yet more grain is produced than serves the inhabi- tants. The population, in 1795, was 651, and had decreased 165 since 1755. The roads are bad. The only antiquity is the abbey of Inch- Effry, founded A. D. 1206, by Gilbert Earl of Strathearn. See INCH-EFFRAY.

(1.) **MADDISON**, a county of Kentucky; bounded on the N. by Fayette, NE. by Clarke, S. by Lincoln, and W. by Mercer.

(2.) **MADDISON**, a town of Virginia; in Amherst county, 150 miles W. by N. of Richmond.

**MADDOX.** See MADOX, N° 1.

\* **MADE**, participle preterite of *make*.—Nei- ther hath this man sinned, nor his parents; but that the works of God should be *made* manifest.

**MADECASSÉS.** See MADAGASCAR, § 6.

\* **MADEFACTION.** *n. f.* [*maefario*, Latin.] The act of making wet.—'To all *maefaction* there is required an imbibition. *Bacon.*

\* **To MADEFY.** *v. a.* [*mad-fy*, Latin.] To moisten; to make wet.

(1.) **MADEIRA**, the largest of the **MADEIRA ISLANDS**, from which the rest take their name, is about 55 English miles long, and 10 miles broad; and was first discovered on the 2d July, in 1419, by Joao Gonzales Zarco. It is divided into two capitania; or governments, named *Funchal* and *Maxico*, from their chief towns. The former contains two judicatures, viz. Funchal and Calhetta; the latter is a town with the title of a county. The capitania of Maxico likewise com- prehends two judicatures, viz. Maxico or Ma- shico, and San Vicente. **FUNCHAL** is the only city in the island. See **FUNCHAL**. There are also 7 villas or towns; of which these 4 are in the

capitania of Funchal, viz. Calheta, Camara de Lobos, Ribeira Braba, and Ponta de Sol: and 3 in that of Maxico, viz. Maxico, San Vicente, and Santa Cruz. Funchal is divided into 26 parishes, and Maxico into 17. The governor is at the head of all the civil and military departments of this island, of Porto Santo, the Salvages, and the Ilhas Desertas, or Desert Isles; which contain only the temporary huts of some fishermen. The law department is under the corregidor, who is appointed by the king of Portugal, commonly sent from Lisbon, and holds his place during the king's pleasure. All causes come to him from inferior courts by appeal. Each judicature has a senate; and a judge, whom they choose, presides over them. At Funchal he is called *Juiz de Fora*; and in the absence, or after the death of the corregidor, acts as his deputy. The foreign merchants elect their own judge, called the *Providor*, who is at the same time collector of the king's customs and revenues, which amount in all to about 12,000l. Sterling. The greatest part of this sum is applied towards the salaries of civil and military officers, the pay of troops, and the maintenance of public buildings. This revenue arises, first from the tenth of all the produce of this island belonging to the king, by virtue of his office as grand master of the order of Christ; 2dly, from 10 per cent duties laid on all imports, provisions excepted; and lastly, from the 11 per cent, charged on all exports. The island has but one company of regular soldiers of 100 men; the rest of the military force is a militia consisting of 3000 men divided into companies, each commanded by a captain, who has one lieutenant under him and one ensign. No pay is given to either the private men or the officers of this militia; and yet their pieces are much sought after, on account of the rank which they communicate. These troops are embodied once a-year, and exercised once a-month. All the military are commanded by the *Sergeante-Mor*. The governor has two *Capitanos de Sal* about him, who do duty as aides-de-camp. The number of secular priests is about 1200, many of whom are employed as private tutors. Since the expulsion of the Jesuits, no regular public school is to be found here; but a priest instructs and educates ten students at the king's expence. These wear a red cloak over the usual black gowns worn by students. All, who intend to go into orders, are obliged to qualify themselves by studying in the university of Coimbra lately re-established. There is also a dean and chapter at Madeira, with a bishop at their head, whose income is considerably greater than the governor's; it consists of 110 pipes of wine, and of 40 mays of wheat, each containing 24 bushels; which amounts in common years to 3000l. Sterling. Here are likewise 60 or 70 Franciscan friars, in 4 monasteries, one of which is at Funchal. About 300 nuns live on the island, in 4 convents, of the order of Merci, Sta. Clara, Incomenzas, and Bon Jesus. Those of the last mentioned institution may marry whenever they choose, and leave their monastery. In 1768, the inhabitants living in 43 parishes of Madeira, amounted to 63,913, of whom there were 31,741 males and 32,172 females. But in that year 5243 persons died, and no more than 2198 children

were born; so that the number of dead that of births by 3045. But it is by some epidemical distemper had carried proportionate a number in that year mate is excellent, the weather in general temperate: in summer, the heat is very on the higher parts of the island, and the snow remains there for several days; habitants are of a tawney colour, and ed; though they have large feet, owing furs they make in climbing the crags this mountainous country. Their faces long, their eyes dark; their black hair falls in ringlets, and begins to crisp in viduals, which may be owing to inter with negroes; in general, they are hard but not disagreeable. Their women are ly ill-favoured. They are small, have cheek-bones, large feet, an ungraceful the colour of the darkest brunette. The portion of the body, the fine form of the and their large lively eyes, in some measure penfate for these defects. The labourers summer, wear linen trowsers, a coarse sh hat, and boots; some have a short jacket of cloth, and a long cloak. The women petticoat, and a short jacket, closely fitted shapes, which is not inelegant. They short, but wide cloak; and those who married tie their hair on the crown of on which they wear no covering. The people are very sober and frugal; their sitting of bread and onions, or other little animal food. Their common diet, or an infusion of the skin of the g it has passed through the wine press, which fermented acquires some tartness and cannot be kept long. The wine of the island is famous, and which they prefer regales them. Their principal occupation and raising vines; but as that branch culture requires little attendance for a of the year, they naturally incline to The vineyards are held only on an acre and the farmer reaps but 4 10ths of the as 4 other 10ths are paid in kind to the land, one tenth to the king, and one clergy. Such small profits, joined together of toiling merely for the advantage discourage improvements. Oppressed however, they preserve a high degree ofness and contentment; and in the evening assemble from different cottages to dance men wear French clothes, commonly very old fashioned. The ladies are delicate have agreeable features; but the mutual jealousy still lock them up, and deprive a happiness which the country would Many of the superior people are a sort of nobles whom we would call *gentry*, whose and genealogical pride makes them uncauses a ridiculous affectation of grand property is in the hands of a few families, who live at Funchal, and in the towns. Madeira consists of one large town, which rises every where from the sea to the centre of the island, converging to the middle of which is an excavation, c

val by the inhabitants, always covered with a rich and delicate herbage. From the calcined appearance and the soil, it seems probable that the island has been formerly a volcano, and, that the Val was its crater. Their supply of water is very scanty and as this article is absolutely necessary to the vineyards, it is not without great expence that a new vineyard can be planted; for the maintenance of which, the owners must purchase water at a high price, from those who are constantly supplied with it. Wherever a level piece of ground can be contrived in the higher hills, the natives make plantations of eddoes enclosed by a dike to cause a stagnation, as that plant succeeds best in swampy ground. The leaves serve as food for hogs, and the country people eat the roots. The sweet potatoe too, is cultivated, and makes a principal article of diet; together with chestnuts, which grow in extensive woods, on the higher parts of the island, where the vine will not thrive. Wheat and barley are likewise sown in spots where the vines are decaying through age, or where they are newly planted. But the crops do not produce above three months provisions; the inhabitants are therefore obliged to have recourse to other food, besides importing considerable quantities of corn from N. America in exchange for wine. The want of manure, and the inactivity of the people, are in some measure the causes of this disadvantage; but though husbandry were tried to perfection here, they could not raise corn sufficient for their consumption. They use their threshing-floors of a circular form, a corner of a field which is cleared and beaten level for the purpose. The sheaves are laid round out in a circle, and a square board, stuck full of sharp nails below, is dragged over them by a pair of oxen, the driver getting on it to increase its weight. This machine cuts the straw as if it had been chopped, and frees the grain from the husk, in which it is afterwards separated. The chief produce of Madeira is the wine, from which it has acquired fame and support. Wherever the soil, exposure, and supply of water, will admit of it, the vine is cultivated. One or more rows, about a yard or two wide, intersect each other, and are enclosed by stone walls two feet high. Along these walks, which are arched over with laths about 7 feet high, they erect wooden bars at regular distances, to support a lattice-work of bamboos, which slopes down from both sides of the walk, till it is only a foot and a half or two feet high, in which elevation it extends over the whole vineyard. The vines are in this manner supported from the ground, and the people have room to root out the weeds which spring up between them. In the season of the vintage, they creep under this lattice-work, cut off the grapes, and lay them into baskets: some bunches of these grapes weigh 6 lbs. and upwards. This method of keeping the ground clean and moist, and ripening the grapes in the shade, contributes to give the Madona wine that excellent flavour and body for which they are remarkable. The owners of vineyards are however obliged to allot a certain spot of ground for the growth of bamboos; for the lattice-work cannot be made without them; and

some vineyards lie quite neglected for want of this useful reed. The wines are of 3 different qualities. The best is called *Madeira Malmoisy*, a pipe of which cannot be bought on the spot for less than 40 or 42 l. Sterling. It is exceeding rich and sweet, and is only made in a small quantity. The next is dry wine, such as is exported to London, at 30 or 31 l. Sterling the pipe. Inferior sorts for the E. and W. Indies, and N. America sell at 28, 25, and 20 l. Sterling. About 30,000 pipes, upon an average, are made annually containing 110 gallons each. About 13,000 pipes, of the better sorts are exported; and all the rest is made into brandy for the Brazils, converted into vinegar, or consumed at home. The inclosures of the vineyards consist of walls, and hedges of prickly pear, pomegranates, myrtles, brambles, and wild roses. The gardens produce peaches, apricots, quinces, apples, pears, walnuts, chestnuts, and many other European fruits; together with some tropical plants, such as bananas, goavas, and pine apples. All the common domestic animals of Europe are found at Madeira; and their mutton and beef, though small, is very well tasted. Their horses are small, but sure-footed; and with great agility climb the difficult paths, which are the only means of communication in the country. They have no wheel-carriages of any kind; but in the town they use a sort of drays or sledges, formed of two pieces of plank joined by cross pieces, which make an acute angle before; these are drawn by oxen, and are used to transport casks of wine, and other heavy goods, to and from the warehouses. The wild animals of the feathered tribe, are numerous; but of wild quadrupeds there is only the common grey rabbit. Turkeys, geese, ducks, and hens, are very rare. There are no snakes, but all the houses, vineyards, and gardens, swarm with lizards; which they catch by hundreds in brass kettles, as, when once they are in, they cannot get out again, from the smoothness of the insides. The shores of Madeira, and of the neighbouring Salvages and Desertas, are not without fish; but as they are not in plenty enough for the rigid observance of Lent, pickled herrings are brought from Gottenburg in English bottoms, and salted cod from New York and other American ports, to supply the deficiency.

(2.) MADEIRAS, a cluster of islands in the Atlantic ocean in W. Long. 10° and between 32° and 33° N. Lat.

MADFUNE, a town of Egypt, anciently called *Abydos*. See *ABYDOS*, N° 3.

\* MADGEHOWLET. *n. f.* [*bubo*.] An owl. *Amfworth*.

\* MADHOUSE. *n. f.* [*mad* and *house*.] A house where madmen are cured or confined.—A fellow, in a *madhouse* being asked how he came there? Why, says he, the mad folks abroad are too many for us, and so they have muffled all the sober people, and couped them up here. *L'Esfrange*.

(1.) MADIAN, in ancient geography, a town of Arabia Petraea, near the Arnan; so called from one of the sons of Abraham by Ketura; in ruins in Jerome's time.

(2.) MADIAN. See *MADIAN*.

MADIANÆA REGIO, the country of MADIAN.  
MADIANÆI, or the inhabitants of MADI-  
MADIANITÆ, § AN.

\* MADLY, *adv.* [from *mad*.] Without un-  
derstanding; furiously.—

He wav'd a torch aloft, and madly vain,  
Sought godlight worship from a servile train.

*Dryden.*

\* MADMAN, *n. f.* [*mad* and *man*.] A man  
deprived of his understanding.—They shall be  
like madmen, sparing none, but still sporting.  
2 *Esdr.* xvi. 71.—He that eagerly pursues any  
thing, is no better than a madman. *L'Esrange.*  
—He who ties a madman's hands, or takes away  
his sword, loves his person while he disarms his  
frenzy. *South.*

MADMAR, a town of Persia, in Chorasan.

(1.) \* MADNESS, *n. f.* [from *mad*.] 1. Distrac-  
tion; loss of understanding; perturbation of the  
faculties.—Why, woman, your husband is in his  
old lunes again; he so buffets himself on the fore-  
head, that any madnes I ever yet beheld seem'd  
but tameness and civility to this distemper.  
*Shak.*—There are degrees of madnes as of folly,  
the disorderly jumbling ideas together, in some  
more, some less. *Lacke.* 2. Fury; wildness of  
passion; rage.—The power of God sets bounds  
to the raging of the sea, and restrains the madnes  
of the people. *King Charles.*—

He rav'd with all the madnes of despair,  
He roar'd he beat his breast, and tore his hair.

*Dryden.*

(2.) MADNESS, a most dreadful kind of delirium,  
without fever. See MEDICINE, *Index.*

(3.) MADNESS, CANINE. See HYDROPHOBIA,  
and MEDICINE, *Index.*

(1.) MADNUA, a district of Maritime Austria,  
in Fauh; containing one town and 24 villages.

(2, 3.) MADNUA, a river in the above district,  
and a borough containing 6000 inhabitants in  
1797.

(1.) MADOX, Dr Isaac, a worthy English  
prelate, born July 27, 1697, of obscure parents,  
who died during his infancy. His aunt placed  
him apprentice to a pastry-cook, but showing an  
inclination to learning, he was put to school by  
some friends, and completed his studies at Aber-  
deen. He entered into orders; and being made  
chaplain to Dr Bradford Bp. of Chichester, he  
married his niece, a very worthy lady, in 1731.  
After this he was made king's chaplain, clerk of  
the closet to queen Caroline, and about 1736 Bp.  
of St Asaph; whence, in 1743, he was translated  
to Worcester. He was an excellent preacher,  
and a great promoter of public charities; parti-  
cularly the Worcester infirmary, and the hospi-  
tal for inoculating the small-pox at London. His  
sermon in favour of this last institution, preached  
in 1752, was much admired, and contributed  
greatly to extend the practice of inoculation. He  
published some other single sermons, and a De-  
fence of the Doctrine and Discipline of the Church  
of England, in answer to Mr Neale's *History of the  
Puritans.*—Dr Madox died in 1759.

(2.) MADOX, Thomas, a learned and indefati-  
gable English Antiquary, of the 18th century,  
born in the 17th, but of whose birth, birth-place,  
family, and death, we find nothing on record.

Patronised by the learned lord Somers, he pub-  
lished, in 1702, "A collection of antique char-  
ters and instruments, taken from the originals,  
from the Norman conquest to the end of the  
reign of Henry VIII." In 1711, he published a  
work of still more importance, viz. "The His-  
tory and antiquities of the Exchequer of the  
Kings of England, from the conquest to the end  
of the reign of Edward II." &c. in fol. which was  
reprinted in 1769, in 4to. This was dedicated  
to Q. Anne, with a long prefatory epistle to lord  
Somers; and appears to have procured him the  
office of Historiographer royal. His last work  
was "Firma Burgi, or a historical Essay concern-  
ing the cities, towns and boroughs of England,"  
dedicated to K. George I. He also compiled a  
valuable "Collection of transcripts, in 94 vols.  
fol. and 4to. consisting chiefly of extracts from re-  
cords in the Exchequer, the rolls in the Tower,  
the Cottonian Library," &c. intended to afford  
materials for a Feudal History of England from  
the earliest times. These vols. which cost him  
30 years labour, were presented by his widow to  
the British Museum; and Mr Madox often said,  
that, when young he would have given 1500  
guineas for them.

MADRAS, or FORT ST GEORGE, a town and  
fort of Hindoostan, on the coast of Coromandel,  
built by Sir W. Langhorne, in 1640, by order of  
the English East India Company, in the reign of  
Charles II. It fronts the sea, and has a salt-water  
river on its back side, which hinders the fresh-  
water springs from coming near the town, so that  
they have no good water within a mile. In the  
rainy seasons it is incommoded by inundations;  
and from April to September, the heat would be  
intolerable were it not for the sea-breezes. It  
consists of two tow-; one, called the *White  
Town*, is walled round, has several bulwarks and  
bastions; is 400 paces long and 150 broad, and  
is divided into regular streets. It has two  
churches, for Protestants, and Papists; a good hos-  
pital, a town hall, and a prison. It is incorpo-  
rated, and has a mayor and aldermen, &c. The  
*Black Town* is inhabited by Gentoos, Mahome-  
tans, Jews, and Portuguese and Armenian Chris-  
tians; each of whom have their temples or  
churches. Both are ruled by the English governor  
and his council. The diamond mines are only  
distant a week's journey, which renders them  
pretty plentiful, but there are no large diamonds  
since the great one was procured by governor  
Pitt. This colony produces very little of its own  
growth or manufacture; and its trade is in the  
hands of the Armenians and Gentoos. The chief  
articles the British deal in, besides diamonds, are  
calicoes, chints, muslins, and the like. The co-  
lony consists of about 80,000 inhabitants, and they  
are generally 400 or 500 Europeans. Their rice is  
brought by sea to Gangam and Orix; their  
wheat from Surat and Bengal, and their fire-  
wood from the islands of Diu. The houses of  
the White Town are built with bricks, and have  
lofty rooms and flat roofs; the Black Town con-  
sists chiefly of thatched cottages. The military  
power is lodged in the governor and council, who  
are also the last resort in civil causes. The salaries  
of the company's clerks are small, but, they com-  
m. 7

rich by trading. It was taken by the  
746, but restored at the peace of Aix-

It lies 100 miles N. by E. of Pon-  
58 SE. of Bombay, and 1030 SW. by  
atta. Lon. 80. 25. E. Lat. 13. 6. N.

DE PORA, a town of S. America, in  
na, seated on the Grande, with a fan-  
t. It is almost as much resorted to  
of America as Loretto is in Europe;  
ge of the Virgin Mary is said to have  
miracles in favour of the sea-faring  
on. 76. o. W. Lat. 11. o. N.

PORA, in natural history, a genus of  
substances; the characters of which  
hey are almost of a stony hardness, re-  
e corals, and are usually divided into  
nd pervious by many holes or cavities,  
frequently of a stellar figure. In the  
stem, this is a genus of lithophyta:  
l that inhabits it is the MEDUSA; it  
is 39 species. According to Donati,  
is white when polished; its surface is  
bled, and the wrinkles run lengthwise  
ches; in the centre there is a sort of  
which is often pierced through its  
h by 2 or 3 holes. From this are de-  
at 17 laminæ, which run to the cir-  
in straight lines; and are transversely  
by other laminæ, forming many iri-  
ities; the cellules, which are compos-  
laminæ ranged into a circle, are the  
of little polypes, which are extreme-  
imals, generally transparent, and va-  
th beautiful colours. M. de Puyssonel  
at those writers who only considered  
of submarine substances, denominated  
of them, which seemed pierced with  
; and those, the holes of which were  
called *madr.pora*. He defines them  
of marine bodies which are of a stony  
without either bark or crust, and which  
e apparent opening at each extremity,  
ith rays that proceed from the centre  
mstance. He observes that the body  
al of the madrepora, whose flesh is so  
divides upon the gentlest touch, fills  
the head is placed in the middle, and  
by several feet or claws, which fill the  
e partitions observed in this sub-  
are at pleasure brought to its head,  
nished with yellow papillæ. He dis-  
at its head or centre was lifted up oc-  
bove the surface, and often contracted  
itself like the pupil of the eye: he  
claws moved, as well as its head or  
then the animals of the madrepora are  
its extremities become white. In the  
he says, the animal occupies the ex-  
nd the substance is of a stony but more  
re than the coral. This is formed, like  
ances of the same nature, of a liquor  
animal discharges; and he adds, that  
s of the polype of the madrepora are  
irily, and others in clusters.

DAID, a town of Spain, in New Cas-  
l of the kingdom, situated in Lon. 3.  
1. 40. 26. N. It stands in the centre of  
n, surrounded with mountains, and in

the very heart of Spain, on the banks of the Man-  
zanares. The city is in general well laid out; the  
streets are wide, clean, and well paved; and the  
houses lofty, but built of brick, with lattice win-  
dows, excepting those of the rich, which are of  
glass; only, during the summer heats, they use  
gauze, to let in the fresh air. There are two  
stately bridges over the Manzanares, and many  
magnificent churches, convents, hospitals, and  
palaces. The royal palace, which stands on the  
W. side of the town, on an eminence, is spacious  
and magnificent, consisting of three courts, and  
commanding a fine prospect. At the E. end of  
the town is the *Prado*, a delightful plain, planted  
with regular rows of poplar trees, and watered  
with many fountains; where the inhabitants of  
all ranks resort. The principal square is the *Plaza  
Mayor*, which is 1536 feet in circuit, and is fur-  
rounded with piazzas, and 156 elegant and lofty  
houses, 5 stories high. A market is held in the  
middle of it. The other squares and streets are  
ornamented with fountains in a very ill taste. The  
water, however, is excellent, and the air, though  
the weather be variable and uncertain, is extreme-  
ly pure. Madrid is well supplied with provisions  
of all kinds at reasonable rates; and the court,  
with the resort and residence of the quality, and  
the colleges and offices that are held in it, occa-  
sion a brisk trade and circulation of money. The  
churches have nothing remarkable in their archi-  
tecture: those of St Pasqual, St Isabella, and the  
Carmelites, contain highly valuable collections of  
pictures. Besides a variety of charitable founda-  
tions, there are here three confraternities, the re-  
venues of which are appropriated to the succour  
of the wretched; and an institution similar to the  
*Mont de Pieté* in Paris, the principal object of  
which is to advance money to the necessitous.—  
Madrid contains 15 gates, 18 parishes, 35 con-  
vents of monks, and 31 of nuns; 39 colleges, hos-  
pitals, and houses of charity; 7398 dwelling-hou-  
ses, and about 140,000 inhabitants. The Lon-  
bard traveller, F. Caino, tells us, that 50,000  
sheep and 12,000 oxen are annually consumed in  
it. There are 4 academies; viz. 1. The Spanish  
academy, founded in 1714, and consisting of 24  
members, including the president. 2. The ac-  
cademy of history; the object of whose meetings is  
to preserve and illustrate the historical monuments  
of Spain. Their labours met the approbation of  
Philip V. who in 1738 confirmed their statutes by  
a royal edict. This academy consists of 24 mem-  
bers, including the president, secretary, and cen-  
sor. 3. The academy of painting, sculpture, and  
architecture: and, 4. The academy of medicine.  
The environs of Madrid contain several royal  
seats; among which are Buen Retiro, Casa del  
Campo, Florida, Pardo, Sorfucia, and St Ildefon-  
so; but the most magnificent not only in this  
country but perhaps in the whole world is the  
Escorial. See ESCORIAL, N° 1. Another royal  
palace, greatly admired for its gardens and water-  
works, is Aranjuez. See ARANJUEZ. Madrid lies  
265 miles NE. of Lisbon, 590 S. by W. of Lon-  
don, 625 SSW. of Paris, and 755 N W. of Rome.

(2) MADRID, New, a town of Louisiana, W. of  
the Mississippi. Lon. 89. 50. W. Lat. 30. 36. N.

\* MADRIER, n. f. *Madrier*, in war, is a kind of  
Pia. k

plank armed with iron plates, having a cavity sufficient to receive the mouth of the petard when charged, with which it is applied against a gate, or other thing intended to be broken down. *Bailey*.

(1.) \* **MADRIGAL**. *n. f.* [*madrigal*, Spanish and French, from *mandra*, Latin; whence it was written anciently *mandriale*, Italian.] A pastoral song; any light airy short song.—A *madrigal* is a little amorous piece, which contains a certain number of unequal verses, not tied to the scrupulous regularity of a sonnet, or subtilty of an epigram: it consists of one single rank of verses, and in that differs from a canzonet, which consists of several strophes, which return in the same order and number. *Bailey*.—

Waters, by whose falls

Birds sing melodious *madrigals*. *Shak.*

His artful strains have oft delid'd

The huddling brook to hear his *madrigal*. *Milt.*  
—Their tongue is light and trifling in comparison of the English; more proper for sonnets, *madrigals*, and elegies, than heroick poetry. *Dryden*.

(2.) A **MADRIGAL** should consist of some tender and delicate thought, expressed with a beautiful and elegant simplicity. Menage derives the word from *mandra*, a sheep-fold, supposing it to have been originally a kind of pastoral; others derive it from *madrugar*, Spanish, to rise in the morning; from the *madrigals* being sung early in the morning by lovers to serenade their mistresses.

(3.) **MADRIGAL**, a town of Spain, in Old Castile.

**MADRIGOLO**, a town of Parma, 6 miles W. of Parma.

**MADRISIO**, a town of Maritime Austria, in Friuli, 30 miles N. of Venice.

**MADROGAN**, the capital of Monomotapa.

(1.) **MADURA**, a province of Indostan, 60 miles long and 30 broad, bounded on the E. by Tanjour and Marava; SE. by the sea; W. by the Balagate mountains, which separate it from Malabar, and N. by Visapour and Carnate. The chief commodities are rice, elephants teeth, and cotton cloth; of which last a great deal is made, very fine. The Dutch have a rich pearl fishery.

(2.) **MADURA**, the capital of the above province, is well fortified with square towers and parapets; 182 miles SSE. of Seringapatam, and 236 SSW. of Madras. Lon. 78. 11. E. Lat. 9. 30. N.

(3.) **MADURA**, an island, with its capital, in the East Indian Ocean, 73 miles long, and from 9 to 12 broad; very fertile in rice, and containing 3 provinces. Lon. 112. 49. E. Lat. 7. 5. S.

(1.) \* **MADWORT**. *n. f.* [*mad* and *wort*.] An herb.

(2.) **MADWORT**. See **ALYSSUM**.

**MÆANDER**, in ancient geography, a celebrated river of Asia Minor, rising near Colænzæ. It flows through Caria and Ionia into the Ægean sea between Miletus and Priene, after receiving the waters of the Marfyas, Lycus, Eudon, Lethæus, &c. It is celebrated among the poets for its numerous windings, which amount to not less than 600; and hence all windings are called *mæanders*.

**MÆATZÆ**, or } an ancient people of Scotland,  
**MÆATS**, } or rather of Britain, who inhabited the middle part of the island, and hence

are styled by Dr Anderson, in his *Royal Geogies*, the *Mid-land Britons*. Their territory between the two Roman walls, and comprehended the country since called Northumberland the territories between it and the Friths of and Forth. *Dunbritton* or **DUNBARTON** was capital; their kingdom was called by the Romans *Regnum Cambrense*; and they had kings of own till the Norman conquest. Such is I Anderson's account of the *Mæatzæ*; but other their territories comprehended only the now called **LAUDERDALE**.

**MÆCENAS**, Caius Cilnius, the great and counsellor of Augustus, and the cele and liberal patron and protector of men of letters. He was descended from the kings of Etruria; his immediate forefathers were only of the trian order. He is supposed to have been at Rome, as his family lived there; but no is known of him previous to the death of A. U. C. 709; when Octavius Cæsar was Rome, to take possession of his uncle's estate; and Mæcenas became first publicly known. From that time he accompanied him through his fortunes, and was his adviser upon all occasions, so that Pædo Albinovanus called him his *right-hand*. In A. U. C. 710, Mæcenas distinguished himself by his courage and military skill in the battle of Modena, as he did afterwards at Philippi. After this last battle began his men friendship with Horace, who was a tribune of the army of Brutus, and was taken prisoner. Mæcenas recommended him to Augustus, who restored to him his estate with no small additions. The league made at Brundisium between Anton and Augustus, was negotiated by Mæcenas on part of the latter. (See Hor. Sat. v. l. 1. A. U. C. 717, when Augustus and Agrippa sailed to Sicily to fight Sextus Pompeius by sea, Mæcenas, who accompanied them, was first appeale some commotions at Rome. After the battle of Actium, he was placed over the management of the empire. While Augustus was extinguishing the remains of the civil war in Egypt, Mæcenas prevented the origin of a new one, by detecting a conspiracy to assassinate the Emperor on his return to Rome, and put to death young Lepidus the founder of it.

The civil wars being ended Augustus returned to Rome; and from this time Mæcenas indulged himself at vacant hours in literary amusements and the conversation of men of letters. His taste was opened all the learned of his time; Virgil, Horace, Propertius, Varius, Fundanius, Fabius, Arifius, Plotius Tucca, Valgius, Ainius P and many others, whom it would be tedious to mention. All these dedicated their work part of them, to Mæcenas, and celebrated his praises; and Plutarch says, even Augustus himself subscribed his Commentaries to him and Agrippa. Mæcenas continued in Augustus's favour to the end of his life, but not without interruption; the emperor broke through all the rules of friendship as well as morals, by forming an intrigue with Mæcenas's wife. Mæcenas died in the year 81 or 745 A. U. C. but at what age is not known. He is often called *patronus* by Pædo Albinovanus.

emporary poet, whose elegy upon him is ex-

He made Augustus his heir; and recom-  
 led his friend Horace to him. Meecenas is  
 ever to have enjoyed a good state of health  
 y part of his life: and many singularities are  
 d of his bodily constitution. Though he  
 n the whole a virtuous character, yet it is  
 d on all hands, that he was very luxurious  
 ffeminate. But his name will ever be vene-  
 y men of letters, on account of the dis-  
 fised patronage and support he gave to all  
 fts and learned men of his time, whence his  
 has become almost an appellative for a pa-  
 of learning and genius. He was also an au-  
 kmicif; as he wrote, 1. *A History of Animals*:  
*Journal of the Life of Augustus*: 3. *A True*  
*precious Stones*: 4. *Octavia*; and, 5. *Pro-*  
*is*, Tragedies; with several other works, but  
 are all lost.

**ABELA**, a town of Spain, in Arragon.

**ABELER**, a beautiful lake of Sweden, be-  
 in Westmanland and Sudermaland.

**ABELSTROM**, a very dangerous whirlpool on  
 the west of Norway, province of Nordland, and  
 of Lofoden, near the island of Moskoe,  
 he it also has its name of MOSKOE-STROM.  
 his amazing whirlpool, Jonas Ramus gives  
 following account. "The mountain of Abel-  
 in Lofoden, lies a league from the island  
 and betwixt these two runs that large  
 cadral stream called *Moskoe-strom*, from the  
 of Moskoe, which is in the middle of it,  
 with several circumjacent isles, as An-  
 half a quarter of a league N. Heden, Hou-  
 Siedholm, Suarves, and Buckholm. Mos-  
 is about half a quarter of a mile south of  
 ed of Ver, and betwixt them these small  
 Otterholm, Fiskan, Sunnlesfen, Stock-

Betwixt Lofoden and Moskoe, the depth  
 water is between 36 and 40 fathoms; but  
 other side, towards Ver, the depth de-  
 so as not to afford a convenient passage for  
 without the risk of splitting on the rocks,  
 happens even in the calmest weather; when  
 od, the stream runs up the country be-  
 Lofoden and Moskoe with a boisterous ra-  
 but the roar of its impetuous ebb to the  
 scarce equalled by the loudest and most  
 id cataract; the noise being heard several  
 off, and the vortices or pits are of such  
 nt, and depth, that if a ship comes within  
 action, it is inevitably dashed and car-  
 wn to the bottom, and there beat to pieces  
 the rocks; and when the water returns,  
 ment thereof are thrown up again. But  
 intervals of tranquillity are only at the turn  
 ebb and flood, in calm weather; and last  
 quarter of an hour, its violence gradually  
 ng. When the stream is most boisterous,  
 fury heightened by a storm, it is danger-  
 come within a Newy mile of it; boats,  
 and yachts having been carried away, by  
 irding against it before they were within  
 sh. It likewise happens frequently, that  
 come too near the stream, and are over-  
 d by its violence; and then it is impossible  
 like their howlings and bellows in their

fruitless struggles to disengage themselves. A  
 bear once attempting to swim from Lofoden to  
 Moskoe, with a design of preying upon the sheep  
 at pasture in the island, afforded the like spectacle  
 to the people; the stream caught him, and bore  
 him down, whilst he roared terribly so as to be  
 heard on shore. Large stocks of firs and pine  
 trees, after being absorbed by the current, rise a-  
 gain, broken and torn to such a degree as if bri-  
 tles grew on them. This plainly shows the bot-  
 tom to consist of craggy rocks, among which they  
 are whirled to and fro. This stream is regulated  
 by the flux and reflux of the sea; it being con-  
 stantly high and low water every six hours. In  
 1645, early in the morning of Senapeima Sunday,  
 it raged with such noise and impetuosity, that on  
 the island of Moskoe, the very houses of the houses  
 fell to the ground." When this whirlpool is agi-  
 tated by a storm, its vortex will reach vessels 5 or  
 6 miles distant. Lon. 10. 40. E. Lat. 68. 8. N.

**MEMACTERIA**, sacrifices offered to Jupiter  
 at Athens in the winter month Mermacterion.  
 The god, furnished Memactes, was incited to  
 find mild and temperate weather, as he presided  
 over the seasons, and was the god of the air.  
**MEMACTERION** was the 4th month of the  
 Athenian year, containing 29 days, and answering  
 to the latter part of our September, and the be-  
 ginning of October; so named from the festival  
*Mermacteria*. It was called by the Bœotians *Alu-*  
*comentis*.  
**MENNA**, in zoology, a species of Sparus.  
**MENALOS**, in ancient geography, a moun-  
 tain of Arcadia sacred to Pan, and greatly fre-  
 quented by the shepherds. It received its name from  
 Menalus a son of Lycæon. It was covered with  
 pine trees, whose echo and shade have been great-  
 ly celebrated by all the ancient poets.  
**MEONIA**, or *Molonis*, a country of Asia Mi-  
 nor, forming part of Lydia; viz. the neighbour-  
 hood of mount Tmolus, and the country watered  
 by the Pactolus. The rest on the sea-coast  
 was called Lydia. See LYDIA, § 1.  
**MEONIDE**, a name given to the Muses, be-  
 cause Homer, their greatest worthiest favourite,  
 was supposed to be a native of Meonia.  
**MEONIDES**, a surname of Homer, because,  
 according to the opinion of some writers, he was  
 born in Meonia, or because his father's name was  
 Meon.  
**MEOTICA PALUS**, } Lætus, a large lake  
**MEOTICUS LÆTUS**, } or part of the sea  
**MEOTIS PALUS**, or } betwixt Europe and  
 Asia, to the N. of the Taurus, which is a com-  
 mandment by the Chinese and Bulgars. It was  
 worshipped as a deity by the Tartars. It ex-  
 tends about 100 miles from SW. to NE. and is  
 about 6 miles in circuit. It is now called  
 the sea of ASOPH or ZAIACK; and reaches from  
 Great Tartary to the mouth of the Don. See ASOPH, N° 5.  
 \* *Mækle-oda*. It is derived from the Saxon  
*ma*, mean, great, noted to *la*, here is all fa-  
 mous; *et*, hence, famous for nobility. *Giljan's*  
*Canada*.  
**MAËE**, or *Maer*. See MAUR.  
**MAËSEYK**. See MAËZYCK.  
 Y y Y **MAELAND**,

**MAESLAND**, or } a town of the Batavian  
**MAESLAND SLUYS**, } republic in the dep. of  
 Delft, and late prov. of S. Holland, 6 miles SW.  
 of Delft, and 10 W. of Rotterdam. Lon. 4. 18.  
 E. Lat. 51. 57. N.

**MÆSTLIN**, Michael, in Latin *Mæstlinus*, a  
 celebrated German astronomer, who was born in  
 the duchy of Wittemberg; but spent his youth  
 in Italy, where he brought Galilæo over from A-  
 ristotle and Ptolemy, to the belief of the Coper-  
 nican system. He afterwards returned to Ger-  
 many, and became professor of mathematics at  
 Tubingen; where, among his other scholars, he  
 taught the great Kepler, who has praised several  
 of his ingenious inventions, in his *Astronomia Op-  
 tica*. Though Tycho Brahe did not assent to Mæst-  
 lin's opinion, yet he allowed him to be an extra-  
 ordinary person, deeply skilled in astronomy.  
 Mæstlin published many mathematical and astro-  
 nomical works; and died in 1590.

**MÆSTRICHT**, an ancient large, and strong  
 town of the French republic, in the ci-devant  
 Austrian Netherlands, and late bishopric of Liege,  
 now capital of the department of the Lower  
 Meuse. It is about 4 miles in circumference, and  
 the public buildings are handsome. It is seated  
 on the Maese, which separates it from Wyck,  
 with which it communicates by a handsome  
 bridge. In 1530, the emp. Charles V. annexed  
 it to Brabant. It revolted from the Spaniards in  
 1570, but was reduced in 1579. Lewis XIV. took  
 it in 1673; but it was restored to the Dutch, by  
 the treaty of Nimègue, in 1678. On the 23d  
 Feb. 1793, it was bombarded by the French un-  
 der Gen. Miranda: but on the 1st March was re-  
 lieved by Gen. Clairfit, who defeated the re-  
 publicans, and compelled them to raise the siege,  
 with the loss of 2000 men and 9 pieces of artillery.  
 On the 23d Sept. 1794, it was again invested by  
 200,000 French troops under Gen. Kleber, but  
 stood a regular siege till the 4th of Nov. when it  
 surrendered, with its garrison of about 8000 men.  
 During the bombardment which lasted 3 days,  
 about 2000 houses were demolished and 200 per-  
 sons killed. Mæstricht lies 15 miles N. of Liege,  
 and 5 E. of Reiffers. Lon. 5. 41. E. Lat. 50. 54. N.

**MÆSTRO**, a town of Maritime Austria, in the  
 Paduana, 3 miles NW. of Venice.

**MÆSURA**, a river of Maritime Austria, in the  
 Trevisano.

**MAESYCK**, a town of the French republic, in  
 the dep. of the Ourte, and late bishopric of Liege,  
 seated on the Maese, 3 miles SW. of Ruremond,  
 and 30 NNE. of Liege. Lon. 23. 18. E. Ferro.  
 Lat. 51. 0. N.

**MÆVIUS**. See **BAVIUS**.

**MAFAREK**, a town of Egypt, 30 miles E. of  
 Kous.

**MAFFACU**, a town of France, in the dep. of  
 the Lower Pyrenees; 42 miles S. of Orthez.

(1.) **MAFFÆUS**, Bernardine, a learned card-  
 inal, who wrote a commentary on Cicero's Epist-  
 les, and a Treatise on Medals and Inscriptions.  
 He died in 1629.

(2.) **MAFFÆUS**, John Peter, a learned Jesuit,  
 born at Bergamo in 1536. He wrote a Life of  
 Ignatius Loyola; a History of the Indies, and o-  
 ther works. He died at Tivoli, in 1603.

(3.) **MAFFÆUS**, Vego, a Latin  
 Lombardy in 1407, greatly admire  
 He wrote epigrams, and a humoro  
 to Virgil, which he called *The th*  
*the Æneid*: this was as humorou  
 to English a few years ago by Mr  
 wrote also some prose works. He  
 of Rome about the end of the pont  
 tin V.; and died in 1458.

(4.) **MAFFÆUS**, or } Francis Sci  
**MAFFEI**, } ted Italian  
 illustrious family, born at Verona,  
 distinguished himself by his valou  
 of Donawert; but he was still mor  
 by his love of learning, which led  
 into France, England, and Germ  
 conversed with the literati. He  
 of the academy of the Arcadi at  
 honorary member of that of Incrip  
 He wrote many works in versè and  
 are esteemed; particularly, 1. *T*  
*Meope*: 2. *Ceremony*, a comedy  
 tion, into Italian versè, of the fir  
 mer's Iliad: 4. Many other pieces  
 collection entitled *Rhyme and Prose*,  
*na illustrata*. 6. *Istoria diplomatica*.

 45. 15. E. Lat. 3. 0. N.

**MAGALAS**, a town of France  
 of Herault, 7½ miles N. of Beziers.

**MAGAM**, a town of Ceylon, 9  
 Candy.

**MAGAS**, [from μαγική to sing  
 nison or octave;] a musical instrum  
 among the ancients. There were two  
*gadás*, the one a stringed instrument,  
 chords arranged in pairs, and tun  
 or octave, so that they yielded te  
 invention whereof is ascribed by some  
 by others, to the Lydians; and by o-  
 thers to Miletus. The other w

which at the same time yielded very high very low notes. The former kind was much loved by Timotheus of Miletus, who is said to have been impeached of a crime, because by raising the number of chords he spoiled and debilitated the ancient music.

(b.) \* **MAGAZINE.** *n. f.* [*magazine*, French; from the Arabick *machfan*, a treasure.] 1. A house, commonly an arsenal or armoury, or repository of provisions.—If it should appear fit to allow shipping in those harbours, it shall be needful that there be a *magazine* of all necessary provisions and ammunitions. *Raleigh*.—*Plain* heroic magnitude of mind; their armories and *magazines* contemptuous.

*Milton.*

Some o'er the publick *magazines* preside,  
And some are sent new forage to provide.

*Dryden.*

Useful arms in *magazines* we place,  
Rang'd in order, and dispos'd with grace.

*Pope.*

The head was so well stored a *magazine*, that nothing could be proposed which he was not master of. *Locke*. 2. Of late this word has signified a miscellaneous pamphlet, from a periodical miscellany called the *Gentleman's Magazine*, published under the name of *Sylvanus Urban*, and *Edward Cave*.

(c.) A **MAGAZINE**, in a fortified town, ought to contain stores of all kinds; *i. e.* not only arms, ammunition and provisions, but materials and tools by which smiths, carpenters, wheel-wrights, &c. may make every thing belonging to the army; as carriages, waggons, &c.

(d.) A **MAGAZINE**, on ship-board, is a close storeroom or store-house, built in the fore or aft part of the vessel, to contain the gunpowder used in the service. This apartment is strongly secured against fire, and no person is allowed to enter it with a torch or candle: it is therefore lighted, as occasion requires, by the candles or lamps in the light-rooms contiguous to it.

(e.) **MAGAZINE AIR-GUN.** See **AIR-GUN**.

(f.) **MAGAZINE, ARTILLERY.** In a siege, the magazine is made about 25 or 30 yards behind the battery, towards the parallels, and at least 10 feet under ground, to hold the powder, shot, led shells, port fires, &c. Its sides and roof must be well secured with boards to prevent the powder from falling in: a door is made to it, and a covered trench or passage is sunk from the magazine to the battery, one to go in and the other to come out at, to prevent confusion. Sometimes gratings are made in the passages to prevent direct shot from plunging into them.

(g.) **MAGAZINE, POWDER,** is that where the gunpowder is kept in very large quantities. Authors are greatly both with regard to the situation and construction; but all agree, that they ought to be arched and bomb-proof. In fortifications, they are frequently placed in the rampart; but when they have been built in different parts of a town. The first powder magazines were built with Gothic arches: but M. Vauban, finding them too weak, constructed them in a semicircular form; whose dimensions are 60 feet long

within, and 25 broad; the foundations are 8 or 9 feet thick, and 8 feet high from the foundation to the spring of the arch; the floor is two feet from the ground, which keeps it from dampness. An engineer of great experience some time ago had observed, that after the centres of semicircular arches are struck, they settle at the crown and rise up at the hanches, even with a straight horizontal extrados, and still much more so in powder magazines, whose outside at top is formed like the roof of a house, by two inclined planes joining in an angle over the top of the arch, to give a proper descent to the rain; which effects are exactly what might be expected agreeable to the true theory of arches. Now, as this shrinking of the arches must be attended with very ill consequences, by breaking the texture of the cement after it has been in some degree dried, and also by opening the joints of the voussoirs at one end, so a remedy is provided for this inconvenience with regard to bridges, by the *arch of equilibration* in Mr Hutton's book on bridges; but as the ill effect is much greater in powder magazines, the same ingenious gentleman proposed to find an arch of equilibration for them also, and to construct it when the span is 20 feet, the pitch or height 10 (which are the same dimensions as the semicircle), the inclined exterior walls at top forming an angle of 113 degrees, and the height of their angular point above the top of the arch equal to seven feet. This curious question was answered in 1775 by the rev. Mr Wildbore. See Hutton's *Miscellaneous Mathematica*.

(7.) **MAGAZINES, LITERARY;** a well known species of periodical publications, of which the first that appeared was *The Gentleman's*, set on foot by Mr Edward Cave in 1731. See **CAVE**, N° 2. This, as Dr Kippis observes, "may be considered as something of an epoch in the literary history of this country. The periodical performances before that time were almost wholly confined to political transactions, and to foreign and domestic occurrences; but the monthly magazines have opened a way for every kind of enquiry and information. The intelligence and discussion contained in them are very extensive and various; and they have been the means of diffusing a general habit of reading through the nation, which in a certain degree hath enlarged the public understanding. Many young authors, who have afterwards risen to considerable eminence in the literary world, have here made their first attempts in composition. Here too are preserved a multitude of curious and useful hints, observations, and facts, which otherwise might have never appeared; or if they had appeared in a more evanescent form, would have incurred the danger of being lost." *The Gentleman's Magazine*, amidst numerous rivals, has preserved its reputation to the present day. The original London Magazine has been long discontinued. The next oldest publication of this kind is *The Scots Magazine*; which was commenced at Edinburgh in 1739; has also survived many rivals, and still subsists.

(1.) **MAGDALEN, Mary.** See **MARY**.

(2.) **MAGDALEN,** a small town in Hants.

(3.) **MAGDALEN ASYLUM,** a retreat for peni-

tent prostitutes, similar to the MAGDALEN HOSPITAL at London, instituted at Edinburgh on the 7th of May 1801.

(4.) MAGDALEN HOSPITAL. See SOUTHWARK.  
(5.) MAGDALEN ISLANDS, a cluster of islands in the Gulf of St Lawrence; 14 leagues NW. of Cape Breton. The largest lies in Lon. 61. 20. W. Lat. 47. 25. N.

(6.) MAGDALEN, RELIGIOUS OF ST., or MAGDALENETTES, a name given to divers communities of nuns, consisting generally of penitent courtizans. Such are those at Metz, established in 1452; those at Paris, in 1492; those at Naples, first established in 1324, and endowed by Queen Sancha; and those of Rouen and Bourdeaux, which had their original among those of Paris in 1618. In each of these monasteries there are 3 kinds of persons and congregations; 1st, those who are admitted to make vows, and who bear the name of *St Magdalen*; 2d, the congregation of *St Mirtha*, composed of those whom it is not judged proper to admit to vows; 3d, the congregation of *St Lazarus*, composed of such as are detained there by force. The religious of *St Magdalen* at Rome were established by Pope Leo X. Clement VIII. settled a revenue on them; and farther appointed, that the effects of all public prostitutes, dying intestate, should fall to them; and that the testaments of the rest should be invalid unless they bequeathed a portion of their effects, at least a fifth part, to them.

(1.) MAGDALENA, one of the MARQUESAS ISLANDS, about 5 leagues in circuit. Lon. 138. 40. W. Lat. 10. 25. S.

(2.) MAGDALENA, a town in the isle of Cuba. MAGDALENE'S CAVE, a cave of Germany, in Cambrilla, 10 miles E. of Gontz. It appears like a chasm in a rock, and at the entrance torches are lighted to conduct travellers. It has several divisions, with a vast number of natural pillars, as white as snow, and almost transparent, which give it a beautiful appearance. The bottom is of the same substance, so that it has been likened to the ruins of an enchanted city, surrounded with magnificent pillars, some entire and others broken.

MAGDALENETTES. See MAGDALEN, N° 6.  
MAGDALUM. See MAGDOLUM.

(1.) MAGDEBURG, a duchy of Germany, in the circle of Lower Saxony; bounded on the N. by that of Mecklenburgh; S. and SW. by the principality of Anhalt and Halberstadt, E. by Upper Saxony and Barchelding; and W. by the duchy of Wolfenbuttel. The Saale circle, and that of Luskewalde, are separated from the rest, and surrounded on all sides by a part of Upper Saxony. This country is, for the most part, level; but sandy, marshy, or overgrown with woods. There are salt springs in it to men, that they are unwholesome to many of the Germans with salt. The *Loos* is said to be the most fruitful part of it. In the *Saale* circle, which wood is scarce, there is plenty of iron, and in another a copper mine. The *Loos* is watered by the *Elbe*, which passes through it, and the *Saale*, *Havel*, *Alder*, *Ore*, and *Elster*, are streams of water some part of its extent. The whole duchy, exclusive of a part of the county of Mansfeld which is con-

nected with it, contains about 20 cities, 6 430 villages, and 350,000 inhabitants. It consist of the clergy, the nobility, and de the cities. Since it became subject to th of Brandenburg, no diets are held in it, the states the direction of the finances. the Reformation, it was an archbishopric in spirituals to the pope alone, and its p primate of all Germany; but embracing formation, it chose its own administrator treaty of Munster in 1648, when it was gether with the bishopric of Halberstadt, lector of Brandenburg, as an equivalent fo ther Pomerania, granted to the king of Lutheranism is the predominant religion ymists, Jews, and Roman catholics, are 1 The last have 5 convents. His matricula is 43 horse and 196 foot, or 1300 florins For the civil government there is a cou gency, with a war and domestic chambe the ecclesiastical, a consistory, and gen intendant. The revenues arising from w es, some of which are very oppressive, 800,000 rixdollars annually. Every ho is obliged to buy a certain quantity of fa self and wife; and also for every child a horse, cow, calf, and sheep, that he The principal places are Magdeburg, I Glauche.

(2.) MAGDEBURG, the capital of the chy, as well as of Lower Saxony, one of all Germany. It is a city of great tly fortified, and very ancient. Its nat the *magda* city; which, some imagine rise from an ancient temple of Venus, y here. The founder of the city is said to Otho I. or his nephew Editha, danc rived I. of England. Otho also want distric convert, which he afterwards into an archbishopric, of which the was a count palatine, and had great. The city is pleasantly situated on the o Elbe, amidst fruitful plains, on the ro High and Low Germany. It has suffe by fires and sieges; but by none so m in 1631, when count Tilly took it, plundered and burnt it, except the cat cement. Of 45,000 burghers, not ab seced. The soldiers committed the r ing barbarities; ripping up women's murdering sucking infants in sight of th and ravishing young women in the tre vout which many of them threw themse Elbe. The city is now populous, larg built, particularly the broad street and square. The principal buildings are palace, the governor's house, the ma nial, and cathedral. The last is a mpr in the antique taste, dedicated to S and has a fine organ, the chief pipe o to 15; that a man can scarce clasp it arm; it all round the tombs of Oth

e marble statue of St Maurice, a port, an altar in the choir of one stone of ours, curiously wrought, and many re- other curiosities. The chapter consists of, and twenty three canons. There r Lutheran collegiate foundations, and a convent dedicated to the Virgin, in a school. Here is also a gymnasium, academy, in which young gentlemen are in the art of war. The canons of the nil make proof of their nobility. The and dignities are all in the gift of the d the revenue of the provost is compu- 000 crowns a-year. Magdeburg has a e, and various manufactures of woollen is, silks, cottons, linens, stockings, hats, bucco, &c. It was formerly one of the imperial towns. Editha, on whom it was as a dowry, among many other privi- ured it the grant of a yearly fair. Mag- 40 miles W. of Brandenburg, and 125 mburg. Lon. 11. 45. E. Lat. 52. 11. N. GDLEBURG HEMISPHERES. See COHE-

ELLA, a town of Saxony, in Weimar. GDOLUM, or MAGDALUM, in ancient i, a town of Lower Egypt, 12 miles S. m; (*Herodotus, Antiqu.*) reckoned the *Magdol* of Jeremiah.

GDOLUM, or MIDDOL, [*i. e.* a tower or brough)] was seated near the Red Sea, far S. of the above.

*V. n. f.* [*magus, Lat.*] A magician. *Sp. n. f.* LHAENS, John Hyacinth DE, a learn- ule ecclesiastic, who was a member of egiu academies, as well as F. R. S. Lond. o London, and resided there many years, ith in 1796. He published several use- on experimental philosophy.

GELLAN, Ferdinand, a celebrated Por- ariner in the 16th century. He went vice of the emp. Charles V. and sailed le with 5 vessels in 1619, when he dis- ased through the strait to which he s, and sailed through the South Sea to ne Islands, where, according to some, sioned in 1520; though others say that id in a mutiny of his people in the Mutan, on account of his severity. His and the world was written by one on d has been often printed in English.

AGELLAN, STRAITS OF, a narrow pas- cen Terra del Fuogo and the S. extremi- ica, first discovered by MAGELLAN. ) Other navigators have passed the time as these straits are exceedingly difficult, it to storms, it has been common to sail torn, rather than through the Straits of

See LE MAIRE, and FULGO, N° 2.

LIANIA, or TERRA MAGELLANICA, e of land in S. America, extending from of Rio de la Plata to the utmost verge Continent: viz. from Lat. 50 to 54° S. ded on the N. by Chili and Cuyo; E. by ern Ocean; S. by the Straits of Magel- W. by the South Sea and Ch. Magel- ured only Cape Virgin and Desire; but naries have discovered several different

nations in this country; particularly the *Chunians* and *Julians*. The former inhabit the country and several islands N. of the latter; who dwell near MAGELLAN'S STRAITS. The Chunians are tyrannised over, hunted, and sold for slaves by the Indians. The soil is barren; the climate cold and inhospitable; the E. coasts are marshy.

MAGELLANIC CLOUDS, whitish apparances like clouds, seen in the heavens towards the south pole, and having the same apparent motion as the stars. They are three in number, two of them near each other. The largest lies far from the south pole; but the other two are not many de- grees more remote from it than the nearest conspicuous star, that is, about 11 degrees. Mr Boyle supposes, that if these clouds were seen through a good telescope, they would appear to be mul- titudes of small stars, like the milky way.

MAGCEL, a river of the French republic, in the dep. of the Dyle, and adjacent province of Austrian Flanders, which runs into the Demer, 4 miles above Diet.

(1.) MAGGI, Bartholomew, brother to the ce- lebrated Jerome Maggi, (see N° 2.) was a physi- cian at Bologna, and wrote a treatise of gun-shot wounds.

(2.) MAGGI, or MAGIUS, Jerome, one of the most learned men of the 16th century, was born at Anghiari in Tuscany. He applied himself to all the sciences, and distinguished himself so much in the art of war, that the Venetians sent him into Cyprus in quality of judge of the admiral- ty. When the Turks besieged Famagusta, he performed all the services that could be expected from the most excellent engineer: he invented mines and machines for throwing fire, by means of which he destroyed all the works of the besieger, and in an instant overthrew what had cost the Turks infinite labour. But they obtained revenge; for, taking the city in 1571, they plundered his library, carried him loaded with chains to Con- stantinople, and treated him in the most barbarous manner. He nevertheless comforted himself from the example of Zeno, Menippus, Epictetus, and other braved men; and, after passing the whole day in the meanest drudgery, spent the night in writing. He composed, from memory alone, treatises filled with quotations, which he dedicated to the Imperial and French ambassadors. These ministers, moved by compassion for this learned man, resolved to purchase him; but while they were treating for his ransom, Maggi made his escape, and got to the Imperial ambassador's house; when the Grand Vizir, enraged at his flight, seized, and caused him to be strangled in prison in 1571. His principal works are, 1. A treatise on the bells of the ancients. 2. On the destruction of the world by fire. 3. Commentaries on *Æmilius Probus's* lives of illustrious men. 4. Commentaries on the *Idistites*. 5. A Treatise on the woods a loss. These works are written in elegant Latin. He also wrote, 6. A Treatise on Fortification in Italian; and, 7. A book on the situation of ancient Tuscany.

(3.) MAGGI, Vincent, a native of Pesse, and a celebrated professor of humanity at Ferrara in Pa- dua, was the author of several works.

MAGGIORA,

MAGGIORA, } or LOCARNO, LAKE, or LAKE  
 MAGGIORE, } MAJOR, a lake of Italy, lying  
 partly in the Italian republic and partly in the  
 Helvetic, being bounded on the N. by the ci-devant  
 Swiss bailiwicks in the latter, and on the S.  
 by the dep. of Olona, (ci-devant Milanese,) in the  
 former. Geographers differ much respecting its  
 extent: Dr Brookes and Mr J. Walker make it 35  
 miles long and 6 broad; the rev. Cl. Crutwell makes  
 it 40 miles long and only 4 broad; but Dr Op-  
 penheim states its length at no less than 56 Italian  
 miles, which, being 15 miles in the 100 longer  
 than English miles, makes it above 64 miles long.  
 He also makes its greatest depth 240 feet, whereas  
 Mr Crutwell makes it only 80. The *Borromean*  
 and several other fertile islands lie in it. It ab-  
 ounds with trouts, perches, &c.

(1.) \* MAGGOT. *n. f.* [*magrod*, Welsh; *mille-  
 pedia*, Lat. *maeu*, Saxon.] 1. A small grub, which  
 turns into a fly.—Out of the sides and back of the  
 common caterpillar we have seen creep out small  
*maggots*. *Ray on the Creation*.—

From the fore although the insect flies,  
 It leaves a brood of *maggots* in disguise. *Garth*.  
 2. Whimsy; caprice; odd fancy. A low word.  
 Figures pedantical, these summer flies,  
 Have blown me full of *maggot* ostentation:  
 I do forswear them. *Shakespeare*.

To reconcile our late dissenters,  
 Our brethren though by other venters,  
 Unite them and their dissent *maggots*,  
 As long and short sticks are in faggots. *Hudibr.*  
 —She pricked his *maggot*, and touch'd him in the  
 tender point; then he broke out into a violent  
 passion. *Arbutnot*.

(2.) MAGGOT, (*s. r. d. f. r.*) or the fly-worm, is  
 bred in flesh, from the egg of the great blue flesh-  
 fly. Notwithstanding the distaste for this animal,  
 its figure and parts are worth attending to; and  
 may serve as a general history of the class of worms  
 produced from the eggs of flies. It is white and  
 fleshy; its body is composed of a number of rings,  
 like the bodies of caterpillars; and is capable, at  
 the pleasure of the animal, of assuming different  
 figures; more or less extended in length, and con-  
 sequently more or less thick. Although it has no  
 legs, it is able to move itself very swiftly; and in  
 its first attempt to move its body, is extended to  
 its greatest length, and assumes something of the  
 figure of a pointed cone. The pointed part of  
 the cone is the head of the animal, and is not se-  
 parated from the next ring by any deeper furrow  
 than the rest of the rings are from one another.  
 Sometimes two short horns are thrust out from  
 the head; but more generally two scaly hooks are  
 observable: these are, however, sometimes hid,  
 and have each a case or sheath; into which the a-  
 nimal can retract them at pleasure. These hooks  
 are bent into an arch, the concavity of which is  
 towards the plane on which the creature is placed;  
 and they are thickest at their insertion in the head,  
 and thence diminish gradually, till they terminate  
 in a fine sharp point. They are placed parallel,  
 and can never come together; and therefore can-  
 not serve in the place of teeth for grinding the  
 food; but merely to pull and sever it in pieces,  
 that it may be of a proper size for the mouth.  
 The maggot has also a kind of dart, at an equal

distance between these hooks, about of  
 their length. This also is brown and  
 them; it is quite straight, and terminates  
 point. The hooks have two scaly thorn  
 points; and this dart seems intended, by  
 its strokes, to divide and break the piece  
 these have separated from the rest into  
 parts. Immediately below the aperture  
 egress of the hooks, is placed the mouth  
 the creature does not show unless press'd  
 something like a tongue appears. This  
 supply the place both of teeth and leg  
 fastening these hooks into the substance  
 ced on, and then drawing up its body  
 pulls itself along. The back lowers itself  
 grees as it approaches the extremity of th  
 and near the place where the back begins  
 itself, are placed the two principal orga  
 spiration; which are two small roundish  
 spots: easily distinguishable by the naked  
 the rest of the body is white. Viewed th  
 microscope, each of these spots appear  
 brown circular eminence raised a little a  
 rest of the body. On each of them there  
 3 oblong oval cavities, of the shape of  
 holes, each situated in a parallel directio  
 other; and their length nearly perpend  
 that of the body of the animal. These  
 admit the air necessary to life. It has 6  
 3 on each side of its body. The great  
 rency of its body shows that it has on ea  
 large white vessel running the whole leng  
 body. These vessels are most distinct to  
 hinder part; and they terminate each in t  
 spot above mentioned: hence they seem  
 two principal tracheæ. The ramification  
 are very beautiful in this creature, espe  
 its belly: but no vessel analogous to the  
 tery in the caterpillar class can be disc  
 these. See ERUCA, § 1.

\* MAGGOTTINESS. *n. f.* [from ]  
 The state of abounding with maggots.

\* MAGGOTTY. *adj.* [from *maggot*  
 of maggots. 2. Capricious; whimsical  
 word.—To pretend to work out a neat  
 thoughts with a *maggotty* unfettered hea  
 diculous as to think to write straight in a  
 coach. *Norris*.

MAGHERAFELT, a town of Ireland  
 donderry, famous for linens; 13 m. W. c

MAGI, or } an ancient religious se

MAGIANS, } sia, and other eastern  
 who maintained that there were two;  
 one the cause of all good, the other th  
 all evil: and, abominating the adora  
 mages, they worshipped God only by  
 they looked upon as the brightest and  
 rious symbol of Oromardes, or the good  
 darkness is the trust symbol of Animan  
 evil god. This religion was reformed b  
 ASTER, who maintained that there wa  
 prime independent Being; and under  
 principles or angels, one the angel of  
 and light, and the other of evil and dark  
 there is a perpetual struggle between th  
 shall last to the end of the world; th  
 angel of darkness and his disciples shall  
 world of their own, where they shall be

ing darkness; and the angel of light and  
es shall go into a world of their own,  
y shall be rewarded in everlasting light.  
ts of the magi were the most skilful ma-  
ans and philosophers of the ages in which  
, infomuch that a learned man and a  
ecame equivalent terms. The vulgar  
their knowledge as supernatural; and  
se who practised wicked and mischief-  
, taking upon themselves the name of  
drew on it that ill signification which  
MAGICIAN now bears among us. This  
bists under the denomination of GAURS,  
s, in Persia, where they watch the fa-  
with the greatest care, and never suffer  
tinguished. See GABRES, N° 1.  
A, a river of Italy, which runs into Lake  
at Locarno.

C. See MAGICK.

MAGICAL. *adj.* [from *magick*.] Acting,  
ned by secret and invisible powers, either  
, or the agency of spirits.—  
umbly signify what, in his name,  
magical word of war, we have effected.

*Sbak.*  
beheld unveiled the *magical* shield of  
slo, which dazzled the beholders with  
brightneis. *Dryden*.—By the use of a  
lafs, and certain attire made of cam-  
on her head, she attained to an evil ar-  
eal force in the motion of her eyes.

MAGICAL DRUM, an instrument of super-  
ed in Lapland, thus described by Schef-  
is history of that country. It is made  
pine, or fir, split in the middle, and  
on the flat side where the drum is  
de. The hollow is of an oval figure;  
vered with a skin clean dressed, and  
with figures of various kinds, such as  
s and moons, animals and plants, and  
stries, lakes and rivers; and of later days,  
preaching of Christianity among them,  
nd sufferings of our Saviour and his a-  
e often added among the rest. All these  
e separated by lines into three regions  
s. There is besides these parts of the  
index and a hammer. The index is a  
beads or iron rings, the biggest of which  
e in its middle, and the smaller ones are  
t. The hammer or drumstick is made  
orn of a rein-deer; and with this they  
drum so as to make these rings move,  
g laid on the top for that purpose. In  
n of these rings about the pictures fig-  
the drum, they fancy to themselves some  
n in regard to the things they inquire  
What they principally inquire into by  
ment, are three things: 1. What sacri-  
prove most acceptable to their gods.  
success they shall have in their several  
ms, as hunting, fishing, curing diseases,  
ke; and, 3. What is doing in places re-  
n them. On these occasions they use  
cular ceremonies, and place themselves  
odd postures as they beat the drum;  
luences the rings to the one or the other

side, and to come nearer to the one or the other  
set of figures. And when they have done this,  
they have a method of calculating a discovery,  
which they keep as a great secret, but which  
seems merely the business of the imagination in  
the diviner or magician.

\* MAGICALLY. *adv.* [from *magical*.] Accord-  
ing to the rites of magick; by enchantment.—  
In the time of Valens, divers curious men, by the  
falling of a ring *magically* prepared, judged that  
oe Theodorus should succeed in the empire.  
*Camden*.

(1.) \* MAGICIAN. *n. s.* [*magicus*, Lat.] One  
skilled in magick; an enchanter; a necromancer.—

What black *magician* conjures up this fiend,  
To stop devoted charitable deeds. *Sbak.*

An old *magician*, that did keep  
Th' Hesperian fruit. *Waller.*

—There are millions of truths that a man is not  
concerned to know; as, whether Roger Bacon  
was a mathematician or a *magician*. *Locke*.

(2.) A MAGICIAN may be defined one who pre-  
tends to have the power of doing wonderful feats  
by the agency of spirits.

MAGICIAN'S MIRRORS. See CATOPTICS, *Ind*.

(1.) \* MAGICK. *u. s.* [*magia*, Lat.] 1. The art of  
putting in action the power of spirits: it was sup-  
posed that both good and bad spirits were subject  
to magick; yet magick was in general held unlaw-  
ful; sorcery; enchantment.—

She once being loost,  
The noble ruin of her *magick*, Antony,  
Claps on his sea wing. *Sbak.*

—What charm, what *magick*, can over-rule the  
force of all these motives. *Rogers*. 2. The writers  
of natural *magick* attribute much to the virtues  
that come from the parts of living creatures, as if  
they did infuse immaterial virtue into the part  
severed. *Bacon*.

(2.) \* MAGICK. *adj.* 1. Acting or doing by pow-  
ers superior to the known powers of nature; en-  
chanted; necromantick.—

Upon the corner of the moon  
There hangs a vap'rous drop, profound;  
I'll catch it ere it come to ground:  
And that distill'd by *magick* flights  
Shall raise such artificial sprights,  
As by the strength of their illusion,  
Shall draw him on to his confusion. *Macbeth*.

Like castles built by *magick* art in air,  
That vanish at approach, such thoughts appear.  
*Granville*.

2. Done or produced by magick.—

And the brute earth would lend her nerves,  
and shake

Till all thy *magick* structures rear'd so high,  
Were shatter'd into heaps. *Milton*.

(3.) MAGICK, [*MAFEIA*, Gr.] in its ancient sense, is  
the science or discipline and doctrine of the magi,  
or wise men of Persia. See MAGI. The origin of  
magic and the magi is ascribed to Zoroaster.  
Salmalius derives the very name from Zoroaster,  
who, he says, was surnamed *Mog*, whence Ma-  
gus. Others make him only the restorer and im-  
prover of the Persian philosophy, alleging, that  
many of the Persian rites in use among the magi  
were borrowed from the Zabii among the Chal-  
deans.

beans, who agreed in many things with the magi of the Persians; whence some make the name *magus* common both to the Chaldeans and Persians.

(4.) *MAGIC*, in a modern sense, is a science which teaches to perform wonderful and surprising effects. The word originally carried with it a very innocent, nay, laudable meaning; being used purely to signify the study of wisdom, and the more sublime parts of knowledge; but as the ancient magi engaged also in astrology, divination, sorcery, &c. the term *magic* in time became odious, and was only used to signify an unlawful and diabolical kind of science, depending on the assistance of the devil and departed souls. Agrippa divides magic into three kinds; viz. natural, celestial and ceremonial or superstitious.

I. *MAGIC, CELESTIAL*, borders nearly on judiciary astrology: it attributes to spirits a kind of rule or dominion over the planets, and to planets a dominion over men; and on those principles builds a ridiculous kind of system. See *ASTROLOGY*.

II. *MAGIC, NATURAL*, is the application of natural active causes to passive subjects; by means whereof many surprising, but yet natural, effects are produced. In this way many of our experiments in natural philosophy, especially those of electricity, optics, and magnetism, have a kind of magical appearance, and among the ignorant and credulous might easily pass for miracles. Such, without doubt, have been some of those miracles wrought by ancient magicians, whose knowledge of the various powers of nature, there is reason to believe, was much greater than modern vanity will sometimes allow. Baptista Porta has a treatise of natural magic, or of secrets for performing very extraordinary things by natural causes. The natural magic of the Chaldeans was nothing but the knowledge of the powers of simples and minerals.

III. *MAGIC, SUPERSTITIOUS, or GOTTIC*, consists of the invocation of devil. Its objects and effects are usually wicked, and frequently supplanting the powers of nature; supposed to be produced by virtue of some compact, either tacit or express, with evil spirits. This species of magic appears to have had its origin in Egypt, the native country of paganism. The first magicians mentioned in history were Egyptians; and that people, so famed for early wisdom, believed not only in the existence of demons, the great agents in magic (see *DEMONS*), but also that different orders of those spirits presided over the elements of earth, air, fire, and water, as well as over the persons and affairs of men. Hence they ascribed every disease which they were obstinate to the immediate agency of some evil demon. When any person was seized with a fever, for instance, they did not think it necessary to search for any natural cause of the disorder; it was immediately attributed to some demon, which had taken possession of the body of the patient, and could not be chased out by charms and incantation. Their physicians could not only cure the sick, but could likewise, and weakly as they were, by means of their superstitious demons, was universally believed. Ancient writers are full of the wonders which they performed. We shall mention one

or two of those which are best attested, and enquire whether they might not have been by other means than the interposition of devils. The first magicians on record are those of Egypt opposed Moses. When Aaron cast his rod, and it became a serpent, they cast theirs the like with their enchantments; "for down every man his rod, and they became serpents." This was a phenomenon which, if confessed, had a very miraculous appearance, and yet there seems to have been nothing which might not have been effected by hand. The Egyptians, and perhaps the inhabitants of every country where serpents have the art of depriving them of their poison, might, so that they may be handled with safety. It was easy for the magicians, if favoured by the court, to pretend to change their rods into serpents, by de substituting one of those animals in place of the rod. In like manner they might produce blood, and to produce blood, if Moses gave in these instances, as he did in others, any previous information of the nature of the miracles which were to be performed, the magicians might easily provide a quantity of blood and a number of frogs sufficient to their purpose. Beyond this, however, they could not go. It stopped where that of the magicians in *legerdemain* must have stopped—at the want of proper materials to work with. Egypt with serpents; blood could be easily procured without difficulty they might have procured from the river. But when Moses produced serpents from the dust of the ground, the magicians had it not in their power to collect a quantity of these animals, were compelled to be an effect of divine agency. The appearance of Samuel to Saul at Endor is another miracle, seemingly performed by the power of magic. It was a common pretence of the magicians that they could raise up ghosts from the dead, or make dead persons appear unto them to foretell future events. Whether the witch of Endor was an illusion of charms, or incantations, the sacred historian has not informed us; but Saul addressed her as if he believed that by some charm she could recall the soul of the prophet, who had been time dead. In the subsequent apparition of the witch, which was produced, some have thought there was nothing more than a trick, by cunning woman imposed upon Saul's credulity; but others believe that some confederate spirit was the ghost of Samuel. But hadst thou the case, the world undoubtedly have not pretended Samuel's answer as pleasing to Saul as possible, both to save her own life, while the king was in danger, and to have procured a larger reward. She would never have said, that Saul and his sons should be delivered to the hands of the Philistines. For if so many either have supposed that the spirit was really an evil angel, by whose assistance the woman was accustomed to work wonders to foretell future events. But it is quite probable, that one of the apostate spirits should have appeared, Saul her appearing to him.

ould have accosted him in such words as these: Wherefore dost thou ask of me, seeing the Lord is departed from thee, and is become thine enemy? For the Lord hath rent the kingdom out of thine hand; Because thou obeyedst not the voice of the Lord;" &c. (1. Sam, xxviii, 15—19.) What was here denounced against Saul was real-prophetic, and was soon fulfilled. Now, though there are created spirits of penetration fully superior to that of the most enlarged human understanding; yet no finite intelligence could ever find out the precise time of the two armies engaging, the success of the Philistines, the consequences of the victory, and the very persons that were to fall in battle. Saul and his sons were indeed men of tried bravery, and therefore likely to expose themselves to the greatest danger; but for the menaces which he received from the apparition, he would have been impelled, one should think, either to make peace with the enemy, or to retire from the field without exposing himself, his family, and the whole army to certain destruction. The suddenness of Samuel's appearance, too, and the effect which it had upon the forcerels of the demon, proves that the apparition was that of no demon. The apparition was not what the king expected; for when the saw Samuel, he fled out for fear. And when the king exhorted him not to be afraid, and asked what he saw, the woman said, I see gods (*elohim*) ascending of the earth." Now, had what the saw been either confident, or subservient demon, it is inconceivable, that the could have been so frightful, or have mistaken her familiar for *ELOHIM*. We are therefore inclined to think that it was Saul himself who appeared and prophesied, not led up by the wretched woman or her demons, but to her confusion, and the disgrace of her art, by God to rebuke Saul's madness in a most striking way, and to deter all others from ever flying to magicians or demons for assistance. The sudden and wonderful destruction of the army of Brennus the Gaul, has likewise been attributed to magic, or to the interposition of evil spirits whom the priests of Apollo invoked as gods. The learned Bp. Warburton has accounted in a very satisfactory manner, (but too prolix to admit of our quoting his arguments) for this event, not only from the policy of the priests of Apollo at Delphi, and partly from natural causes. As for the pretended miracles of Apollonius Tyaneus and other ancient magicians, they are evidently impostures and legerdemain tricks. Still, however it may be said, that in magic and divination events have been produced out of the ordinance of nature; and as we cannot suppose the Supreme Being to have countenanced such unlawful practices by the interposition of his agency, we must necessarily attribute those effects to the agency of demons, or evil spirits. But we are well assured, that the devil has it not in his power to reverse in a single instance the laws of nature without a divine permission; and we can give but one occasion, (See DEMONIAC, § 4.) in which such permission could be given consistent with the wisdom and the goodness of God. All such, therefore, of diabolical agency in magic and witchcraft must undoubtedly be false; for a

**PL. XIII. PART II.**

power which the devil is not himself at liberty to exert, he cannot communicate to a human creature. This has been fully proved by the failure of Pharaoh's magicians; who, though by legerdemain they imitated some of the miracles of Moses, could not form the vilest insect, or stand before the disease he inflicted upon them as well as upon others. The revival of learning, and the success with which the laws of nature have been investigated, have long ago banished this species of magic from all the enlightened nations of Europe. Among ourselves, none but persons grossly illiterate pay the least regard to magical charms; nor are they any where abroad more prevalent than among the ignorant inhabitants of Lapland and Iceland. These people, indeed, place an absolute confidence in the effects of certain idle words and actions; and ignorant sailors from other parts of the world are deceived by their assertions and their ceremonies. The famous MAGICAL DRUM of the Laplanders is still in constant use in that nation. See that article: also ORACLE, WITCH-CRAFT, &c.

(5.) MAGIC LANTERN. See CHROMATICS, and DIOPTRICS, *Index*.

(6.) MAGIC PICTURE. See ELECTRICITY, *Ind.*

(7.) MAGIC SQUARE, a square figure, formed of a series of numbers in mathematical proportion; so disposed in parallel and equal ranks, as that the sums of each row, taken either perpendicularly, horizontally, or diagonally, are equal. Let the several numbers which compose any square number (for instance, 1, 2, 3, 4, 5, &c. to 25 inclusive; the square number) be disposed, in their natural order, after each other in a square figure of 25 cells, each in its cell; if now you change the order of these numbers, and dispose them in the cells in such manner, as that the 5 numbers which fill an horizontal rank of cells, being added together, shall make the same sum with the five numbers in any other rank of cells, whether horizontal or vertical, and even the same number with the five in each of the two diagonal ranks: this disposition of numbers is called a *magic square*, in opposition to the former disposition, which is called a *natural square*: Thus:

NATURAL SQUARE:	MAGIC SQUARE:
1 2 3 4 5	16 14 8 2 25
6 7 8 9 10	3 22 20 11 9
11 12 13 14 15	15 6 4 23 17
16 17 18 19 20	24 18 12 10 1
21 22 23 24 25	7 5 21 19 13

Emanuel Mosehopulus, a Greek author of no great antiquity, is the first that appears to have spoken of magic squares: and from the age where he lived, there is reason to imagine he did not look on them merely as a mathematician. However, he has left us some rules for their construction. But as magic squares have not hitherto been found of any use in mathematics, we shall refer to the works of Messrs Bachet, Frenicle, Poignard, and De La Hire, for the various methods of constructing these curious arrangements of numbers. The latest writer, who has written upon the subject, was the celebrated Dr FRANKLIN, who constructed what he called a Magic Square of Squares

2 2 2

kinds of persons and congregations; 1st, those who are admitted to make vows, and who bear the name of *St Magdalen*; 2d, the congregation of *St Marth*; compose 1 of those whom it is not judged proper to admit to vows; 3d, the congregation of *St Lazarus*, composed of such as are detained there by force. The religious of *St Magdalen* at Rome were established by Pope Leo X. Clement VIII. settled a revenue on them; and farther appointed, that the effects of all public prostitutes, dying intestate, should fall to them; and that the testaments of the rest should be invalid unless they bequeathed a portion of their effects, at least a fifth part, to them.

(1.) **MAGDALENA**, one of the **MARQUESAS ISLANDS**, about 7 leagues in circuit. Lon. 138. 50. W. Lat. 10. 25. S.

(2.) **MAGDALENA**, a town in the isle of Cuba.

**MAGDALENE'S CAVE**, a cave of Germany, in Carinthia, 10 miles E. of Goitz. It appears like a chain in a rock, and at the entrance torches are lighted to conduct travellers. It has several divisions, with a vast number of natural pillars, as white as snow, and almost transparent, which give it a beautiful appearance. The bottom is of the same substance, so that it has been likened to the ruins of an enchanted castle, surrounded with magnificent pillars, some entire and others broken.

**MAGDALENETTES**. See **MAGDALEN**, N<sup>o</sup> 6.

**MAGDALUM**. See **MAGDOLUM**.

(1.) **MAGDEBURG**, a duchy of Germany, in the circle of Lower Saxony; bounded on the N. by that of Mecklenburgh; S. and SW. by the principality of Anhalt and Halberstadt, E. by Upper Saxony and Brandenburg; and W. by the duchy of Wolfenbüttele. The Saale circle, and that of Luskewalde, are separated from the rest, and

es, amount to 314. The Jews have a synagogue at Halle. The manufactures are cloth, stockings, linen, oil-skins, leather, and paper, which, with grain of all sorts, large quantities are exported. The king of Prussia has a lease as duke of Magdeburg. His matricular is 43 horse and 196 foot, or 1300 florin. For the civil government there is a chancery, with a war and domestic chamber, the ecclesiastical, a consistory, and general intendant. The revenues arising from the city, some of which are very oppressive, 800,000 rixdollars annually. Every house is obliged to buy a certain quantity of fire for self and wife; and also for every child a horse, cow, calf, and sheep, that he may be able to support his family. The principal places are Magdeburg, Glauche.

(2.) **MAGDEBURG**, the capital of the duchy, as well as of Lower Saxony, and of all Germany. It is a city of great trade, well fortified, and very ancient. Its name is the *maiden city*; which, some imagine, arose from an ancient temple of Venus, here. The founder of the city is said to be Otho I. or his empress Editha, daughter of Canute I. of England. Otho also founded a convent, which he afterwards converted into an archbishopric, of which the city was a count palatine, and had great trade. The city is pleasantly situated on the banks of the Elbe; amidst fruitful plains, on the borders of High and Low Germany. It has suffered by fires and sieges; but by none so much as in 1631, when count Tilly took it, plundered and burnt it, except the cathedral convent. Of 40,000 burghers, not above 10,000 remained. The soldiers committed the

a; a fine marble statue of St. Maurice, a porphyry font, an altar in the choir of one stone of seven colours, curiously wrought, and many relics and other curiosities. The chapter consists of a provost, and twenty three canons. There are 4 other Lutheran collegiate foundations, and a Lutheran convent dedicated to the Virgin, in which is a school. Here is also a gymnasium, and an academy, in which young gentlemen are instructed in the art of war. The canons of the apter must make proof of their nobility. The benefices and dignities are all in the gift of the emperor; and the revenue of the provost is computed at 12,000 crowns a-year. Magdeburg has a great trade, and various manufactures of woollen cloth, fluffs, silks, cottons, linens, stockings, hats, shoes, tobacco, &c. It was formerly one of the most important towns. Editha, on whom it was conferred as a dowry, among many other privileges, procured it the grant of a yearly fair. Magdeburg is 40 miles W. of Brandenburg, and 125 N. of Hamburg. Lon. 11. 45. E. Lat. 52. 11. N.

(3.) MAGDEBURG HEMISPHERES. See COHE-  
 ON, § 5.

MAGDELLA, a town of Saxony, in Weimar.  
 (1.) MAGDOLUM, or MAGDALUM, in ancient  
 geography, a town of Lower Egypt, 12 miles S.  
 Pelusium; (*Herodotus, Antiquities*) reckoned the  
 idol or Magdol of Jeremiah.

(2.) MAGDOLUM, or MAGDOL, [*i. e.* a tower or  
 place of strength] was seated near the Red Sea,  
*(Mofes)* far S. of the above.

\* MAGI, *n. s.* (*magus*, Lat.) A magician. *Spens.*  
 MAGELHAENS, John Hyacinth DE, a learned  
 Portuguese ecclesiastic, who was a member of  
 several foreign academies, as well as F. R. S. Lond.  
 He came to London, and resided there many years,  
 his death in 1790. He published several useful  
 tracts on experimental philosophy.

(1.) MAGELLAN, Ferdinand, a celebrated Por-  
 tuguese navigator in the 16th century. He went  
 into the service of the emp. Charles V. and sailed  
 from Seville with 5 vessels in 1519, when he dis-  
 covered and passed through the strait to which he  
 gave his name, and sailed through the South Sea to  
 the Ladrone Islands, where, according to some,  
 he was poisoned in 1520; though others say that  
 he was killed in a mutiny of his people in the  
 island of Mutan, on account of his severity. His  
 voyage round the world was written by one of  
 his attendants, and has been often printed in English.

(2.) MAGELLAN, STRAITS OF, a narrow pas-  
 sage between Terra del Fuego and the S. extremity  
 of America, first discovered by MAGELLAN.  
 (See N° 1.) Other navigators have passed the Straits  
 of Magellan; but as these straits are exceedingly difficult,  
 and subject to storms, it has been common to sail  
 round Cape Horn, rather than through the Straits of  
 Magellan. See THE MAPS, and FUEGO, N° 2.

MAGELLANIA, or TERRA MAGELLANICA,  
 a tract of land in S. America, extending from  
 the prov. of Rio de la Plata to the utmost verge  
 of the S. Continent: viz. from Lat. 37 to 54° S.  
 It is bounded on the N. by Chili and Cuyo; E. by  
 the Northern Ocean; S. by the Straits of Magel-  
 lan; and W. by the South Sea and Chile. Magel-  
 lan discovered only Cape Virrin and Desire; but  
 the Missionaries have discovered several different

nations in this country; particularly the *Chunians*  
 and *Tuhians*. The former inhabit the country  
 and several islands N. of the latter; who dwell  
 near MAGELLAN'S STRAITS. The Chunians are  
 tyrannical over, hunted, and sold for slaves by the  
 Tuhians. The soil is barren; the climate cold  
 and inhospitable; the E. coasts are marshy.

MAGELLANIC CLOUDS, whitish appearances  
 like clouds, seen in the heavens towards the south  
 pole, and having the same apparent motion as the  
 stars. They are three in number, two of them  
 near each other. The largest lies far from the  
 south pole; but the other two are not many de-  
 grees more remote from it than the nearest con-  
 spicuous star, that is, about 11 degrees. Mr Boyle  
 supposes, that if these clouds were seen through  
 a good telescope, they would appear to be mul-  
 titudes of small stars, like the milky way.

MAGGEL, a river of the French republic, in  
 the dep. of the Dyle, and adjacent province of  
 Austrian Flanders, which runs into the Demer, 4  
 miles above Diet.

(1.) MAGGI, Bartholomew, brother to the ce-  
 lebrated Jerome Maggi, (see N° 2.) was a physi-  
 cian at Bologna, and wrote a treatise of gun-shot  
 wounds.

(2.) MAGGI, or MAGIUS, Jerome, one of the  
 most learned men of the 16th century, was born  
 at Anghiari in Tuscany. He applied himself to  
 all the sciences, and distinguished himself so  
 much in the art of war, that the Venetians sent  
 him into Cyprus in quality of judge of the admiral-  
 ty. When the Turks besieged Famagusta, he  
 performed all the services that could be expected  
 from the most excellent engineer: he invented  
 mines and machines for throwing fire, by means of  
 which he destroyed all the works of the besieger,  
 and in an instant overthrew what had cost the  
 Turks infinite labour. But they obtained revenge;  
 for, taking the city in 1571, they plundered his  
 library, carried him loaded with chains to Con-  
 stantinople, and treated him in the most barbarous  
 manner. He nevertheless comforted himself  
 from the example of Zeno, Menippus, Epictetus,  
 and other famous men; and, after passing the  
 whole day in the meanest drudgery, spent the  
 night in writing. He composed, from memory al-  
 one, treatises filled with quotations, which he  
 dedicated to the Imperial and French ambassadors.  
 These ministers, moved by compassion for this  
 learned man, resolved to purchase him; but while  
 they were treating for his ransom, Maggi made  
 his escape, and got to the Imperial ambassador's  
 house; when the Grand Vizir, enraged at his  
 flight, seized, and caused him to be strangled in  
 prison in 1572. His principal works are, 1. A  
 treatise on the bells of the ancients. 2. On the  
 destruction of the world by fire. 3. Commentaries  
 on Zeno's Probans's lives of illustrious men. 4.  
 Commentaries on the Institutes. 5. A Treatise on  
 the wooden horse. These works are written in  
 elegant Latin. He also wrote, 6. A Treatise on  
 Fortification in Italian; and, 7. A book on the  
 situation of ancient Tuscany.

(3.) MAGGI, Vincent, a native of Bresse, and a  
 celebrated professor of humanity at Ferrara in Pa-  
 gua, was the author of several works.

thing; something above the common rate. Not used.—Too greedy of *magnalities*, we make but favourable experiments concerning welcome truths. *Brown.*

(1.) \* **MAGNANIMITY.** *n. f.* [*magnimité*, Fr. *magnanimous*, Lat.] Greatness of mind; bravery; elevation of soul.—

With deadly hue, an armed corse did lye,  
In whose dead face he read great *magnanimity*.

*Spenser.*

—Let but the acts of the ancient Jews be but indifferently weighed, from whose *magnanimity*, in causes of most extreme hazard, those strange and unwonted resolutions have grown, which, for all circumstances, no people under the roof of heaven did ever hitherto match. *Hooker.*—

They had enough reveng'd, having reduc'd  
Their face to misery beneath their fears,  
The rest was *magnanimity* to remit,  
If some convenient ransom was propos'd.

*Milton.*

—Exploding many things under the name of trifles, is a very false proof either of wisdom or *magnanimity*. *Swift.*

(2.) **MAGNANIMITY** appears most conspicuous in circumstances of trial and adversity. Mr Stretch well observes of it, in his *Beauties of History*, that "it is the good sense of pride, and the noblest way of acquiring applause." It renders the soul superior to the trouble, disorder, and emotion which the appearance of great danger might excite; and it is by this quality, that heroes maintain their tranquillity, and preserve the free use of their reason in the most surprising and dreadful accidents. It admires the same quality in an enemy; and fame, glory, conquests, desire of opportunities to pardon and oblige their opposers, are what glow in the minds of the brave. *Magnanimity* and courage are inseparable. Instances need not be quoted. The histories of Greece, Rome, Great Britain, &c. abound with them.

\* **MAGNANIMOUS.** *adj.* [*magnanimus*, Lat.] Great of mind; elevated in sentiment; brave.—

To give a kingdom hath been thought  
Greater and nobler done, and to lay down  
Far more *magnanimous*, than to assume. *Milton.*  
In strength

All mortals I excell'd, and great in hopes,  
With youthful courage and *magnanimous*  
thoughts

Of birth from heaven foretold, and high exploits.

*Milton.*

—*Magnanimous* industry is a resolyed assiduity and care, answerable to any weighty work. *Grew.*

\* **MAGNANIMOUSLY.** *adv.* [from *magnanimous*.] Bravely; with greatness of mind.—A complete and generous education fits a man to perform justly, skilfully, and *magnanimously*, all the offices of peace and war. *Milton.*

**MAGNANO**, a town of Italy, in Placentia, 13 miles SSE. of Placentia.

**MAGNAVACCA**, [*i. e.* the Great Cow.] a fort of the Italian republic, in the dep. of the Lower P., and district of Comacchio, (late Ferrarese) on a canal, 3 miles SE. of Comacchio.

**MAGNE**, a town of France, in the dep. of the Two Seves; 3 miles WNW. of Nicort.

**MAGNES.** See **MAGNET**, § 2.

**MAGNESA**, or } in ancient geography, a  
(1.) **MAGNESIA**, } town or district of Thessaly, at the foot of mount Pelius, called by Philip V. one of the three keys of Greece. *Pausanias.*

(2.) **MAONESIA**, in ancient geography, a maritime district of Thessaly, lying between the S. part of the Sinus Thermaicus and the Pegasus on the S. and to the E. of the Pelasgiotis. *Magnus* and *Magneffus*, the epithet. *Horace.*

(3.) **MAGNESIA**, a town of Asia Minor on the Mæander, about 15 miles from Ephesus. The mistocles died there: it was one of the three towns given him by Artaxerxes, "to furnish his table with bread." It is also celebrated for a battle which was fought there, 190 years before the Christian æra, between the Romans and Antiochus king of Syria. The forces of Antiochus amounted to 70,000 men according to Appian, or 70,000 foot and 12,000 horse according to Livy, which has been exaggerated by Florus to 300,000 men: the Roman army consisted of about 28 or 30,000 men, 2000 of which were employed in guarding the camp. The Syrians lost 50,000 foot and 4000 horse; and the Romans only 300 killed, with 600 horse. It was founded by a colony from Magnesia in Thessaly; and was commonly called

**MAGNESIA AD MÆANDRUM**, to distinguish from

(4.) **MAGNESIA AD SIPYLUM**, a town of Tantalus, the residence of Tantalus, and capital of Mæonia, where now stands the lake Sale; seat at the foot of mount Sipylus, E. of the Hellespont. It was adjudged free under the Romans, but was destroyed by an earthquake in the reign of Tiberius.

(5.) **MAGNESIA**, or } in mineralogy, and chem.

**MAGNESIA ALBA**, } mistry, a kind of earth only discovered since the beginning of the 18th century. It was first known at Rome by the name of the *Count de Palma's powder*, which was there offered as a general remedy for all disorders. It was by many considered as a calcareous earth, but F. Hoffman showed it to be essentially distinct. The same was afterwards done by Black of Edinburgh and M. Magraaf of Bonn, though unknown to each other at the time. It is one of the most infusible substances in nature, neither melting, nor even hardening nor contracting, in the focus of the most powerful burning glass. (See **CHEMISTRY**, *Index*.) An experiment was made on it, in summer 1782, by M. Magellan with Mr Parker's burning-glass; when a cube of magnesia, a quarter of an inch each side, being put into its focus, was hardened, and reduced to less than  $\frac{1}{3}$  of its bulk each way, in from .25 of an inch to .08. But on applying a similar cube of magnesia, from Mr Henry's manufacture at Manchester, it neither became harder nor sensibly diminished in size. Bergman informs that magnesia, unless precipitated by the volatile alkali, or by the neat alkali tartar, always contains some siliceous or calcareous earth. Almost the same thing happens when it is separated by calcination from the remaining fixations of the nitrous and marine acids; in which case, it such a violent fire, it adheres together, and even shows a tendency to vitrify. Notwithstanding this extreme refractoriness of magnesia by fire.

it melts easily with borax, though scarce  
ed by alkalis or the calces of lead; when  
d with other earths it produces hard mass  
rious kinds; when mixed with calcareous, ar  
eous, or siliceous earths, it melts in the fire;  
f four times its weight of green glass be ad  
o it, the mass forms a kind of porcelain so  
as to strike fire with steel. But neither an  
part of the above earths, nor of ponder  
arth, glass of lead, vegetable alkali, nor vi  
ted tartar, added separately to magnesia,  
nelt in the fire: however, when mixed with  
non argillaceous earth, it melts into a hard

Magnesia differs from calcareous earth in  
g a much smaller attraction for fixed air. In  
spect it is inferior even to fixed alkaline  
so that it will not render any of these caus  
ough it will do so to the volatile alkali. It  
arts very readily with its own fixed air by  
heat; and it was by making experiments on  
stance that Dr Black made his first disco  
concerning FIXED AIR. In its calcined  
however, it does not show any of the caus  
of lime, but may be safely taken internally;  
even preferred by some to that which con  
fixed air. In this state it is much less fo  
than when combined with fixed air, and  
not effervesce with any acid. When mixed  
water, a very small degree of heat is excited,  
about 7962 times its weight of water it to  
lissolves. It also dissolves very readily in ac  
id, by which means it is frequently united  
resh water. For the same reason when we  
solution of perfectly mild alkali, either  
or volatile, with a solution of magnesia, no  
ntation follows; because the great quantity  
d air, extricated by the union of the acid  
alkali, instantly dissolves the precipitate as  
it is formed. But if we put this mixture o  
e fire, it will grow thick, and coagulate as  
s it is heated to a certain degree; because the  
fia is unable to retain, in any considerable  
as much fixed air as is necessary for its solutio  
etting magnesia into water, and afterwards  
it, it is found to retain eighteen hundredth  
of its weight of aqueous fluid; but when  
aturated with aerial acid, it will absorb and  
sixty-six hundredth parts of the same. When  
aturated with aerial acid, it is more soluble  
ld than in hot water; because the heat of  
utter dissipates part of the fixed air. Mag  
when combined with different acids, forms  
is salts. See CHEMISTRY, *Index*. It is usually  
red either from the bittern of sea-salt, or  
the salt prepared from that liquid under the  
of *Epsom salt*. The magnesia prepared di  
from the bittern, however, is not so pure  
at produced from the finer kinds of Epsom  
Hence, to have pure magnesia, Bergman  
the following directions: "Let Epsom salt,  
ell-formed crystals, be dissolved in distilled  
; and from this the magnesia is to be pre  
ced by mild volatile alkali. Some of this  
that remains suspended in the solution, by  
s of aerial acid, may be easily precipitated  
simple ebullition. Of this magnesia, 100lb.  
rightly prepared, contains near 25 parts of  
air, 30 of water, and 45 of pure earth. Its

specific gravity is then 2.155. This method of  
preparation may answer very well for having a  
very pure magnesia; but when it is required to  
have it very light and spongy, which by those who  
use it, is looked upon to be the only criterion of  
its goodness, we must use the following method:  
Take any quantity of Epsom salt, dissolve it in  
boiling water, and filter the solution. Dissolve  
also half the quantity of good pearl-ash, and fil  
ter this solution. Both these solutions ought to  
be somewhat diluted; and it will be proper to  
use twice the quantity of water which would  
fairly dissolve the salts. Mix the two solutions  
when nearly cold, and stir them very well toge  
ther. Let the mixture stand for some hours, un  
til the precipitate has fallen to the bottom in form  
of a coarse gritty powder. Put the whole then  
into a clean copper kettle, under which a mode  
rate fire is made: Stir it incessantly with a large  
wooden spatula, to prevent the powder from  
sticking to the bottom. As the mixture heats,  
the powder loses its sandy appearance, and in  
creases greatly in quantity; so that, though at  
first the mixture was quite thin, with only a small  
portion of sandy matter amongst it, before it has  
attained the boiling heat it will be so thick that  
it can scarce be stirred. When the grittiness is  
quite gone, the matter must be put upon a fil  
tering cloth, and warm water poured upon it till  
it runs inspid. The magnesia is then to be put  
upon chalk stones, which will absorb the greatest  
part of the moisture; and it may at last be fully  
dried in a stove. Magnesia alba is a good absor  
bent; and undoubtedly to be preferred to crab's  
eyes, on account of its purgative quality when  
united with an acid, which the other has not. It  
has been esteemed hurtful in bilious habits where  
there is a disposition in the stomach contrary to  
acidity. This, however, according to Mr Henry  
is doubtful: and where putrid bile is to be cor  
rected, he thinks good purposes may be answered  
by taking magnesia with an acid in a state of  
effervescence; as the fixed air, thus extricated,  
will correct the putridity of the contents of the  
intestines, while they are at the same time evac  
uated downwards. He is also of opinion, that in  
cutaneous diseases it may enter the circulation in  
form of a neutral salt, and, by acting as a dia  
phoretic and diuretic, prove an excellent altera  
tive. For some medical purposes, magnesia is  
used in a calcined state; in which case it is depr  
ived of its fixed air, and then it proves nearly as  
aperient as a double quantity of magnesia in its  
uncalcined state. Mr Henry is of opinion, that  
it may be useful in distensions of the bowels ar  
ising from flatus; that it may be successfully em  
ployed as a cathartic with patients labouring un  
der the stone, who are using the lixivium saponac  
eum; and that, joined with warm aromatics, it  
may be of service in correcting the great flatulency,  
which so much afflicts people of a gouty dispo  
sition. From several experiments made by the  
same author, it also appears that magnesia has a  
considerable antiseptic power. The like virtue he  
ascribes to all kinds of testaceous powders: whence  
he concludes, that medicines of this kind are by  
no means improper in fevers of a putrescent type;  
that where bile is suspected to be the cause of a

any putrid disease, those antiseptics should be prescribed which particularly impede its corruption; that, as calcined magnesia is a more powerful antiseptic than most other absorbents, it merits a preference to these; and that where an acid cacochymy prevails, magnesia or other absorbents, taken immediately before or after meal-time, may, by increasing the putrefactive fermentation of animal food, be of very great service. He hath also found, that magnesia hath a power of promoting the solution of resinous gums in water; and thus we have an elegant and easy method of preparing aqueous tinctures from these substances. Such tinctures, however, are calculated only for extemporaneous prescription, as most of them deposit a sediment when they have been kept a week or two.

(5.) **MAGNESIA BLACK.** See **MANGANESE.**

(1.) \* **MAGNET.** *n. f.* [*magnes*, Lat.] The loadstone; the stone that attracts iron.—

Two *magnets*, heav'n and earth, allure to bliss,

The larger loadstone that, the nearer this. *Dryd.*—It may be reasonable to ask, Whether obeying the *magnet* be essential to iron? *Locke.*

(2.) *The* **MAGNET**, or **LOADSTONE**, is a sort of ferruginous stone, in weight and colour resembling iron ore, though somewhat harder and more heavy; endowed with various extraordinary properties, attractive, directive, inclinatory, &c. See **IRON**, § 9; and **MAGNETISM**. It is also called *Lapis Heracleus*, from Heraclea, a city of Magnesia, a district of ancient Lydia, where it is said to have been first found, and from which it is usually supposed to have taken its name. Others derive the word from a shepherd named **MAGNETIS**, who first discovered it with the iron of his crook on mount Ida. It is also called *Lapis Nauticus*, from its use in navigation; and *Siderites*, from its attracting iron, which the Greeks call *σίδηρος*. The magnet is usually found in iron mines, and sometimes in very large pieces half magnet half iron. Its colour is different according to the different countries it is brought from. Norman observes, that the best are those brought from China and Bengal, which are of an iron or sanguine colour; those of Arabia are reddish; those of Macedonia, blackish; and those of Hungary, Germany, England, &c. the colour of unwrought iron. Neither its figure nor bulk is determinate; it is found of all forms and sizes. The ancients reckoned five kinds of mag-

nets, different in colour and virtue; the **E Magnesian**, **Bæotic**, **Alexandrian**, and **Thessaly**. They also took it to be male and female: chief use they made of it was in medicine, especially for the cure of burns and defluxion eyes.—The moderns, more happy, employ conduct them in their voyages. See **NAVIGATION**. The most distinguishing properties of the are, That it attracts iron, and that it dips the poles of the world; and in other circles also dips or inclines to a point below the horizon, directly under the pole; and communicates these properties, by its attraction, to iron; on which foundation are built the maker's needles, both horizontal and inclinatory.

**MAGNETES**, the ancient inhabitants of Magnesia in Thessaly. See **MAGNESIA**, N<sup>o</sup> 1.

\* **MAGNETICAL.** } *adj.* [from *magnet*]  
(1.) \* **MAGNETICK.** } Relating to the magnet.—

Review this whole *magnetick* scheme.—Water is 19 times lighter, and by consequence 19 times rarer, than gold; and gold is attracted very readily, and without the least opposition, transmits the *magnetick* effluvia, and admits quicksilver into its pores, and to pass through it. *Newton.* 2. Having power correspondent to those of the magnet.—The magnet acts upon iron through all dense bodies, whether cold, or red hot, without any diminution of its virtue; as through gold, silver, lead, &c. *Newton.* 3. Attractive; having the power to draw things distant.—The moon is attracted by heat, as the sun is of cold and moisture.

She, that had all *magnetick* force all round,  
To draw and fasten hundred parts in

They, as they move towards his all-attracting  
Lamp,

Turn swart their various motions, and  
By his *magnetick* beam.

4. *Magnetick* is once used by *Milton* for

As the *magnetick* hardest iron draws  
(2.) **MAGNETICK ISLAND**; an island of the South Sea, on the NE. coast of New Holland, discovered by Capt. Cook in 1770.

(3.) **MAGNETIC NEEDLE.** See **NEEDLE**.

(4.) **MAGNETIC ROCK.** See **LOCHMITE**, N<sup>o</sup> 1.

To **MAGNETISE**, *v. a.* To communicate magnetic virtue.

## M A G N E T I S M.

### DEFINITIONS.

**MAGNETISM** is thus defined by Dr Johnson:

\* **MAGNETISM.** *n. f.* [from *magnet*.] 1. Power of the loadstone.—Many other *magnetisms*, and the like attractions through all the creatures of nature. *Brown.* 2. Power of attraction.—By the *magnetism* of interest our affections are irresistibly attracted. *Glanville.*

**MAGNETISM** is more accurately defined by o-

thers, that power by which the loadstone is attracted, manifesting itself by certain attractive and directive virtues; and which may be understood from the following phenomena afterwards mentioned, which are common to all magnets.

### HISTORY of MAGNETISM.

THE ATTRACTIVE POWER of the magnet was known to the ancients; and is mentioned by **PLATO** and **EURIPIDES**, who call it *μαγνητις*.

one, because it commands iron which every thing else. But the knowledge of its power, whereby it disposes its poles on the meridian of every place, and occasions pieces of iron, &c. touched with it, to fly north and south, is of a much later date than the exact time of its discovery, and the manner in which it first appeared, are not ascertained. The first account recorded of these is in 1260, when Marco Polo the Venetian is said to have introduced the compass; though not as an invention of his own, but as derived from the Chinese, who are said to have had the use of it long before. Some imagine that the Chinese derived it from the Europeans.

BEMBO, or GIOIA, a Neapolitan, who lived in the 13th century, is usually supposed to be the first to give a title to the discovery: though SIR THOMAS BREWSTER mentions, that he had seen a book written by much older, which supposed the use of the magnet, though not as applied to the uses of navigation, but of astronomy. And GUYOT, an ancient French poet, who wrote in the 12th century, makes express mention of the loadstone compass; and obliquely hints at the nature of navigation.

THE DECLINATION of the MAGNET, or its declivity from the true north pole, was first discovered by Sebastian Münster, a Dutch merchant, in 1500; and the variation of the compass, by Mr Gellibrand, an Englishman, in the year 1625. See VARIATION. See also MAGNETISM, § 7.

THE DIP or INCLINATION of the NEEDLE, or its inclination at liberty to play vertically, to a point in the horizon, was first discovered by some of our countrymen, Mr R. Norman, about the year 1670. See the article DIPPING NEEDLE, § 11.

P A R T I.

GENERAL PRINCIPLES AND LAWS OF MAGNETISM.

Of the PHENOMENA of the MAGNET.

Whether natural or artificial, all substances which contain iron are attracted to the magnet. The semimetallic called NICKEL, and some others are attracted by the magnet, as freely from iron as much as possible. A needle may be suspended by a thread, nicely adjusted, so that it may revolve, and constantly the same end of the needle turns towards the north pole of the earth, the other end turning towards the south. The two extremities or parts of the magnet have been called the north and south poles, and the lines which pass through the designations of north and south are called the magnetic meridian.

This property is called the *polarity* of the magnet; and when it is in the act of turning to this position, it is said to *traverse* the plane perpendicular to the horizon which passes through the poles of a magnet, after it has turned round the *magnetic meridian*; and the angle which it makes with the meridian of the place is called the *declination* of the magnet or of the needle.

When either the north or the south poles of two magnets are placed near to each other, they

repel; but a north and a south pole attract each other.

4. A magnet placed in such a manner as to be entirely at liberty, inclines one of its poles to the horizon, and of course elevates the other above it. This property is called the *inclination* or *dipping* of the magnet; and is most conspicuous in artificial magnets or needles, which may be accurately balanced before the magnetic virtue is imparted to them.

5. By proper management any magnet may be made to communicate its virtue to a piece of steel or iron, which virtue it will retain for a longer or shorter time according to circumstances.

SECT. II. Of the DIFFERENT SUBSTANCES ATTRACTED by the MAGNET.

IRON is the only substance which the magnet particularly attracts, and that too when in its metallic state. Nevertheless this metal is so universally diffused, that there are few substances which do not contain a sufficient quantity of it to be in some degree affected by the magnet. Iron itself is attracted with different degrees of force according to the state in which it is with regard to malleability. Even the purest calx or solution, that can be made, is said to be in some degree affected by the magnet; but of all substances soft iron is attracted with the greatest force when clean, and of an uniform texture. Hardened steel is attracted with much less force than iron; but the scales separated from red-hot iron, and the fused globules from flint and steel, or finery cinder, are attracted as much as iron itself. The black calx of iron is attracted but very weakly; and the red calx or rust so little, that it is generally said to be quite insensible to the magnetic attraction; though this is not found to be strictly true, even when the calx is prepared by fire, and purified in the most careful manner. Sometimes the scales and calx are capable of acquiring a polarity, though weakly. Ores of iron are attracted with greater or less force according to the state of the metal in them, and according to the quantity of it they contain; though the attraction is always manifest, even when they contain such a small quantity as scarcely to deserve the name of ores. They are generally much more attracted after calcination than before. Ores of lead, tin, and copper, are likewise attracted, as well as native cinnabar, on account of the quantity of iron they contain; and though pure lead in its metallic state is not the least attracted, its calx is so in some degree. The calx of tin is also attracted, though in a still smaller degree than that of lead. Zinc, bismuth, and cobalt, but especially the ores of these semimetals, are attracted; but not antimony, unless it be first exposed to a gentle heat; and arsenic is not attracted at all. Platina is slightly attracted, (See CHEMISTRY, *Index*.) but one kind of bismuth is said to be absolutely repelled by the magnet. Almost all other minerals are attracted, at least after having been exposed to the action of fire. Calcareous earth is attracted less than any other kind, and the siliceous earth the most frequently. Sand, especially the black kind, is generally attracted; and amber as well as other combustible substances, have the same property, after being burned. Al-

most every part of animal and vegetable bodies is affected by the magnet after being burned; but unburned animal or vegetable substances are very seldom if ever perceptibly attracted. It is also remarkable, that even soot, or the dust which falls upon any thing left exposed to the atmosphere, are sensibly attracted. Colourless precious stones, as the diamond, and crystals, are not attracted; neither the amethyst, topaz, chalcidony, nor such as are deprived of their colour by fire; but all others, as the ruby, chrysolite, and tourmalin, are attracted. The emerald, and particularly the garnet, are not only attracted, but often acquire an evident polarity. The opal is attracted but weakly.

The attraction of so many different substances shows the universal diffusion of iron throughout almost all terrestrial substances; for to this only we can ascribe the attraction by the magnet. How small a quantity of iron indeed will give a substance this property, is evident from the following experiment related by Mr CAVALLO: "Having chosen a piece of Turkey stone which weighed above an ounce, I examined it by a very sensible magnetic needle, but did not find that it was affected in the least. A piece of steel was then weighed with a pair of scales, which would turn with the 20th part of a grain, and one end of it drawn over the stone in various directions. After this operation the steel was again weighed, and found to have lost no perceptible part of its weight; yet the Turkey stone, which had acquired only this very small quantity of steel, now affected the magnetic needle very sensibly." In his observations on this experiment, he proposes the magnet as a test of iron in different substances, being capable of detecting a smaller quantity than any method that chemistry can yet afford.

Mr CAVALLO has made many experiments to investigate the magnetic properties of brass and other metals; of which the following are the chief results: 1. Hammered brass is much more generally attracted by the magnet than other kinds. 2. A piece of brass rendered magnetic by hammering, loses the property on being made red hot so as to become softened; by a second hammering it becomes again magnetic; and thus it loses its property and recovers it alternately. 3. Suspecting that the magnetic property might be occasioned by a small quantity of iron abraded from the hammer, the pieces of brass were beat between two pieces of card paper; notwithstanding which precaution, it acquired the magnetic property as before. 4. Sometimes an evident degree of magnetism was communicated by 2 or 3 strokes, and with the card paper not above 30 strokes were given to make the brass sensibly magnetic. 5. A piece of brass was hardened by heating it between two large flints, using one for the hammer and the other for the anvil; but still it acquired a magnetic property, though less than with the iron hammer. 6. By melting the brass in a crucible, it entirely lost its magnetism. 7. A piece of brass deprived of its magnetic property by fire, regained it after a few strokes of the hammer, though laid between two pieces of copper. 8. Most of the pieces of brass tried by our author became magnetic by hammering; but some, though rendered equally hard with the rest, did not affect

the needle in the least. 9. On mixing quantity of iron with 4 times its weight which could not be made magnetic by hammering, the whole was rendered powerful magnetic; but on again mixing this compound 50 times its weight of the same brass, the attraction became so weak as to be scarcely perceptible; and was neither augmented by heat nor diminished by softening.

From these and other experiments Mr draws the following conclusions: 1. Metal becomes magnetic by hammering, and it loses its property by annealing or softening in the furnace; at least its magnetism is so far weakened that it afterwards to be only discovered when floated upon quicksilver. 2. The acquired magnetism is owing to particles of iron naturally or artificially mixed with the brass. 3. The pieces of brass which have that property retain it with diminution after a great number of repetitions, but he found no method of giving magnetism to brass which had it not naturally. 4. A large piece of brass has generally a stronger magnetism than a small one; and the flat surface of a needle more powerfully than the edge of one. 5. If only one end of a piece of brass be heated, then that end alone will disturb the needle. 6. The magnetic power which acquires by hammering has a certain limit which it cannot be increased by farther hammering. This limit is different in different pieces of brass, according to their thickness or quality. In the course of his experiments, the following circumstance was twice observed: A piece of brass which had the property of becoming magnetic by hammering, and of losing that property by annealing, lost its magnetic power entirely when left in the fire till partially melted, but regained it again on being fully so. 8. A long coil of brass, which alters the texture of the metal, making it what some workmen call "spring brass," generally destroys the magnetic property; whence this property seems to be owing to a particular configuration of its parts. 9. Brass is used in magnetical instruments, either to be left entirely soft, or chosen of such a hardness as will not become magnetic by hammering. 10. There are few substances in nature when floated upon quicksilver, are not attracted in some degree by the magnet.

The result of Mr Cavallo's experiments on metals was, that though pieces of hammer would sometimes attract the needle, yet attraction was always exceedingly weak, and had no effect, either in its natural state, or hammered as much as it could bear without being, or mixed with other metals. He discovered no magnetic property in nickel; and in the magnetic properties of platina he found it very similar to those of brass.

### SECT. III. *Of the Attraction of the Magnet towards IRON in its VARIOUS STATES OF EXISTENCE.*

1. EXPERIMENTS have been made by KIRCHER and CAVALLO, to determine whether mere heat makes any change in the magnetic properties of iron, without destroying its

minishing the power of the magnet to which it is applied: But their results were quite opposite, the one of the former being in the affirmative, and the other of the latter in the negative, though by heating iron to a red, or even to a white heat, the attraction of the magnet for it is not absolutely annihilated; but it is so far diminished, that it does not affect the magnetic needle.

It was next tried what would be the effect of decomposing iron; and with this view an iron vessel, containing about 2 ounces of iron filings, was placed near the south end of the needle of the compass, by which the latter was turned a little out of its direction. On adding distilled water, and then vitriolic acid, the attraction of the needle was to be increased, and the needle came nearer the filings. This superior attraction continued till the effervescence began to cease; and at last it was found to be inferior to what it had been originally. To obviate some objections which might arise from the motion of the iron filings, the experiment was repeated with steel wire twisted in various directions, so as to present a large surface to the acid; and being placed at a proper distance from the needle, it attracted it out of its direction at  $281^{\circ}$  to  $280^{\circ}$ . After adding the diluted vitriolic acid, a strong effervescence ensued, and the needle was moved to  $279^{\circ} 47'$ ; five minutes after it stood at  $279^{\circ} 35'$ ; and in five minutes more it was at  $279^{\circ} 30'$ ; seeming even to come somewhat nearer in a little time after: but as it then appeared to have gained its maximum of attraction, the acid was removed, and the needle went back to its original station of  $281^{\circ}$ .

In repeating this experiment with different acids, it was found that the vitriolic increased the attraction more than either the nitrous or marine.

The former of these the maximum of attraction was sooner gained and sooner lost than with the other two; and with marine acid the attraction was the least of all; which, however, our author imputes to his not being able to raise a sufficient effervescence with this acid.

The degree of magnetic attraction depends on the strength of the magnet, the weight and quantity of the iron presented to it, the magnetic or ferrous state of the body, and the distance between them. A piece of clean and soft iron is attracted more powerfully, than any other ferruginous substance of the same size and shape. The attraction is strongest at the poles, diminishing according to the distance from them, and entirely ceasing at the equator or middle point betwixt the poles.

It is strongest near the surface of the magnet, diminishing as we recede from it; but the distance in which this diminution takes place has not been exactly determined. M. MÜSCHENBERG made the following experiments to determine this point:

A cylindrical magnet, two inches long, and weighing 16 drams, was suspended by an accurate scale above a cylinder of iron exactly of the same shape and dimensions, and the degree of attraction betwixt the two measured by weights put on the opposite scale; the magnet being successively placed at different distances from the iron. The results were, that at 6 inches distant, it attracted 3 grains; at 3 inches, 6 gr. at 1 inch, 18 gr.; and at no distance, or in close contact, 57 gr.

II. A spherical magnet of the same diameter with the cylindrical one, but of greater strength, was affixed to one of the scales of the balance, and the cylindrical magnet used in the former experiment placed upon the table with its south pole upwards, facing the north pole of the spherical magnet; when the attractions were at 6 inches distance, 21 gr. at 3 inches, 44; at 1, 100; and at 0, 260 grains.

III. Changing the cylindrical magnet for the iron cylinder abovementioned, the attractions were, at 6 inches distant, 7 gr. at 3 inches, 25; at 1, 92; and at 0, 340 grains.

IV. Using a globe of iron of the same diameter with the magnet instead of the cylinder, the attractions were, at 8 inches distant, 1 grain; at 6,  $3\frac{1}{2}$ ; at 3, 16; at 1 inch, 64; and at 0, 290 grains.

In the experiments with the cylinder, the magnet attracted a shorter cylinder with less force, but in the same proportion.—From the others, it appears, that one magnet attracts another with less force than a piece of iron, but that the attraction begins from a greater distance; whence it must follow a different law of decrease.

4. The attraction between the magnet and a piece of iron is subject to variation from the mere shape of the latter, there being a limit in the weight and shape of the iron, in which it will attract it more forcibly than any other; but this can only be determined by actual experiment.

5. Although magnetic attraction generally takes place only between the opposite poles of two magnets, yet it often happens, that though the north pole of one magnet be presented to the north pole of another, that they show neither attraction nor repulsion; but that when placed very near each other, they will attract. This is explained by M. Cavallo in the following manner: "When a piece of iron, or any other substance that contains iron, is brought within a certain distance of a magnet, it becomes itself a magnet, having the poles, the attractive power, and, in short, every property of a real magnet. That part of it which is nearest to the magnet acquires a contrary polarity; but it often happens that one of the magnets, being more powerful than the other, will change the pole of that other magnet in the same manner as it gives magnetism to any other piece of iron which is exposed to its influence; and then an attraction will take place between two poles apparently of the same names; though, in fact, it is an attraction between poles of different names; because one of them has actually been changed. Thus, suppose that a powerful magnet has been placed with its north pole very near the north pole of a weak magnet, it will be found, that, instead of repelling, they will attract each other, because that part of the weak magnet which before was a north pole, has been changed into a south pole by the action of the strong magnet."

6. Neither the attraction nor the repulsion of magnetism is sensibly affected by the interposition of bodies of any sort, excepting iron or ferruginous substances. Thus suppose, that, when a magnet is placed an inch distant from a piece of iron, an ounce, or any determinate weight, is required

quired to move it; the same will be required, though a plate of metal, glass, or any other substance excepting iron be interposed. Neither the absence nor presence of air has any effect upon it.

7. By heat, the power of a magnet is weakened; and when it arrives at that degree called a *white heat*, it is entirely destroyed. On the other hand, the attraction is increased considerably by adding more and more weight to the magnet; for thus it will be found that the magnet will keep suspended this day a little more weight than it did the day before; which additional weight being added to it on the following day, or some day after, it will be able to suspend a weight still greater, and so on as far as a certain limit. On the other hand, by an improper situation, or by diminishing the quantity of iron appended to it, the power will decrease very considerably.

8. The magnetic attraction is communicable to any given piece of steel only in a certain degree; and therefore if a magnet is strong enough to give the maximum of attraction to the piece, it cannot be afterwards rendered more powerful by applying another magnet, however strong. Thus, indeed, the steel may be made stronger for a few minutes; but this overplus of attraction begins to go off as soon as the strong magnet is withdrawn; and the power, continuing gradually to diminish, settles in a short time at that degree which is its limit ever after.

9. If a piece of iron be held to one of the poles of a magnet, the attractive power of the other pole will thus be augmented: Hence we may understand why a magnet will lift a greater weight from a piece of iron than from wood or any other substance, viz. that the iron appended to the magnet becomes itself a magnet while it remains in that situation; and thus, having two poles, the iron which is placed near the one increases the attractive power of the other which adheres to the magnet, and enables it to sustain a greater weight than it would otherwise do.

10. Soft iron acquires the magnetic power by being appended to a magnet; but it lasts only while the iron remains in that situation, vanishing as soon as the magnet and iron are separated from each other. With hard iron, but especially steel, the case is quite different; and the harder the iron or steel is, the more permanent is the magnetism which it acquires; though in proportion to this same hardness it is difficult to impregnate it with the virtue.

11. The smallest natural magnets generally possess the greatest proportion of attractive power; so that there have frequently been seen magnets not weighing more than 20 or 30 grains, which would take up 40 or 50 times their own weight; but the greatest proportion of attractive power, perhaps ever known, belonged to the magnet worn by SIR ISAAC NEWTON in his ring. It weighed only three grains, yet was able to take up 746 grains, or nearly 250 times its own weight; and MR CAVALLO has seen one which could not weigh more than 6 or 7 grains, and yet was capable of lifting 300. A semicircular steel magnet made by MR CANTON, weighing one ounce and 13 penny-weights, took up 90 ounces; but magnets of above two pounds seldom lift more

than 5 or 6 times their own weight, seldom so much. It frequently happens a piece cut off from a large natural magnet will lift more than the stone itself did which is to be attributed to the heterogeneous nature of the stone itself; for if part of it were pure, it is plain that this must obstruct the virtue of the remainder, which consequently act more powerfully when the obstructing part is removed.

12. As the two magnetic poles taken together are capable of lifting a much greater weight than a single one, and as they are generally situated in opposite parts of its surface, it is customary to adapt two broad pieces of iron to them, letting the pieces project on one side of the magnet; because, in that case, the pieces themselves being rendered magnetic, and the iron could be conveniently adapted to the projections so as to let both poles act together. These pieces of iron are generally held to the magnet by means of a brass or silver wire, in which case the magnet is said to be *armed*; the pieces of iron are called its *arms*. For the same purpose, and to avoid the artificial magnets have been commonly made in the shape of a horse-shoe having their pole extremities. This is by far the best shape for magnets; and the horse-shoe ones are much more powerful than straight magnetic

#### SECT. IV. Of the POLARITY of the

ALTHOUGH, properly speaking, a magnet can have more than two poles, yet it frequently has both the natural and artificial kind as if it were into several magnets; each of which likewise a north and south pole, appears to have a number of poles, in denomination and some of the other qualities of poles arises sometimes from the heterogeneous nature of the magnet itself; and with respect to which have more than two poles, the following laws have been observed: 1. That the poles adjacent to one pole are endowed with contrary polarity. 2. That the poles of one magnet are not always equal in number, but may never differ by more than one; thus a magnet has 4 south poles, it will either have 5 north poles. Good and properly adapted magnets, however, have only two poles opposite to one another; though in some ways one half, or at least a great part of it, that possess one kind of polarity having the contrary kind; the two poles we call the *poles*, being only those where the attractive virtue is strongest. Those two good magnets, are joined by a line passing through the centre, which line is called the *axis* of the magnet; and a circle, whose plane is parallel to the axis encompassing the magnet, is called its *equator*; and to express the supposed similarity between the terrestrial and magnetical bodies, the latter have been formed of a spherical shape, with the poles and equator marked upon their surface in case they have got the name of *terrestrial*

On breaking a magnet into two or three  
 h one becomes a perfect magnet, though  
 ne not always an equal number of poles  
 me denomination. The poles of the  
 pieces generally answer to those of the  
 gnet which were nearest them, though  
 not always hold good.

net with two poles will very readily  
 f in the magnetic meridian, if suspend-  
 ne thread, or otherwise left at liberty  
 out when there are more than two poles,  
 ppen that their opposite tendencies will  
 t each other in such a manner that the  
 annot traverse; though it will still at-  
 repel as if it had only two. Thus, sup-  
 an oblong magnet has a N. polarity at  
 and a S. polarity in the middle; if the  
 ire both equally strong, then it is plain,  
 er of them can point towards that quar-  
 erence to the other; but if a magnet  
 ind be broken in the middle, the two  
 traverse very readily. It seldom hap-  
 ever, that both poles are equally strong;  
 case one of them will always get the bet-  
 e other, and the magnet will traverse  
 nding its having more than two poles.  
 rity of the magnet is its most valuable  
 as upon it depends the construction of  
 etic needle, or mariner's compass, so use-  
 vigation; for an account of which, see  
 , N° V, § 1—5; and NEEDLE.

variation of the needle, or its declina-  
 the true N. and S. direction, see VA-

 of the magnetic needle, see DIPPING  
 § II, 1—6.

rective, or polar power of a magnet, ex-  
 her than its attractive power: thus if a  
 reely suspended, be placed in the neigh-  
 of another, it will be found that they  
 each other's direction when their attrac-  
 rds iron or towards each other cannot  
 ed. This may be easily tried by placing  
 em in a scale of a balance and the other  
 see below it.

P A R T. II.

THEORIES OF MAGNETISM.

phenomena of magnetism, like those of  
 r, depend on a cause so little subject to  
 gitation of our senses, that any regular  
 supported theory can as yet scarcely be

The subject indeed is still more diffi-  
 that of electricity; for in the latter the  
 ten made visible and otherwise percep-  
 our senses; but no experiment could ever  
 e cause of magnetism perceptible other-  
 1 by its effects. The idea of its being  
 d by a fluid entering in at one pole and  
 at at another, took its rise, and became  
 neral, from the following experiment:  
 ut a small artificial magnet among some  
 gs laid upon a piece of paper, give the  
 w gentle knocks with your hand, so as  
 the filings a little, and they will dispose  
 lves as represented in *fig. 1. Plate CCVI.*

B and C D represent the two poles of

the magnet, and the dotted lines the disposition  
 of the filings. Mr Cavallo observes, that  
 this experiment cannot be any proof of the fluid's  
 circulation; "Because if the fluid, of whatever  
 nature it may be, did really circulate from one  
 pole to the other, and had any action on the  
 filings, these would be all driven towards that  
 pole to which the fluid directed its course. The  
 true cause of the disposition of the filings is their  
 becoming actually magnetic, and their two ex-  
 tremities being possessed of contrary polarities.  
 Now, when there are many particles of iron near  
 the magnet, those which touch its surface are  
 rendered magnetic; consequently they attract other  
 particles, and these being also rendered magnetic,  
 attract others, and so on, forming strings of small  
 magnets, which gradually increase in power as  
 they recede from the magnetic poles, by a little  
 consideration it will appear, that the farthest ends  
 of these strings or lines which proceed from the  
 parts adjacent to one of the poles of the magnet,  
 for instance the N. are likewise possessed of the  
 N. polarity; and the farthest extremities of those  
 which proceed from the parts adjacent to the S.  
 pole of the magnet, are possessed of the S. polar-  
 ity: hence, when they come sufficiently near,  
 they attract the extremities of the former strings,  
 and consequently form the curves delineated on  
 the figure. The shaking of the table in this ex-  
 periment serves to stir the filings, by making them  
 jump up a little way, and thus place themselves  
 in the proper situation; otherwise the action of  
 the magnet will not have power sufficient to dis-  
 pose properly those particles which stand at a  
 considerable distance."

The late discoveries in electricity have suggest-  
 ed another theory, viz. that the magnetic pheno-  
 mena may be occasioned by a fluid analogous to  
 the electric, or perhaps by the very same. To  
 ascertain this theory, the phenomena of magnet-  
 ism and electricity have been compared, and the  
 analogy between them marked. This analogy  
 consists principally in the following particulars:  
 1. Electricity is of two kinds, positive and ne-  
 gative, each of which repels its own kind, and  
 attracts the opposite. In magnetism, the N. and  
 S. poles do the same; each being repulsive of its  
 own kind of magnetism, and attracting the op-  
 posite.

2. In electricity, whenever a body in its natu-  
 ral state is brought near an electrified one, it be-  
 comes itself electrified, and possessed of the con-  
 trary electricity; after which an attraction takes  
 place. In like manner, when a piece of iron or  
 steel is brought within the influence of a magnet,  
 it becomes itself possessed of a magnetism contra-  
 ry to that which the magnet possesses, and is of  
 course attracted.

3. One sort of electricity cannot be produced  
 without the other, neither is it possible to produce  
 one kind of magnetism without the other also.

4. The electric power may be retained by cer-  
 tain substances, as amber, glass, &c. but easily  
 pervades other substances, which are therefore  
 called *conductors*. Magnetism has a similar con-  
 ductor in soft iron; for by means of it the virtue  
 may be extended farther than can be done with-  
 out it; at the same time that the iron itself loses

all magnetic power the moment it is separated from the magnet. Hardened iron, cast iron, and steel, perform a part analogous to that of electric; for the virtue does not easily pervade them, but is retained, and may be communicated by them to other unmagnetic pieces, as the electric virtue is to bodies by an excited electric. As to other substances, they seem not to be conductors of magnetism, because the fluid pervades them as if nothing were present, and they cannot transmit the virtue farther than it would go without them. With soft iron it is otherwise. Thus, if to one of the poles of a magnet we append a piece of iron of considerable length, the end furthest from the magnet will likewise attract iron with much more force than the magnet could do at that distance without it, while at the same time this attractive power is plainly that of the magnet itself, and not inherent in the iron, as it vanishes the moment we separate them. If a piece of hard steel of an equal length with the iron be appended to the magnet by one of its ends, the distant end will not show any attraction, and it will be a considerable time before the magnetic virtue can diffuse itself for any distance along it; but when the separation is made, the steel will be found to be magnetic, and will preserve its virtue for a long time.

5. The electric virtue exerts itself most powerfully on points, which carry it off or receive it in vast quantities. In like manner a magnet will hold a piece of iron more powerfully by a corner, or blunt point, than by a flat surface. On sharp points indeed the magnet has but little hold by reason of the deficiency of surface.

6. From some experiments related under ELECTRICITY, it appears possible to superinduce the negative and positive electricities upon one another; and in magnetics it is possible to do the same. Thus, if we place a wire of some length upon a pivot, so that it can turn very easily, by touching both ends of it upon the poles of a magnet it will acquire a polarity; one end being repelled by one pole and attracted by the other. If now we give the N. end, for instance, a very slight touch with the N. pole of the magnet, we will find that it has a small degree of S. magnetism superinduced upon it, so that on approaching the S. pole of the magnet it will be repelled; but by approaching the magnet nearer, or holding the wire for a little from flying away, the S. magnetism of the wire will be entirely destroyed, and the N. magnetism appear as before. This experiment is not very easily made; its success depends on having the first magnetism as strong and the second as weak as possible.

These are the most remarkable particulars in which magnetism and electricity agree; but the differences between them are no less remarkable. The magnetic power affects none of our senses, and perceptibly attracts only iron; while electricity attracts and repels bodies of every kind indiscriminately. The electric virtue resides on the surface, but that of the magnet pervades the whole substance. A magnet loses nothing of its power by communicating its virtue to other bodies, but electricity always does; and, lastly, the magnetic virtue is permanent; whereas that of e-

lectricity, without the greatest care, is exceedingly perishable, and easily dissipated.

Notwithstanding these disagreements, however, the analogies betwixt magnetism and electricity are so great, that the hypothesis of a magnetic as well as of an electric fluid has now gained general credit; and upon this hypothesis Prof. ERSTED has attempted to solve the phenomena of magnetism in the following manner:

1. This fluid is sufficiently subtle to penetrate the substance of all terrestrial bodies, and like the electric fluid is supposed to be repulsive of itself.

2. There is a mutual attraction between the magnetic fluid and iron, but an indifference betwixt it and all other bodies.

3. There is a great resemblance betwixt ferruginous bodies and electric, as the magnetic fluid passes with difficulty through the former.

4. Iron and all ferruginous substances contain a quantity of magnetic fluid equally dispersed through their substance when those bodies are unmagnetic. In this state they show neither attraction nor repulsion, because the repulsion between the particles of magnetic fluid is balanced by the attraction between the matter of those bodies and the fluid; in which case these bodies are said to be in a natural state: but when in a ferruginous body the quantity of magnetic fluid is drawn to one, then the body becomes magnetic; one extremity of it being now overcharged with magnetic fluid and the other undercharged. Bodies thus rendered magnetic, exert a repulsion between their overcharged extremities in virtue of the repulsion between the particles of that excess of magnetic fluid, which is more than overbalanced by the attraction of their matter. There is an attraction exerted between the overcharged extremity of one magnetic body and the undercharged extremity of the other, on account of the attraction between that fluid and the matter of the body; but to explain the repulsion which takes place betwixt their undercharged extremities, we must either imagine that iron when deprived of the magnetic fluid is repulsive of itself, or that the undercharged extremities appear to repel each other only because either of them attracts the opposite overcharged extremities.

A ferruginous body, therefore, according to this hypothesis, is rendered magnetic by having the equable diffusion of magnetic fluid through the substance disturbed, so as to have an overplus in it in one or more parts and a deficiency in others; its magnetism remaining as long as its impermeability prevents the restoration of the balance between the overcharged and undercharged parts.

A piece of iron is rendered magnetic by the vicinity of a magnet; because when the overcharged part, or pole of the magnet is presented to it, the overplus of the magnetic fluid in that pole repels the fluid from the nearest extremity of the iron, which therefore becomes undercharged, or possessed of the contrary polarity, to the most remote part of the iron, which consequently becomes overcharged, or possessed of the same polarity as the present pole of the magnet. When the piece of iron is rendered magnetic by presenting it to the undercharged extremity or pole of the magnet, then the part of the iron which is

est to it becomes overcharged, &c. because part of the magnet, being deprived of its ætæic fluid, attracts the magnetic fluid of the rest to that extremity of the iron which lies near it itself.

ence, to give magnetism to a piece of steel, strength of the magnet employed must be such to overcome the resistance which the substance of steel makes against the free passage of the ætæic fluid: hence a piece of soft steel is rendered magnetic more easily than a hard one, and a strong magnet will render magnetic such bodies which a weak one cannot affect. When two magnets of equal power have their opposite poles presented to each other, they mutually preserve and strengthen the powers of each other; but when poles of the same denomination are forced together, the powers are equal, they mutually weaken each other; or if unequal, the weaker will have its powers altered, or perhaps its attractive power entirely destroyed in a short time.

This theory seems not to be tenable. It is impossible to show why the mere turning of a bar of iron should accumulate the fluid, unless it were supposed to be a *gravitating fluid*, towards the earth; and even on this extravagant supposition it would still be impossible to account for the same fluid being repelled by the earth in the northern hemisphere; for if the N. magnetism be accumulation, the S. must be a deficiency, and *versu*.

Another hypothesis is advanced by Mr CAVALLO who considers it as so well established, "that it can hardly be a philosopher sceptical enough to doubt of its truth." This is, that "the EARTH is a magnet;" a hypothesis advanced above thirty years ago, by Dr GILBERT of Colchester. Mr Cavallo says, is proved almost to a demonstration in the following manner:

Almost all the phenomena which may be exhibited with a common magnet may also be exhibited with the earth, as far as it can be tried.

Vast masses of iron or ferruginous matter actually magnetic are dug out of the earth almost in every part of it.

In support of the above position, he adduces the phenomena of the compass, dipping needle, and magnetism which soft iron receives when properly situated. (See Part III. S. 2. I.) All these may be imitated by a common magnet. An objection, however, occurs, that the most remarkable phenomenon of all, viz. the attraction of iron is wanting. No experiment has yet shown that this metal is attracted more powerfully near the poles than at the equator itself; yet this is not to be the case in such a large magnetic body.

The dipping of the needle may indeed show, in this hemisphere there is a superiority of attraction between one end of the needle and the earth; but it remains to be proved, whether this superiority resides in the needle or in the earth itself.

The following consideration seems to show the power, whatever it is, resides in the needle; namely, that at the equator, the needle does not remain in an E. and W. direction, if so it were; because of the equal attraction of the N. and S. poles. Were the needle carried to the

poles itself, we can only suppose that it would point perpendicularly downwards; in every other case, the attraction will not be perpendicular, but oblique: and supposing us to recede from the point of perpendicular attraction only a few miles, the obliquity would become so great, that no attraction or repulsion towards that point would be distinguishable from an horizontal direction. The inclination of the needle therefore shows, that it is not actuated by the influence of a distant point in the earth; but by some power in the atmosphere immediately acting upon the needle, and directing its course either to the earth, or from it, in a certain position.

Those who maintain the magnetism of the earth, have been considerably embarrassed with some of the natural phenomena. The variation of the compass first showed that the needle was not influenced by those points on which the earth turns round in its diurnal course. This was attempted to be solved by another hypothesis, viz. that the earth had two magnetical poles by which the needle is influenced, and two others round which it turns on its axis. This hypothesis was likewise embarrassed by the continual shifting of the variation either to the E. or W. Another supposition was made by Dr HALLEY; viz. that there is a large magnet in the body of the earth, which not being fixed to the external part, moved with respect to it, and of consequence occasioned the variation. This was likewise overthrown, by observing that the variation of the compass was irregular; and differed so much in different parts of the world, that it could not be owing to any regular cause diffused over the whole. Four magnetic poles were then supposed to lie within the earth, and to be moveable with respect to each other; and that therefore the variation, whose theory would now be very intricate, ought to be derived from all their actions conjointly; but, notwithstanding all this complication of poles, it might still be objected, that some kind of regularity, not observed in the variation of the magnetic compass, ought to have taken place. The celebrated EULER adopted the theory of GILBERT and CAVALLO, but supposes only two poles; and upon this principle, has reduced the computation of the variations of the needle to a wonderful simplicity. (See VARIATION.) Mr CHURCHMAN has also adopted the opinion of a *magnetic nucleus* within the earth, with only two poles; whereby he accounts for all the VARIATIONS of the needle.

But notwithstanding these great names, and plausible theories, many are still of opinion, that the earth neither is nor contains, a magnet, but is surrounded by a fluid whose motion is productive of magnetism in iron. This fluid they suppose to be the ELECTRIC FLUID. Under the articles AURORA BOREALIS, EARTH QUAKE, ELECTRICITY, &c. it is shown, that the solar light, absorbed by the equatorial regions of the earth, becomes subject to new laws of motion, acting in short as if it were another fluid, in which state we call it *electricity*, or the *ætæic fluid*. In this state it passes through the substance of the earth from the equator towards the polar regions, getting out again in the vicinity of the poles, ascending into the high atmospherical regions, and then returning

turning to the equatorial parts from whence it came. On this supposition, which appears to be confirmed by various natural phenomena, it is easy to see, why in the northern and southern parts the direction of the currents issuing from the earth should always become more and more perpendicular to the earth as we approach the poles, and on the contrary why their direction must be horizontal or nearly so in the equatorial parts. The discovery of this general cause therefore seems to be the nearest approach we can as yet make to the knowledge of the origin of magnetical phenomena. In what manner iron more than other metals is influenced by this fluid, or why the direction of a current of electric matter either to or from the earth, should cause such strong attraction as magnetical bodies are sometimes endowed with, we have as yet no data for understanding.

## PART III.

## PRACTICE OF MAGNETISM.

THIS consists in communicating the magnetic virtue from one body to another; making artificial magnets, compasses, dipping-needles, &c.; and investigating the various phenomena resulting from bodies placed in different situations.

SECT. I. *How to COMMUNICATE MAGNETISM by the LOADSTONE.*

MAGNETISM is communicated merely by presenting a piece of iron or steel to one of the poles of a magnet or loadstone, even without touching it; though a strong and permanent power cannot be given without contact, or even stroking the one upon the other for a number of times. In this operation, that part of the ferruginous body which touches the pole of the magnet acquires the contrary magnetism; that is, if it touches the north pole, it will turn towards the south, *et vice versa*. The power acquired is strongest when soft iron is applied, weaker with hardened iron, and weakest of all with hard steel; but the permanency of it follows just the reverse of this rule; for steel or hardened iron will preserve its virtue for many years, but soft iron loses it the moment we withdraw the magnet. When we desire a strong and permanent virtue, therefore, it is best to use the hardest steel, and to impregnate it by means of one or more powerful magnets; taking care that the north pole of the magnet which gives the virtue be applied to that end of the steel which is to be made the south pole. The same method may be employed in rendering a weak magnet more powerful than before, or in restoring the virtue to one which has lost it.

The operation of communicating magnetism to pieces of steel or iron, is called *touching* them; and as this is of the utmost utility in navigation, for the purpose of giving polarity to needles, very considerable pains have been bestowed upon the subject, in order to discover the methods of giving them the magnetic virtue in the most effectual and permanent manner. When only one magnetic bar is to be made use of, one of its poles must be applied to the end of the needle or steel bar to be impregnated; and drawn along the surface of it, to the other extremity several times. By this me-

thod, that other extremity of the needle when the magnet touched last acquires the magnetism. This method, however, is to be equally effectual with that in magnets, or both poles of one magnet use of.

To communicate magnetism by magnetic bars, place the bar or needle on a table; then set the two magnetic bars right upon it at a little distance, equidistant from the middle of the needle in such a manner that the south pole of one of them be next that end of the needle which is the north pole, &c. These two bars be slid gradually towards one another, keeping them constantly at the same distance from each other; and when one has arrived at the one end, then they must be drawn in the contrary way, till the other arrives at the same end; and thus the needle must be rubbed a greater or smaller number of times, till it be found to have acquired a considerable power. The best magnetic bars are powerful, and the best made of very good steel, and not very large, and the strokes are fully sufficient.

To communicate the greatest magnetism possible, we may proceed in the following manner: 1. The magnetic bars may be joined together by interposing a piece of wood or other substance excepting iron; for the like poles, being contiguous in the wood, strengthen each other, and of consequence the lower ones are also strengthened. 2. The bars may be rendered magnetic by being placed in contact with bars of soft iron, as shown by the figures. 3. The magnetic bars may be inclined in any contrary way, as recommended by Mr. Canton, making an angle of about 15 degrees with the horizontal line AB. See fig. 3. In the same manner a piece of soft iron may be rendered magnetic by an armed or horseshoe magnet. In any of the methods hitherto mentioned, however, the bar to be rendered magnetic must be stroked on every side; and to let the magnet's centre fall just in its middle, care must be taken to stroke one half of the bar just as much as the other. Whenever a steel bar, or, in general, a ferruginous matter, is rendered magnetic by the application of two bars, or by the two poles of one magnet, the operation is called *touching*; but the single touch when only one bar is used is called *stroking*.

Artificial magnets of a semicircular or horse-shoe shape, have the magnetism communicated to them in the same manner as straight bars, which are straight, only the magnetism for this purpose must follow the curve of the bar to be impregnated. Thus, supposed a piece of crooked iron ABC, fig. 4. lay it flat on a table, and at the extremities apply the magnets DE, EG, joined together at their extremities FG with the conductor of soft iron FG. Apply then the magnets to the middle of the piece ABC, and draw them from end to end, following the curve of the bent steel, so that on one side of it the magnetic bars may stand as represented by the lines LK. When the piece of steel has been rubbed a sufficient number of times, it is then to be turned, and rubbed in the

the other, until it has acquired a sufficient degree of magnetism.

Mr Cavallo, by repeated experiments found, that if magnetism be communicated to a piece of steel while softened by heat, and the metal then hardened by pouring cold water upon it while in the act of receiving the magnetism, though it does not receive any extraordinary degree of magnetism, it is yet very useful in constructing artificial magnets. For thus they will acquire a considerable degree of power, without any additional trouble to the workman, and may then be fully impregnated in the usual way, which cannot be done without a great deal of labour when the operation is begun upon bars which have no virtue at all.

§ II. *How to COMMUNICATE the MAGNETIC VIRTUE without any MAGNET either NATURAL or ARTIFICIAL.*

This may be done with a soft iron bar in the manner already related, viz. by turning it in a position perpendicular to the surface of the earth, or other excepting a line directly perpendicular to the dipping needle. The magnetism thus acquired, however, is always weak, and is instantaneously lost; while a steel bar will not receive any perceptible degree of magnetism by this method.

If an iron bar be made red hot, and left to cool in the magnetic line, or if it be repeatedly struck with a hammer while in that line, it will acquire a small degree of permanent magnetism; though this also will soon vanish by leaving the bar in an improper position, or by inverting and turning it again. The magnetism lasts longer in proportion to the hardness of the iron; but a great time will be required to give it the degree of virtue it is capable of receiving by this method. An iron bar be left for a long time in the direction

of the magnetic line, or even in a perpendicular posture, it will sometimes acquire a great degree of power. Mr Boyle mentions an iron rod 10 feet long, which had acquired so much virtue by standing in this posture, that it exceeded a loadstone of 34 lb. weight, and would turn a needle 8 or 10 feet distant. Even tongs, axes, and other kitchen utensils, by being often heated, and set to cool again in an erect posture, frequently observed to gain a magnetic virtue. Sometimes iron bars, which were not capable of receiving permanent magnetism on account of their softness, have, merely by exposure to the atmosphere for a great length of time, acquired a considerable degree of power; at the same time it has been remarked, that these bars became much weaker by this exposure; the cause of which has yet been discovered.

Iron or steel acquires a very perceptible degree of magnetism by drilling, hammering, or other methods by which they are put into violent action. The cause of this magnetism Mr Cavallo ascribes for in the earth itself, the changeable nature of the metal by heat or cold, and the vibratory motion into which its parts are accidentally put. For the same reasons (says he) it seems that magnetism, in certain cases, is produced by electricity; the particulars observed concerning which are the following:—When the bar or needle is

laid horizontally in the magnetic meridian, whichever way the shock of an electric jar or battery enters, the end of the needle which lies towards the N. acquires the N. polarity, viz. the power of turning towards the N. when freely suspended, the other end acquiring the S. polarity. If the bar before it receives the shock has some polarity, and is placed with its poles contrary to the usual direction, then its original polarity is always diminished, and sometimes reversed. When the needle is struck standing perpendicularly in this hemisphere, the lower end becomes the N. pole, even when it had some magnetism before, and receives the shock while standing with its S. pole downwards. When all other circumstances are alike, the degree of magnetism received seems to be the same, whether the needles are struck while standing horizontally in the magnetic meridian or perpendicular to the horizon. When a needle is placed in the magnetic equator, a shock through its length very seldom renders it magnetic; but if the shock be passed through its breadth, it acquires the virtue, the extremity which lay towards the W. generally becoming the N. pole. If a needle or bar strongly magnetic, or a natural magnet, be struck by the electric shock, its power is thereby diminished. When the shock is too strong, so that the needle is thereby rendered considerably hot, it acquires either no magnetism at all or a very small degree of it. Hence a stroke of lightning often renders pieces of iron or steel magnetic, as well as those bodies which naturally contain iron, as some bricks, &c."

There are various methods of communicating a permanent magnetism to ferruginous bodies, by a bar rendered magnetic by the earth; of which the most simple is that described by Mr MARCEL. Being employed in 1726, in making some observations on the magnetic power which he found in great pieces of iron, he took a large vice weighing 90 lb. in which he fixed a small anvil weighing 12 lb. The steel to which he wished to give the magnetic virtue was laid upon the anvil in a N. and S. position, which happened to be the diagonal of the square surface of the latter. He then took a piece of iron 22 inch square, and 33 inches long, weighing about 8 lb. having one end rounded and bluntly pointed, the other tapered. Holding the steel fast upon the anvil with one hand, he took the iron bar in the other; and holding it perpendicularly, he rubbed the steel hard with the rounded part towards him from N. to S. always carrying the bar far enough round about to begin again at the N. Having thus given 10 or 12 strokes, the steel was turned upside down, and rubbed as much on the other side. Proceeding in this manner till it had been rubbed 400 times, the steel was as strongly magnetic as if it had been touched by a powerful loadstone. The place where he began to rub was always the N. pole. In these experiments it sometimes happened that the virtue was imparted by a few strokes; nay, by a single one, a small needle was made to receive a very considerable power. Thus he imparted to two compass needles such a degree of magnetic power, that one took up 2½ times another a whole ounce of iron; and though these needles were anointed with mixed oil to keep them

them from rusting, and a hard coat was thus formed upon them, they nevertheless retained their virtue. Thus also a knife was made so strongly magnetical, that it would take up an ounce and three quarters of iron. Four small pieces of steel, each an inch long and one twelfth of an inch broad, as thin as the spring of a watch, were thus impregnated with the magnetic virtue, and then joined into a small artificial magnet; which at its first formation took up 8 times its own weight of iron; and after being six years kept in the most careless manner, was found to have rather gained than lost any thing of its virtue. In the course of his experiments, Mr MARCEL found, that the end at which he began to rub was always the N. pole, whatever position the steel was laid in. On rubbing a piece of steel from one end to the middle, and then from the other end to the middle, it acquired two N. poles, one at each end, the middle being a south pole. Beginning to rub from the middle towards each end, he found a N. pole in the middle and a S. pole at each extremity.

Magnetism may be communicated to a small piece of soft steel in the following manner. Take two iron bars about an inch square, and upwards of 3 feet long, keep them in the magnetical line, or in a perpendicular posture, as represented *fig. 5.* Let the piece of steel BC be either fastened to the edge of a table or held by an assistant; and placing the lower extremity of the bar AB, and the upper extremity of the bar CD, on opposite sides, and in the middle of the steel, stroke the latter from the middle towards its extremities, moving both bars at the same time. When both are arrived at the extremities of the steel, remove them from it, and apply them again to the middle. Do so 40 or 50 times, and the steel will be found to have a considerable degree of magnetic power. Care, however, must be taken, in removing the bars, not to draw them along the surface of the steel, or the experiment will not succeed, because the magnetism is destroyed by the contrary strokes.

The late Dr GODWIN KNIGHT possessed a surprising skill in magnetism, being able to communicate an extraordinary degree of attractive or repulsive virtue, and to alter or reverse the poles at pleasure; but as he refused to discover his methods upon any terms whatever (even, as he said, though he should receive in return as many guineas as he could carry), these curious and valuable secrets have died with him. In the 69th vol. of the *Philos. Trans.* however, Mr B. WILSON hath given a process which at least discovers one of the leading principles of Dr Knight's art. Having provided himself with a great quantity of clean iron filings, he put them into a large tub that was more than one third filled with clean water; he then, with great labour, worked the tub to and fro for many hours together, that the friction between the grains of iron by this treatment might break off such smaller parts as would remain suspended in the water. The water being thus rendered very muddy, he poured it into a clean iron vessel, leaving the filings behind; and when the water had stood long enough to become clear, he poured it out carefully, without disturb-

ing such of the sediment as still remained, which now appeared reduced almost to impalpable powder. This powder was afterwards removed into another vessel to dry it; but as he had not obtained a proper quantity thereof by this step, he was obliged to repeat the process many times. Having at last procured enough of this very fine powder, the next thing was to make a paste of it with linseed oil. With these two ingredients only he made a stiff paste, and took care to knead it well before he moulded it into convenient shapes. Sometimes, while the paste continued in its soft state he would put the impression of a seal upon the several pieces; one of which is in the British Museum. This paste was then put upon wood, and sometimes on tiles, to bake or dry it before a moderate fire, at about the distance of a foot or so. The time required in drying this paste was generally about 5 or 6 hours before it attained a sufficient degree of hardness. When that was done, and the several baked pieces were become cold, he gave them their magnetic virtue in any direction he pleased, by placing them between the extreme ends of his large magazine of artificial magnets for a few seconds more as he saw occasion. By this method the virtue they acquired was such, that, when any of those pieces were held between two of his ten-guinea bars, with its poles purposely inverted, it immediately of itself turned about to reverse its natural direction, which the force of the very powerful bars was not sufficient to counteract. In the 66th vol. of the *Philos. Trans.* Fothergill had previously mentioned this subject. From these accounts it appears, that the basis of Dr Knight's artificial loadstones was black powder to which iron filings are reduced by water, called MARTIAL ÆTHIOPS: which Mr CAVALLO gives the following receipt for imitating the natural magnets.—“Take some martial æthiops, or which is more easily procured, reduce into very fine powder the scales which fall from red-hot iron when hammered, and about in smiths shops. Mix this powder with dry linseed oil, so as to form it into a very stiff paste and shape it in a mould so as to give it any form you require; whether of a terrilla, a button head, or any other. This done, put it into a warm place for some weeks, and it will dry so to become very hard; then render it magnetic by the application of powerful magnets, and it will acquire a considerable power.”

In making artificial magnets of steel, none has succeeded better than Mr CANTON, whose process is as follows: Take 12 bars; six of soft steel each 3 inches long, one quarter of an inch broad and one twentieth of an inch thick; with two pieces of iron, each half the length of one of the bars, but of the same breadth and thickness: also six pieces of hard steel, each five inches and a half long, half an inch broad, and three twentieths of an inch thick; with two pieces of iron half the length, but the whole breadth and thickness of one of the hard bars; and let all the bars be marked with a line quite round them at one end. Then take an iron poker and tongs, or two bars of iron, (the larger and the longer used, the better) and fixing the poker upright between the

es, hold to it, near the top, one of the soft  
s, having its marked end downwards, by a  
ce of sewing silk, which must be pulled tight  
the left hand, that the bar may not slide: then  
sping the tongs with the right hand, a little  
ow the middle, and holding them neatly in a  
tical position, let the bar be stroked by the  
ver end from the bottom to the top, about ten  
es on each side, which will give it a magnetic  
ver sufficient to lift a small key at the marked  
e: which end, if the bar was suspended on a  
ant, would turn towards the N. and is there-  
e called the *north pole*; and the unmarked end  
for the same reason, called the *south pole*. Four  
the soft bars being impregnated after this man-  
n lay the two (*fig. 6.*) parallel to each other,  
the distance of one fourth of an inch between  
two pieces of iron belonging to them, a N.  
S. pole against each piece of iron: then take  
of the 4 bars already made magnetical and  
ec them together so as to make a double bar  
thickness, the N. pole of one even with the S.  
e of the other: and the remaining two being  
e to these, one on each side, so as to have 2 N.  
e 2 S. poles together; separate the N. from  
S. pole at one end by a large pin, and place  
m perpendicularly with that end downward  
the middle of one of the parallel bars, the two N.  
e towards its S. and the two S. poles towards  
N. end: slide them backward and forward 3  
times the whole length of the bar, and re-  
ing them from the middle of this, place them  
the middle of the other bar as before directed,  
go over that in the same manner; then turn  
the bars the other side upwards, and repeat  
former operation: this done, take the two  
a between the pieces of iron; and, placing  
two outermost of the touching bars in the  
e, let the other two be the outermost of  
four to touch these with; and this process  
e repeated till each pair of bars have been  
ed 3 or 4 times over, put the 6 together  
the manner of the 4 (*fig. 6.*), and touch them  
two pair of the hard bars placed between  
irons, about half an inch from each other;  
lay the soft bars aside; and with the 4 hard  
e let the other two be impregnated (*fig. 7.*),  
ing the touching bars apart at the lower end  
two 10ths of an inch; to which distance let  
a be separated after they are set on the parallel  
e and brought together again before they are  
en off: then proceed according to the method  
cribed above, till each pair have been touched 2  
times over. But as this vertical way of  
ching a bar will not give it quite so much of  
magnetic virtue as it will receive, let each  
e now touched once or twice over in their  
lled position between the irons, with two of  
bars held horizontally, or nearly so, by draw-  
at the same time the N. pole of one from the  
dle over the S. end, and the S. of the other  
the middle over the N. end of a parallel  
e: then bringing them to the middle again,  
hout touching the parallel bar, give 3 or 4 of  
horizontal strokes to each side. The hori-  
ntal touch, after the vertical, will make the  
as strong as they possibly can be made, as  
ars by their not receiving any additional

strength, when the vertical touch is given by a  
great number of bars, and the horizontal by those  
of a superior magnetic power. The whole pro-  
cess may be gone through in about half an hour;  
and each of the large bars, if well hardened, may  
be made to lift 28 Troy ounces, and sometimes  
more. And when these bars are thus impregna-  
ted, they will give to an hard bar of the same size  
its full virtue in less than two minutes; and there-  
fore will answer all the purposes of magnetism in  
navigation and experimental philosophy much  
better than the loadstone, which is known not to  
have a sufficient power to impregnate hard bars.  
The 6 being put into a case in such a manner as  
that two poles of the same denomination may not  
be together, and their irons with them as one  
bar, they will retain the virtues they have recei-  
ved; but if their power should, by making experi-  
ments, be ever so far impaired, it may be restored  
without any foreign assistance in a few minutes.  
And if a much larger set of bars should be requi-  
red, these will communicate to them a sufficient  
power to proceed with: and they may, in a short  
time, by the same method, be brought to their  
full strength.

To expedite the process of making magnets,  
the bars should be fixed in a groove, or between  
brass pins, to prevent them from sliding; or they  
may be kept steady by a weight and ruler, as in  
*fig. 7.*

#### SECT. III. APPARATUS for making EXPERI- MENTS in MAGNETISM.

THE apparatus necessary in magnetics is but  
small, consisting only of a few magnets or mag-  
netic bars, a magnetic horizontal needle or com-  
pass, and a dipping needle. For those who do  
not intend to be very accurate, a common arti-  
ficial horse-shoe magnet and a few sewing needles  
may be sufficient; but where greater accuracy is  
required, it will be necessary to have a good set  
of magnetic bars, commonly six; a few small  
magnetic needles, a larger needle in a box with a  
graduated circle, and a dipping needle; to which  
may be added some pieces of steel wire, a few  
bars of soft iron, &c.

The magnetic bars ought to be made of the  
best steel, and tempered quite hard. There is  
not, however, any method yet known by which  
we can distinguish the kind of steel which is best  
for magnetical purposes. It will be proper, there-  
fore, previous to the construction of the bars, to  
try the quality of the metal in the following man-  
ner: Take a piece of it about 3 inches long and  
 $\frac{1}{4}$  of an inch thick; make it red-hot, and plunge it  
into cold water, which hardens it so that a file will  
not touch it. Apply then two powerful magne-  
tic bars; holding the N. pole of one to one ex-  
tremity of the steel, and the S. pole of the other  
magnet to the other extremity of the steel. Ha-  
ving kept them in this position for about a mi-  
nute, separate them from the steel, and then try  
whether it will keep suspended a key or other  
piece of iron. By treating in this manner pieces  
of different steel, it will easily be perceived which  
is capable of lifting the greatest weight, and con-  
sequently the most proper for the construction of  
the bars.

ving determined the quality of the material, the next thing to be considered is the shape of the bars; for unless the length and breadth of them bear a certain proportion to each other, they will not be capable of receiving their utmost power. The best shape, according to Mr Cavallo, is when the length is ten times the breadth and 20 times the thickness. The usual dimensions are  $\frac{5}{8}$  inches in length, half an inch in breadth, and  $\frac{1}{8}$  of an inch in thickness. Cylindrical bars are less convenient.—It is not absolutely necessary to polish these bars; though in this state they are much less liable to rust. The N. pole is generally marked with a line all round, to distinguish it from the S. pole. When kept together, the magnetic bars must be placed alternately with the marked end of one contiguous to the unmarked end of the other. Two pieces of soft iron called *supports* always belong to each set of bars. Each of these is equal in size to the half of one of the bars; so that when placed contiguous to one another in one direction, they may equal one of the bars. These are useful when other bodies are to be rendered magnetic. For the construction of the COMPASS and DIPPING NEEDLE, see COMPASS, N° V, § 2, 5, 6; and DIPPING, § II, 6.

#### SECT. IV. EXPERIMENTS with the above described APPARATUS.

1. To DETERMINE whether any SUBSTANCE IS ATTRACTED by the MAGNET or NOT.—If the substance to be examined contains iron, the attraction will evidently shew itself on bringing near it one of the magnetic bars. The quantity of attraction will always be known by the force requisite to separate them, and its proportion is estimated by the degree of that force. If the attraction be so small that it cannot be thus perceived, it must be put to swim upon water in an earthen or wooden vessel, by means of a piece of wood or cork. In this way the attraction will be much more easily manifested by the body coming towards the magnet when approached to it. It will sometimes be necessary to bring the magnet within one  $\frac{1}{2}$  of an inch of the body to be attracted; and as the latter advances, care must be taken to withdraw the magnet; for if they be suffered to strike against each other, the body, if hard, will generally recede; and it will likewise be proper to prevent the magnet to the body when the latter is at rest.

By setting the substances to be attracted swim upon quicksilver, a still smaller degree of attraction can be perceived. In using this fluid, the following particulars must be attended to. 1. The aperture of the vessel in which the quicksilver is kept must be at least six inches in diameter. The reason is, that, as the surface of the quicksilver descends near the side of the vessel, the curvature of surface formed by that descent is proportionably greater in the narrow vessels than larger ones. If the vessel is only 3 or 4 inches in diameter, the body to be attracted will perpetually run from one side to another; a common soup plate, however, will be found a very convenient vessel for this purpose. 2. It will be necessary to have the quicksilver very pure; and as it is difficult to preserve it in that state, it must be

frequently passed through a piece of paper rolled up conically, and having a ture of about one 40th of an inch diameter lower part. 3. The neighbouring air must be disturbed, that the body may be kept in motion; and, while in this state, one end of the magnet is to be presented to it in manner as when the experiment is tried. It was thus that Mr Cavallo made the experiments above described, *Part I; Sect.*

If it be suspected that the given body contains magnetism already, the same process is only observing to present a piece of soft iron to the body when swimming upon quicksilver. A piece of iron about half weight, and an inch in length, will be sufficient for this purpose.

2. To FIND the POLES of a MAGNET.—Present the various parts of the body successively to one of the poles of a magnetic needle; it will soon be discovered which parts of the body are possessed of a contrary polarity. One of the poles being thus discovered, the opposite pole of the magnetic needle to it will soon find out its own. When the magnetism of the body to be tested is very weak, there will be danger of receiving a contrary polarity by bringing the needle too near; distance at which this effect will take place will be determined, it will always be proper to keep it so far distant, that it can only feel the needle. Where there are only iron filings upon the body; for these will be attracted to the poles. They may be distinguished by setting the body to float in water, by tying it to a thread and letting it hang so that one may turn towards the N. and the other towards the S. This method, however, is not so exact when there are more than two parts directly opposite to one another.

3. EFFECTS of the MAGNET on a NEEDLE.—Having placed a magnetic needle upon a bar of soft iron about 8 inches long, and  $\frac{1}{2}$  of an inch thick, so near that it may draw the needle a little out of the way, and then approach gradually the N. pole of the magnet to the other extremity of the bar, and the N. end of the needle will recede from the bar more, in proportion as the magnet is brought nearer the bar. In the experiment by repeating the experiment by repeating the experiment, the N. end of the needle will be attracted by the bar. This shews, that when we bring the N. pole of a magnet towards one end of the bar, the other end acquires a S. polarity, and the other end a N. polarity. Hence the needle is not attracted to either magnetic pole of the same kind; but when the S. pole is brought near the end of the bar, that end which it receives the N. polarity, and the other end the S.; whence the needle, instead of being repelled, is now attracted. By approaching the magnetic needle to different parts of the bar, it will be found that one half of it possesses a contrary polarity, and the other the contrary

tic centre, however, or the limit betwixt two polarities, is not always in the middle of the bar; but is generally nearer that end which is nearest to the magnet. The difference increases as the bar is lengthened; and when the latter has a certain length, it acquires several poles. It depends on the strength of the magnet; and it happens, the first magnetic centre comes nearest to the end of the bar which stands next to the magnet, and the successive centres are formed at every two poles. Thus, supposing the north end of a magnet to be brought to the end of the bar, the end it touches becomes a S. pole; and when it recedes further a N. polarity takes place, after which it becomes a S. polarity, and so on. The poles become weaker as they recede from the end to which the magnet touches; so that if the bar be of considerable length, they totally vanish long before they come to the other end. Hence, by bringing a magnet to one end of a long bar, we thereby give any magnetism to the other; and this will happen when a magnet capable of lifting 1 lb. of iron is applied to a bar of about an inch and 5 feet long.

*The ACTION of MAGNETISM SHOWN by the REPEL- LION of two pieces of WIRE.*—Tie two pieces of wire each to a separate thread, and hang them close by each other, bring the poles of a magnet under them, and they will immediately repel; the divergency being greater as the magnet is brought nearer to a certain limit, and decreasing as the magnet is removed. If steel wires or common sewing-needles be used, the repulsion will continue a considerable time after the magnet is removed; this divergency will even be greater after the removal of the magnet, as its attraction does not draw them nearer each other; and, if they are too near, no repulsion will be shown by the magnet. The experiment may be agreeably diversified by using 4 or more needles, and presenting them to one pair, and a S. to another, &c.

*What circumstances a MAGNET can lift the HEAVIEST WEIGHT.*—By a crooked wire we may see at the power of a magnet varies according to the length of the wire. Thus, let a piece of wire about 1 inch in diameter, and 4 or 5 inches long, in the form represented by ACB, fig. 8. be held by a crooked corner at C. Tie it fast to a cross-bar at DE. Then apply either pole of the magnet to one of its extremities; and if in addition a small piece of iron, as II, be put on the other corner C, it will remain suspended. On the contrary pole of another magnet to the other extremity of the wire, the piece of iron immediately fall off; but if a pole of the same magnet be applied, it will not only be still kept sus-

but be more strongly attracted than before. In this experiment, the 1st magnet is assisted by the action of the 2d, but to strengthen a magnet in this manner, it does not appear necessary to use a magnet at all. Thus, having found how much a magnetic bar can lift, a long oblong piece of iron about 4 inches long, and somewhat heavier than the bar can bear. Append this to the pole of the bar holding

it with your hand till you place under the other end a larger piece of iron. It will then be found that the magnet will support the piece of iron which it could not do before. The lower piece of iron is to be placed between an half and three quarters of an inch below the under part of the oblong piece which hangs at the magnet. The same effect will be produced by the opposite pole of another magnet; but a pole of the same kind would weaken the attraction.

6. *The GENERATION of POLES, and of MAGNETIC CENTRES in the parts of a broken magnet.*—Take a magnetic bar about 6 or 8 inches long and  $\frac{1}{2}$  of an inch diameter, whose magnetic centre will be in the middle, or near it. Break off about  $\frac{1}{2}$  part by a smart stroke of a hammer, and it will be found that the broken part, though in the magnet it had but one polarity, will now have acquired a N. and S. pole, with a magnetic centre, as if it were a distinct magnet. The experiment may be diversified as follows: Having made a steel bar about 6 inches long and  $\frac{1}{2}$  of an inch thick quite hard, break it into two unequal parts. Join these, and press them hard together, giving it the magnetic virtue at the same time by two powerful magnets; while the parts remain in this position, so that the bar looks as if it had not been broke, it will have only two poles; but as soon as they are separated, each part will be found to become a distinct magnet, having a N. and S. pole proper to itself.

7. *To REMOVE the MAGNETIC CENTRE in a MAGNET.*—This may be done in various ways; as, by striking a magnetic bar repeatedly, heating it, hard rubbing, &c.; but in all these methods the magnetism of the bar is diminished at the same time that the centre is removed; so that they ought not to be continued beyond what is necessary to produce a sensible removal of the magnetic centre.

8. *The DISADVANTAGES of using MAGNETS of UNEQUAL POWER, and of STEEL NOT PROPERLY HARDENED.*—Having communicated the magnetic virtue to a steel bar by a magnet of any given power, then rub it with a weaker magnet, and it will be found, that the power of the bar, instead of being augmented, will be diminished; being no stronger than if it had been rubbed only with the weak magnet. The impropriety of using soft steel in making artificial magnets may be understood from the following example: Take two wires about 14 inches long, and  $\frac{1}{4}$  of an inch in thickness; let one be of very hard steel, the other of soft steel or iron, though not of the softest sort; then, by means of magnetic bars, give the virtue to those wires, treating them both in the same manner, and it will be generally found that the hard wire will have only two poles, but the other a greater number.

9. *To WEAKEN or DESTROY the MAGNETISM of a WIRE by BENDING.*—Having communicated the magnetic virtue to an iron or soft steel wire of about 4 or 5 inches long and one 20th of an inch in diameter, roll it round a stick so as to make 4 or 5 revolutions. When taken off the stick it will have its virtue quite destroyed, or at least very much weakened by the bending. This effect cannot be produced but when the texture of the wire is strained by bending; for if it be of such an elas-

straightness after being  
 k, little change is made  
 When only the middle  
 or no change takes place  
 If a piece of magnetic

 Provide two plates of soft iron, equi-  
 t those surfaces where the poles stand,  
 ng a little on one side of the stone, as  
 9. The projections marked DD

be much narrower than the breadth of the plates, from a quarter to half an inch being sufficient for the larger magnets, and about one sixth of an inch for small ones, for the purpose of applying to them the surface of the iron F. The thickness of the plates CD CD must be proportional to the strength of the magnet AB; and this proportion cannot easily be determined without an actual experiment. The best method, therefore, is to make them somewhat thick at first, and then keep filing them down as long as the power of the magnet increases; after which the filing is to be discontinued. The armature may be kept on, either by tying or by a box; which last is preferable. The armature of spherical magnets must be adapted to their shape, and each large enough to cover a quarter of it. In like manner may artificial magnets be armed, and thus a compound magnet may be produced much more powerful than any single one. Thus Dr Knight constructed two very powerful artificial magnets, or magazines of magnetic bars, which are now in the repository of the Royal Society. Each of these consists of 240 bars disposed in 4 lengths, so as to form a parallelepipedon, each length containing 60 bars. They are all kept together by iron braces, and the whole suspended on pivots, with a wooden wheel or carriage, by which they may be easily placed in any required position. If the artificial magnets be made in the shape of a hemisphere or a lens, they have no occasion for an armature, being sufficient to join them either by one top or by means of a box; and indeed every when straight bars are used, a compound

magnet may be made without armature; but then as the poles cannot act in the same plain, it is necessary to have two magazines in order to give magnetism the more conveniently to other bodies. The power of a magnet is rather augmented by being armed, for the same reason that it is increased by a piece of iron affixed to it. E is a brass ring, by which it may be suspended with the iron adhering to it, which is the best method for preserving its virtue.

12. *Of the TIME required by MAGNETISM to PENETRATE through IRON.* Having placed a bulky piece of iron, suppose one weighing 40 or 50 lb. so near a magnetic needle as to draw it a little out of its direction, apply one of the poles of a strong magnet to the other extremity of the iron, and it will require some seconds before the needle can be affected by it. The interval is great or less according to the size of the iron and the strength of the magnet.

ART. V. ENTERTAINING EXPERIMENT.

CONSTRUCTION of the MAGNETIC PERISCOPE-GLASS. Provide an ivory tube, about two inches and a half long, and of the form in fig. 10. The sides of this tube must be thin enough to admit a considerable quantity of light. It must be closed at one end with a screw; at that end there must be placed an eye-glass of about two inches diameter, and at the other end any glass. Have a magnetic needle, like that placed on a common compass.

It must be strongly touched, and so placed at the bottom of the tube that it may turn round. It is to be fixed on the centre of a

small ivory circle C, fig. 11. of the thickness of a counter, which is placed on the object-glass D, and painted black on the side next it. This circle must be kept fast by a circular rim of paste-board, that the needle may not rise off its pivot, after the same manner as in the compass. This tube will thus become a compass, sufficiently transparent to show the motions of the needle. The eye-glass serves more clearly to distinguish the direction of the needle; and the glass at the other end, merely to give the tube the appearance of a common perspective. The needle in this tube, when placed over, and at a small distance from, a magnet, or any machine in which it is contained, will necessarily place itself in a position directed by that magnet, and consequently show where the N. and S. pole of it are placed; the N. end of the needle constantly pointing to the S. end of the magnet. This effect will take place, though the magnet be enclosed in a case of wood, or even metal. But the attracting magnet must not be far distant from the needle, especially if it be small. This tube may be differently constructed, by placing the needle in a perpendicular direction, on a small axis of iron, on which it must turn quite freely, between two small plates of brass placed on each side the tube; the two ends of the needle should be so placed as to act in equilibrium. The N. and S. ends of this needle will, in like manner, be attracted by the S. and N. ends of the magnetic bar. The former construction, however, appears preferable.

EXP. 1. THE COMMUNICATIVE CROWN. Take a crown piece, and bore a hole in the middle of it.

in which place a piece of wire, or a large le, well polished, and strongly touched with magnet. Then close the hole with a small piece of paper, that it may not be perceived. Now hold the needle in the magnetic perspective before described, when it is brought near to this piece of paper, will fix itself in a direction correspondent to the wire or needle in that piece. Desire any person to lend you a crown piece, which you may easily change for one that you have prepared above. Then give the latter piece to another person, and leave him at liberty either to put it privately in a snuff-box, or not; he is then to take the box on a table, and you are to tell him, by means of your glass, if the crown is or is not in the box. Then bringing your perspective close to the box, you will know, by the motion of the needle, whether it be there or not; for as the needle in the perspective will always keep to the position of itself, if you do not perceive it has any motion, you conclude the crown is not in the box. It may happen, however, that the wire in the snuff-box may be placed to the N. end in which case you may be deceived. Therefore, to be sure of success, when you find the needle in the perspective remain stationary, you may make some motion to desire the person to move the box into another position, by which you will certainly know if the crown piece be there or not. The needle in the perspective must be very sensible as the wire in the crown cannot have any attractive power.

**EXP. 2. The MAGNETIC TABLE.** Under the top of a common table place a magnet that turns on a pivot; and fix a board under it, that nothing may appear. There may also be a drawer under the table, which you pull out to show that there is nothing concealed. At one end of the table there must be a pin that communicates with the magnet, and by which it may be placed in different positions: this pin must be so placed as not to be visible to the spectators. Strew some steel filings or very small nails over that part of the table where the magnet is. Then ask any one to lend you a knife, or a key, which will then attract part of the nails or filings. Then placing your hand in a careless manner on the pin at the end of the table, you alter the position of the magnet; and when you give the key to any person, you desire him to do the experiment, which he will then not be able to perform. You then give the key to another person; at the same time placing the magnet in the former position, by means of the pin, in the first position, so that that person will immediately perform the experiment.

**EXP. 3. The MYSTERIOUS WATCH.** Desire any person to lend you his watch, and ask him if it will go when it is laid on a table. If he say it will, you place it over the N. end of the magnet, and it will presently stop. Then mark with chalk, or a pencil, the point where you placed the watch; and when you change the position of the magnet, as in the former experiment, you give the watch to another person, and desire him to make the experiment; which he not succeeding, you give it to a third person, at the same time replacing the magnet,

and he will immediately perform the experiment. In this experiment the balance of the watch must be of steel.

**EXP. 4. The MAGNETIC DIAL.** Provide a circle of wood or ivory, of about 5 or 6 inches diameter, as *fig. 12*, which must turn quite free on the stand B (*fig. 13*.) in the circular border A: on the circle must be placed the dial of pasteboard C, (*fig. 12*.) whose circumference is to be divided into 12 equal parts, in which must be inscribed the numbers from 1 to 12, as on a common dial. There must be a small groove in the circular frame D, to receive the pasteboard circle. Between this last and the bottom of the frame, place a small artificial magnet E, (*fig. 14*.) that has a hole in its middle, or a small protuberance. On the outside of the frame place a small pin P, which serves to show where the magnetic needle I, that is placed on a pivot at the centre of the dial, is to stop. This needle must turn quite free on its pivot, and its two sides should be in exact equilibrium. Then provide a small bag, that has 5 or 6 divisions, like a lady's work-bag, but smaller. In one of these divisions put small square pieces of pasteboard, on which are wrote the numbers from 1 to 12, and you may put several of each number. In each of the other divisions you must put twelve or more like pieces; observing, that all the pieces in each division must be marked with the same number. Now the needle being placed upon its pivot, and turned quickly about, it will stop at that point where the N. end of the magnetic bar is placed, and which you previously know by the situation of the small pin in the circular border. Present to any person that division of the bag which contains the several pieces on which is wrote the number opposite to the N. end of the bar, and tell him to draw any one of them he pleases. Then placing the needle on the pivot, turn it quickly about, and it will stop at that particular number. Another experiment may be made with the same dial, by desiring two persons to draw each of them one number out of two different divisions of the bag; and if their numbers, when added together, exceed 12, the needle or index will stop at the number they exceed it; but if they do not amount to 12, the index will stop at the sum of those two numbers. To perform this experiment, place the pin against the number 5, if the two numbers to be drawn from the bag be 10 and 7; or against 9 if they be 7 and 2.—If this experiment be made immediately after the former, as it easily may, by dexterously moving the pin, it will appear the more extraordinary.

**EXP. 5. The CYLINDRIC ORACLE.** Provide a hollow cylinder about 6 inches high and 3 wide, as AB, *fig. 15*. Its cover CD must be made to fit on any way. On one side of this cylinder let there be a groove, nearly of the same length with that side; in which place a small steel bar, (*fig. 16*.) strongly impregnated, with the N. pole next the bottom of the cylinder. On the upper side of the cover describe a circle; and divide it into ten equal parts, in which are to be wrote the numbers from 1 to 10, as is expressed in *fig. 17*. Place a pivot at the centre of this circle, and have ready a magnetic needle. Then provide a bag, in which

there

are several divisions, like that described in 4. In each of these divisions put a number, on which the same or similar questions are to be asked. In the cylinder put several different questions to each question, and seal them up in the top of small letters. On each of these letters there is to be wrote one of the numbers of a circle at the top of the box. You are to know the number of the answers to each question. Then offer one of the divisions of the bag, observing which division it is, to any person and desire him to draw one of the papers, and put the top on the cylinder, with that number which is wrote on the answer directly over the bar. Then placing the needle on the pivot, it briskly about, and it will stop at the number of the bar. Then desire the person who asks the question to observe the number at which the needle stands, and to search in the box for a paper which has the same number, which he will find the answer.—You may repeat the experiment by offering another division of the bag to the same or another person; and placing the needle on the magnetic bar, proceed as before. Various answers may be given to the same question. *E. g.* suppose the question to be, Is it proper to marry? *Ans.* 1. While you are young, not yet; when you are old, not at all. 2. Marry in haste, and repent at leisure. 3. Yes, if you can get a good fortune; for something has some favour, but nothing has no flavour. 4. No, if you are apt to be out of humour with yourself; for then you will have two persons to quarrel with. 5. Yes, if you are sure to get a good husband (wife); for that is the greatest blessing of life. 6. No, if the person you should marry is an angel; unless you will be content to live with the devil: &c.

**FIG. 6. THE ENCHANTED EWER.** Fix a conical ewer, as A, (fig. 18) of about 12 inches high, upon a square stand B; in one side of which there must be a drawer D, of about 4 inches square and half an inch deep. In the ewer place a hollow tin cone, inverted, as AB, fig. 19, of about 4½ inches diameter at top, and 2 inches at bottom; and at the bottom of the ewer there must likewise be a hole of two inches diameter. Upon the stand, at about an inch distance from the bottom of the ewer, and directly under the hole, place a small convex mirror H, of such convexity that a person's visage, when viewed in it, at about 15 inches distance, may not appear above

two inches and a half long. Upon the stand, at the point I, place a pivot of half an inch high, on which must be fixed a thin pasteboard circle, enclosed in a circle of very thin pasteboard OS, fig. 20, of five inches diameter. Divide the pasteboard into 4 parts, in each of which is to be painted a small circle; and in 3 of these circles paint, as 1, 2, 3, the dress of each of which is to be different, one, for example, having a turban, another a hat, and the other a woman's cap. Cut out that part which contains the face in each of the circles, and let the 4th circle be entire; as it is expressed in the figure. The dresses of the needle are to be disposed in the same manner as in the plate. Next provide a small square of wood or pasteboard, fig. 21, 22, 23, 24, of the same size with the inside of the drawer. On these frames must be painted the same dresses as on the circular pasteboard; with this difference, that there must be no part of them cut out behind each of these pictures place a magnet in the same direction as is expressed in the figure, and cover them over with paper, that they may not be visible. Matters being thus prepared in the drawer the frame, fig. 24, on which the dresses are nothing painted. Then pour a small quantity of water into the ewer, and desire the person to look into it, asking them if they see the dresses as they are. Then take out the frame, fig. 24, and give the 3 others to any one, and let him choose in which of those dresses he will appear. Then put the frame with the dresses in the drawer; and a moment after a person looking into the ewer will see his own face surrounded with the dresses of that picture. The pasteboard circle, divided, as above, into 4 parts, in 3 of which are painted the dresses as on 3 of the boards, and the 4th blank, containing a magnetic needle, as above, boards having each a concealed magnet. Therefore, when one of them is put in the drawer the ewer, the circle will correspond to the position of that magnet, and consequently the person looking into the top of the ewer will see his own face surrounded with the head dress figure in the drawer.—This experiment, when formed, is highly agreeable. As the pasteboard circle can contain only three heads, you may form several such circles, but you must then use several other frames: and the ewer must be taken off from the stand.

## MAG

**MAGNETISM, ANIMAL**, a sympathy lately supposed by some persons to exist between the magnet and the human body; by means of which the former became capable of curing many diseases in an unknown way, something resembling the performances of the old magicians. The fanciful system, to call it by no worse name, of animal magnetism, appears to have originated, in 1774, from a German philosopher named *Fausermann*, who greatly recommended the use of the magnet in medicine. M. Mesmer, a physician of

## MAG

the same country, by adopting the principles of Fausermann, became the direct founder of the sect; but, afterwards deviating from the tenets of his instructor, he lost his patronage, as well as the favour of Dr Ingenhouthz, which he had formerly enjoyed. Mesmer had already distinguished his system by a dissertation on the influence of the fluid in the human body, which he publicly delivered at the university of Vienna; but he was so unable to stand before the opposition of Mesmer and Ingenhouthz, that his system fell

ntly into disrepute. Mesmer appealed to the  
 lemy of sciences at Berlin; but they rejected  
 principles as destitute of foundation, and un-  
 worthy of the smallest attention. He then made  
 ur through Germany, publishing every where  
 great cures he performed by means of his  
 al magnetism, while his opponents every  
 re pursued him with detestations of the false-  
 of his assertions. Mesmer still undaunted  
 for many defeats, returned to Vienna; but  
 ting there with no better success than before,  
 retired to Paris in the beginning of 1778. Here  
 met with a very different reception. He was  
 patronized by the author of the *Dictionnaire*  
*Mercurielles de la Nature*; in which work a great  
 ber of his cures were published, Mesmer him-  
 receiving likewise an ample testimony of his  
 our and solid reasoning. He soon collected  
 ents, and, in April 1778, retired with them  
 eteil, whence he in a short time returned  
 them perfectly cured. His success was now  
 great as his disappointment had been before.  
 ents increased so rapidly that he was soon o-  
 ed to take in pupils to assist him in his opera-  
 e. These pupils succeeded as well as Mesmer  
 self; and so well did they take care of their  
 emolument, that one of them, named M.  
 on, realized upwards of 100,000 l. Sterling.  
 779, Mesmer published a *Memoir on Animal*  
*magnetism*, promising afterwards a complete work  
 n the subject, which should make as great a  
 lution in philosophy as it had already done in  
 icine. The new system now gained ground  
 y; and soon became so fashionable, that the  
 ay of the faculty was thoroughly awakened,  
 an application concerning it was made to go-  
 vment. In consequence of this a committee  
 appointed to inquire into the matter, con-  
 ing partly of physicians and partly of members  
 le royal academy of sciences, with Dr Benja-  
 Franklin at their head. This was a thunder-  
 bolt to the supporters of the new doctrine.—  
 Mesmer himself refused to have any communica-  
 . with the committee; but his most celebra-  
 pupil D. Flouin was less scrupulous, and explained  
 principles of his art in the following manner:  
 Animal magnetism is an universal fluid, con-  
 stituting an absolute plenum in nature, and the  
 sum of all mutual influence between the celest-  
 bodies, and betwixt the earth and animal bo-  
 . 2. It is the most subtle fluid in nature; ca-  
 ble of a flux and reflux, and of receiving, pro-  
 ducing, and continuing all kinds of motion. 3.  
 animal body is subjected to the influences of  
 fluid by means of the nerves, which are im-  
 mediately affected by it. 4. The human body has  
 s and other properties analogous to the mag-  
 . 5. The action and virtue of animal magne-  
 . may be communicated from one body to  
 ther, whether animate or inanimate. 6. It o-  
 ces at a great distance without the interven-  
 of any body. 7. It is increased and reflected  
 mirrors; communicates, propagates, and in-  
 creases by sound; and may be accumulated, con-  
 centrated, and transported. 8. Notwithstanding  
 universality of this fluid, all animal bodies are  
 equally affected by it; on the other hand,  
 e are some, though but few in number, the

presence of which destroys all the effects of ani-  
 mal magnetism. 9. By means of this fluid ner-  
 vous disorders are cured immediately, and others  
 mediately; and its virtues, in short, extend to  
 the universal cure and preservation of mankind.  
 From this extraordinary theory, Mesmer or M.  
 Defflon, had fabricated a paper, in which he stat-  
 ed that there was in nature but one disease and  
 one cure, and that this cure was animal magne-  
 tism. To ascertain the truth of these assertions,  
 the committee attended M. Defflon, in the room  
 where his patients underwent his magnetical ope-  
 rations. The apparatus consisted of a circular  
 plat-form made of oak, 12 feet high; with a num-  
 ber of holes at the top, in which were iron rods  
 with moveable joints, for the purpose of applying  
 them to any part of the body. The patients were  
 placed in a circle around it, each touching one  
 of these rods, and joined to one another, by a  
 cord passing round their bodies. Each of them  
 held an iron rod in his hand 10 or 12 feet long,  
 to concentrate the magnetism. M. Defflon al-  
 called in the aid of music, from a piano forte; on  
 which some airs were played, accompanied with  
 songs; alleging that music is a conductor of ani-  
 mal magnetism, which is transmitted to the pa-  
 tients by the sounds. The internal part of the  
 platform was said to concentrate the magnetism,  
 and was the reservoir whence the virtue was dis-  
 fused among the patients. The committee sat-  
 isfied themselves, by means of a needle and electro-  
 meter, that neither common magnetism nor elec-  
 tricity was concerned. Dr Defflon also commu-  
 nicated the magnetism by his finger, and a rod  
 which he held in his hand, and which he carried  
 about the face, head, or such parts of the patient  
 as were diseased. His principal application, how-  
 ever, was by pressure of his hands or fingers on  
 the lower regions of the stomach. The effects of  
 these operations upon his patients were very dif-  
 ferent. Some felt nothing; others spit, coughed,  
 sweat, and felt, or pretended to feel, extraordi-  
 nary heats in different parts of the body. Many  
 women, but very few men, had convulsions, which  
 Defflon called their crisis, &c. The commis-  
 sioners at last finding they could come to no satis-  
 factory conclusion, while they attended in this pu-  
 blic way, determined to try the experiments them-  
 selves privately. Accordingly they 1. Tried the  
 effects of animal magnetism upon themselves, and  
 felt nothing. 2. Seven of Defflon's patients were  
 magnetized at Dr Franklin's house, of whom 4  
 felt nothing; 3 felt, or affected to feel something.  
 3. Several persons in a higher sphere of life were  
 magnetized, and felt nothing. 4. The commis-  
 sioners, now determined to discover what none  
 imagination had in this business, blindfolded a  
 great number of the common people, and made them  
 sometimes think that they were magnetized, at other  
 times they magnetized them without letting them  
 know that they did so; the consequence was, that  
 when they supposed themselves magnetized, they  
 likewise thought they felt something, and else-  
 wise they felt nothing. 5. A mulctree tree was said to produce  
 convulsions; a young man, blindfolded, fell into  
 convulsions, when he imagined himself near the  
 tree, though he was really at a considerable dis-  
 tance from it. Defflon accounted for this on the

principle of all trees being magnetic: but in this case, every one, susceptible of magnetism, would be seized with convulsions when he approached a tree. The same influence of imagination was observed in a woman accustomed to have convulsions when magnetised. They came on when nothing was done to her, on being told, when blinded, that she was magnetised. Other instances were given, from which it was evident, either that the patients were impostors, or in such a wretched state of debility both of mind and body, that the most trifling effects of the former had the most powerful effects on the latter. The commissioners therefore entirely disapproved of the whole. The touch, imitation, and imagination, they concluded, were the great causes of the effects produced by Mr Deslon's operations; and by means of these they supposed that convulsions, which in themselves are a very violent disorder, might be spread much farther than could be wished, even through a whole city. It was observed that the operator sometimes pressed strongly, and for a long time, upon the hypochondria and pit of the stomach; and it is well known that a strong pressure on these parts will produce disagreeable sensations in those who enjoy perfect health. Mesmer complained of the report of the commissioners, petitioned parliament, and was by them commanded to discover the mysteries of his doctrine; which is now universally exploded. The conclusion of the academicians concerning it was, that it is not entirely useless to philosophy; as it affords one *fait* more to be added to the history of the errors and illusions of the human mind, and a signal instance of the power of imagination.

MAGNICOURT, a town of France, in the dep. of the Strate of Cahors; 6 m. S.W. of St. Pol.

MAGNIZ, Nicolas, a learned and laborious ecclesiastic, who died in 1749 at an advanced age. He composed an excellent Latin dictionary, entitled *Nomen*, printed at Paris 1721 and 1722; 2 vols 4to. This dictionary, besides the words in the classics, contains all those which occur in the Bible, the breviary, and ecclesiastical authors, the terms of art, the names of great men, bishops, councils, heresies, &c.; in short, more than 60,000 words which are not to be found in the common dictionaries.

\* MAGNIFIABLE, *adj.* [from *magnus*.] Worthy to be extolled or praised. Unchangeable—Noble, though wonderful in itself, and unchangeably *magnifiable* from its demonstrable perfection, hath yet received objections from the multiplying conceits of men. *Bacon*.

\* MECHANICAL MAGNETIC, *adj.* [from *magnus*, I. (ind.)] Attractive; grand; great; noble. Proper, but little used.—The iron that is to be pulled for the Lord must be exceeding *magnetically* of fine and of glory. 1 *Chro.* xxii. 3.

T'rence, domination; pre-eminence, virtue, power.

If there *magnific* titles yet remain,  
Not merely vulgar. *Alston*.

O parent! there are thy *magnific* deeds;  
Thy triumphs! *Milton*.

\* MAGNIFICENCE, *n. f.* [from *magnus*, Latin.] Grandeur of appearance; splendour.—

Nor want we skill or art, from whence  
*Magnificence*.

No Babylon,  
Nor great Alcairo, such *magnificence*  
Equal'd in all her glories.

—One may observe more splendour and  
*cence* in particular persons houses in Gene  
in those that belong to the publick. *Add*

\* MAGNIFICENT, *adj.* [from *magnificus*.]  
1. Grand in appearance; splendid; pompous.  
Man he made, and for him built  
*Magnificent* this world.

—It is suitable to the *magnificent* harmon  
universe, that the species of creatures sh  
gentle degrees, ascend upward from us  
his perfection, as we see they gradually  
from us downwards. *Locke*—

When Rome's exalted beauties I de  
*Magnificent* in piles of ruin lie.

2. Fond of splendor; setting greatness  
—If he were *magnificent*, he spent with  
ring intent: if he spared, he heaped with  
ring intent. *Sidney*.

\* MAGNIFICENTLY, *adv.* [from *magnificus*.]  
Pompously; splendidly.—

Beauty a monarch is,  
Which kingly power *magnificently* pro  
By crowds of slaves and peopled empire

—We can never conceive too highly of  
neither too *magnificently* of nature, h  
work. *Greco*.

\* MAGNIFICO, *n. f.* [Italian.] A gr  
Venice.—

The duke himself, and the *magnifico*  
Of greater port, have all proceeded w

\* MAGNIFIER, *n. f.* from *magnifico*.  
that praises; an encomiast; an extoll  
praise *magnifier* of this star were t  
the, who notwithstanding chiefly regard  
relation to their river Nilus. *Bacon*:  
that exceeds the bulk of any object.

\* To MAGNIFY, *v. a.* [from *magnifico*.] 1.  
To make great; to exaggerate; to  
to exalt.—The ambassador, making his  
did to *magnify* the king and queen, as w  
to glut the flatterers. *Bacon*. 2. To exal  
vate; to raise in estimation.—

Thus that day  
Thy thunders *magnify* him.

3. To raise in public opinion or pretension.—He  
all his *magnify* himself above every  
—If ye will *magnify* yourselves against  
now that God will overthrow you. *J*  
—He shall *magnify* himself in his heart.

4. To enlarge the bulk of any ob  
eye.—How thick red globules would  
gules could be found that could *mag*  
a thousand times more, is uncertain. *J*

By true reflection I would see my  
Way being the best *magnifying* way  
—The greatest *magnifying* glasses make  
a man's eyes when they look upon an  
atom. *Plut*—

As things seem large which we thro  
defery,  
Dullness is ever apt to *magnify*.

word for to *have effect*.—My governers father I had wanted for nothing; that oft eaten up with the green sickness: *agnifed* but little with my father. *Spef.*IFYING, *part.* in optics, the making obar larger than they would otherwise do; convex lenses, which do this, are called *glaffes*. See OPTICS.  
ISA, a town of Asiatic Turkey, in Narently called MAGNESIA; 60 miles N.

ISI, a peninsula of Sicily, in the valley 6 miles N. of Syracuse.

MAGNITUDE. *n. f.* [*magnitudo*, Latin.] *is*; grandeur.—

ith plain heroic *magnitude* of mind, estial vigour arm'd, rmories and magazines contemns. *Milt.* rative bulk.—This tree hath no exy *magnitude*, touching the trunk or s hard to find any one bigger than the *gb's History of the World*.—Never repose pon any man's single council, fidelity ion, in managing affairs of the first *mag-* to create in yourself, or others, a diffi- our own judgment. *K. Charles*.— I behold this goodly frame, this world, en and earth consisting; and compute *magnitudes*; this earth, a spot, a grain, n, with the firmament compar'd. *Milt.* ince the world that you're devout and e;

er be your birth, you're sure to be of the first *magnitude* to me. *Dryden*. e these particles of bodies to be so dis- ongst themselves, that the intervals of ces between them may be equal in *mag-* hem all; and that these particles may sed of other particles much smal- have as much empty space between uals all the *magnitudes* of these smal- es. *Newton*.

MAGNITUDE is applied to any thing made s locally extended, or having several di- as a line, surface, solid, &c.

MAGNOLIA, the LAURFL-LAIVED TULIP botany, a genus of the polygynia order, to the polyandria class of plants; and aral method ranking under the 52d or- *az.* The calyx is triphyllous; there etals; the capules bivalved and imbri- e seeds pendulous, and in the form of There are 4 species: viz.

MAGNOLIA ACUMINATA, with oval, spear- pointed leaves, is a native of the inland orth America. The leaves are near 8 g, and 5 broad; ending in a point. The me out early in spring, and are com- a white petals; the wood is of a fine an orange colour.

MAGNOLIA GLAUCA, the small magnolia, of Virginia, Carolina, and other parts America. In moist places it rises from 15 or 16 feet high, with a slender stem. is white and spongy, the bark smooth greenish white colour; the branches with thick smooth leaves, of an oval both on their edges, and white under- **III. PAR II.**

neath. The flowers are produced at the extre- mities of the branches, are white, composed of six concave petals, and have an agreeable scent. The fruit increases in size till it becomes as large as a walnut with its cover; but of a conical shape, having many cells round the outside, in each of which is a flat seed about the size of a small kidney-bean, and of a brown colour. The seeds are discharged from their cells, and hang by a slender thread. This species generally grows in a poor swampy soil, or on wet meadows. The English and Swedes in Pennsylvania and New Jersey call it *beaver tree*, because the root of it is the food of beavers, which are caught by its means. It drops its leaves early in autumn, though some of the young trees keep them all winter. It is seldom found N. of Pennsylvania, where it begins to flower about the end of May. The scent of its blossoms are exquisite, can be perceived at the distance of 3 quarters of an English mile, provided the wind be not against it. It is extremely agreeable to travel in the woods about that time. They retain their flowers for 3 weeks, or longer, according to the soil, spreading their odoriferous exhalations. The berries likewise look very fine, having a rich red colour, and hanging in bunches on slender stalks. The cough and other pectoral diseases are cured by putting the berries into rum or brandy, and taking a draught of this tincture every morning. The virtues of this remedy are greatly extolled for their salutary effects in consumptions. The bark put into brandy, or boiled in any liquor, is said to ease pectoral diseases and to be of service against all internal pains and heat: and it was thought that a decoction of it could stop the dysentery. Even the branches of the tree boiled in water, gives great relief in cases of cold. *Kalm*.

3. MAGNOLIA GRANDIFLORA, the *great magnolia*, is a native of Florida and S. Carolina. It rises to 80 feet or more, with a straight trunk above 2 feet in diameter, and a regular head. The leaves resemble those of the laurel, but are larger, and continue green throughout the year. The flowers are produced at the ends of the branches, and are of a purplish white colour.

4. MAGNOLIA TRIPETALA, the *umbrella tree*, is a native of Carolina. It rises, with a slender trunk, to 16 or 20 feet; the wood is soft and spongy; the leaves very large, and produced in horizontal circles, somewhat resembling an umbrella; whence the inhabitants of those countries have given it this name. The flowers are composed of 10 or 11 white petals, hanging down without order. The leaves drop off at the beginning of winter.—All these species are propagated by seeds, which must be procured from the places where they grow naturally. They should be put up in sand, and sent over as soon as possible; for they seldom grow if kept long out of the ground.

(1.) MAGNUS, Albertus, a Dominican friar, afterwards Bp. of Ratibon, was one of the most learned men and most famous doctors of the 13th century. He is said to have acted as a man-midwife. A book entitled *De Natura Rerum*, of which he was reputed the author, gave rise to this report. In this treatise there are several instructions for midwives, and so much skill shown

in their art, that the author could not have arrived at it without having himself practised; but the advocates for Albert say he was not the writer thereof, nor of another piece entitled *Alberti Magni De Secretis Mullerum*; in which there are many expressions unavoidable on such a subject, which raised a great clamour against the supposed author. It must be confessed, that there are in his *Comment upon the Master of Sentences*, some questions concerning conjugal duty, in which he has used some words rather too gross for chaste ears: but he used to say in his vindication, that he came to the knowledge of so many monstrous things at confession, that it was impossible to avoid touching upon such questions. Albertus Magnus was certainly a man of a most inquisitive turn of mind, which gave rise to other accusations; such as, that he laboured to find out the philosopher's stone; that he was a magician; and that he made a machine in the shape of a man, which was an oracle to him, and explained all the difficulties he proposed. He had great knowledge in the mathematics, and by his skill in that science might probably have formed a head with springs capable of articulate sounds. (See AUTOMATON, § 2.) John Matheus de Luna, in his treatise *De Rebus Inventoribus*, has attributed the invention of fire-arms to Albert; but in this he is confuted by Naude, in his *Apologie des Grands Hommes*. Many fables are told of him by Bayle and others; such as that the virgin Mary appeared to him, and offered him his choice of excelling in philosophy or divinity, &c. He died at Cologne, Nov. 15. 1280. His works were printed at Lyons, in 1651, in 21 volumes in folio.

(2.) MAGNUS, JOHN, Abp. of Upsal, was born at Linköping in 1172. Being made apostolical nuncio, he used his utmost endeavours to prevent Gustavus Vasa from becoming king of Sweden, and the introduction of Lutheranism into his dominions. He died at Rome in 1545. He wrote a history of Sweden, and a history of the archbishops and bishops of Upsal.

(3.) MAGNUS, OLAV, Abp. of Upsal, succeeded his brother (N<sup>o</sup> 2.) in 1544. He appeared with great credit at the council of Trent in 1546, and finished his journey for the Catholic religion. He wrote A History of the Manners, Customs, and Wars of the Northern Nations of Europe.

(4.) MAGNUS CASTRUS, in ancient geography, a tract lying towards Scythopolis, or Bethshan in Galilee, beyond which it extends into Samaria; and is supposed the common boundary between these two parts in the Camp of Magus. It was the name of a *Tabula* (Table); 30 miles long, and 13 broad, lying Samaria with mount Ephraim on the S. the Genezareth on the E. mount Carmel on the W. and Lebanon on the N.

(5.) MAGNUS PORTUS, in ancient geography, a part of the B. Sea, in Britain, on the Channel; and thought to be PORTSMOUTH.

(6.) MAGNUS PORTUS, a town of Hispania Bætica, in Africa.

(7.) MAGNY, a town of France, in the dep. of Yonne, 8 miles S. of Nevers, and 6 N. of St. Etienne.

(2.) MAGNY, a town of France, in the the Seine and Oise, 30 miles NW. of Paris.

(1.) MAGO, the name of several Cartl generals. See CARTHAGE, § 4.

MAGY, a town and fort of Indes, east of Madag. 6 miles SE. of Tanca 30 NW. of Cicut. It was taken by the French, Decem. Aug. 1773.

MAGY, in botany, a genus of t aquatic order, belonging to the penant of plants.

MAGY, the name given by the Ind O. to the root of a tree, the fruit of which bread-fruit, when, in consequence of

zone a fermentation, will keep a considerable time, and supply them with food when no ripe fruit is to be had. See *ARTOCARUS*, § 4. **MALIC**. See *HIBISCUS*, N<sup>o</sup> 6. **MALIOCAN**. See *SWEETENIA*. **(I.) MAHOMET**, or **MOHAMMED**, the *Impostor*, Emperor of Persia, A. D. 571. He came into the world under some disadvantages. His father **Abdallah** was a younger son of **Abdalmotaleb**; and being very young, left his widow and infant son very mean circumstances, his whole substance consisting but of 5 camels and one Ethiopian female slave. **Abdalmotaleb** was therefore obliged to take care of his grandchild, which he not only did during his life, but at his death enjoined it on his son **Abu Taleb**, who was full brother **Abdallah**, to provide for him afterwards. This very affectionately did, and instructed him in the business of a merchant, for which purpose he took him to Syria when he was only 13. He afterwards recommended him to **Khadijah**, a rich dowry, for her factor; in whose service he behaved so well, that she married and raised him to equality with the richest in Mecca. After this advantageous match he formed the scheme of establishing a new religion, or, as he expressed it, restoring the only true and ancient one professed by Adam, Noah, Abraham, Moses, Jesus, &c. all the prophets; by destroying the gross idolatry into which the generality of his countrymen had fallen, and weeding out the corruptions and superstitions which the latter Jews and Christians had, as he thought, introduced into their religion, and reducing it to its original purity, which consisted chiefly in the worship of one God. But before he made any attempt abroad, he resolved to begin with the conversion of his own household, and therefore retired with his family, as he had done several times before, to a cave in ancient times, he there opened the secret of his mission to his wife; and acquainted her, that the angel Gabriel had appeared to him, and told him that **was appointed** the apostle of God; he also related to her a passage which he pretended had been revealed to him by the angel, with those other circumstances of this first appearance, which are related by the Mahometan writers. **Khadijah** received the news with great joy; swearing by Allah in whose hands her soul was, that the truth he would be the prophet of his nation; and immediately communicated what she had heard to her cousin **Warakah Ebn Nawfal**, who, being a Christian, could write in the Hebrew character, and was tolerably well versed in the scriptures; he as readily came into her opinion, assuring her that the same angel who had formerly appeared unto Moses was now sent to Mahomet. The next overture the prophet made was in the month Ramadan, in the 40th year of his age, which is before usually called the year of his mission. He encouraged, he resolved to proceed, and for some time what he could do by private suggestion, not daring to hazard the whole affair by exposing it too suddenly to the public. He soon made proselytes of those under his own roof; viz. his servant **Zaid Ebn Haretha**, to whom

he gave his freedom on that occasion, (which afterwards became a rule to his followers), and his cousin and pupil **Ali**, the son of **Abu Taleb**, tho' then very young; but this last, making no account of the other two, used to style himself the *first of believers*. The next person Mahomet applied to was **Abdallah Ebn Abu Kehala**, surnamed **Abu-Bekr**, a man of great authority among the Koreish, and one whose interest he knew would be of great service, as it soon appeared: for **Abu Bekr** being gained over, prevailed on **Othman Ebn Affan**, **Abdallah Ebn Awf**, **Saad Ebn Abbi Wakkas**, **al Zobeir Ebn al Awwam**, and **Talha Ebn Obaidallah**, all principal men of Mecca, to follow his example. These men were the six chief companions, who, with a few more, were converted in 3 years: at the end of which, Mahomet having, as he hoped, a sufficient interest to support him, made his mission no longer a secret, but gave out that God had commanded him to admonish his near relations; and to do it with more convenience and prospect of success, he directed **Ali** to prepare an entertainment, and invite the sons and descendants of **Abdalmotaleb**, intending then to open his mind to them. This was done, and about 40 of them came; but **Abu Laheeb**, one of his uncles, making the company break up before Mahomet had an opportunity of speaking, obliged him to give them a second invitation the next day; and when they were come, he made them the following speech: "I know no man in all Arabia who can offer his kindred a more excellent thing than I now do you: I offer you happiness both in this life, and in that which is to come; God Almighty hath commanded me to call you unto him: Who, therefore, among you will be assiduous to me here, and become my brother and my vicegerent?" All of them listening, **Ali** rose up, and declared, that he would be his assistant; and vehemently threatened those who should oppose him. Mahomet upon this embraced **Ali**, and desired all who were present to obey him as his deputy; at which the company broke out into a fit of laughter, and told **Abu Taleb** that he must now pay obedience to his son. This repulse, however, was so far from discouraging Mahomet, that he began to preach in public to the people; who heard him with patience till he began to upbraid them with their idolatry, obstinacy, and perverseness; which highly provoked them. The chief of the Koreish warmly solicited **Abu Taleb** to desert his nephew, remonstrated against the innovations he was attempting; and threatened him with an open rupture, if he did not prevail on Mahomet to desist. On this **Abu Taleb** earnestly dissuaded his nephew from pursuing the affair any further, representing the great danger he and his friends must otherwise run. But Mahomet told his uncle plainly, that if they set the face against him on his right hand, and the moon on his left, he would not leave his enterprise; and **Abu Taleb**, seeing him so firmly resolved to proceed, promised to stand by him against all opposition. The Koreish, then tried what they could do by force, using Mahomet's followers to very injudiciously, that it was not safe for them to continue at Mecca: whereupon Mahomet gave leave to such of them as had not

friends to protect them to seek for refuge elsewhere. And accordingly in the 5th year of his mission, 12 men and 4 women fled into Ethiopia; among whom were Othman Ebn Affan and his wife Rakiab, Mahomet's daughter. This was the first flight; but afterwards they were followed by 83 men and 18 women, besides children. These refugees were kindly received by the Najashi, or king of Ethiopia; who refused to deliver them up to the Koreish; and, as the Arab writers unanimously attest, even professed the Mahometan religion. In the 6th year of his mission, Mahomet had the pleasure of seeing his party strengthened by the conversion of his uncle Hamza, a man of great valour and merit; and of Omar Ebn al Kattab, a person highly esteemed, and once a violent opposer of the prophet. Islamism now made so great a progress among the Arab tribes, that the Koreish, to suppress it effectually, in the 7th year of Mahomet's mission, made a solemn league against the Hashemites and the family of Abdalmotaleb, engaging themselves to contract no marriages with any of them, and to have no communication with them; and, to give it the greater sanction, reduced it into writing, and laid it up in the Caaba. Upon this the tribe became divided into two factions: and the family of Hashem all repaired to Abu Taleb as their head: except only Abdal Uzza, surnamed *Abu Labeb*, who, out of hatred to his nephew and his doctrine, went over to the opposite party, whose chief was Abu Sofian Ebn Harb, of the family of Ommeya. The families continued thus at variance for 3 years: but in the 10th year of his mission, Mahomet told Abu Taleb, that God had manifestly showed his disapprobation of the league which the Koreish had made against them, by sending a worm to eat out every word of the instrument except the name of *God*. Of this accident Mahomet had probably some private notice; for Abu Taleb went immediately to the Koreish, and acquainted them with it; offering, if it proved false, to deliver his nephew up to them; but in case it were true, he insisted that they ought to lay aside their animosity, and annul the league they had made against the Hashemites. To this they acquiesced; and going to inspect the writing, to their great astonishment found it to be as Abu Taleb had said: and the league was thereupon declared void. In the same year Abu Taleb died, aged above 80; and many writers say, he died an infidel: though others say, that when he was at the point of death he embraced Mahometanism; and in proof of this produce some passages out of his poetical compositions. About a month, or as some write, 3 days after his uncle's death, Mahomet had the additional mortification to lose his wife Khadijah; whence this year is called *the year of mourning*. The Koreish began now to be more troublesome than ever to the prophet, and especially some who had formerly been his intimate friends; insomuch that he found himself obliged to seek for shelter elsewhere, and first pitched upon Tayef, about 60 miles E. of Mecca, for the place of his retreat. Thither therefore he went, accompanied by his servant Zaid, and applied himself to two of the chief of the tribe of Thaklan who were the inhabitants of that place; but they received him very coldly.

However, he staid there a month; and some of the more considerate treated him with respect; but the slaves and inferior people rose against him, and obliged him to return to Mecca, where he put himself under the protection of Al Motan Ebn Adi. This repulse greatly discouraged his followers. However, Mahomet boldly continued to preach to the public assemblies at the pilgrimage, and gained several proselytes; and among them six of the inhabitants of Yathreb of the Jewish tribe of Khazraj; who, on their return home, failed not to speak much in commendation of their new religion, and exhorted their fellow-citizens to embrace it. In the 12th year of his mission, Mahomet gave out that he had made his miraculous night journey from Mecca to Jerusalem, and thence to heaven. Dr Pridaux thinks he invented it, either to answer the expectations of those who demanded some miracle as a proof of his mission; or else, by pretending to have conversed with God, to establish the authority of way of oral tradition, and make his sayings to serve the same purpose as the oral law of the Jews. But it does not appear that Mahomet himself ever expected so great a regard should be paid to his sayings, as his followers have since done: and seeing he all along disclaimed any power of performing miracles, it seems rather to have been a fetch of policy to raise his reputation, by pretending to have actually conversed with God in heaven, as Moses had heretofore done in the mount, and to have received several institutions immediately from him, whereas before he contented himself with pretending them, that he had all by the ministry of Gabriel. However, this story seemed so absurd and incredible, that several of his followers left him upon it; and had probably ruined the whole design, had not Abu Beer vouched for his veracity, and declared, that, if Mahomet affirmed it to be true, he verily believed the whole. This not only retrieved the prophet's credit, but increased it to such a degree, that he might now make his disciples swallow whatever he pleased. And this fiction, notwithstanding its extravagance, was one of the most artful contrivances Mahomet ever put in practice, and what chiefly contributed to raise his reputation to that great height to which it afterwards arrived. In this year, called by the Mahometans *the accepted year*, 12 men of Yathreb or Medina, of whom 10 were of the tribe of Khazraj, and two of that of Aws, came to Mecca, and took an oath of fidelity to Mahomet at Akaba, a hill on the N. of that city. The oath was called *the women's oath*; not that any women were present at this time, but because it was the same oath that was afterwards exacted of the women, the form of which is in the Koran, and runs to this effect: That they should renounce all idolatry; and they should not steal, nor commit fornication, nor kill their children (as the Pagan Arabs used to do when they apprehended they should not be able to maintain them), nor forge calumnies; and that they should obey the prophet in all things that were reasonable. When they had solemnly engaged to all this, Mahomet sent one of his disciples, named *Masab Ebn Omair*, home with them.

instruct them more fully in his new religion. He being arrived at Medina, by the assistance of those who had been formerly converted, gained several proselytes, particularly Osaïd Ebn Horra, a chief man of the city, and Saad Ebn Sâd, prince of the tribe of Aws; Mahometan spreading so fast, that there was scarce a household in there were not some who had embraced it.

In the 12th year of Mahomet's mission, he returned to Mecca, accompanied by 73 men and two women of Medina who had professed Islam, besides some others who were as yet unconverted. On their arrival, they immediately sent Mahomet, and offered him their assistance, of which he was now in great need; for his adversaries were by this time grown so powerful in Mecca, that he could not stay there much longer without imminent danger. Wherefore he accepted their proposal, and met them one night, by appointment, at Akaba, attended by his uncle Abbas; who, though he was not then a believer, wished his nephew well, and made speech to those of Medina; wherein he told them, that as Mahomet was obliged to quit his native city, and seek an asylum elsewhere, and if he had offered him their protection, they would well not to deceive him; that if they were not fully resolved to defend, and not betray him, they had better declare their minds, and let him provide for his safety in some other manner. Upon their protesting their sincerity, Mahomet swore to be faithful to them, on condition that they should protect him against all insults as readily as they would their own wives and families. They then asked him what recompence they were to expect if they should happen to be killed in his quarrel; he answered, Paradise. Whereupon they pledged their faith to him, and returned home; after Mahomet had chosen 12 of their number, who were to have the same authority among them as the 12 apostles of Christ among his disciples. Hitherto Mahomet had propagated his religion by fair means; so that the great success of his enterprise, before his flight to Medina, must be attributed to persuasion only, and not to compulsion. For before this solemn oath taken at Akaba, he had no permission to use any force at all; and in several verses of the Koran, which he pretended were revealed during his stay at Mecca, he declares his mission was only to preach and admonish; that he had no authority to compel any person to embrace his religion; and that, whether people believed or not, was none of his concern, but belonged solely unto God. And he was so far from allowing his followers to use force, that he exhorted them to bear patiently those injuries which he offered them on account of their faith; and, when persecuted himself, chose rather to quit the city of his birth and retire to Medina, than to offer any resistance. But this great passiveness and moderation seem entirely owing to his want of power, and the great superiority of his opposers; for the first 12 years of his mission; for no power was he enabled, by the assistance of those of Medina, to make head against his enemies, and he gave out, that God had allowed him and his followers to defend themselves against the in-

fidels; and at length, as his forces increased, he pretended to have the divine leave to attack them, to destroy idolatry, and set up the true faith by the sword. That Mahomet had a right to take up arms for his own defence against his unjust persecutors, must doubtless be allowed; but this gave him no right to use them for establishing his religion. It is certainly one of the most convincing proofs that Mahometanism was no other than a human invention, that it owed its progress and establishment almost entirely to the sword; and it is one of the strongest demonstrations of the divine original of Christianity, that it prevailed against all the opposition, and power of the Pagan world by the mere force of its own truth, after having stood the assaults of all manner of persecution for 300 years together. Mahomet, having provided for the security of his companions as well as his own, by the league offensive and defensive which he concluded with those of Medina, directed them to repair thither, which they accordingly did; but himself with Abu Beer and Ali staid behind. The Koreish fearing the consequence of this new alliance, began to think it absolutely necessary to prevent Mahomet's escape to Medina; and having held a council thereon, they came to a resolution that he should be killed; and agreed that a man should be chosen out of every tribe for the execution of this design; and that each man should have a blow at him with his sword, that the guilt of his blood might fall equally on all the tribes, to whose united power the Hashemites were much inferior, and therefore durst not attempt to revenge their kinsman's death. This conspiracy was scarce formed, when the news of it reached Mahomet, who gave out that it was revealed to him by the angel Gabriel, who ordered him to retire to Medina. Whereupon, in order to amuse his enemies, he directed Ali to lie down in his place, and wrap himself up in his green cloak, which he did; and Mahomet escaped to Abu Beer's house, unperceived by the conspirators, who had already assembled at the prophet's door. They, in the mean time, looking through the crevice, and seeing Ali, whom they took to be Mahomet himself, asleep, continued watching there till morning, when Ali awoke, and they found themselves deceived. From Abu Beer's house Mahomet and he went to a cave in mount Thur, SE. of Mecca, accompanied only by Amer Ebn Foheirah, Abu Beer's servant, and Abdallah Ebn Oreitah, an idolater whom they had hired for a guide. In this cave they lay hid 3 days, to avoid their enemies, whom they very narrowly escaped, and not without the assistance of more miracles than one: for some say that the Koreish were struck with blindness, so that they could not find the cave; others, that after Mahomet and his companions were got in, two pigeons laid their eggs at the entrance, and a spider covered the mouth of the cave with her web, which made them look no farther. Their enemies being retired, they left the cave, and set out for Medina, by a by-road; and having fortunately escaped some who were sent to pursue them, arrived safely at that city; whither Ali followed them in 3 days. The first thing Mahomet did after his arrival at Medina, was to build a temple for his religious

ligious worship, and a house for himself, which he did on a parcel of ground which belonged to Sahal and Soheil the orphan sons of Amru. This action Dr Prideaux exclaims against, as a flagrant act of injustice, to these poor orphans; and says he thus founded the first fabric of his worship with the like wickedness as he did his religion. But the Mahometan writers set this affair in a quite different light; one saying, that the young men insisted he would accept the ground as a present; while others affirm that he actually bought it, and that the money was paid by Abu Beer. Mahomet, being thus settled at Medina, began to send out small parties to make reprisals on the Koreish; the first consisting of only 9 men, who plundered a caravan belonging to that tribe, and took two prisoners. But what established his reputation, and laid the foundation of all his succeeding greatness, was the gaining of the battle of Bedr, fought in the 2d year of the Hegira. Some reckon no less than 27 expeditions wherein Mahomet was personally present, in 9 of which he gave battle, besides several others, in which he was not present. His forces he maintained partly by the contributions of his followers, which he called *sacat* or *alms*, and the paying of which he very artfully made an article of his religion; and partly by ordering one 5th of the plunder to be brought into the public treasury for that purpose. In a few years, by the success of his arms, (though he was sometimes defeated,) he considerably raised his credit and power. In the 6th year of the Hegira he set out with 12000 men to visit the temple of Mecca, not with any intent of committing hostilities, but in a peaceable manner. However, when he came to Bakkilidya, which is partly within and partly without the sacred territory, the Koreish sent to let him know that they would not permit him to enter Mecca; whereupon he resolved to attack the city; but the people of Mecca sending Arwa Ebn Masud, prince of the tribe of Thakuf, as their ambassador, to desire peace, a truce was concluded for ten years, by which any person was allowed to enter into league either with Mahomet, or with the Koreish, as he thought fit. To show the inconceivable veneration the Mahometans by this time had for their prophet, we may mention the account which the above-mentioned ambassador gave the Koreish, of their behaviour. He said he had been at the courts both of the Roman emperor and of the king of Persia, but never saw any prince so highly respected by his subjects as Mahomet was by his companions: for, when he made the ablution, before prayers, they ran and caught the water that he had used; when he spit, they licked it up; and superstitiously gathered every hair that fell from him. In the 7th year of the Hegira, Mahomet began to think of propagating his religion beyond the bounds of Arabia; and sent messengers to the neighbouring princes, with letters inviting them to embrace his doctrine. Nor was this project without some success. Khoiru Parviz, then king of Persia, received his letter with great disdain, and tore it in a passion, sending away the messenger very abruptly; which when Mahomet heard, he said *God shall tear his kingdom*. And soon after a messenger came to Mahomet from Bakhra

king of Yaman, who was a dependent on the Persians, to acquaint him that he had received orders to send him to Khoiru. Mahomet put off his answer till the next morning, and then told the messenger it had been revealed to him that night that Khoiru was slain by his son Shiruyeh; adding, that he was well assured his new religion and empire should rise to as great a height as that of Khoiru; and therefore bid him advise his master to embrace Mahometanism. The messenger being returned, Bakhra in a few days received a letter from Shiruyeh, informing him of his father's death, and ordering him to give the prophet no further disturbance. Whereupon Bakhra and the Persians with him turned Mahometans. The emperor Heraclius, as the Arabian historians affirm, received Mahomet's letter with great respect, laying it on his pillow, and dismissed the messenger honourably. Mahomet wrote to the same effect to the king of Ethiopia, though he had been converted before, according to the Arab writers; and to Mokawkas, governor of Egypt, who gave the messenger a very favourable reception, and sent several valuable presents to Mahomet, and among the rest two girls, one of whom, named Mary, became a great favourite with him. He also sent letters of the like purport to several Arab princes; particularly one to al Hareth Ebn Abi Sumer king of Ghassian, who returning for answer that he would go to Mahomet himself, the prophet said, *May his kingdom perish*: another to Hordia Ebn Ali, king of Yamama, who was a Christian, and, having some time before professed Islamism, had lately returned to his former faith; this prince sent back a very rough answer, upon which Mahomet cursing him, he died soon after; and a third to al Mondar Ebn Sawa, king of Bahra, who embraced Mahometanism, and all the Arabs of that country followed his example. The 8th year of the Hegira was a very fortunate year to Mahomet. In the beginning of it, Khaled Ebn al Walid and Amru Ebn al As, both excellent soldiers, the first of whom afterwards conquered Syria and other countries, and the latter Egypt, became proselytes to Mahometanism. And soon after the prophet sent 3000 men against the Grecian forces, to revenge the death of one of his ambassadors, who, being sent to the governor of Bofra on the same errand as those who went to the abovementioned princes, were slain by al Arab, of the tribe of Ghassian, at Muta, a town in the territory of Baika in Syria, about three days journey E. of Jerusalem, near which town they encountered. The Grecians being vastly superior in number (for, including the auxiliary Arabs, they had an army of 100,000 men), the Mahometans were repulsed in the first attack, and lost successively three of their generals, viz. Zeid Ebn Harethia Mahomet's Freed man, Jaafar the son of Abu Taleb, and Abdallah Ebn Rawziah; but Khaled Ebn al Walid succeeding to the command, overthrew the Greeks with a great slaughter, and brought away abundance of rich spoil; on occasion of which action Mahomet gave him the title of *Sif mine sword of Allah*, "one of the swords of God." In this year also Mahomet took the city of Mecca, the inhabitants whereof had broken the truce. For the tribe of Beer, who were con-

rates with the Korcish, attacking those of Azrah, who were allies of Mahomet, killed several of them, being supported in the action by a party of the Korcish themselves. The consequence of his violation was soon apprehended; and Arabian himself made a journey to Medina on purpose to head the breach and renew the truce; but in vain; for Mahomet refused to see him; whereon he applied to Abu Bcer and Ali; but they giving him no answer, he was obliged to return to Mecca as he came. Mahomet immediately ordered preparations to be made, that he might receive the Meccans while they were unprovided to receive him: in a little time he began his march thither; and by the time he came near the city, his forces were increased to 10,000 men. Those of Mecca, being unable to defend themselves against so formidable an army, surrendered at discretion; and Abu Sofian saved his life by turning Mahometan. About 28 of the idolaters were killed by a party under the command of Khaled; this happened contrary to Mahomet's orders, so, when he entered the town, pardoned all the Korcish on their submission; except 6 men and 4 women, who had apostatised, and were solemnly proscribed by the prophet himself; but of these only 3 men and 1 woman were put to death, the rest being pardoned on their embracing Mahometanism, and one of the women making her peace. The remainder of this year Mahomet employed in destroying the idols in and around Mecca, sending several of his generals on expeditions for that purpose, and to invite the Arabs to Mahometanism: wherein it is no wonder if they now were with success. The next year, being the 9th of Hegira, the Mahometans call *the year of embassies*: the Arabs had been hitherto expecting the issue of the war between Mahomet and the Korcish; so soon as that tribe, the principal of the Meccans, and the genuine descendants of Ishmael, their prerogatives none offered to dispute, had submitted, they were satisfied that it was not in their power to oppose Mahomet; and therefore they came in to him in great numbers, and sent embassies to make their submissions to him, to Mecca, while he still there, and also to Medina, whither he returned this year. Among the rest, five kings of the tribe of Hemyar professing Mahometanism, and sent ambassadors to no other name. In the 10th year, Ali was sent in person to propagate the Mahometan faith in the city of Hamdan in one day. Their example was immediately followed by all the inhabitants of that country, except only those of Najran, who, being Christians, chose rather to pay tribute. Thus Mahometanism established, and idolatry root and branch destroyed in Mahomet's life time (for he died the next year), throughout all Arabia, except only in Sanaa, where Mokilana, who set up also as a prophet as Mahomet's competitor, had a party, and was not reduced till the Khalif Abu Bcer; and the Arabs being then united in one faith, and under one prince, found themselves in a condition of making those conquests which extended the Mahometan faith over so great a part of the world.

(2—6 MAHOMET, the name of 5 emperors of the Turks, viz.

MAHOMET I. emperor of the Turks, son of Bajazet I. succeeded his brother Moses in 1413; restored the glory of the empire, which had been ravaged by Tamerlane, and made Adrianople his capital. He died in 1421, aged 47.

MAHOMET II. surnamed *the GREAT*, the 7th emperor, was born at Adrianople, the 24th March 1420; and succeeded his father Amurath II, in 1451. He took Constantinople in 1453, and thereby drove many learned Greeks into the West, which was a great cause of the restoration of learning in Europe, as the Greek literature was then introduced here. He was one of the greatest men upon record, considered merely as a conqueror; for he conquered two empires, 12 kingdoms, and 200 considerable cities. He was very ambitious of the title of *Great*, which both Turks and Christians have given him. And he was the first of the Ottoman emperors whom the Western nations dignified with the title of *Grand Signior*, or Great Turk, which posterity has preserved to his descendants. Italy had suffered greater calamities, but had never felt a terror equal to that which this sultan's victories imprinted. The inhabitants seemed already condemned to wear the turban; and Pope Sixtus IV. dreading the fate of Constantinople, thought of escaping into Provence, and transferring the holy see to Avignon. Hence, the news of Mahomet's death, which happened the 3d May 1481, was received at Rome with the greatest demonstrations of joy. Mahomet appears to have been the first sultan who was a lover of arts and sciences; and even cultivated polite letters. He often read the history of Augustus, and the other Caesars; and he perused those of Alexander, Constantine, and Theodosius, with more than ordinary pleasure, because these had reigned in the same country with himself. He was fond of painting, music, sculpture, and agriculture. He was much addicted to astrology; and used to encourage his troops by giving out, that the influence of the heavenly bodies promised him the empire of the world. Contrary to the genius of his country, he delighted so much in foreign languages that he not only spoke the Arabian, but also the Persian, Greek, and French, or corrupted Italian. Isidore, a knight of Rhodes, collected several of his letters, written in Syriac, Greek, and Turkish, and translated them into Latin. Where the originals are is unknown, but the translation has been published at Lyons 1520, in 4to; at Bonn 1725, 12mo; in a collection by Oporinus, at Marburg 1624, in 8vo; and at Leipzig, in 1753, 12mo. Prof. Melchior Junger, published at Middelburg, 1597, a collection of letters, in which there are 3 written by Mahomet II. to Suleyber. These letters have neither of Turkish freedom in that they are written in such terms, and as of a manner, as the most polite prince in Christendom could have written.

MAHOMET III. succeeded his father Amurath III. in 1596. He was a bold conqueror, and 19 of his battles to be distinguished, and 10 of his fathers wives to be drowned. He took Agria by capitulation,

capitulation, yet massacred the whole garrison. He died in 1603.

**MAHOMET IV.** was born in 1642, and succeeded in 1649, on the murder of his father Ibrahim I. He was unsuccessful in most of his enterprises. He took Caudia from the Venetians in 1669, but lost 100,000 men in the siege. He took several towns in Poland, but was repeatedly defeated by K. John Sobieski. In 1683, he besieged Vienna, but was completely routed by the Poles and Austrians. In 1687 he was deposed by the Janizaries, and succeeded by Solyman III. He died in prison in 1693.

**MAHOMET V.** the son of Mustapha II. was born in 1696, and succeeded his uncle Achmet III. on his deposition in 1730. Kouli Khan took from him Georgia and Armenia. He died in 1754.

**MAHOMETANISM, or MAHOMETISM,** the system of religion broached by Mahomet, and still adhered to by his followers. See **MAHOMET, N<sup>o</sup> 1,** and **ALCORAN.** Mahometanism is professed by the Turks, Persians, and several nations among the Africans, and many in the E. Indies. The Mahometans divide their religion into two general parts, faith and practice: of which the first is divided into six distinct branches; Belief in God, in his angels, his scriptures, his prophets, in the resurrection and final judgment, and in God's absolute decrees. The points relating to practice are, prayer, with washings, &c. alms, fasting, pilgrimage to Mecca, and circumcision.

**I. MAHOMETANISM, ARTICLES OF FAITH IN.**

1. The Mahometans, at least those who are reckoned orthodox, profess to believe in and worship the true God, the God of the Jews and Christians. 2. The existence and purity of ANGELS, are required to be believed in the Koran; and he is reckoned an infidel who denies there are such beings, or hates any of them, or asserts any distinction of sexes among them. They believe them to have pure and subtle bodies, created of fire; that they neither eat nor drink, nor propagate their species; that they have various forms and offices, some adoring God in different postures, others singing praises to him, or interceding for mankind. They hold, that some of them are employed in writing down the actions of men; others in carrying the throne of God, and other services. The four angels, whom they look on as more eminently in God's favour, are, Gabriel, to whom they give several titles, particularly those of the *holy spirit*, and the *angel of revelations*, supposing him to be honoured by God with a greater confidence than any other, and to be employed in writing down the divine decrees; Michael; the friend and protector of the Jews; Azrael, the *angel of death*, who separates mens souls from their bodies; and Israfil, whose office it will be to sound the trumpet at the resurrection. They also believe, that two guardian angels attend on every man, to observe and write down his actions, being changed every day, and therefore called *al Moakkibat*, or "the angels who continually succeed one another." The **DEVIL**, whom Mahomet names *Eblis*, from his *despair*, was once one of those angels who are nearest to God's presence, called *Azazel*; and fell, for refusing to pay homage to Adam at the command

of God. Besides angels and devils, the Mahometans believe in an intermediate order of creatures, which they call *jinn* or **GENII**, created also of fire, but of a grosser fabric than angels, as they eat and drink, and propagate their species, and are subject to death. Some of these are supposed to be good and others bad, and capable of salvation or damnation, as men are; whence Mahomet pretended to be sent for the conversion of gentes as well as men. 3. As to the **SCRIPTURES**, the Koran, teaches, that God, in divers ages of the world, gave revelations of his will in writing to several prophets, the whole and every one of which is absolutely necessary for a good Moslem to believe. The number of these sacred books were, according to them, 104: of which 10 were given to Adam, 50 to Seth, 30 to Edris or Enoch, 10 to Abraham; and the other four, being the Pentateuch, the Psalms, the Gospel, and the Koran, were successively delivered to Moses, David, Jesus, and Mahomet; which last being the last of the prophets, those revelations are now closed, and no more are to be expected. All these divine books, except the 4 last, they agree to be now entirely lost, and their contents unknown; though the Sabians have several books which they attribute to the antediluvian prophets. And of those four, the Pentateuch, Psalms, and Gospel, they say, have undergone so many alterations and corruptions, that, though there may possibly be some part of the true word of God therein, yet no credit is to be given to the present copies in the hands of the Jews and Christians. The Mahometans have also a gospel in Arabic, attributed to St Barnabas. (See **BARNABAS**, § 4.) Of this gospel the Moriscos in Africa have a translation in Spanish. It appears to be no original forgery of the Mahometans; that they have, no doubt, altered it since, e. g. instead of the *Paraclete*, or *Comforter*, they have in this apocryphal gospel inserted the word *Perichlytis*, the *famous* or *illustrious*; by which they pretend their prophet was foretold by name, that being the signification of *Mohammed* in Arabic; and that they lay to justify that passage of the Koran, when Jesus Christ is formally asserted to have foretold his coming, under his other name of *Abmed*, which is derived from the same root as *Mohammed*, and of the same import. From these, or some other forgeries of the same stamp, the Mahometans quote several passages, of which there are not the least vestige in the New Testament. The number of the **PROPHETS**, from time to time sent by God into the world, amounts to no less than 224,000, according to one Mahometan tradition; or 124,000, according to another: among whom 10 were apostles, sent with special commissions to reclaim mankind from infidelity and superstition, and six of them brought new laws or dispensations, which successively abrogated the preceding: these were Adam, Noah, Abraham, Moses, Jesus, and Mahomet. All the prophets in general, the Mahometans believe to have been free from great sins, and professors of the same religion, viz. ISLAM, notwithstanding the different laws and institutions which they observed. They hold some of them to be more excellent and honourable than others. The first place they give to the revealers of new dispensations,

persons, and the next to the apostles. In this great number of prophets, they not only reckon the patriarchs and persons named in scripture, but not recorded to have been prophets, as Adam, Seth, Lot, Ishmael, Nun, Joshua, &c. and introduce some of them under different names, as *Eber, Heber, and Jethro*, who are called, in the *Quran*, *Edris, Hud, and Shacib*; but several others whose names do not appear in scripture, as *Leh, Khedr, Dkulkest, &c.* They believe in a general resurrection and a future judgment. When a corpse is laid in the grave, they say he is reviewed by an angel, who gives him notice of the coming of the two examiners; who are two black livid angels, of a terrible appearance, named *Mouker* and *Nahir*. These order the dead person to sit upright, and examine him concerning his faith, as to the unity of God, and the mission of Mahomet: if he answer rightly, they order the body to rest in peace, and it is refreshed by the air of paradise; but, if not, they beat him on the temples, with iron maces, till he roars for anguish so loud, that he is heard by all east to west, except men and genii. They press the earth on the corpse, which is gnawed and stung till the resurrection by 99 dragons, each 7 heads each; or, as others say, their fangs become venomous beasts, the grievous ones stinging like dragons, the smaller like scorpions, and others like serpents: circumstances which some understand in a figurative sense. As to the soul they hold, that, when it is separated from the body by the angel of death, who performs his office with ease and gentleness towards the good, and with violence towards the wicked, it enters into that which they call *al berzakb*, or the interval between death and the resurrection. If the departed person was a believer, they say two angels meet it, who convey it to heaven, that its place there may be assigned, according to its merit and degree. For they distinguish the souls of the faithful into three classes: viz. 1st. prophets, whose souls are admitted into paradise immediately; 2d. martyrs, whose spirits, according to a tradition of Mahomet, rest in the crops of ten birds, which eat of the fruits and drink of the rivers of paradise; and 3d. other believers, concerning the state of whose souls before the resurrection there are various opinions. Though the Mahometans have thought that the resurrection will be merely spiritual, and no more than the returning of the soul to the place whence it first came (an opinion defended by Ebn Sina, and followed by some the opinion of the *philosophers*); and others, who allow man to consist of body only, think it will be merely corporeal; the received opinion is, that both body and soul will be raised: and their doctors argue strenuously for the possibility of the resurrection of the body, and dispute with great subtilty concerning the manner of it. But Mahomet has taken care to prepare one part of the body, whatever becomes of it, to serve for a basis of the future edifice, rather a haven for the mass which is to be added to it. For he taught, that a man's body is entirely consumed by the earth, except only a bone called *al aji*, which we name the *os coxalis*, or rump-bone; and that, as it was the first

formed in the human body, it will also remain uncorrupted till the last day, as a seed from whence the whole is to be renewed; and this, he said, would be effected by a 40 years rain, which God should send, and which would cover the earth to the height of 12 cubits, and cause the bodies to sprout forth like plants. Herein, also, is Mahomet beholden to the Jews; who say the same things of the bone *Luz*, excepting that what he attributes to a grain, will be effected, according to them, by a dew, impregnating the dust of the earth. The time of the resurrection the Mahometans allow to be a perfect secret to all but God alone; the angel Gabriel himself acknowledging his ignorance in this point, when Mahomet asked him about it. However, they say, the approach of that day may be known from certain signs which are to precede it. These signs they distinguish into two sorts, the lesser and the greater. The lesser signs are, 1. The decay of faith among men. 2. The advancing of the meanest persons to eminent dignity. 3. That a maid-servant shall become the mother of her mistress (or master); by which is meant, either that towards the end of the world men shall be much given to sensuality, or that the Mahometans shall then take many captives. 4. Tumults and seditions. 5. A war with the Turks. 6. Great distresses in the world, so that a man, when he passes by another's grave shall say would to God I were in his place. 7. That the provinces of Iraq and Syria shall refuse to pay their tribute. And, 8. That the buildings of Median shall reach to Ahab, or Yabab. The greater signs are, 1. The sun's rising in the west; which some have imagined it originally did. 2. The appearance of the beast, which shall rise out of the earth, in the temple of Mecca, or on mount Safa, or in the territory of Tayet, or some other place. This beast, they say, is to be 60 cubits high; though others, not satisfied with so small a size, will have her reach to the clouds and to heaven; and that she will appear for three days, but show only a third part of her body. They describe this monster as to her form, to be a compound of various species; having the head of a bull, the eyes of a hog, the ears of an elephant, the horns of a stag, the neck of an ostrich, the breast of a lion, the colour of a tiger, the back of a cat, the tail of a ram, the legs of a camel, and the voice of an ass. Some say this beast is to appear three times in several places, and that she will bring with her the rod of Moses and the seal of Solomon; and, being so swift that none can overtake or escape her, will with the first strike all the believers on the face, and mark them with the word *Muhammed*, i. e. believer; and with the latter will mark the unbelievers on the face likewise, with the word *Kafir*, i. e. infidel, that every person may be known for what he really is. They add, that the same beast is to demonstrate the vanity of all religions, except Islam, and to speak Arabic. All this stuff seems to be the result of a confused idea of the beast in the Revelations. 1. War with the Greeks, and the taking of Constantinople by 70,000 of the posterity of Isaac, who shall not win that city by force of arms, but the walls shall fall down while they cry out, *There is no God but God; God is most great!* As they are dividing the spoils,

news will come to them of the appearance of Antichrist; whereupon they shall leave all and return back. 4. The coming of Antichrist, whom the Mahometans call *Mafab al Dajjal*, i. e. the false or lying Christ, and simply *al Dajjal*. He is to be one eyed, and marked on the forehead with the letters C. F. R. signifying *Cafir*, or infidel. They say that the Jews gave him the name of *Messiah Ben David*; and pretend he is to come in the last days, and to be lord both of land and sea, and that he will restore the kingdom to them. 5. The descent of Jesus on earth. They pretend that he is to descend near the white tower to the east of Damascus, when the people are returned from the taking of Constantinople: that he is to embrace the Mahometan religion, marry a wife, get children, kill Antichrist; and at length die after 40 years, or, according to others, 24 years continuance on earth. Under him, they say, there will be great security and plenty in the world, all hatred and malice being laid aside; when lions and camels, bears and sheep, shall live in peace, and a child shall play with serpents unhurt. 6. War with the Jews; of whom the Mahometans are to make a dreadful slaughter, the very trees and stones discovering such of them as hide themselves, except only the tree called *gharkad*, which is the tree of the Jews. 7. The eruption of Gog and Magog, or, as they are called in the east, *Yajuj* and *Majuj*; of whom many things are related in the Koran and the traditions of Mahomet. These barbarians, they tell us, having passed the lake of Tiberias, which the vanguard of their vast army will drink dry, will come to Jerusalem, and there greatly distress Jesus and his companions; till, at his request, God will destroy them, and fill the earth with their carcases, which, after some time, God will send birds to carry away, at the prayers of Jesus and his followers. Their bows, arrows, and quivers, the Moslems will burn for 7 years together; and at last, God will send a rain to cleanse the earth and make it fertile. 8. A smoke which shall fill the whole earth. 9. An eclipse of the moon. Mahomet is reported to have said, that there would be three eclipses before the last hour; one to be seen in the east, another in the west, and the third in Arabia. 10. The returning of the Arabs to the worship of Allat and al Uzza, and the rest of their ancient idols, after the decease of every one in whose heart there was faith equal to a grain of mustard seed, none but the very worst of men being left alive. For God, they say, will send a cold odoriferous wind, blowing from Syria Damaſcena, which shall sweep away the souls of all the faithful, and the Koran itself, so that men will remain in the grossest ignorance for 100 years. 11. The discovery of a vast heap of gold and silver by the retreating of the Euphrates, which will be the destruction of many. 12. The demolition of the Caaba, or temple of Mecca, by the Ethiopians. 13. The speaking of beasts and inanimate things. 14. The breaking out of fire in the province of Hejaz; or, according to others, in Yaman. 15. The appearance of a man of the descendants of Kahtan, who shall drive men before him with his staff. 16. The coming of the *Messiah*, or director; concerning whom Mahomet prophesied, that the world should not

have an end, till one of his own family should govern the Arabians, whose name should be the same with his own name, and whose father's name should also be the same with his father's name, and who should fill the earth with righteousness. This person the Shiites believe to be now alive, concealed in some secret place till the time of manifestation; for they suppose him no other than the last of the 12 Imams, named *Mahomet al kafeem*, as their prophet was; and the son of *fan al Askeri*, the 11th of that succession. He was born at Sermanrai, in the 255th year of the Hegira. From this tradition, it is to be presumed, opinion pretty current among the Christians, that the Mahometans are in expectation of their prophet's return. 17. A wind shall sweep away the souls of all who have not a grain of faith in their hearts, as has been mentioned under the tenth sign. These are the signs, which, according to their doctrine, precede the resurrection, but still leave the time of it uncertain; for the immediate sign of its coming will be the first blast of the trumpet, which they believe will be sounded three times. The first they call the *blast of consternation*; hearing of which all creatures in heaven and earth shall be struck with terror, except whom God shall please to exempt from it. The effects attributed to this first sound of the trumpet are very wonderful: for they say, the earth shall be shaken, and not only all buildings, but the very mountains levelled; that the heavens shall be darkened, the stars fall, on the command of the angels, who, as some imagine, hold suspended between heaven and earth; and the sun shall be troubled and dried up, or, according to others, turned into flames, the sun, moon, and stars being thrown into it: the Koran, and the greatness of the terror of that day, add women who give suck shall abandon their infants, and even the she camels which have gone 10 months with young (a most valuable commodity of the substance of that nation) shall be neglected. A farther effect of this blast will be the concurrence of beasts mentioned in the Koran, some doubt whether it be to precede the resurrection or not. They who suppose it will precede think that all kinds of animals, forgetting their respective natural fierceness and timidity, will be gathered together into one place, being terrified by the sound of the trumpet and the sudden shock of the trumpet. The Mahometans believe that this first blast will be followed by a second, which they call the *blast of exinanition*; by which all creatures in heaven and earth shall die or be annihilated, except those which God shall please to exempt from the common fate; and this, they say, shall happen in the twinkling of an eye, nay in a moment; nothing surviving except God alone, paradise and hell, and the inhabitants of those places, and the throne of glory. The last blast shall die will be the angel of death. Forthwith after this will be heard the *blast of return*, when the trumpet shall be sounded the second time by Israfil, who, together with Gabriel and Michael, will be previously restored to life, and, standing on the rock of the temple of Jerusalem, at God's command, call together all the dry

ten bones, and other dispersed parts of the body, and the very hairs to judgment. This angel, having, by the divine order, set the trumpet to his mouth, and called together all the spirits from all parts, will throw them into his trumpet, from whence, on his giving the last command, at the command of God, they will fly like bees, and fill the whole space between heaven and earth, and then repair to their respective bodies, which the opening earth will suffer to receive; and the first who shall so arise, according to the tradition of Mahomet, shall be himself. For the birth the earth will be prepared by the rain we mentioned, which is to fall continually for seven years, and will resemble the seed of a man, and be applied from the water under the throne of God, which is called the *living water*; by the efficacy of which the dead bodies shall spring forth from their graves, as they did in their mother's womb, or as corn sprouts forth by common rain, they become perfect after which breath will be breathed into them, and they will sleep in their niches till they are raised to life at the last trumpet. When those who have risen shall have received the limited time, the Mahometans believe it will at length appear to judge them; Mahomet undertaking the office of intercessor, after it has been declined by Adam, Noah, Abraham, and Jesus, who shall beg deliverance only for their own souls. They say, that on this solemn occasion God will come in the clouds, surrounded by angels, and will produce the books where in the actions of every person are recorded by their guardian angels, and will command the prophets to bear witness against those to whom they have been respectively sent. Then every one will be examined concerning all his words and actions uttered and done by him in this life; not as if God needed any satisfaction in these respects, but to oblige the sinner to make public confession and acknowledgment of God's justice. The particulars, of which they shall give an account, as Mahomet himself enumerated them, are, of their time, how they spent it; of their wealth, by what means they acquired it, and how they employed it; of their bodies, wherein they exercised them; of their knowledge and learning, what use they made of them. To the questions we have mentioned every person shall answer, and make his defence in the best manner he can, endeavouring to excuse himself by casting the blame of his evil deeds on his soul and the body, to which of them their guilt ought to be imputed: the soul saying, *O Lord, my body I received from thee; for thou createdst me without a hand to lay hold with, a foot to stand with; an eye to see with, or an understanding to apprehend with, till I came and entered into this body; therefore punish it eternally, but deliver me. My body on the other side, will make this apology: O Lord, thou createdst me like a flock of sheep, having neither hand that I could lay hold with, nor foot that I could walk with, till this soul was my eye of sight, entered into me, and my tongue was to speak, my eye to see, and my foot to walk; therefore punish it eternally, but deliver me. But God will propound to them the following parable of the blind man and the lame man, which,*

as well as the preceding discourse, was borrowed by the Mahometans from the Jews. A certain king, having a pleasant garden, in which were ripe fruits, set two persons to keep it, one of whom was blind, and the other lame; the former not being able to see the fruit, nor the latter to gather it: the lame man, however, seeing the fruit, persuaded the blind man to take him upon his shoulders, and by that means he easily gathered the fruit; which they divided between them. The lord of the garden coming some time after, and inquiring after his fruit, each began to excuse himself: the blind man said he had no eyes to see with; and the lame man, that he had no feet to approach the trees. But the king, ordering the lame man to be set on the blind, passed sentence on and punished them both. And in the same manner will God deal with the body and the soul. As these apologies will not avail on that day, so it will be in vain for any one to deny his evil actions; since men and angels, and his own members, nay, the very earth itself, will be ready to bear witness against him. At this examination, they also believe, that each person will have the book wherein all the actions of his life are written delivered to him; which books the righteous will receive into their right hand, and read with great pleasure and satisfaction; but the ungodly will be obliged to take them, against their wills, in their left, which will be bound behind their backs, their right hand being tied up to their necks. To show the exact justice which will be observed on this great day of trial, the next thing they describe is the balance, wherein all things shall be weighed. They say it will be held by Gabriel; and that it is of so vast a size, that its two scales, one of which hangs over paradise, and the other over hell, are capacious enough to contain both heaven and hell. Though some are willing to understand what is said in the Koran concerning this balance allegorically, and only as a figurative representation of God's equity; yet the more ancient and orthodox opinion is, that they are to be taken literally; and since words and actions, being mere accidents, are not capable of being themselves weighed, they say that the books wherein they are written will be thrown into the scales, and according as those wherein the good or evil actions are recorded shall preponderate, sentence will be given: those whose balances laden with good works shall be heavy, will be saved; but those whose balances are light, will be condemned. Nor will any one have cause to complain that God suffers any good action to pass unrewarded, because the wicked for the good they do have their reward in this life, and therefore can expect no favour in the next. This examination being past, that mutual retaliation will follow, according to which every creature will take vengeance one of another, or have satisfaction made them for the injuries which they have suffered. And, since there will then be no other way of returning like for like, the manner of giving this satisfaction will be by taking away a proportional part of the good works of him who offered the injury, and adding it to those of him who suffered it. Which being done, if the angels (by whose ministry this is to be performed)

news will come to them of the appearance of Antichrist; whereupon they shall leave all and return back. 4. The coming of Antichrist, whom the Mahometans call *Masih al Dajjal*, i. e. the false or lying Christ, and simply *al Dajjal*. He is to be one eyed, and marked on the forehead with the letters C. F. R. signifying *Cafir*, or infidel. They say that the Jews gave him the name of *Messiah Ben David*; and pretend he is to come in the last days, and to be lord both of land and sea, and that he will restore the kingdom to them. 5. The descent of Jesus on earth. They pretend that he is to descend near the white tower to the east of Damascus, when the people are returned from the taking of Constantinople: that he is to embrace the Mahometan religion, marry a wife, get children, kill Antichrist; and at length die after 40 years, or, according to others, 24 years continuance on earth. Under him, they say, there will be great security and plenty in the world, all hatred and malice being laid aside; when lions and camels, bears and sheep, shall live in peace, and a child shall play with serpents unhurt. 6. War with the Jews; of whom the Mahometans are to make a dreadful slaughter, the very trees and stones discovering such of them as hide themselves, except only the tree called *gharhad*, which is the tree of the Jews. 7. The eruption of Gog and Magog, or, as they are called in the east, *Tajuj* and *Majuj*; of whom many things are related in the Koran and the traditions of Mahomet. These barbarians, they tell us, having passed the lake of Tiberias, which the vanguard of their vast army will drink dry, will come to Jerusalem, and there greatly distress Jesus and his companions; till, at his request, God will destroy them, and fill the earth with their carcases, which, after some time, God will send birds to carry away, at the prayers of Jesus and his followers. Their bows, arrows, and quivers, the Moslems will burn for 7 years together; and at last, God will send a rain to cleanse the earth and make it fertile. 8. A smoke which shall fill the whole earth. 9. An eclipse of the moon. Mahomet is reported to have said, that there would be three eclipses before the last hour; one to be seen in the east, another in the west, and the third in Arabia. 10. The returning of the Antis to the worship of Allah and of Uzza, and the cast of their ancient idols, after the decease of everyone in whose heart there was faith equal to a grain of mustard seed, none but the very worst of men being left alive. For God, they say, will send a cold odoriferous wind, blowing from Syria Damascus, which shall sweep away the faith of all the faithful, and the Koran itself, so that men will remain in the grossest ignorance for one year. 11. The discovery of a vast heap of gold and silver by the retreating of the Euphrates, which will be the destruction of many. 12. The demolition of the Castle, or temple of Mecca, by the Ethiopians. 13. The speaking of beasts and inanimate things. 14. The breaking out of fire in the province of Hejaz; or, according to others, in Yemen. 15. The appearance of a man, the descendant of Kahtan, who shall drive me before him with his staff. 16. The coming of *M. al*, or director; concerning whom Mahomet prophesied, that the world should not

have an end, till one of his own family should govern the Arabians, whose name should be the same with his own name, and whose father's name should also be the same with his father's name; and who should fill the earth with righteousness. This person the Shiites believe to be now alive, and concealed in some secret place till the time of his manifestation; for they suppose him no other than the last of the 12 Imams, named *Mahomet al-kafem*, as their prophet was; and the son of Isfan al Alkeri, the 11th of that succession. He was born at Sermanrai, in the 255th year of the Hegira. From this tradition, it is to be presumed, in opinion pretty current among the Christians, that its rise, that the Mahometans are in expectation of their prophet's return. 17. A wind which shall sweep away the souls of all who have but a grain of faith in their hearts, as has been mentioned under the tenth sign. These are the greater signs, which, according to their doctrine, are to precede the resurrection, but still leave the hour of it uncertain; for the immediate sign of its being come will be the first blast of the trumpet, which they believe will be sounded three times. The first they call the *blast of consternation*; at the hearing of which all creatures in heaven and earth shall be struck with terror, except those whom God shall please to exempt from it. The effects attributed to this first sound of the trumpet are very wonderful; for they say, the earth will be shaken, and not only all buildings, but the very mountains leveled; that the heavens shall melt, the sun be darkened, the stars fall, on the death of the angels, who, as some imagine, hold them suspended between heaven and earth; and the sea shall be troubled and dried up, or, according to others, turned into flames, the sun, moon, and stars being thrown into it; the Koran, to express the greatness of the terror of that day, adds, that women who give suck shall abandon the care of their infants, and even the she camels which have gone 10 months with young (a most valuable part of the substance of that nation) shall be utterly neglected. A farther effect of this blast will be that concourse of beasts mentioned in the Koran, tho' some doubt whether it be to precede the resurrection or not. They who suppose it will precede, think that all kinds of animals, forgetting their respective natural fierceness and timidity, will run together into one place, being terrified by the sound of the trumpet and the sudden shock of nature. The Mahometans believe that this first blast will be followed by a second, which they call the *blast of examination*; by which all creatures both in heaven and earth shall die or be annihilated, except those which God shall please to exempt from the common fate; and this, they say, shall happen in the twinkling of an eye, nay in an instant; nothing surviving except God alone, with paradise and hell, and the inhabitants of those two places, and the throne of glory. The last which shall die will be the angel of death. Forty years after this will be heard the *blast of resurrection*, when the trumpet shall be sounded the 3d time by Israfil, who, together with Gabriel and Michael, will be previously restored to life, and, standing on the rock of the temple of Jerusalem, shall, at God's command, call together all the dead, and

en bones, and other dispersed parts of the body, and the very hairs to judgment. This having, by the divine order, set the trumpet to his mouth, and called together all the spirits from all parts, will throw them into his lap, from whence, on his giving the last command, at the command of God, they will fly like bees, and fill the whole space between heaven and earth, and then repair to their respective bodies, which the opening earth will suffer to receive; and the first who shall so arise, according to the tradition of Mahomet, shall be himself. For at the birth the earth will be prepared by the rain mentioned, which is to fall continually for seven years, and will resemble the seed of a man, and be supplied from the water under the throne of God, which is called the *living water*; by the efficacy of which the dead bodies shall spring forth from their graves, as they did in their mother's womb, or as corn sprouts forth by common rain, they become perfect after which breath will be breathed into them, and they will sleep in their niches till they are raised to life at the last trumpet. When those who have risen shall have passed the limited time, the Mahometans believe the angels will at length appear to judge them; Mahomet undertaking the office of intercessor, after it shall have been declined by Adam, Noah, Abraham, and Jesus, who shall beg deliverance only for their own souls. They say, that on this solemn occasion God will come in the clouds, surrounded by his angels, and will produce the books where in the actions of every person are recorded by their guardian angels, and will command the prophets to bear witness against those to whom they have been respectively sent. Then every one will be examined concerning all his words and actions uttered and done by him in this life; not as if God needed any satisfaction in their respects, but to oblige the person to make public confession and acknowledgment of God's justice. The particulars, of which they shall give an account, as Mahomet has enumerated them, are, of their time, how they spent it; of their wealth, by what means they acquired it, and how they employed it; of their families, wherein they exercised them; of their knowledge and learning, what use they made of it. To the questions we have mentioned every person shall answer, and make his defence in the best manner he can, endeavouring to excuse himself by casting the blame of his evil deeds on his parents; so that a dispute shall arise even between heaven and the body, to which of them their fault ought to be imputed: the soul saying, *O Lord, my body I received from thee; for thou createdst me without a hand to lay hold with, a foot to stand with, an eye to see with, or an understanding to bend with, till I came and entered into this body; therefore punish it eternally, but deliver me from this body* on the other side, will make this apology, *O Lord, thou createdst me like a flock of sheep, having neither hand that I could lay hold with, nor foot that I could walk with, till this soul gave me my sight, entered into me, and my tongue to speak, my eye to see, and my foot to walk: therefore punish it eternally, but deliver me.* But the angels will propound to them the following parable of the blind man and the lame man, which,

as well as the preceding dialogue, was borrowed by the Mahometans from the Jews. A certain king, having a pleasant garden, in which were many ripe fruits, set two persons to keep it, one of whom was blind, and the other lame; the former not being able to see the fruit, nor the latter to gather it: the lame man, however, seeing the fruit, persuaded the blind man to take him upon his shoulders, and by that means he easily gathered the fruit; which they divided between them. The lord of the garden coming some time after, and inquiring after his fruit, each began to excuse himself: the blind man said he had no eyes to see with; and the lame man, that he had no feet to approach the trees. But the king, ordering the lame man to be set on the blind, passed sentence on and punished them both. And in the same manner will God deal with the body and the soul. As these apologies will not avail on that day, so it will be in vain for any one to deny his evil actions; since men and angels, and his own members, nay, the very earth itself, will be ready to bear witness against him. At this examination, they also believe, that each person will have the book wherein all the actions of his life are written delivered to him; which books the righteous will receive into their right hand, and read with great pleasure and satisfaction; but the ungodly will be obliged to take them, against their wills, in their left, which will be bound behind their backs, their right hand being tied up to their necks. To show the exact justice which will be observed on this great day of trial, the next thing they describe is the balance, wherein all things shall be weighed. They say it will be held by Gabriel; and that it is of so vast a size, that its two scales, one of which hangs over paradise, and the other over hell, are spacious enough to contain both heaven and hell. Though some are willing to understand what is said in the Koran concerning this balance allegorically, and only as a figurative representation of God's equity; yet the more ancient and orthodox opinion is, that they are to be taken literally; and since words and actions, being mere accidents, are not capable of being themselves weighed, they say that the books wherein they are written will be thrown into the scales, and according as those wherein the good or evil actions are recorded shall preponderate, sentence will be given: those whose balances laden with good works shall be heavy, will be saved; but those whose balances are light, will be condemned. Nor will any one have cause to complain that God suffers any good action to pass unrewarded, because the wicked for the good they do have their reward in this life, and therefore can expect no favour in the next. This examination being past, and mutual retaliation will follow, according to which every creature will take vengeance out of another, or have satisfaction made them for the injuries which they have suffered. And, since there will then be no other way of returning like for like, the manner of giving this satisfaction will be by taking away a proportional part of the good works of him who offered the injury, and adding it to those of him who suffered it. Which being done, if the angels (by whose ministrations this is to be performed)

as *no God but God*; Mahomet is the *apostle of God*. They generally perform the operation between 6 and 16. Prayer was by Mahomet thought so necessary a duty, that he used to call it *the pillar of religion, and the key of paradise*; and when the Thakufites, who dwelt at Tayef, sending, in the 49th year of the Hegira, to make their submission to the prophet, after the keeping of their favourite idol had been denied them, begged at least, that they might be dispensed with as to their saying of their appointed prayers, he answered, *That there could be no good in that religion wherein was no prayer*. That so important a duty, therefore, might not be neglected, Mahomet obliged his followers to pray 5 times every 24 hours, at certain stated times; viz. 1. In the morning before sunrise: 2. When noon is past, and the sun begins to decline from the meridian: 3. In the afternoon, before sun-set: 4. In the evening, after sun-set, and before day be shut in; and, 5. After the day is shut in, and before the first watch of the night. At these times, of which public notice is given by the *Muezzins, or Criers*, from the steeples of their mosques (for they use no bells), every conscientious Muslim prepares himself for prayer, which he performs either in the mosque or any other place, provided it be clean, after a prescribed form, and with a certain number of praises or ejaculations (which the more scrupulous count by a string of beads), and using certain postures of worship; all which have been particularly set down and described, and must not be abridged, unless on a journey, or preparing for battle, &c. It is also requisite that they turn their faces, while they pray, towards the temple of Mecca; the quarter where the same is situated, being, for that reason, pointed out within their mosques by a niche, which they call *al Mchrab*; and without, by the situation of the doors opening into the galleries of the steeples: there are also tables calculated for the ready finding out their Kebab, or part towards which they ought to pray, in places where they have no other direction. 2. *ALMS* are of two sorts, *legal and voluntary*. The *legal alms* are of indispensable obligation, being commanded by the law, which directs and determines both the portion which is to be given, and of what things it ought to be given; but the *voluntary alms* are left to every one's liberty, to give more or less, as he shall see fit. The former kind are called *zaca*, either because they *increase* a man's store by drawing down a blessing thereon, or because they purify the remaining part of one's substance from pollution, and the soul from the filth of avarice: The latter *sadakats*, because they are a proof of a man's sincerity in the worship of God. 3. *FASTING* is a duty of so great moment, that Mahomet used to say it was *the gate of religion*, and that the *odour of the mouth of him who fasts is more grateful to God than that of musk*; and Ghazali reckons fasting *one fourth part of the faith*. According to the Mahometan divines, there are 3 degrees of fasting; 1. The restraining the belly and other parts of the body fit in satisfying their lusts: 2. The restraining the ears, eyes, tongue, hands, feet, and other members, from sin; and, 3. The fasting of the heart from worldly cares, and restraining the thoughts from every thing be-

lides God. The Mahometans are obliged, by the Koran, to fast the whole month of *RAMADAN*, from the new moon till the next new moon; during which they must abstain from eating, drinking, and women, from day-break till night or sun-set. And this injunction they observe so strictly, that, while they fast, they suffer nothing to enter their mouths, or other parts of their body, or steaming the fast broken, and null, if they smell perfumes, take a clyster or injection, bathe, or even purposely swallow their spittle; some being so cautious, that they will not open their mouths to speak lest they should breathe the air too freely: the fast is also deemed void, if a man kiss touch a woman; or if he vomit designedly. But after sun-set they are allowed to refresh themselves, and to eat and drink, and enjoy the company of their wives till day-break; though the more rigid begin the fast again at midnight. The fast is extremely rigorous and mortifying when the month of Ramadan happens to fall in summer (for the Arabian year being lunar, each month runs through all the different seasons in the course of 33 years), the length and heat of the day making the observance of it much more difficult and uneasy than in winter. The reason given why the month Ramadan was pitched on for this purpose is, that on that month the Koran was sent down from heaven. Some pretend, that Abraham, Moses, and Jesus, received their respective revelations in the same month. 4. The pilgrimage to *MECCA* is so necessary a point of practice, that, according to a tradition of Mahomet, he who dies without performing it may as well die a Jew or a Christian; and it is expressly commanded in the Koran. The temple of Mecca stands in the midst of the city, and is honoured with the title of *Masjad al elcharam*, i. e. *the sacred or inviolable temple*. What is principally revered in this place, and gives sanctity to the whole, is a square stone building, called the *CASBA*. (See that article.) To this temple every Mahometan, who has health and means sufficient, ought, once at least in his life, to go on pilgrimage; nor are women excused from the performance of this duty. The pilgrims meet at different places near Mecca, according to the different parts from whence they come, during the months of Shawwal and Dhulkaada; being obliged to be there by the beginning of Dhulhajja; which month is peculiarly set apart for the celebration of this solemnity. At these places the pilgrims properly commence such; when the men put on the *libram* or sacred habit, which consists of two woollen wrappers, one wrapped about their middle, and the other thrown over their shoulders, having their heads bare, and a kind of slippers which cover neither the heel nor the instep, and so enter the sacred territory in their way to Mecca. While they have this habit on, they must neither hunt nor fowl, (though they are allowed to fish); which precept is so punctually observed, that they will not kill even a louse or flea on their bodies: there are some noxious animals, however, which they have permission to kill during the pilgrimage, as kites, ravens, scorpions, mice, and dogs given to bite. During the pilgrimage, it behoves a man to have a constant guard over his words and actions;

quarrelling, all converse with women, and discourse; and to apply his whole to the good work he is engaged in. The being arrived at Mecca, immediately kneeling; and then enter on the performance of prescribed ceremonies, which consist in going in procession round the CAABA, between the mounts Safa and Merwa, the station on mount Arafat, and slayings, and shaving their heads in the valley. In compassing the Caaba, which times, beginning at the corner where the stone is fixed, they use a short quick three first times they go round it, and a slow pace the 4 last. But the aforesaid they are not obliged to use every time in this piece of devotion, but only at certain times. So often as they pass by the stone, they either kiss it, or touch it with hand and kiss that. The running between Merwa is also performed 7 times, at a slow pace and partly running: for gravely till they come to a place beset with pillars; and there they run, and afterwards again; sometimes looking back, and stopping, like one who had lost some present Hagar seeking water for her the 9th of Dhulhajja, after morning the pilgrims leave the valley of Mina, and come the day before; and proceed in a slow and rushing manner to mount where they perform their devotions till when they go to Mozdalifa, an oratory beset with fat and Mina; and there spend the night in reading the Koran. The next morning they break they visit *al Masjar al Karam*, and *al moniment*; and, departing thence beset, pass by Batn Mohasser to the valley where they throw 7 stones at 3 marks or imitation of Abraham, who, imitating in that place, and, being by him disturbed in devotion, or tempted to disobedience was going to sacrifice his son, was com- manded by God to drive him away by throwing stones; though others pretend this rite to be in honour of Adam, who also put the devil to flight in the place, and by the same means. This being over, on the same day, the 10th of the pilgrims slay their victims in the valley of Mina; of which they and their wives eat part, and the rest is given to the poor. The victims must be either sheep, goats, kine, or camels; if of either of the two former they must be either of either of the latter; and if of the latter they must be either of the former. The sacrifices being over, they shave their heads and cut their nails, burying them in the valley; after which the pilgrimage is considered as completed: though they again visit the Caaba, to take their leave of that sacred build-

**MAHOMETANISM, SUCCESS OF, ACCOUNT OF.** The rapid success, which attended the introduction of this new religion, was owing to its being plain and evident, and must rather prevent, our surprize, when they are very considered. The terror of Mahomet, and the repeated victories which were

gained by him and his successors, were, no doubt, the irresistible arguments that persuaded such multitudes to embrace his religion and submit to his dominion. Besides, his law was artfully and marvellously adapted to the corrupt nature of man; and, in a more particular manner, to the manners and opinions of the eastern nations, and the vices to which they were naturally addicted: for the articles of faith which it proposed were few in number, and extremely simple; and the duties it required were neither many nor difficult, nor such as were incompatible with the empire of appetites and passions. It is to be observed farther, that the gross ignorance, under which the Arabians, Syrians, Persians, and the greatest part of the eastern nations, laboured at this time, rendered many an easy prey to the artifice and eloquence of this bold adventurer. To these causes of the progress of Mahometanism, we may add the bitter dissensions and cruel animosities that reigned among the Christian sects, particularly the Greeks, Nestorians, Eutychians, and Monophysites; dissensions that filled a great part of the East with carnage, assassination, and such detestable enormities, as rendered the very name of Christianity odious to many. We might add, that the Monophysites and Nestorians, full of resentment against the Greeks, from whom they had suffered the most injurious treatment, assisted the Arabians in the conquest of several provinces, into which, of consequence, the religion of Mahomet was afterwards introduced. Other causes of the sudden progress of that religion will naturally occur to such as consider attentively its spirit and genius, and the state of the world at that time.

**MAHOMETANS**, those who believe in the religion and divine mission of Mahomet. See ALKORAN, MAHOMET, and MAHOMETANISM.

**MAHOMETISM**. See MAHOMETANISM.

(2.) MAHON, a termeno, or county of MINORCA.

(3.) MAHON, PORT. See PORT MAHON.

**MAHRA'TTAS**. See MARHATTAS.

**MAHWAH**, or MAWEE, in botany; an East Indian tree, so called by the natives of Bihar and the neighbouring countries, but of which the Shanscrit name is *Mahwa* or *Mehudhruwa*. According to Lieut. C. Hamilton, by whom a very particular account of this tree is given in the *Asiatic Researches*, (Vol. I. art. xiv.) it is of the class of the polyandra monogynia of Linnæus, but of a genus not described by him. The calyx is monophyllous, quadriid, half divided, and imbricated in its divided part; the two opposite and outer parts covering partially the two opposite and inner. The corolla is monopetalous, having an inflated tube for its lower part, of near an inch long, thick, fleshy, and of a cream colour: from this arise 9 small leaves, like petals from a calyx, imbricated and twisted one over the other, from right to left, clasping the lower part of the style in a point; by which they seem to serve, in some respects like a creeps, to detach the whole corolla at the season of its dropping. There are no fr-

laments; but the anthers, which are commonly 26, long, scabrous, and spear-headed, are inserted in rows, on the inside and upper part of the tube of the corolla. The style is long, round, and tapering, and projects about an inch beyond the corolla; it is succeeded by a drupe, with a thick pericarpium, bilocular, containing 2 or 3 seeds, covered with a dark-brown skin, in separate divisions. The flowers rise in bunches, from the extremities of the smaller branches; and have each a pedicle of about an inch and a half long, mostly turned downwards, whence the corollas more easily drop off. The tree, when full grown, is about the size of a Mango tree, with a bushy head and oval leaves a little pointed; its roots spreading horizontally, are sunk but little in the earth; the trunk, which is often of a considerable thickness, rises seldom to any great height, without giving off branches; it is, however, not uncommon to see it shoot up clear 8 or 10 feet: the wood is moderately hard, fine grained, and of a reddish colour. By incision it affords a resinous gum from the bark. The flowers "differ essentially (says Mr Hamilton) from those of any other plant with which I am acquainted, as they have not, in any respect, the usual appearance of such, but rather resemble berries; and I, like many others, had long conceived them to be the fruit." The leaves fall in Feb. and early in March: these flowers begin to come out in clusters of 30, 40, or 50, from the extremity of every small branch. From this period to the end of April, as the flowers come to maturity (for they never open), they continue falling off, with their anthers, in the mornings, a little after sun-rise; when they are gathered, and dried by exposure in the sun. Thus prepared, they resemble a dried grape, both in taste and flavour. Immediately after the flowers drop off, fresh shoots are made for the new leaves, which soon appear, coming quickly to their full growth. The fruit is of two sorts; the one resembling a small walnut, the other somewhat larger and pointed: it is ripe towards the middle of May; and continues dripping from the tree till the whole fall, which is generally towards the middle of June. The outer covering, or *pericarpium*, which is of a soft texture, commonly bursts in the fall, so that the seeds are very easily squeezed out of it: the seeds are somewhat of the shape, but longer than an olive. These seeds are replete with a thick oil, of the consistence of butter, which is obtained by expression. This tree and its productions are of singular and general use, in those barren countries, which are not calculated for producing the necessaries of life. The flowers, after being dried, are eaten by the natives raw or dressed with their *curries*; and, when even simply boiled with rice, they afford a strengthening and wholesome nourishment. They are also often fermented, and yield by distillation a strong spirit, which the people here sell so very cheap, that for one *pie* (about a halfpenny) may be purchased no less than a *cutelafur* (above a pint English) with which any man may get completely drunk. These flowers make an article of trade; being exported to Patna and elsewhere in considerable quantities, as well as the oil yielded by the fruit. This oil resembles *ghee* so much, that, being cheaper, the

natives often mix it with that common use it as *ghee* in their victuals, and in position of some sweetmeats; and burn lamps. It is also regarded as a saluta applied externally to wounds and cutations. It is at first of the consistence oil, but soon coagulates: after being kept some time it acquires a bitterish taste and ra which renders it somewhat less agreeable ticle of food: but this inconvenience, being properly clarified, might perhaps ed. The gum is not applied to an though it might be collected in large q March and April. The wood cannot had in beams of any considerable les to make it so useful in buildings as therwise be, from its not being liable en by the white ants. Mr Kier, how our author, that when he was at Cho lage upon the Caramassa near Buxa beams of it above 20 feet long; but ther respects it is a most useful wood; tough, and of a strong texture, it mig be employed to advantage in ship-b which case, if properly cultivated in ma that seem well adapted for it, and fit fo it might in time become a valuable ar branch at Calcutta, whither it coul transported during the rainy season fr any part of these countries, by var The tree will grow in the most bar even amongst stones and gravel, w is the least appearance of a soil; an to destroy all the smaller trees a wood about it. It does not require n ture, producing nearly as well in the o most favourable years, and in every fi is therefore admirably fitted for the c of the inhabitants of these hilly coun: are peculiarly subject to long and fever during the hot months. "Yet, notw its utility, (says our author,) and th quantity of ground that seems so well the growth of it, both here and in the ing provinces of Catak, Pacheet, Ro have myself never observed, nor can who ever have remarked, one single trant state. We can see, every where, trees in great abundance; but, never m any young plants, both I and all wh spoken to on the subject, are at some l ceive how they should have come he can the country people themselves, c have inquired, give any rational accou although it appears pretty evident, bers of them must have been cultiv time or other, every village having mar growing about it. This is a circumst sufficiently marks the true character o er order of natives in their most supbe and sloth; owing chiefly to the igne stupid rapacity of their Rajahs, Zam other landholders, and their total t to the welfare of those dejected wret whom they derive their consequence. Of their base indifference to the i those whom they thus affect to hel

When I am dead, strew me o'er  
With maiden flowers, that all the world may know  
I was a chaste wife to my grave. *Shak. H. VIII.*  
By this maiden blossom in my hand  
I scorn thee and thy fashion. *Shak. Hen. VI.*

(2.) MAIDEN, *n. f.* See MAID, N° 1.  
(3.) MAIDEN, or MAYDEN, an instrument anciently used in Scotland for beheading criminals, similar to the Guillotine. See GUILLOTINE. Of the use and form of this instrument Mr Pennant gives a particular account, which we have anticipated under the article HALIFAX, N° 2. He adds, that it "was very freely used during the reign of Elizabeth: the records before that time were lost: 25 suffered in her reign, and at least 12 from 1623 to 1650; after which I believe the privilege was no more exerted. This machine of death is now destroyed; but I saw one of the same kind in a room under the parliament house at Edinburgh, where it was introduced by the regent Morton, who took a model of it as he passed through Halifax, and at length suffered by it himself. It is in form of a painter's easel, and about 10 feet high: at 4 feet from the bottom is a cross bar, on which the felon lays his head, which is kept down by another placed above. In the inner edges of the frame are grooves; in these is placed a sharp ax, with a vast weight of lead, supported at the very summit with a peg; to that peg is fastened a cord, which the executioner cutting, the ax falls, and does the affair effectually, without suffering the unhappy criminal to undergo a repetition of strokes, as has been the case in the common method."

(4.) MAIDEN is also a name of a machine first used in Yorkshire, and since introduced into other places, for washing linen; consisting of a tub 19 inches high, and 27 in diameter at the top, in which the linen is put, with hot water and soap, to which is adapted a cover, fitting it very closely, and fastened to the tub by two wedges; through a hole in the middle of the cover passes an upright piece of wood, kept at a proper height by a peg above, and furnished with two handles, by which it is turned backward and forward: to the lower end of this upright piece is fastened a round piece of wood, in which are fixed several pieces, the core of a wheel. The operation of this machine makes the linen pass and repass quick through the water.

(5.) MAIDEN RENTS, in old English writers, a noble paid by the tenants of some manors on their marriage. This was found to be given to the lord for his outting the custom of *maritagium*, (See MARCHETA) whereby he was to have the first night's lodging with his tenant's wife; but it seems more probably to have been a fine for a licence to carry a daughter.

(6.) \* MAIDENHAIR *n. f.* [*maiden* and *hair*; *azilum* &c.] This plant is a native of the south-parts of France and in the Mediterranean, where it grows on rocks and old ruins, from whence it is brought for medicinal use.—June is drawn in a mantle of dark grass green, upon his head a garland of bent's king's caps, and *maidenhair*. *Fuchus*.

(7.) MAIDENHAIR. See ADYANTHUM.

(8.) MAIDENHAIR, GOLDEN. See POLYTRICHUM.

(9.) MAIDENHEAD, a town 20 miles from London, with 2 for Thames. It is governed by a mayor, a steward, and 10 aldermen; last two bridgemaisters are chosen town stands partly in the parishly in that of Cookham; and halliar to the corporation, the m chosen by the inhabitants, and tend the bishop's visitation. It several almshouses and charity now so considerable, did not be its bridge was built. The bar maintained by the corporation are allowed the tolls over and unple have a great trade in malt, which they carry in their barge; this is the great thoroughfare Bath, Bristol, &c. the adjacent noted for robberies. It has a nedday, 3 fairs, and frequent ho

1.—  
ge the complexion of her *maidpale* peace  
'let indignation. *Sbak.*

**SERVANT.** *n. f.* A female servant.—It  
y right what you say of the indifference  
n friends, whether we are sick or well;  
*maid-servants* in a family have the same  
*wife*.

**TONE,** a town of Kent, 36 miles from  
seated on the Medway, a branch of  
is through it. It is a corporation, and  
members to parliament. Its chief trade  
thread, which is made to great perfec-  
n hops; of which there are many planta-  
t the town, as well as orchards of cher-  
: tide flows up to the town, and brings  
, &c. of 50 or 60 tons. It has a fine  
3c. One of the public gaols is kept in  
; and the custody of weights and mea-  
wed by the standard of Henry VII. was  
l to it by parliament. The knights of  
re always elected, and the courts of jus-  
here, and generally the affizes. The  
nterbury is parson of this parish, which  
liar, and served by his curate. It has  
hools, in which are above 100 boys  
London is supplied with more com-  
om hence than from any market town  
; particularly with large bullocks from  
l of Kent; with timber, wheat, hops,  
l cherries; with a sort of paving stones,  
hes square, exceedingly durable; and  
ne white sand for glass-houses and sta-  
here are many gentlemen's seats within  
o that the town is not more noted for  
for gentry. The market on Thursday  
in the country; it has another on the  
y of every month, and fairs on Feb.  
12th, June 20th (called *Garlic fair*),  
7th. It is 20 miles W. of Canterbury,  
by E. of London. Lon. o. 38. E. Lat.

**NE.** See **MAINE**, and **MAYENNE**.  
**ESTICALLY.** *adv.* [from *majestical.*]  
ty; with grandeur.—  
From Italy a wand'ring ray  
ng light illuminates the day;  
urd the bands, *majestically* bright,  
e she fixes her imperial light. *Granv.*  
re I seen in black and white  
ng thing, a magpie height,  
*icallly* stalk;  
, worthless animal.  
s the tongue, and wags the tail,  
tter, pride, and talk. *Swift.*

**STICAL.** } *adj.* [from *majesty.*] 1.  
**STICK.** } August; having dignity;  
erial; regal; great of appearance.—

They made a doubt  
*majestical* would put him out: *Sbak.*  
e start of the *majestick* world,  
r the palm alone. *Sbak.*  
o it wrong, being so *majestical*,  
it the show of violence. *Sbak.*

In his face  
knelt, heighten'd with *majestic* grace.  
*Dunbam.*

And forth he mov'd, *majestick* as a god. *Pope.*

2. Stately; pompous; splendid.—It was no mean  
thing which he purposed; to perform a work so *ma-*  
*jestical* and stately was no small charge. *Hooker.* 3.

Sublime; elevated; lofty.—Which passage doth  
not only argue an infinite abundance, both of ar-  
tizans and materials, but likewise of magnificent  
and *majestical* desires in every common person.  
*Wotton.*—The least portions must be of the e-  
epick kind; all must be grave, *majestical* and  
sublime.

(1.) \* **MAJESTY.** *n. f.* [*majestas*, Lat.] 1. Digi-  
nity; grandeur; greatness of appearance; an ap-  
pearance awful and solemn.—The voice of the  
Lord is full of *majesty*. *Psal.* xxix. 4.—The Lord  
reigneth; he is clothed with *majesty*. *Psal.* xciii.—  
Amidst

Thick clouds and dark, doth Heav'n's all-rul-  
ing Sire

Chuse to reside, his glory unobscur'd,  
And with the *majesty* of darkness round  
Covers his throne. *Milton.*

Great, without pride, in sober *majesty*. *Pope.*

2. Power; sovereignty.—Thine, O Lord, is the  
power and *majesty*. 1 *Chron.* xxix.—To the only  
wife God be glory and *majesty*. *Jude*, 25.—He  
gave Nebuchadnezzar thy father *majesty*. *Dan.* v.  
18. 3. Dignity; elevation of manner.—

The first in loftiness of thought' surpass'd,  
The next in *majesty*. *Dryden.*

4. The title of kings and queens.—

Most royal *majesty*,  
I crave no more than what your highness offer'd,  
Nor will you tender less. *Sbak.*

I have a garden opens to the sea,  
From whence I can your *majesty* convey  
To some nigh friend. *Walker.*

—He, who had been always believed a creature  
of the queen, visited her *majesty* but once in six  
weeks. *Clarendon.*—

I walk in awful state above  
The *majesty* of heaven. *Dryden.*

(2.) **MAJESTY** (§ 1, *def.* 4.) is derived from *ma-*  
*yor*, Lat. greater, and *status*, state. The emperor  
is called *Sacred Majesty*, *Imperial Majesty*, and *Cæ-*  
*sarean Majesty*; The king of Hungary, *His Aposto-*  
*lic Majesty*. The king of Spain, *His most Catho-*  
*lic Majesty*; and the king of Portugal, *His most*  
*Faithful Majesty*. The king of France was called  
*His most Christian Majesty*; and when he treated  
with the emperor, the word *Sacred* was added.  
As to other kings, the name of the kingdom is  
prefixed; as *His Britannic Majesty*, *His Sardinian*  
*Majesty*, &c. Formerly princes were more sparing  
in giving titles, and more modest in claiming  
them; before the reign of Charles V. the king of  
Spain had only the title of *Highness*; and before  
that of Henry VIII. the kings of England were only  
address'd under the titles of *Grace* and *Highness*.  
Under the Roman republic, the title *Majesty* (*ma-*  
*jestas*) belonged to the whole body of the people,  
and to the principal magistrates; so that to dimi-  
nish or wound the *majesty* of the commonwealth,  
was to be wanting in respect to the state or to its  
ministers. But the power afterwards passing into  
the hands of a single person, the appellation of  
*Majesty* was transferred to the emperor and the  
imperial family. Pliny compliments Trajan on his

ces, Lewis XIV. bestowed upon him the title of Leghorn. Being appointed in 1715 the sea-ports in the Levant and on the Barbary, he was so successful, that he was permitted to retire with a considerable pension settled at Marseilles; where he died in the 79th year of his age. He was a man of great imagination, gentle manners, and the most probity. He paid particular attention to natural history, and was anxious to investigate every part of our globe. On this important subject he made some curious observations, which have been published in 8vo under the title of *Tellamed*, his name written backwards. The editor, the Abbé Mascrier, has given to this work the title of dialogue. An Indian philosopher is introduced as explaining to a French missionary his notions concerning the nature of the globe, and the origin of mankind. His great object is to show that all the strata of which this globe is composed, even to the tops of the highest mountains, have come from the bosom of the waters. He dedicated his book to the illustrious Cyrano de Bergerac, author of *Travels to the sun and moon*; numerous epistle, wherein he says, that dialogues are nothing but a collection of ideas and fancies. Of the 6 dialogues which compose this work, the 4 first contain many important philosophical observations; in the other two he finds nothing but conjectures, fancies, and tales, sometimes amusing, but always absurd. *Description of Egypt*, was collected from the observations by Mascrier, in 1743, 4to, or in 2 vols.

MEZAIS, a town of France in the department of Vendée, situated in an island formed by the sea and Autize, 6 miles S. of Fontenay, and 10 miles of Rochelle. Lon. o. 40. W. Lat. 46.

MAILLY, the name of 4 towns of France, viz. 1. in the dep. of Aube, 9 miles N. of Troyes; 2. in that of Saone and Loire, 4 miles S. of Mâcon; 3. in that of Douens; and 4. MAILLY LE CHATEAUX, a town in the dep. of Yonne, 12 miles NW. of Avallon, and 12 miles from Auxerre.

MAIMI, a river of Abyssinia, in Sarnen, rises near a village built on a precipice, flows through a wood, where it divides into 2 rivers running N. and S. after which they unite and running  $\frac{1}{2}$  of a mile farther, the united stream is precipitated down a cataract 150 feet high.

MAIM, *n. f.* [from the verb.] 1. Privation of an essential part; lameness, produced by loss of a limb, or amputation.—Surely there is more reason to fear, lest the want thereof be a *maim*, than to use a blamish. *Hooker*.—The duke of Gloucester, scarce himself, bears so shrewd a *maim*. *Scots*. 2. Mischievousness.

Not to deep a *maim*, to be cast forth in the common air. *Shakspere*. Lat. defect.—A noble author esteems it to be in history, that the acts of parliament are to be cited. *Hayward*.

MAIM, MAHLEM, or MAYHEM, in law, is a writ by which a person loses the use of a

member that might have been a defence to him; as when a bone is broken, a foot, hand, or other member cut off, or an eye put out; though the cutting off an ear or nose, or breaking the hinder-teeth, was formerly held to be no maim. A maim by castration was anciently punished with death, and other maims with loss of member for a member; but afterwards they were only punished by fine and imprisonment. It is now enacted by the statute 22 and 23 Car. II. that if any person, from malice aforethought, shall disable any limb or member of any of the king's subjects, with an intent to disfigure him, the offender, with his aiders and abettors, shall be guilty of felony without benefit of clergy, but shall not corrupt the blood, or occasion forfeiture of lands, &c.

\* To MAIM, *v. a.* [*maitan*, Gothick, to cut off; *mebaigner*, to maim, old French; *mebaina*, Armorick; *mancus*, Lat.] To deprive of any necessary part; to cripple by loss of a limb: originally written from the French *maybem*.—

You wrought to be a legate; by which power you *maim'd* the jurisdiction of all bishops. *Shakspere*.—The multitude wondered when they saw the dumb to speak, the *maimed* to be whole, and the lame to walk. *Matth. xv. 31*.

(1.) MAIMBOURG, Lewis, a celebrated French Jesuit, born in 1610. He joined the Jesuits in 1626; and acquired great reputation both as a teacher, and a historian. He published *Histories* 1. of *Arianism*; 2. of the *Iconoclastes*; 3. of *Calvinism*; 4. of *Lutheranism*, and 5. of the *Crosses*. The Jansenists criticized the two first of these, and the 3d was violently opposed; but he made no replies. In 1682, he was, by order of Pope Innocent XI, expelled the Society of Jesuits, for his zeal in defending the liberty of the Gallican church against the Ultramontans; but Lewis XIV. made him amends by a genteel pension. He retired into the abbey of St. Victor, where he died in 1686.

(2.) MAIMBOURG, Theodore, cousin to the preceding, embraced Calvinism, afterwards returned to the Romish church, returned back to the reformed religion, embraced Socinianism, and died at London about 1693, after having published some works.

MAIMONIDES, Moses, or MOSES THE SON OF MAIMON, a celebrated rabbi, called by the Jews *the eagle of the doctors*, was born of an illustrious family at Cordova in Spain, in 1135. He is also called MOSES ÆGYPTIUS, because he settled in Egypt, where he spent his life as physician to the Sultan. He also opened a school, which was soon filled with pupils from Alexandria, Damascus, &c. who spread his fame all over the world. He was no less eminent in philosophy, mathematics, and divinity, than in medicine. Casaubon says of him, that "he was the first of his tribe who ceased to be a trifler." It would be tedious to enumerate all his works; some were written originally in Arabic, but are now extant only in Hebrew translations. "Those (says Collier) who desire to learn the doctrine and the canon law contained in the Talmud, may read Maimonides's compendium of it in his book entitled *Yad*; wherein they will find great part of the tables in the Talmud discarded. But the

*More Newchin* is the most valued of all his works; designed to explain the obscure words, phrases, metaphors, &c. in scripture." He died in Egypt, aged 70, and was buried in Upper Galilee.

(1.) \* MAIN. *adj.* [*magnus*, old Fr. *magnus*, Lat.] 1. Principal; chief leading.—Every grand of *main* publick duty which God requireth of his church.—

A man may prophesy,  
With a near aim, of the *main* chance of things  
As yet not come to life. *Shak.*

He is superstitious grown of late,  
Quite from the *main* opinion he had once  
Of fantasy, of dreams, and ceremonies. *Shak.*  
—There arose three notorious and *main* rebellions,  
which drew several out of England. *Davies.*—

The nether flood,  
Which now divided into four *main* streams,  
Runs diverse. *Milton.*

I should be much for open war, O peers,  
If what was urg'd  
*Main* reason to persuade immediate war,  
Did not dissuade me most. *Milt.*

—All creatures look to the *main* chance, that is  
Food and propagation. *L'Estrange.*—Our *main*  
interest is to be as happy as we can, and as long  
as possible. *Tillotson.*—

Be careful still of the *main* chance. *Dryd.*  
—Whilst they have buified themselves in various  
learning, they have been wanting in the one *main*  
thing. *Baker.*—Nor is it only in the *main* design,  
but they have followed him in every episode. *Pope.*  
2. Mighty; huge; overpowering; vast.—

You may as well go stand upon the beach,  
And bid the *main* flood bate his usual height. *Shak.*

Seest thou what rage  
The spirit of our liberty, whom no bounds,  
Nor yet the *main* seas,  
Will limit, can contain? *Milton.*  
2. *adj.* concerning the chief part.—  
We ourself will follow  
In the *main* battle. *Shak.*

All already  
Clang'd our *main* battle's front. *Shak.*  
2. Important; possible.—This young prince, with  
a train of young noblemen and gentlemen, but  
not with any *main* army, came over to take pos-  
session of his new patrimony. *Davies.*—

That, which thou might  
Believ'st so *main* to our success, I bring. *Milton.*

(2.) MAIN (2) *1. def. 1.* is usually applied by  
writers to whatever is principal, as opposed to  
whatever is secondary. Thus the MAIN LAND is  
used in contradistinction to an island or peninsula;  
and the main mast, the main wale, the main keel,  
and the main hatchway, are distinguished from  
fore and after masts, the channel wales, the  
fore keel, and the fore and after hatchways, &c.

(3.) \* MAIN. *1. def. 2.* The gross; the bulk; the  
greater part.—The *main* of the iron may be reduced  
to language and an iron oxymoron in wisdom, by  
repetition. *Locke.* 2. To name the whole; the  
part.—They allowed the clergy and government  
of the church of England to be the *main*.  
*The Church.*—The *main* of the country consists  
of the *main* hills, but the *main* hills are above

twelve months. *Locke.* 3. The ocean;  
sea, as distinguished from bays or rivers.

His state  
Empties itself, as doth an inland brook  
Into the *main* of waters.

Bids the wind blow the earth into  
Or swell the curled water 'bove the  
That things might change.

He fell, and struggling in the *main*,  
Cry'd out for help, but cry'd in vain.  
Say, why should the collected *main*  
Itself within itself contain?

4. Violence; force.—  
He 'gan to advance  
With huge force, and importable *mai*  
With might and *main*

He hasted to get up again.  
With might and *main* they chac'd  
d'rous fox,

With brazen trumpets, and inflated b  
5. [From *manus*, Latin.] A hand at dice  
All at one cast, to set so rich a *main*  
In the nice hazard of one doubtful ho  
To pass our tedious hours away,  
We throw a merry *main*. *Karl Desj*

Writing is but just like dice,  
And lucky *main*s make people wife.

6. The continent.—In 1589 we turned  
lengers, and invaded the *main* of Spain  
7. A hamper. *Am'worth.*

(4.) MAIN, in Geography. See MAIN

(1.) MAINA, a country of European  
in the Morea, between two chains of m  
which, with the bravery of the people, l  
served them from the yoke of the Tur  
have never been able to subdue them.

(2.) MAINS, the capital of the above  
with a harbour on the W. coast of the S  
MAINBURG, a town of Bavaria, of  
mos, 18 miles ESE. of Ingoldstadt, and  
of Munich.

(3.) MAINE, or MAW, one of the 1  
States of N. America; bounded on the  
mountains which separate it from Lou  
da; E. by the river St Croix, and Ne  
wick; SE. and S. by the Atlantic Oee  
W. by the Piscataqua, and New Hampsh  
graphers differ greatly as to its extent. Dr  
and Mr Walker make it 300 miles long  
broad; others make its length and bread  
200 miles each; Mr Joseph Scott, and  
*States Gazetteer* makes its greatest li  
miles, and its breadth along the coast 22

rev. Dr Jedidiah Monk, in his *American*  
*Geography*, (Boston, 1793) reduces its l  
170 miles and its breadth to 125; while  
Clement Cruttwell makes it 195 miles l  
only 110 broad. These differences seem  
partly arisen from confounding the *I*  
*Main*, with the old *Province of Main*,  
which forms only a part of it. The te  
to its of the District, now the State of M  
estimated at 40,000 square miles, or 15  
acres; those of the old province were  
square miles. The climate, soil, and pe  
of the country are much the same with  
New Hampshire; (see HAMPSHIRE, N<sup>o</sup>

tempt to settle it was made in 1607; on the side of the Kennebeck; and attempts were variously made between 1620 and 1630, when it had a settlement at the place now called *Wassallo*. But no permanent settlement was effected till 1635, when Sir Ferdinand Gorges secured a grant from the council of Plymouth country between the Piscataqua and the Kennebeck, forming a square of 120 miles: and he obtained a charter from K. Charles I, the most unlimited privileges; which enabled him to institute a government in the province.

In 1647 he died, on which the people re-elected their own governors annually; they did till 1652, when the inhabitants of Massachusetts claiming a right of jurisdiction over the province by their charter, the people of Maine revolted; the district was named *Yorkshire*; 7 courts were held as in Massachusetts, and 7 magistrates sent deputies to the general court at Boston. In 1677, the citizens of Massachusetts rescinded Gorges's patent for 1200. But in 1684, a charter was vacated, and in 1691, by a new charter from William and Mary, the province of Maine and the large territory eastward to Nova Scotia were incorporated with MASSACHUSETTS; which time it has been governed as that both before and since the revolution. At that period it was divided into two districts, called *Acadia* and *Maine*. From its first settlement, 1600, this country has been dreadfully harassed by the Indians. In 1675, almost all the settlements were destroyed. From 1692 till 1702, it was a continued scene of murder, burning, and depredation. The inhabitants also suffered much in 1720 and 1727: and even so late as 1744 and 1748, many of them were killed and carried off by the Indians from the towns on the coast. During these last 50 years, they have lived in peace and have increased rapidly. At that period the population did not exceed 50,000 souls. In 1802 it is estimated at above 120,000. The principal religious sects are Congregationalists and Baptists; but there are also Presbyterians, Quakers, Methodists, Episcopalians, and Papists. The only Indians who reside in this state are the Penobscotians.

This extensive country was, in 1761, divided into 3 counties, containing 4½ millions of acres each; but now consists of 5, viz. York, Cumberland, Lincoln, Hancock, and Washington, which are subdivided into 94 townships. The chief towns are Portland, the capital, York, Bangor, Hallowell, Waldoborough, Penikese, and Machias. The principal rivers are the Kennebeck, Union, Penobscot, Kennebec, Sheepfoot, Androscoggin, Moose, Nonotuck, Saco, and Sebacoek. The chief cities are Bangor and Sebacoek. The coast is everywhere a bay. The only mountain is *Agassiz*, a noted lead mine, in York county and rises 8 miles from the shore. Iron ore abounds, some coppers and sulphur; and several iron mines are carried on. Wool and flax are raised for home consumption; but the trade till lately was in lumber. Dried fish is a capital article of exportation; and shipping is carried on to a considerable extent.

The constitution is the same with that of MASSACHUSETTS. The citizens are industrious, enterprising, brave, hardy, and hospitable. Maine lies between 4° and 9° Lon. E. of Philadelphia; and between 68° and 72° Lon. W. of London: in Lat. from 43° to 48° N.

(2.) MAINE, a ci-devant prov. of France, now forming the department. (See N° 3.) It was bounded on the N. by Normandy; E. by Perche; S. by Touraine and Vendomois; and W. by Anjou and Bretagne. It was divided into *Upper and Lower Maine*. MANS was the capital.

(3.) MAINE, or MAYENNE, a department of France, which includes the above province; so named from the river (N° 5.) It is bounded on the N. by the departments of the Channel and Orne; E. by that of the Sarthe; S. by that of Maine and Loire; and W. by that of Ille and Vilaine. It is 45 miles long from N. to S. and 30 broad. LAVAL is the capital.

(4.) MAINE, MAIENNE, or MAYENNE, the capital of the above department, seated on the river (N° 5.) with a castle on a rock; containing about 6000 citizens. Lon. 0. 35. W. Lat. 48. 18. N.

(5.) MAINE, or MAYENNE, a river of France, which rises near Linieres, in the dep. of Charente; passes by Ambrier, Maine, (N° 4.) Laval, Chateau, Gontier, &c. and joining the Sarthe 3 miles N. of Angers, forms the MAYNE.

(6.) MAINE, a river of Germany, which rises in the circle of Franconia, runs by Bamberg, Wurtzburg, Alschaffenburg, Hauna, and Francfort, and falls into the Rhine at Mentz.

(7.) MAINE AND LOIRE. See MAYNE, N° 3.

(8.) MAINE, DISTRICT OF. See N° 1.

(9.) MAINE, PROVINCE OF, a considerable part of the district of Maine, formerly called *Yorkshire*, about 120 miles square. It was bounded on the N. and NE. by the land called *Sagadahock*; S. by the Atlantic, and W. by New Hampshire. See N° 1.

MAINEVILLE, a town of France, in the department of Eure, 8 miles ESE. of Rouen.

(1.) \* MAINLAND. *n. f. (main and land.)* Continent. *Spenser* and *Dryden* seem to accept this word differently.

None was it island then,  
But was all desolate, and of some thought,  
By sea to have been from the *Cornick mainland*  
brought. *Spenser.*  
Those whom Tyber's holy forests hide,  
Or Circe's hills from the *mainland* divide. *Dryden.*

(2.) MAINLAND, or POMONA, the largest of the Orkney Islands. According to Dr Brookes and J. Walker, it is 24 miles long and 9 broad; but others make its length 33 miles. It contains 9 parishes, and 4 excellent harbours. See ORKNEY and POMONA. KIRKWALL is the capital.

(3.) MAIN-LAND, the largest of the Shetland, or Zetland Islands. It is about 60 miles long from N. to S. and in some places 20 broad, but in others not much above two. Its mountains are cavernous and abound with game, and its coast with fish. It has a mine of copper and another of iron, both very productive. Its sheep and horses are uncommonly small; but the latter are remarkable

ably strong and handsome, and the former are famous for the finest of wool. LEAWICK is the capital. See SHETLAND.

\* MAINLY, *adv.* [from *main*.] 1. Chiefly; principally.—

A brutish vice,

Inductive *mainly* to the sin of Eve. *Par. Lost.*  
—They are *mainly* reducible to three. *More.*—  
The metallic matter now found in the perpendicular intervals of the strata; being interspersed amongst the matter, whereof the said strata *mainly* consist. *Woodward.* 2. Greatly; hugely.—It was observed by one, that himself came hardly to a little riches, and very easily to great riches: for when a man's stock is come to that, that he can expect the prime of markets, and overcome those bargains, which, for their greatness, are few mens money, and be partner in the industries of younger men, he cannot but increase *mainly*. *Bacon.*

\* MAINMAST, *n. s.* [*main* and *mast*.] The chief or middle mast.—

One dire shot,

Clof by the board the prince's *mainmast* bore.

*Dryden.*

—A Dutchman, upon breaking his leg by a fall from the *mainmast*, told the standers-by, it was a mercy it was not his neck. *Spektor.*

MAINOUR, MANOUR, or *Meinour* (from the French *mainier*, i. e. *mainu vultare*), in a legal sense denotes the thing that a thief taketh away or stealth: *To be taken with the mainour* is to be taken with the thing stolen about him; and again it was presented, that a thief was delivered to the sheriff or viscount, together with the mainour. If a man be indicted, that he feloniously stole the goods of another, where, in truth, they are his own goods; and the goods be brought into the court as the mainour; and if it be demanded of him, what he saith to the goods; and he disclaim them; though he be acquitted of the felony, he shall lose the goods. If the goods were taken with the manour, and the manour be carried to the court, they, in such cases, would arraign him upon the manour, without any appeal or indictment. *Covent. Black. Comment. Vol. III. 71. Vol. IV. 305.*

\* MAINPURNABLE, *adj.* Bailable; that may be admitted to give surety.

(1.) \* MAINPURNOR, *n. s.* Surety; bail.—He enforced the clergy himself to fly, till 26 noblemen became *mainpurnors* for his appearance. *Darwin.*

(2.) MAINPURNORS differ from bail, in that a man's bail may impound, or surrender him up before the appointed day of appearance; mainpurnors can do neither, but are merely sureties for his appearance at the day: but mean only sureties, that the parties be answerable for the special matter for which they stipulate; mainpurnors are bound to produce him to answer all charges whatsoever. See HABEAS CORPUS.

\* MAINPRISE, *n. s.* T. bail.

(1.) \* MAINPRISE, *n. s.* [*main* and *pris*, French.] Delivery by a the custody of a friend, upon security given for appearance at bail.—The earl of Devonland used to *mainprise* his brother.—  
By the way of *mainprise*, said  
Downy from this base restraint. *Hallifax.*

(2.) MAINPRISE, or } See IMPRISONMENT,  
MAINPRISE, } 3. The writ of main-

prise, *maincapio*, is a writ directed to the sheriff (either generally, when any man is imprisoned for a bailable offence, and bail hath been refused; or specially, when the offence or cause of commitment is not properly bailable below), commanding him to take sureties for the prisoner's appearance, usually called MAINPURNORS, and to let him at large.

MAINS, or MAINS OF FINTRY, a parish of Scotland, in Angus-shire, 4 miles long and 3 broad. The soil is a deep loam, very fertile, producing excellent crops of all kinds; husbandry being much improved. The population, in 1790, was 813; increase 169 since 1755; number of horses 1200 and black cattle 300. There are 33 mills in the parish, all turned by the *Dighty*; which runs through it; and 9 bleachfields, 3 of them very extensive.

MAINSAC, a town of France, in the dep. of Creuse, 101 miles NE. of Aubusson, and 72 SW. of Evux.

\* MAINSAIL, *n. s.* [*main* and *sail*.] The sail of the main-mast.—They committed themselves into the sea, and hoisted up the *main-sail* to the wind, and made toward shore. *Ag.*

\* MAINMATE, *n. s.* [*main* and *mate*.] The boat or sail of the mainmast.—

Strike, strike the top-sail; let the *main-mate*,  
And furl your sails. *Dryden.*

(1.) \* TO MAINTAIN, *v. a.* [*maintenir*, Fr.]

1. To preserve; to keep; not to suffer to change.—The ingredients being prescribed in their proportion, *maintain* the blood in a gentle fermentation. *Harvey.* 2. To defend; to hold out; to make good; not to resign.—

This place, these pledges of your love *maintain*.

—God values no man more or less, in placing his high or low, but every one as he *maintains* his post. *Govul's Cujus.* 3. To vindicate; to justify; to support.—If any man of quality will *maintain* upon Edward earl of Gloucester, that he is a most bold traitor, let him appear. *Shak.*—I have possessions being unlawfully gotten, could not be *maintain'd* by the just and honourable law of England.

*Boyer.*—Lord Roberts was full of contradictions in his temper, and of parts so much superior to any in the company, that he could too well *maintain* and justify those contradictions. *Clarke's*—  
*Maintain*

My right, nor think the name of mother vain.

4. To continue; to keep up; not to suffer to cease.—*Maintain* talk with the duke, that my chaff be not of him perceived. *Shak. King Lear.*

Some did the tongue, and some the choir *maintain*.

Beneath a haughty shade.

5. To keep up; to support the expense of.—  
Sufficeth, that I have *maintain'd* my estate,  
And feeds the poor well pleased from my gifts.

—What concerns it you if I wear pearl and rubie?  
I thank my good father I am able to *maintain* the

same. 6. To support with the continuance of  
etc.—Was St. Paul's choice to *maintain* himself

by

his own labour. *Hooker*.—If a woman *maintain* husband, she is full of anger and much reproach. *E. cluf.* xxv. 22.—It is hard to maintain truth, but much harder to be *maintained* by *fools*. 7. To preserve from failure.—Here ten thousand images remain without confusion, and their rank *maintain*.

*Blackmore.*

.) \* To MAINTAIN. *v. n.* To support by argument; to assert as a tenet.—In tragedy and *satire* *maintain* against some of our modern critics, this age and the last have excelled the ancients. *Dryden's Fies.*

MAINTAINABLE. *adj.* [from *maintain*.] Defensible; justifiable.—Being made lord lieutenant of *Loire*, the walls sore beaten and shaken, and he *maintainable*, he defended the place against *Dauphin*. *Harvour*.

MAINTAINER. *n. f.* [from *maintain*.] Supporter; cherisher.—He dedicated the work to *Sir Sidney*, a special *maintainer* of all learning. *Er's Post*.—The *maintainers* and cherishers of *ular* devotion, a true and decent piety. *South*.

.) \* MAINTENANCE. *n. f.* [from *maintenant*, *Fr.*] Supply of the necessaries of life; sustenance; provision.—It was *St Paul's* choice to maintain himself, whereas in living by the churches *maintenances*, as others did, there had been no offence committed. *Hooker*.—God assigned *Adam* maintenance of life, and then appointed him a law to use. *Hooker*.—Those of better fortune not learning their *maintenance*, take degrees little improvement. *Swift*. 2. Support; defence.—They knew that no man in reason take upon him to determine his right, and according to his own determination proceed in *maintenance* thereof. *Hooker*.—The origin and cause of this ordinance amongst the *was* for the defence and *maintenance* of their in their posterity. *Speiser*. 3. Continuance; stay from failure.—Whatever is granted to church for God's honour, and the *maintenance* of service, is granted to God. *South*.

.) MAINTENANCE, in law, bears a near relation to *BARRETRY*; being an officious intermeddling in a suit that does not belong to one, by aiding or assisting either party with money *betwixt*, to prosecute or defend it: a practice greatly encouraged by the first introduction of *money*. This is an offence against public justice, keeps alive strife and contention, and perverts the remedial process of the law into an end of oppression. By the Roman law, it was a crime of the *crimen falsi*, to enter into any conspiracy, or do any act to support another's law by money, gifts, or patronage. A man *awfully*, however, maintain the suit of his *sinister*, *friend*, or poor neighbour, out of pity and compassion. Otherwise the punishment by common law is fine and imprisonment; by stat. 2 Hen. VIII. c. 9. a forfeiture of 10 l. *APATRY*, § 2.

.) MAINENON, Madame DE, a French lady of extraordinary fortune, descended of an ancient family, and whose proper name was *F. are s bigne*, was born in 1635. She was born in *Paris*, where her father had been indicted for some gross offence; and her mother

being unable to support her, she fell to the charge of her father's sister, Mad. Vilette. To escape this state of dependence, she married that famous old buffoon, the Abbe SCARRON, who himself subsisted on a pension allowed him by the court. She lived with him many years, which *Voltaire* calls the happiest of her life; but when he died in 1660, she found herself as indigent as before her marriage. Her friends endeavoured to get her husband's pension continued to her, and presented to many petitions to the king about it, all beginning with "The widow Scarron most humbly prays your majesty, &c." that he was quite weary of them, and would exclaim, "Must I always be pestered with the widow Scarron?" At last, however, through the recommendation of Mad. de Montespan, he settled a much larger pension on her, with a genteel apology for making her wait so long; and afterward appointed her to take care of the education of the young duke of Maine, his son by Mad. de Montespan. The letters she wrote on this occasion charmed the king, and were the origin of her advancement; her personal merit effected all the rest. He bought her the lands of MAINTENON, (see N° 2.) the only estate she ever had, and called her publicly *Madam de Maintenon*; which was of great service to her, by releasing her from the ridicule attending that of *Scarron*. Her elevation was to her only a retreat; the king came to her apartment every day after dinner, before and after supper, and continued there till midnight; here he did business with his ministers, while she, engaged in reading or needlework, never showed any desire to talk of state affairs. She did not even make use of her power to dignify her own relations. About the end of 1685, Lewis XIV. married her, he being then in his 48th and she in her 50th year. She prevailed on him to found a religious community for the education of 300 young ladies of quality at St Cyr, where she frequently retired from that melancholy, of which she complains so pathetically in one of her letters, and which few will suppose she should have been liable to in such an elevated situation. But, as M. *Voltaire* says, if any thing could show the vanity of ambition, it would certainly be this letter. She could have no other uneasiness than the uniformity of her manner of living with a great king; and this made her once say to the Count D'Aubigne her brother, "I can bear it no longer; I wish I were dead!" Lewis, however, died before her in 1715; when she retired wholly to St Cyr, and spent the rest of her days in acts of devotion. What is most surprising is, that her husband left no certain provision for her, only recommending her to the duke of Orleans. She would accept no more than a pension of 80,000 livres, which was punctually paid her till she died in 1719. A collection of her letters has been published, and translated into English; from which her character will be best known.

(2.) MAINTENON, a town of France, in the Dept. of Eure and Loire, and late prov. of *Beauce*; seated on the Eure, in a valley betw. on two mountains, on the ground given to Mad. Maintenon. It has a church and castle, and lies 9 miles N. of Chartres, and 12 SW. of Dreux. Lon. 1. 36. E. Lat. 48. 31. N.

\* **MAINTOP**. *n. f.* [*main and top*.] The top of the mainmast.—

From their *maintop* joyful news they hear  
Of ships. *Dryden.*  
Dictys could the *maintop* mast bestride,  
And down the ropes with active vigour slide. *Addison.*

**MAINUNGEN**, a town and district of Franconia, 8 miles N. of Henneberg. Lon. 10. 39. E. Lat. 50. 46. N.

\* **MAINYARD**. *n. f.* [*main and yard*.] The yard of the mainmast.—With sharp hooks they took hold of the tackling which held the *mainyard* to the mast, then rowing they cut the tackling, and brought the *mainyard* by the board. *Arbutnot.*

**MAJO BAMBIA**, a town of Peru, in Chacopoya.  
(1.) \* **MAJOR**. *adj.* [*major*, Latin.] 1. Greater in number, quantity, or extent.—They bind none, tho' not though they be many, saving only when they are the *major* part of a general assembly. *Hooker.*—The true meridian is a *major* circle passing through the poles of the world and the zenith of any place, exactly dividing the east from the west. *Brown's Vulgar Err.*—In common discourse we denominate persons and things according to the *major* part of their character. *Watt's Logic.* 2. Greater in dignity.—

Fall Greek, fall fame, honour, or go, or stay,  
My *major* vow lies here. *Troil. and Cressida.*

(2.) \* **MAJOR**. *n. f.* 1. The officer above the captain; the lowest field officer. 2. A mayor or head officer of a town Obsolete. 3. The first proposition of a syllogism, containing some generality.—The *major* of our author's argument is to be understood of the material ingredients of bodies. *Boyle.*

(3.) **MAJOR**, in geography. See **MAGGIORE**.

(4.) **MAJOR**, in law, a person who is of age to manage his own affairs. By the civil law a man is not a *major* till the age of 25 years; in England, he is a *major* at 21; in Normandy at 20, &c.

(5.) **MAJOR**, in logic, is understood of the first proposition of a regular syllogism. It is called *major*, because it has a more extensive sense than the minor proposition, as containing the principal term. See *Logic. Part III; Sect. I, § VI.*

(6.) **MAJOR** and **MINOR**, in music, are applied to concerts which differ from each other by a semitone. See *CONCERT*, § IV. *Major tone* is the difference between the fifth and fourth; and *minor semitone* the difference between the major fourth and the third. The *major* tone surpasses the minor by a comma.

(7.) **MAJOR**, John, a Scottish divine and historian, born at Crichton, near Haddington, in 1469. He studied both at Oxford and Cambridge. He went to Paris in 1493, and studied in the college of St Barthe, under John Boulic. Thence he removed to that of Montacute, where he studied divinity under Standouk. In 1498, he was entered of the college of Navarre. In 1525, he was created D. D.; returned to Scotland in 1519, and taught theology several years in the university of St Andrew's. But being disgusted with the quarrels of his countrymen, he returned to Paris, and resumed his lectures in the college of Montacute, where he had several pupils, who afterwards became eminent. About 1539, he returned once

more to Scotland, and was chosen professor of theology at St Andrew's, of which he afterwards became provost; and there died in 1547. His logical treatises, his commentary on Aristotle's *physics*, and his theological works, to several volumes large folio; which, now disregarded, were admired by his contemporaries. A work, less prized in his own age, made him known to posterity. His book *titus Sutorum* was first published at Paris by Julius Ascenius, in 1521. He rejects in it the fictions of former historians. He intermingles the history of England with that of Scotland, showing his impartiality, by admitting the superiority of English writers often in preference to those of his own country. Bede, Caxton, and Froissart were much consulted by him. The freedom which he has censured the rapacity and insolence of ecclesiastics, and the strain of ridicule which he treats the pope's supremacy, do honour to his judgment. But Bp. Spotiswood has styled his style *Sorbonnic* and *barbarous*.

(8.) **MAJOR**, (§ 2, def. 1.) in the art of war, the title of several officers of very different ranks and functions: as,

i. **Aid-MAJOR**, an officer on sundry occasions appointed to act as major, who has a precedence above others of the same denomination. Our horse and foot-guards have their guidons and 3d. majors

ii. **Drum-MAJOR**. See **DRUM-MAJOR**. He has the same authority over his drummers as a corporal has over his squad. He instructs them in their different beats; is daily at orders with the sergeants, to know the number of drummers in duty; and marches at their head when they are in a body. In the day of battle, or at a review, he must be very attentive to the orders given that he may regulate his beats according to the movements ordered.

iii. **Fife-MAJOR**, he that plays best on the fife. He has the same authority over the fife-drum-major has over the drummers. He instructs them in their duty, appoints them for guard.

iv. **Town-MAJOR**, the 3d officer in an army or garrison, and next to the deputy governor should understand fortification, and his particular charge of the guards, regiments, and companies of foot.

v. \* **MAJOR-GENERAL**. The general officer of the second rank.—*Major-general* Raviart was named with the French king's answer. *Turenne.*

vi. **The MAJOR-GENERAL** is the next officer to the lieutenant-general. His chief business is to receive orders from the general, or in his absence from the lieutenant-general of the day; and to distribute to the brigade-majors, with which he is to regulate the guards, convoys, and regiments, &c. On him rests the whole satisfaction of duty of the army roll. He is to be with the encampment of the army; place himself at the head of it when they march; mark the ground of the camp to the quarters-majors; and places the new guards for the night of the camp. When the army is to march, he dictates to the field-officers the order of the march, which he has received from the general; and on other days gives them the parole. In a

charged with the foraging, with reconnoitring the ground for it, and posting the escorts, if there are two separate attacks, the duty belongs to him; but if there is but one, he is either from the right or left of the attack, which the lieutenant-general has not chosen. When the army is under arms, he assists the lieutenant-general, whose orders he executes. If the army marches to an engagement, his post is at the head of the guards of the army, until they are enough to the enemy to rejoin their different regiments; after which he retires to his own proper post: for the major-generals are disposed in the front of battle as the lieutenant-generals are; to the rear, however, they are subordinate, for the command of their divisions. The major-general receives the aid-de-camp paid for executing his orders.

**MAJOR OF A REGIMENT OF FOOT**, the second officer to the lieutenant-colonel, generally promoted from the eldest captain. He is to take care that the regiment be well exercised, to see it kept in good order, and to rally it in case of being broke in action: he is the only officer among the infantry that is allowed to be on horseback in the field of action, that he may the more readily execute the colonel's orders.

**MAJOR OF A REGIMENT OF HORSE**, as well as foot, ought to be a man of honour, intelligence, understanding, courage, activity, experience, and address: he should be master of arithmetic, and keep a detail of the regiment in every particular: he should be skilled in horsemanship, and attentive to his business: one of his principal duties is, to keep an exact roster of the officers and privates: he should have a perfect knowledge in the military evolutions, as he is obliged by his duty to instruct others, &c.

**MAJOR OF ARTILLERY**, is the next officer to the lieutenant-colonel. His post is very laborious, as the whole detail of the corps rests with him; and therefore all the non-commissioned officers are subordinate to him, as his title of **SERJEANT-MAJOR** imports: in this quality they must obey him an exact account of every thing which comes to their knowledge, either regarding the orders or wants of the artillery and soldiers. He should possess a perfect knowledge of the power of artillery, together with all its evolutions. In the field he goes daily to receive orders from the lieutenant-major, and communicates them with the lieutenant to his superiors, and then dictates them to the adjutant. He should be a very good mathematician, and be well acquainted with every thing relating to the train of artillery, &c.

**MAJOR OF BRIGADE**. See **BRIGADE-MAJOR**. He is appointed only in camp: he goes every day to the head quarters to receive orders from the adjutant-general: there he writes exactly what is dictated to him; thence he goes to give the orders, at the place appointed, to the different majors or adjutants of the regiments, which compose the brigade, and regulates with them the number of officers and men which each are to furnish for the service of the army; taking care to keep an exact roster, that one may not give more than another; and that each march in their tour. In short, the adjutant of brigade is charged with the particular

detail in his own brigade, in much the same way as the adjutant-general is charged with the general detail of the duty of the army. He sends every morning to the adjutant-general an exact return, by battalion and company, of the men of his brigade missing at the retreat, or a report expressing that none are absent: he also mentions the officers absent with or without leave. As all orders pass through the hands of the majors of brigade, they have numberless occasions of showing their talents and exactness.

**xi. MAJOR OF ENGINEERS**, commonly called **SUB-DIRECTOR**, should be well skilled in military architecture, fortification, gunnery, and mining. He should know how to fortify in the field, to attack and defend all sorts of posts, and to conduct the works in a siege, &c. See **ENGINEER**.

**xii. MAJOR, SERGEANT**. See **SERGEANT-MAJOR**; and § ix.

**\* MAJORATION**. *n. f.* [from *major*.] Encrease; enlargement.—There be five ways of *majoration* of sounds: enclosure simple; enclosure with dilation; communication; reflection concurrent; and approach to the senfory. *Escon.*

**(1.) MAJORCA**, an island of the Mediterranean, lying between Yvica on the W. and Minorca on the E. These 3 islands were anciently called *Balæars*, (See **BALEARES**) and originally belonged to the Carthaginians; but during the wars of that people with the Romans, they regained their liberty. In 122 B. C. they were subdued by Metellus, who treated the inhabitants with such cruelty, that out of 30,000 he scarce left 1000 alive. He then built two cities on Majorca; one on the E. called **PALMA**, now *Majorca*: the other on the W. named **POLLENTIA**, now no longer existing. The island continued subject to the Romans, and to the nations who over-ran the western empire, for many ages. At last it was subdued by the Moors about A. D. 800. By them it was put in a much better condition than it ever was before or since. The Moors, being numerous and industrious, surrounded the coast with towers and lines; cultivated every spot capable of cultivation; and built no fewer than 15 great towns, whereas now there are not above three. The Moorish monarch could then bring into the field an army superior in number to the whole of the inhabitants now upon it, of all ranks, sexes, and ages. In 1229, the island was subdued by the king of Arragon, who established in it a new kingdom, feudatory to that of Arragon, which was destroyed in 1341 by the same monarchs; and ever since, the island hath been subject to Spain, and hath entirely lost its importance. It is about 60 miles long, and 45 broad. The air is clear and temperate, and the heat in summer is so qualified by the breezes, that it is by far the most pleasant of all the islands in the Mediterranean. There are some mountains; but the country is generally flat, and the soil very fertile, producing great quantities of excellent corn. Oil, wine, and salt, are very plentiful, as also black cattle, and sheep; but deer, rabbits, and wild fowl, abound so much, that they alone are sufficient for the subsistence of the inhabitants. There are no rivers, but many springs and wells, with several good

harbours. The inhabitants are robust, active, and good fishermen.

(2.) MAJORCA, a handsome, large, and strong town, in the SW. part of the above island, with a garrison and bishop's see. It contains about 6000 houses, and 20 churches, besides the cathedral. The squares, cathedral, and royal palace, are magnificent. A captain-general resides there, who commands the whole island. It was taken by the English in 1706; but was retaken in 1715. It has a good harbour, 70 miles NE. of Yvica, 120 SE. of Barcelona, 120 E. of Valencia, and 300 from Madrid. Lon. 2. 55. E. Lat. 39. 36. N.

(1.) \* MAJOR-DOMO. *n. f.* [*majeur-dome*, French.] One who holds occasionally the place of master of the house.

(2.) MAJOR-DOMO is an Italian term, often used for master of the *household*. The title was formerly given, in the courts of princes, to three different kinds of officers. 1. To him who took care of what related to the prince's table, or eating; otherwise called *ELKATER*, *praefectus mensae*, *archibutlinus*, *dapifer*, and *princeps coquorum*.—2. It was also applied to the steward of the household.—3. It was also given to the chief minister, or him to whom the prince deputed the administration of his affairs, foreign and domestic, relating to war and peace. Instances of major-domos in the two first senses are frequent in the English, French, and Norman histories.

\* MAJORITY. *n. f.* [from *major*.] 1. The state of being greater.—It is not the plurality of parts without *majority* of parts that maketh the total greater. *Grav.* 2. The greater number. [*majorité*, French.] It was highly probable the *majority* would be so wise as to censure that candidate which was most agreeable to the publick. *Milly*.

As in a state, so in schools,  
*Majority* of votes rules. *Prior*.  
 —Different opinions keep the world in awe; for read in the *majority* of mankind ought to be in general every year. *Zacharias*. 3. [From *maiores*, Lat.] Ancestry.—Of old parents an evil generation, a posterity not unlike their *maiores*. *Brown*. 2. Full age; end of minority.—During the infancy of Henry the III. the barons were troubled in expelling the French; but this prince was no sooner come to his *majority*, but the barons raised a civil war against him. *Lives*. 5. First rank. Obsolete.—

Douglas, whose high deeds,  
 Whose hot incursions, and great name in arms,  
 Holds from all soldiers chief *majority*,  
 And military title capital. *S'ak*.  
 6. The office of a major.

MAIRAN, John-James D'Ortois DE, an eminent French writer, descended of a noble family at Beliers, and born in that city in 1678. He was one of the most illustrious members of the academy of sciences, and of the French academy. In 1641, he succeeded Fontenelle as secretary to the former. This station he filled with the most distinguished success till 1744. He possessed the faculty of placing the most abstract subjects in the clearest light; a rare talent which appears conspicuous in all his works. The chief of them are 1. *Le traitte sur la Glace*; 1709, 12mo, twice translated into German and Italian. 2. *Dissertation*

*sur la cause de la lumiere des Phosphores*, 1711. 3. *Traite historique & physique de l'Air*, 12mo, 1733; afterwards much enlarged 1754. 4. *Lettre au Pere Pannin, sur diverses questions sur la Chine*, 12mo. 5. A number of papers in the memoirs of the academies (since 1719), of which he published volumes. 6. Several Dissertations, which are small pamphlets. 7. The *Eloges* of the Academics of the Academy of Sciences, who 1741, 1742, 1743, in 12mo, 1747. With Fontenelle, the author attained almost excellence by his talent of discriminating characters, appreciating their merits, and them due praise, without concealing their His reputation extended into foreign parts. He was a member of the imperial academy of Peterburgh, of the royal academy of Liège, the institution at Bologna, of the royal of Edinburgh and Upsal, &c. The gentleman's manners made him be considered as model of the social virtues. The chance guesseau, observing in him great original thought, appointed him president of the *des Savans*; a station which he filled to the satisfaction of the public. His of an honest man is equal to that of the honestest man (said he) is one whose blood is ed with the recital of a good action." *Fdy* at *repartes*. He died at Paris of a of the lungs, Feb. 20, 1771, aged 93.

MAIRE, STRAITS OF LE, a passage Horn, situated between Terra del Fueg ten island: discovered by Le Maire.

however, less used than formerly, surround Staten Island as well as Terra del

MAIRNS, a town of Scotland in 6 miles SE. of Paisley.

MAISONS, a town of France, in 12 miles of Paris, 4 miles SE. of Paris.

MAISSÉ, a town of France, in 12 miles of Oise; 9 miles E. of Etampes.

(1.) MAISTRE, Anthony LE, a French barrister at Paris in 1668, and bred He afterwards joined the Society of St. Bernard, and other works. He published a translation of Christy Life of St. Bernard, and other works. Paris Royal in 1678.

(2.) MAISTRE, Lewis Isaac LE, called was born at Paris in 1613. His genius very early. After an excellent course he was made priest in 1648, and soon afterwards director of the religious of Per Champagne. As these were accused of their enemies persecuted them. In 1670 he was obliged to conceal himself; and in 1671 committed to the Bastille. During his confinement, he is said to have composed the *gures de la Bible*, in which, amidst the most bitter sufferings endured by the justifications more probable, that it was composed by Fontaine his fellow prisoner. To his confinement the public are indebted for the translation of the Bible, finished in 1688 being before the seat of all Courts; who valued his liberty, after an imprisonment of years and a half. He was presented to and the muses, and all the favour

as, that they would send several to examine the state of the prisoners.

He continued at Paris till 1675, and went to Port-Royal, which he was in from 1679. He then settled at Pontreuil, died Jan. 4th, 1684, aged 71.

1. *La Traduction de la Bible*, with the spiritual and literal meanings; which were chiefly done by Du Jours and Tourneux. This is the best French Bible that has yet appeared, and the best of Paris in 32 vols 8vo, 1682, &c. 2. *Traduction des Psaumes selon l'Hebreu & le Grec*, 2mo. 3. *Une Version des Homelies de St Matthieu*; 3 vols 8vo. 4. *de l'Imitation de Jesus Christ (sous le nom de P. prieur de St Val)*, Paris 1663, 8vo. 5. *Les vies de St Amand, &c.* 12mo. (*sous le nom de St Amand Com. de Terence* in 12mo. 6. *de Bongars (sous le nom de Brian) Pome de St Prosper sur les ingrates, &c. en prose.* 9. *Les Enluminures de des Jesuites*, 1694, 12mo, and *de Port-Royal*, in 12mo. 11. *de St Amand*, Paris 1690, 2 vols 8vo.

own of France, in the dep. of Calvados, N. of Higny, and 27 NW. of Caen. See OSNABURG, N° 3.

MALAND, the name of an ancient island, originally called *Mautalant*. The founder of the house was Sir Richard, famous for his valour, who in the middle of the 13th century. In 1312, his son William Maitland married Agnes Patrick, daughter of George Lord Scaton, at Fleiden in 1513.

MALAND, Sir Richard, a Scottish poet of a noble character, born in 1496. He was the son of William above mentioned (N° 3.) at St Andrew's; and went to study the laws. Upon his return, says he became a favourite of James V.

an extraordinary lord of session in the latter part of James VI. it appears that he had served his grandfire, goodfire, mother, and himself, faithfully, in the times of the regents. He became blind before he was 40 years of age; but notwithstanding, he was made a member of the college of justice, by James VI. 1561, 15th Nov. 1561; and he was one of the council and privy council; which office he held till 1657, and it was in favour of John his son, who continued a lord of session during all the times of the regents in the reign of James VI. till 1624, when he resigned; and he died in 1625. By Mary his wife, Thomas Countess of Carly, he had three sons: 1. William, the first; 2. Sir John, afterwards Lord Chancellor; and, 3. Thomas, who afterwards with Buchanan in his treatise

*De Jure Regni*.—Sir Richard is never mentioned by writers but with respect, as a man of great talents and virtue. Knox indeed blames him for taking a bribe, to let Cardinal Beaton escape when imprisoned at Seaton. But Mr Pinkerton vindicates him. One poem of Sir Richard's was published in the Evergreen; but no more of his works appeared till they were inserted in *Pinkerton's Collection*. He wrote also, "The Chronicle and History of the House and Surname of Seaton, unto November 1558. MS. Mackenzie gives an account of it.—Mr Forbes, in the preface to his *Decisions*, tells us there is still a MS. of the decisions, from 15th December 1550 till 30th July 1565, by our author, fol. in the advocate's library.

(5.) MAITLAND, John, Lord Thirlstane, and lord high chancellor of Scotland, 2d son of Sir Richard, was born in 1537, educated in Scotland, and afterwards sent to France to study the law. On his return, he commenced advocate; in which profession his abilities became conspicuous. In 1567, his father resigned the privy seal in his favour. This office he kept till 1570; when, for his loyalty to the queen, he lost the seal, which was given to George Buchanan. He was made a lord of session, in 1581; secretary of state in 1584; and lord chancellor in 1586. His power and influence created him many enemies among the Scottish nobility, who made several attempts to destroy him, but without success. In 1589, he attended king James on his voyage to Norway, where his bride, the princess of Denmark, was detained by contrary winds. The marriage was immediately consummated; and they returned with the queen to Copenhagen, where they spent the winter. During their residence in Denmark, the chancellor became intimately acquainted with the celebrated Tycho Brahe. In 1590 he was created Lord Maitland of Thirlstane. He died in 1597, much regretted by the king. He bears a high character both for talents and integrity. Melville, who writes the *Memoirs*, (says Mr Pinkerton,) was his personal enemy, so must not receive much credit in his censures of him. Besides his Scottish poetry in the *Maitland Collection*, he wrote several Latin epigrams, &c. to be found in the *Delicie Poetarum Sæculorum*, vol. ii.

(6, 7.) MAITLAND, John, lord Thirlstane, the chancellor's only son, was first made viscount and then earl of Lauderdale, by James VI. 1624. The earl's son was John, the only duke of Lauderdale, born in 1626 at Lathington.

(8.) MAITLAND, William, F. R. S. an eminent Scottish antiquarian, born in Brechin, in 1691. He was of the family of Pitricheie, a branch of the Lauderdale family, and was originally bred a hair merchant, but gave up business, and went to London, where he published an extensive *history* of that metropolis, in one volume folio, which was reprinted after his death, with additions, in 2 volumes. The rev. John Birket, late minister of Brechin says, that "he had studied the history of his own country with the utmost care, and as he had occasion to travel through a great part of it, he describes all its antiquities, which fell under his observation, with an uncommon degree of accuracy and precision." (Sir J. Sinclair's *Stat. Acc.* vol. xxi. 125.) His other works were, *The History*

of Edinburgh, in one vol. folio, and a treatise on the History and Antiquities of Scotland, in one vol. folio. A 2d volume of this work was afterwards published by Dr Granger. Mr Maitland travelled into some of the northern countries of Europe, and died at Montrose in 1757, unmarried.

MAITTAIRE, Michael, A. M. an eminently learned writer, born in 1668. Dr South canon of Christ Church, made him a student of that house, where he took the degree of M. A. March 23, 1696. From 1695 till 1699 he was 2d master of Westminster school. In 1706, he published *Græcæ Linguae Dialecti, in usum Scholæ Westmonasteriensis*, 1706, 8vo; reprinted at the Hague in 1738; and in 1713, "The English Grammar, applied to, and exemplified in the English Tongue," 8vo. In 1711, he published "Remarks on Mr Whiston's Account of the Convocation's proceedings with relation to himself," 8vo.; and "An Essay against Arianism, and some other Heresies; or a Reply to Mr W. Whiston's Historical Preface," &c. 8vo. In 1709 he gave the first specimen of his great skill in typographical antiquities, by publishing *Stephanorum Historia, vitas ipsorum ac libros complectens*, 8vo. This was followed in 1717, by *Historia Typographorum aliquot Parisiensium, vitas et libros complectens*, 8vo. In 1719, *Annales Typographici, ab artis inventæ origine, ad annum MD. 4to.*

The 2d vol. continued to 1536, was published at the Hague in 1720; with an introductory letter of John Toland *de prima Typographiæ inventione* &c. as was also the 3d. continued to 1557, and, by an Appendix, to 1664, in 1721. In 1733 was published at Amsterdam, the 4th volume, continued to 1664. In 1741 the work was completed at London, by the publication of the 5th and 6th vols. with an index to the whole. These 4 last vols were in 2 parts each. In the intermediate years he was employed on various useful works. In 1713 he published by subscription *Opera et Fragmenta Veterum Poetarum*; in 2 vols. folio. In 1714, he published a Greek Testament, in 2 vols. The Classics, which he published separately, with indexes, came out in the following order: In 1713, *Christus Patiens; Justin; Lucretius; Phædrus; Sallust; Terence.* In 1715, *Catullus; Tibullus; Propertius; C. Nepos; Florus; Horace; Juvenal; Ovid; Virgil.* In 1717, *Cæsar; Martial; Q. Curtius.* In 1718 and 1725, *Velleius Paterculus.* In 1719, *Lucan.* In 1720, *Bonifonii Carmina.* In 1721, *Batrachomyomachia Græcæ ad veterum exemplarium fidem recusa; Glossæ Græcæ; var. lict. vers. Lat. &c. illustrata*, 8vo. In 1722, *Miscellanea Græcorum aliquot Scriptorum Carmina, cum vers. Lat. et Notis*, 4to. In 1725 and 1741, *Asæreon* in 4to. In 1724 he compiled, at the request of Dr Freind, an Index to the splendid folio edition of *Aretæus*, in 1723. In 1726, he published *Pevi Petiti Medici Parisiensis in tres priores Aretæi Cappadocens Libros Commentarii; nunc primum editi*, 4to; a work found among the papers of Grævius. From 1728 to 1733 he published *Mormorum A-malibæarum, Sædænavorum, aliorumque A-malibæarum, donatarum, una cum Comædiarum et Indicis, editio 2da*, fol. with an Appendix. His *Epistola ad D. P. Des Maizeaux, in qua Indici in Annale Typographice methodus explicatur*, &c. is printed in

*The Present State of the Republic of Lett* 1733, p. 142. His life of R. Stephens with a complete list of his works, is in the improved edition of R. Stephens's *rus*; 4 vols fol. in 1734. In 1736 *appetitæ Inscriptiones duæ*, folio; being a copy on two large copper tables discovered in Elea, in the Bay of Tarentum. In 1735 dressed to Anne empress of Russia a fine poem, entitled *Carmen Epinicion Augustissimum Imperatrici sacrum.* In 1741, he published anonymously Plutarch's *Apophthegmata*, his last publication was *Senilia, sive Pœctia argumentis varii generis tentamina*; in 4to. He died in 1747, aged 79. His valuable collection which had been 50 years collecting, was sold at auction, in 1747 and 1748, taking up 100 nights. He was patronised by the first earls of Oxford; and was also Latin tutor to Stanhope, Chesterfield's favourite son.

MAIUS. See MAY, N° 1 and 3.

MAIXANT, or MAIXENT, a town of the T. res, and late prov. of Poitou. It has a good soil, in corn, stockings and woollen stuffs; and is situated on the Sevre, 26 miles SW. of Poitou, W. of Paris. Lon. o. 7. W. Lat. 46. 24.

(1.) \* MAIZE, or Indian Wheat. The whole maize plant has the appearance of wheat. This plant is propagated in England with curiosity, but in America it is the principal support of the inhabitants, and consequently cultivated with great care. *Miller.*—Maize is very strong nourishment, but more viscid than wheat. *Schubner.*

(2.) MAIZE, or INDIAN CORN. See MAIZIERES, a town of France, in the prov. of the Upper Maine; 4½ miles NW. of Paris.

(1.) \* MAKE. *n. f.* [from the verb *facere*]; nature.—Those mercurial spirits were only lent the earth to shew men in admiring it, possess delights of a nature and nature, which antedate immortality.—Upon the decease of a lion the beards of a king: several put up, but one wanted brains for a king; another wanted brains of *L'Esperance.*—

Is our perfection of so frail a make,  
As ev'ry plot can undermine and shake.  
—Several lies are produced in the loyal Portoken of so feeble a make, as not bear to the Royal Exchange. *Addison.*—It makes superior souls as with gigantick, while the due proportion of parts, and like heroes of that make, commit something of extravagance. *Pope.*

(2.) \* MAKE. *maca, gemaca, Sax.* a nation; favourite friend.—

The elf therewith astoned,  
Upstarted lightly from his looser make  
Every one that misseth then her maid  
Shall be by him amercé with penance

The maids and their makes,  
At dances and wakes,

Had their napkins and posies,  
And wipers for their noses.

Re-  
"To MAKE, &c. a. [Lazarus, Suetonius]

*make*, Dutch.] 1. To create.—Let an in our image. *Gen.* i. 26.—The Lord all things for himself. *Prov.* xvi. 4.—

Remember'ft thou  
ting, while the Maker gave thee being?

*Milton.*  
n of materials.—He fashioned it with a  
l, after he had *made* it a molten calf.  
i. 4.—God hath *made* of one blood all  
men. *Acts.*—We have no other mea-  
one of the moon, but are artificially  
f these by compounding or dividing  
*ter on Time.* 3. To compose: as, parts,  
r ingredients.—

if my fellows had the speed of him;  
almost dead for breath, had scarcely  
re  
ould *make* up his message. *Macbeth.*  
leav'n, the air, the earth, and bound-  
sea,  
it one temple for the deity. *Waller.*  
f salt of tartar, exposed unto a moist  
*ake* more liquor than the former mea-  
contain. *Brown.* 4. To form by art  
t natural.—

lavish nature, in her best attire,  
rth sweet odours, and alluring sights;  
with her contending, doth aspire  
l the natural with *made* delights. *Spenser.*  
duce or effect as the agent.—If I suf-  
out cause, why then *make* sport at me;  
ne be your jest. *Shak.*—When their  
e merry they said, Call for Sampson,  
y *make* us sport. *Judg.* xvi. 25.—Give  
non a perfect heart to build the palace  
hich I have *made* provision. 1 *Chron.*

-Thou hast set signs and wonders in the  
ypt, and hast *made* thee a name. *Jer.*  
-Joshua *made* peace, and *made* a league  
.  
*Job.*—

Both combine  
e their greatness by the fall of man.

*Dryden.*  
t, mad with superstition grown,  
ods of monsters. *Tate's Juvenal.*

duce as a cause.—Wealth *maketh* many  
ut the poor is separated from his neigh-  
r. xix. 4.—A man's gift *maketh* room  
and bringeth him before great men.  
i. 16.—The child taught to believe any  
e to be a good or evil omen, or any  
week lucky, hath a wide inroad *made*  
foundness of his understanding. *Watts.*  
; to perform; to practise; to use in ac-  
ough the appear honest to me, yet in o-  
s she enlargeth her mirth so far, that  
rewd construction *made* of her. *Shak.*—  
haste, and let down her pitcher. *Gen.*  
-We *made* prayer unto our God. *Neb.*

shall *make* a speedy riddance of all in  
*Zeeph.*—They all began to *make* excuse.

18.—It hath pleased them of Macedo-  
chaia to *make* a certain contribution for  
*Rom.* xv. 26.—The Venetians, provoked  
rks with divers injuries, both by sea  
resolved, without delay, to *make* war  
pon him. *Knolles.*—  
musick as before was never *made*,

But when of old the sons of morning sung.

*Milton.*  
—All the actions of his life were ripped up and  
surveyed, and all malicious glosses *made* upon all  
he had said, and all he had done. *Clarendon.*—  
Says Carneades, since neither you nor I love  
repetitions, I shall not now *make* any of what else  
was urged against Themistius. *Boyle.*—The Phœ-  
nicians *made* claim to this man as theirs, and at-  
tributed to him the invention of letters. *Hale.*—

What hope, O Pantheus! whether can we  
run!

Where *make* a stand? *Dryden.*

While merchants *make* long voyages by sea

To get estates, he cuts a shorter way. *Dryden.*

—To what end did Ulysses *make* that journey?  
*Dryden.*—He that will *make* a good use of any  
part of his life, must allow a large portion of it  
to recreation. *Locke.*—

*Make* some request, and I,

Whate'er it be, with that request comply.

*Addison.*  
—Were it permitted, he should *make* the tour of  
the whole system of the sun. *Mart. Scrib.* 8. To  
cause to have any quality.—She may give so much  
credit to her own laws, as to *make* their sentence  
weightier than any bare and naked conceit to the  
contrary. *Hooker.*—I will *make* your cities waste.

*Lev.* xxvi. 31.—Her husband hath utterly  
made them void on the day he heard them. *Numb.* xxx.  
—When he had made a convenient room, he set it  
in a wall, and *made* it fast with iron. *Wis.* xiii. 15.

—He *made* the water wine. *John.* iv. 46.—He  
was the more inflamed with the desire of battle  
with Waller to *make* even all accounts. *Clarendon.*

I bred you up to arms, rais'd you to power,  
Permitted you to fight for this usurper;

All to *make* sure the vengeance of this day,  
Which even this day has ruin'd.

*Dryden.*  
—In respect of actions within the reach of such a  
power in him, a man seems as free as it is possible  
for freedom to *make* him. *Locke.* 9. To bring in-  
to any state or condition.—I have *made* thee a god  
to Pharaoh. *Exod.* vii. 1.—Joseph *made* ready his  
chariot, and went up to meet Israel. *Gen.* xlvii.  
29.—Who *made* thee a prince and a judge over  
us? *Exod.* ii.—Ye have troubled me to *make* me  
to stink among the inhabitants. *Gen.* xxxiv. 30.—  
He *made* himself of no reputation. *Phil.* ii. 7.—He  
should be *made* manifest to Israel. *John.* i. 31.—  
Though I be free from all men, yet have I *made*  
myself servant unto all. 1 *Cor.* ix. 19.—He hath  
*made* me a by-word of the people. *Job.* xvii. 6.—  
*Make* ye him drunken. *Jer.* xlvi. 26.—Joseph  
was not willing to *make* her a public example,  
*Matth.* i. 19.—By the assistance of this faculty we  
have all those ideas in our understandings, which,  
though we do not actually contemplate, yet we  
can bring in sight, and *make* appear again, and  
be the objects of our thoughts. *Locke.*—The La-  
cedemonians trained up their children to hate  
drunkenness by bringing a drunken man into their  
company, and shewing them what a beast he  
*made* of himself. *Watts.* 10. To form; to settle;  
to establish.—

Those who are wise in courts  
*Make* friendships with the ministers of state,  
Nor seek the ruin of a wretched exile. *Roque.*

21. To hold; to keep.—

Deep in a cave the fybil *makes* abode. *Dryd.*  
22. To secure from distress; to establish in riches or happiness.—He hath given her this monumental ring, and thinks himself *made* in the unchange composition. *Shak.*

This is the night,  
That either *makes* me, or foredoes me quite.

*Shak.*  
Each element his dread command obeys,  
Who *makes* or ruins with a smile or frown.

23. To suffer; to incur.—

The loss was private that I *made*;  
'Twas but myself I lost. *Dryden.*  
—He accuseth Neptune unjustly, who *makes* shipwreck a second time. *Bacon.* 14. To commit.—I will neither plead my age nor sickness in excuse of the faults which I have *made*. *Dryden.* 15. To compel; to force; to constrain.—That the soul in a sleeping man should be this moment busy a thinking, and the next moment in a waking man not remember those thoughts, would need some better proof than bare assertion to *make* it be believed. *Locke.*—They should be *made* to rise at their early hour. *Locke.* 16. To do; in this sense it is used only in interrogation.—

He may ask this civil question, friend!  
What dost thou *make* a shipboard? to what end? *Dryden.*

—Gomez, what *mak'st* thou here with a whole brotherhood of city bailiffs? *Dryden.* 17. To raise as profit from any thing.—He's in for a commodity of brown pepper; of which he *made* five marks ready money. *Shak.*—Did I *make* a gain of you by any of them I sent? *Cor.*—If Aulus, a negligent prince, *made* so much, what must now the Romans *make*, who govern it so wisely? *Arbutnot.*—If it is meant of the value of the purchase, it was very high; it being hardly possible to *make* so much of land, unless it was reckoned at a very low price. *Arbutnot.* 18. To reach; to tend to; to arrive at; a kind of sea term.—A costa recordeth, they that sail in the middle can *make* no land of either side. *Bacon's Vulg. Err.*—I've *made* the port already. *Dryden.*

They ply their flatter'd oars  
To nearest land, and *make* the Libyan shores. *Dryden.*

Did I but purpose to embark with thee,  
While gentle zephyrs play in prosp'rous gales;  
But would forsake the ship, and *make* the shore,  
When the winds whistle, and the tempests roar? *Prior.*

19. To gain.—The wind came about, and settled in the west for many days, so as we could *make* little or no way. *Bacon.*—

I have *made* way  
To some Phillip in lords. *Milton.*  
—Now mark a little why Virgil is so much concerned to make this marriage, it was to *make* way for the divorce which he intended afterwards. *Dryd. Ene.* 20. To force; to gain by force.—

Rugged rocks are enterpris'd in vain;  
He *makes* his way o'er mountains. *Dryd. Virg.*  
—The rope wall, which divides China from Tartary, is reckoned 900 miles long, running over rocks, and *making* way for rivers through mighty

arches. *Temple.* 21. To exhibit.—When they *makest* a dinner, call not thy friends but the poor. *Luke,* xiv. 12. 22. To pay; to give.—He shall *make* amends for the harm that he hath done. *Lev.* 24. To put; to place.—You must *make* a great difference between Hercules's labours by land, and Jason's voyage by sea for the golden Broom. *Bacon.* 24. To turn to some use.

Whate'er they catch,  
Their fury *mak's* an instrument of war. *Dryden.*  
25. To incline to; to dispose to.—It is not requisite they should destroy our reason, that we *make* us rely on the strength of nature, when he is least able to relieve us. *Brown's Vulg. Err.* 26. To effect as an argument.—Seeing they judge this to *make* nothing in the world for them. *Bacon.*—You conceive you have no more to do than having found the principal word in a concordance introduce as much of the verse as will serve your turn, though in reality it *makes* nothing for you. *Swift.* 27. To present; to show.—He is set that goose and ass that Valla would *make* him. *Baker on Learning.* 28. To constitute.—Our desires carry the mind out to absent good, according to the necessity which we think there is of to the *making* or increase of our happiness. *Locke.* 29. To amount to.—Whatsoever they were, *maketh* no matter to me. *Gal. ii.* 16. 30. To mould; to form.—Lye not erect but hollow, which is in the making of the bed. *Bacon.*

Some undeterred fault  
I'll find about the *making* of the bed. *Shak.*  
—They mow fern green, and burning of them to ashes, *make* the ashes up into balls with a little water. *Mariner.* 31. To MAKE away. To kill; to destroy.—He will not let slip an advantage to *make away* him whose just title, may one day shake the seat of a never-secure tyranny. *Sidney.*—Corruption was, by practice of evil persons about the king his brother, called thence away, and fasten'd, by sinister means, was clean *made away*. *Spencer on Ireland.*

He may have a likely guest,  
How these were they that *made away* his brother. *Shak.*

—Trajan would say of the vain jealousy of princes that seek to *make away* those that aspire to their succession, that there was never king that did put to death his successor. *Bacon.*—My mother flew at my very birth, and soce have *made away* two of her brothers. *Hayward.*

Give poets leave to *make* themselves wags. *Restormon.*  
—What multitude of infants have been *made away* by those who brought them into the world. *Addison.* 32. To MAKE away. To transfer.—Debtors,

When they never mean to pay,  
To some friend *make* all away. *Waller.*  
33. To MAKE account. To reckon; to believe.—They *make* no account but that the navy should be absolutely master of the seas. *Bacon's Hist. Spain.* 34. To MAKE account of. To esteem; to regard. 25. To MAKE free with. To treat without ceremony.—The same who have *made free with* the greatest names in church and state. *Daniel.* 36. To MAKE good. To maintain; to defend; to justify.—The grand master, guarded with

company of most valiant knights, drove them again by force, and *make good* the place. *Waller's History of the Turks*.—When he comes to *see good* his confident undertaking, he is rain to things that agree very little with one another.

I'll either die, or I'll *make good* the place. *Dryd.* with an example he could bring from them. *Ed. mak. it good. Dryd. on Dramatic Po. ff.*—I will what the same author subjoins to *make good*

**Foregoing remark. Locke on Education. 37. To *make good.*** To fulfil; to accomplish.—This let both *make good* the friar's words. *Shaks. 28. MAKE light of.* To consider as of no consequence.—They *made light of* it, and went their way. *Matth. xxii. 29. To MAKE love.* To court; to lay the gallant.—How happy each of the sex would be, if there was a window in the breast of every one that *makes or receives love.* *Guardian.*

**To MAKE merry.** To feast; to partake of entertainment.—A hundred pound or two *make merry* withal! *Shak.*—The king went *amatham, to make merry* with his mother and the queen. *Bacon's Hen. VII.*—A gentleman and his wife ride to *make merry* with his neighbour, and in a day they two go to a third. *Carow's Survey. 41. To MAKE much of.* To cherish; to esteem.—The king, hearing of their adventure, *scarcely fails to take pride in making much of* them. *Sidney.*

The bird is dead  
That we have *made too much of!* *Sivak. Cymb.*  
It is good discretion not to *make too much of* a man at the first. *Bacon's Essays*.—The easy the lazy *make much of* the goat; and yet *bring much of* themselves too, they take care to *carry it* presently to bed, and keep it warm. *Temple. 42. To MAKE of.* What to *make of,* how to understand.—That they should have knowledge of the languages and affairs of those countries, as if such a distance from them, was a thing could not tell what to *make of.* *Bacon.*—I can't feel a pain I knew not what to *make of,* the same joint of my other foot. *Temple.*—There is another statue in brass of Apollo, with a monstrous inscription on the pedestal, which I know what to *make of.* *Addison on Italy.*—I desired would let me see his book: he did so, smiling: could not *make any thing of* it. *Taylor.*—Upon the side were huge pieces of iron, cut into strange shapes, which we knew not what to *make of.* *Swift.*

**To MAKE of.** To produce from; to effect. I am afraid, that at those who have appeared in this paper have *made* very little of it. *Johnson. 43. To MAKE of.* To consider; to account; to esteem.—*Makes* the no more of me than a slave? *Dryden. 44. To MAKE of.* To cherish; to esteem. Not used.—Kerens was wonderfully beloved, and *made of,* by the Turkish merchants, whose language he had learned. *Emilia.*

**To MAKE over.** To settle in the hands of another.—Widows, who have tried one lover, will not *make over* again till they have *made over.* *Hudibras.*—The wife betimes *made over* their estate: *Quare* for my honour by a deed of trust. *Dryd.*

**Vol. XIII. PART II.**  
Dr JOHNSON might have added, as he often does in similar cases, that the verb is still used in use in Scotland.

**To MAKE over.** To transfer.—The second mercy *made over* to us by the second covenant, is the promise of pardon. *Hammond.*—Age and youth cannot be *made over*: nothing but time can take away years; or give them. *Collins.*—My waist is reduced to the depth of four inches by what I have already *made over* to my neck. *Guardian.*—Moor, to whom that patent was *made over,* was forced to leave off coining. *Swift. 48. To MAKE out.* To clear; to explain; to clear to one's self.

**Make out** the rest.—I am disorder'd so, I know not farther what to say or do. *Dryden.*—Antiquaries *make out* the most ancient medals from a letter with great difficulty to be discerned. *Ishton.*—It may seem somewhat difficult to *make out* the bills of fare for some suppers. *Arbutnot. 49. To MAKE out.* To prove; to evince.—There is no truth which a man may more evidently *make out* to himself, than the existence of a God. *Locke.*—What may be *made out* from them by a way deduction, may be depended on as certain and infallible truths. *Locke.*—Men of wit and parts, but of short thoughts and little meditation, distrust every thing for fiction that is not the dictate of sense, or *made out* immediately to their senses. *Burton.*—We are to vindicate the just providence of God in the government of the world, and to endeavour, as well as we can, upon an imperfect view of things, to *make out* the beauty and harmony of all the seeming discords and irregularities of the divine administration. *Tillotson.*—Scaliger hath *made out,* that the history of Troy was no more the invention of Homer than of Virgil. *Dryden.*—In the passages from divines, most of the reasonings which *make out* both my propositions are already suggest'd. *Arbutnot.*—I dare engage to *make it out,* that they will have their full principal and interest at six per cent. *Swift. 50. To MAKE sure of.* To consider as certain.—They *made as sure* of health and life, as if both of them were at their disposal. *Dryden. 51. To MAKE sure of.* To secure to one's possession.—

But whether marriage bring joy or sorrow, *Make sure* of this day, and hang to-morrow. *London.*  
**To MAKE up.** To get together.—How will the farmer be able to *make up* his rent at quarter-day? *Locke. 52. To MAKE up.* To reconcile; to compose.—I know when seven justices could not *make up* a quarrel. *Shak. 53. To MAKE up.* To repair.—I lookt for a man among them that should *make up* the bedstead. *Shak. 54. To MAKE up.* To compose, as in words.—These are the ingredients of flattery, which do together *make up* a sort of most extreme deformity. *Carte of the Town.*—He is to me under an enemy *made up* of wiles and stratagems: an old serpent, a long experienced deceiver. *Shak.*—Zeal should be *made up* of the largest measure of spiritual love, desire, hope, love, and self-denial. *Spratt.*

Oh! it was all *made up* of love and charms;—  
Whatever had *made up* the child's  
—Had queen's part *made up* of blunders and absurdities. *Add.*—Vines, figs, oranges, apples, olives, rayth, and a d'boys of corn, *make up* the most delightful little landscape. *Add.*

G y g g O H

Old mould'ring urns, racks, daggers, and distress,

*Make up* the frightful horror of the place *Garth*.—The parties among us are *made up* on one side of moderate whigs, and on the other of presbyterians. *Swift*. 56. *To MAKE up*. To shape.—A catapotium is a medicine swallowed solid, and most commonly *made up* in pills. *Arbutn. on Coins*. 57. *To MAKE up*. To supply; to make less deficient.—Whatsoever, to *make up* the doctrine of man's salvation, is added as in supply of the scripture's insufficiency, we reject it. *Hooker*.—I borrowed that celebrated name for an evidence to my subject, that so what was wanting in my proof might be *made up* in the example. *Glanville*.—

Thus think the crowd,  
Who ne'er consider, but without a pause  
*Make up* in passion what they want in cause.

*Dryden*.—If his romantick disposition transport him so far as to expect little or nothing from this, he might however hope, that the principals would *make it up* in dignity and respect. *Swift*. 58. *To MAKE up*. To compensate; to balance.—If they retrench any the smaller particulars in their ordinary experience, it will easily *make up* the halfpenny a-day which we have now under consideration. *Speltz*.—

Thus wisely she *makes up* her time,  
Mis-spent when youth was in its prime. *Granv*.  
—There must needs be another state to *make up* the inequalities of this, and to salve all irregular appearances. *Atterbury*. 59. *To MAKE up*. To settle; to adjust.—

The reasons you allege, do more conduce  
To the hot passion of distemper'd blood,  
Than to *make up* a free determination  
'Twixt right and wrong. *Shak. Troil. and Cress*.  
Yet I can *make* my audit *up*, that all,  
From me do back receive the flow'r of all,  
And leave me but the bran. *Shak. Coriolanus*.  
—He was to *make up* his accounts with his lord. *Egerton*. 60. *To MAKE up*. To accomplish; to conclude; to complete.—There is doubt how far we are to proceed by collection before the full and complete measure of things necessary be *made up*. *Hooker*.—

I know she is not; for this match *made up*,  
Her presence would have interrupted much.

*Shak*.  
—On Wednesday the general account is *made up* and printed. *Granv*.—This life is a scene of vanity, that soon passes away, and affords no solid satisfaction but in the consciousness of doing well, and in the hopes of another life: this is what I can say upon experience, and what you will find to be true when you come to *make up* the account. *Locke*. 61. This is one of the words so frequently occurring, and used with so much latitude, that its whole extent is not easily comprehended, nor are its attenuated and fugitive meanings easily caught and restrained. The original sense, including either *production* or *formation*, may be traced through all the varieties of application.

(2.) \* *To MAKE*. v. n. 1. To tend; to travel; to go any way.—

What villains have done this?  
—I think, that one of them is hereabouts,  
And cannot *make* away. *Shak. Othello*.

I do beseech your majesty *make* up  
Lest your retirement do amaze you

—The earl of Lincoln resolved to *make* up the king was, to give him battle. *Bacon* *made* forth to us a small boat, with persons in it. *Bacon*.—Warily provide we *make* forth to that which is better not with that which is worse. *Bacon*.—ful erroneous observation that *makes* commonly received contrary to experience.

*Make* on, upon the heels  
Of men, struck down like piles, to *make*  
Of those remain and stand.

—The Moors, terrified with the hide  
The soldiers *making* towards land, &  
beaten from the shore. *Knolles*.—Wh  
out from mount Singi they *made* north  
*Rishmah. Brown's Vulg. Errors*.—

*Make* to the city by the postern gate  
The bull

His easier conquest proudly did fore;  
And *making* at him with a furious bore  
From his bent forehead aim'd a doul

Too late young Turnus the delus'd  
Far on the sea, still *making* from the

—A man of a disturbed brain seeing in  
one of those lads that used to vex him  
into a cutler's shop, and seizing on a name  
*made* after the boy. *Locke*.—Seeing a col  
tleman trotting before me with a sp  
horse's side, I *made up* to him. *Add*  
French king *makes* at us directly, and br  
by him to set over us. *Addison*.—

A monstrous boar rush't forth; at n  
Whetting his tusks. *Smith's Phiz*.  
2. To contribute; to have effect.—*V*  
*makes* nothing to your subject, and is in  
it, admit not unto your work. *Dryden*  
he is, to believe that the right is wrong,  
is right, when it *makes* for his own  
*Swift*. 3. To operate; to act as a pre  
ment, or cause.—Where neither the c  
any law divine, nor any notable public  
nience doth *make* against that which ou  
ecclesiastical have instituted. *Hooker*.—I  
should *make* for them must prove, that  
not to make laws for church regiment.  
It is very needful to be known, and is  
the right of the war against him. *Spon*  
follow after the things which *make* for pe  
—Perkin Warbeck finding that time a  
rizing, which, whilst his practices we  
*made* for him, did now, when they wen  
ed, rather *make* against him, resolv'd to  
exploit upon England. *Bacon*.—A thing  
to my present purpose. *Boyle*.—It *ma*  
purpose, that the light conserving sp  
must be set in the sun before they re  
*Digby*.—Even my own confession *ma*  
me. *Dryd. Ded. to An*. 4. To shew; t  
to carry appearance.—Joshua and all h  
as if they were beaten before them, and f  
viii. 15.—It is the unanimous opinion  
friends, that you *make* as if you hang'd  
and they will give it out that you are q

*1b. John Bull.* 5. To MAKE away with. To destroy; to kill; to make away. This phrase is proper.—The women of Greece were seized on an unaccountable melancholy, which disposed several of them to make away with themselves.

6. To MAKE for. To advantage; to favour.—Compare these disparities of times, and we plainly perceive, that they make for the advantage of England. Bacon.—None deny there is God, but those for whom it maketh that there is no God. Bacon.—

That made for me; I knew that liberty would draw thee forth. Milton.

MAKE up for. To compensate; to be indebted.—Have you got a supply of friends to make up those who are gone? Swift. 8. To MAKE

To concur.—Antiquity, custom, and consent in the church of God, making with that a law doth establish, are themselves most potent reasons to uphold the same. Hooker.

MAKEBATE. *n. f.* [*make and debate.*] Breeder of quarrels.—Love in her passions, like a right whistler, whispered to both sides arguments of war. Sidney.—Outrageous party-writers are a couple of makebates, who inflame small wars by a thousand stories. Swift.

MAKEDA, Q. of Sheba. See ETHIOPIA, § 10.

MAKEPEACE. *n. f.* [*make and peace.*] Peacemaker; reconciler.—

To be a makepeace shall become my age. Shak.

MAKER. *n. f.* [*from make.*] 1. The Creator.—

God in him, in all things, as is met,

is universal Maker we may praise. Milton.

His the divine Cecilia found,

to her Maker's praise confin'd the sound. Pope.

Each plain roof as piety could raise,

is only vocal with the Maker's praise. Pope.

is power of reasoning was given us by our

is to pursue truths. Watts. 2. One who

is any thing.—Every man in Turkey is of

is made; Sultan Achmet was a maker of ivory

is Notes on the *Odyssey*.—I dare promise her

is dare to do. Pope. 3. One who sets any

is in its proper state.—You be indeed makers

is vers of all mens manners within the realm.

MAKERSTON, a parish of Scotland, in

is northshire, on the banks of the Tweed, near-

is Des long from E. to W. and  $4\frac{1}{2}$  broad, in

is an oblong square. The surface is flat;

is dry, and the soil fertile. Of 3,300 acres,

is 200 are in pasture; and feed 1000 sheep,

is 100 and 180 black cattle. The population,

is in 1755; increase 90 since 1755.

MAKERSTON, [*i. e. Mac-Ker's Town.*] a vil-

is llage above parish, containing near 60 people.

MAKEWEIGHT. *n. f.* [*make and weight.*] A

is thing thrown in to make up weight.—

is is lonely sitting, nor the glimmering light,

is make-weight candle, nor the joyous talk

is being friend delights. Philips.

MAK. See LEMUR.

MAKRAN. See MACKERAN.

MESZIN, a town of Turkey in Bulgaria, on

is the Danube, 60 miles WSW. of Ismacel. It was

is taken by the Russians in 1771.

MALABAR, the name given to a great part of the W. coast of Indostan, from the kingdom of Baglala, or from the N. extremity of that of Canara, to Cape Comorin. It is bounded on the E. by the mountains of Ballagate; on the S. and W. by the Indian sea; and on the N. by the Deccan.

MALACA, in ancient geography, a maritime town of Hispania Bætica, surnamed *Federatorum* by Pliny: A Carthaginian colony according to Strabo; so called from *Malach, salt*; a place noted for pickled or salted meat: Now called MALAGA.

(1.) MALACCA, the most southerly part of the great peninsula beyond the Ganges, is about 600 miles long, and from 60 to 150 broad. It is bounded by the kingdom of Siam on the N. by the bay of Siam and the Indian ocean on the E. and by the straits of Malacca, which separate it from the island of Sumatra, on the SW. It lies more to the S. than any other country in the East Indies; and comprehends the towns and kingdoms of Patan, Pahan, Igohor, Pera, Queda, Borkelon, Ligor; and on the N. the town and kingdom of Tanassery, where the Portuguese formerly carried on a great trade.

(2.) MALACCA, a kingdom in the above country. The people are in general subject to the Dutch, who possess all the fringed places on the coast, and compel them to trade on their own terms, excluding all other nations of Europe from having any commerce with them. The MALAYS are governed by feudal laws. A chief, who has the title of *king* or *sultan*, issues his commands to his great vassals, who have other vassals in subjection to them. A small part of the nation live independent, under the title of *oranicai* or *nobles*, and sell their services to those who pay them best; while the rest are slaves, and live in perpetual servitude. Most of these people are restless, fond of navigation, war, plunder, emigrations, desperate enterprises, adventures, and gallantry. They talk incessantly of their honour and their bravery; whilst they are universally considered by those with whom they have intercourse, as the most treacherous, ferocious people on earth. This ferocity, which the Malays style *raourage*, is so well known to the European companies in the Indies, that they have universally prohibited the captains of their ships who may put into the Malay islands, from taking on board any seamen from that nation, except in the greatest distress, and then on no account to exceed 2 or 3. It is not uncommon for a few of these horrid savages suddenly to embark, attack a vessel by surprise, take her and massacre the people. Malay batteaux, with 24 or 30 men, have sometimes boarded European ships of 30 or 40 guns, and murdered with their pignards great part of the crew. Those who are not slaves go always armed; they would think themselves disgraced if they went abroad without their *criss* or pignards. They cannot endure the long flowing garment in use among the other Asiatics. Their habits are exactly adapted to their shapes, and loaded with a multitude of buttons, which fasten them close to their bodies. The country is very fertile. It abounds with odoriferous woods, such as aloe, sandal, and Cassia.

The ground is covered with flowers of the greatest fragrance, of which there is a perpetual succession throughout the year. There are many mines of the most precious metals, said to be richer than those of Brazil or Peru, and in some places are mines of diamonds. The sea abounds with excellent fish, ambergris, pearls, &c. and the rocks with those delicate bird's nests so much in request in China; which are of such an exquisite flavour, that the Chinese for a long time purchased them for their weight in gold. See BIRDS NEST, § 4; and HIRUNDO, N° 7. Notwithstanding all this plenty, the Malays are miserable. The culture of the lands, abandoned to slaves, is fallen into contempt. These wretched labourers, dragged incessantly from their rustic employments by their restless masters, who delight in war and maritime enterprises, have never time or resolution to give the necessary attention to the labouring of their grounds; of consequence the lands for the most part are uncultivated, and produce no kind of grain for the subsistence of the inhabitants. The sago tree indeed supplies in part the defect of grain. See CYCAS, N° 2; and SAGO, § 2.

(3.) MALACCA, the capital of the above kingdom, is situated in a flat country close to the sea. The walls and fortifications are founded on a solid rock, and are carried up to a great height; the lower part of them is washed by the sea at every tide, and on the land side is a wide canal, ut from the sea to the river, which makes it an island. In 1641 it was taken from the Portuguese by the Dutch, since which time it has continued in their possession. In this city there are many broad streets; but they are badly paved. The houses are tolerably well built, and some of them have gardens adjacent. The inhabitants consist of a few Dutch, many Malaysians, Moors, Chinese, and other Indians; who are kept in awe by a fortress, which is separated from the city by a river; and by good walls and bastions, as well as by strong gates, and a draw-bridge on the E. side. The city is well situated for trade and navigation. It was taken by the British in Nov. 1795; but restored in 1802. Lon. 102. 2. E. Lat. 2. 12. N.

(4.) MALACCA, STRAITS OF, a narrow sea between MALACCA (N. 1.) and the island of Sumatra, extending from the Equinoctial to Lat. 5. 0. N.

MALACESENE, or MALSesine, a populous town of the Italian republic, in the dep. of the Minicio, and district (late duchy) of Verona; at the foot of Mount Baldo, 8 miles E. of Verona.

(1.) MALACHI, מלאכי, Heb. i. e. my messenger. the last of the 12 lesser prophets. He prophesied about 300 years before Christ, reproving the Jews for their wickedness after their return from Babylon, and condemning the priests for being careless in their ministry: at the same time encouraging the few, who maintained their integrity. He distinctly points at the Messiah, as well as his forerunner John the Baptist, who should come in the spirit and power of Elijah.

(2.) MALACHI, THE PROPHECY OF, the last canonical book of the Old Testament.

(3.) \* MALACHITE. n. f. — This stone is sometimes intirely green, but lighter than that of the pephritick stone, so as in colour to resemble the

leaf of the mallow, μαλαχίτη, from which name; though sometimes it is veined w or spotted with blue or black. *Woodw.*

(2.) MALACHITE is not a stone, but of copper ore, in a state of oxydation.

MISTRY, *Index.*

MALACIA, in medicine. See Lox. MALACOPTERYGEOUS, *adj.* a thyologists, an appellation given to fish have the rays of their fins bony, but not sharp at the extremities, like those of terygeous fishes.

MALACOTOMOUS, *adj.* a term fishes destitute of teeth in the jaws, called *tober-moutbed*, as the tench, carp, brea

MALACHRA, in botany, a genus andria order, belonging to the monad of plants.

\* MALADY. n. f. [*maladie*, Fr.] a distemper; a disorder of body; sickness it is to be private in sorrow's torry'd to the pomp of a palace, nurse in dies. *Sidney.*—Physicians first require *malady* be known thoroughly, alter how to cure and redress it. *Spenser.*— Say, can you fast? your stomach young:

And abstinence engenders *maladies*. —An accidental violence of motion, that *malady* that has baffled the skill of *Soub.*—

Love's a *malady* without a cure.

MALAGA, an ancient, rich and 1 of Spain, in Grenada, with two castles, and a good harbour, which rende of considerable commerce. This according to M. Bourgoanne, is entire of Spain; though with little advantage; for of 842 vessels which an port in 1782, from almost every com tion, scarcely 100 were Spanish, eve the ships of war. The English, who session of the greatest part of the thither woollens and great quantities ware; the Dutch carry spice, cutlery ribbons, thread, &c. These nation the north, and Italy, export to the two millions and a half of piastres in v carry thither amounts only to abcu and a half. The streets of Malaga but there are some good squares; and dral church is a superb building, f large as St Paul's. The bishop's palace edifice, but looks insignificant from it the other. Its prelate enjoys a L. 16,000 Sterling. Malaga is seated diterranean, at the foot of a craggy Lon. 4. 36. E. Lat. 36. 44. N.

MALAGRIDA, Gabriel, an Italian in 1686. He was appointed to condu into Portugal. To great eloquence h most ardent zeal for the interest of He soon became the fashionable dir was respected as a saint, and consulted racle. When a conspiracy was form duke of Aveiro against the king of Por said that he and other two Jesuits wen

cerning the measure, and gave it as their opinion, that it was only a venial crime to kill a king who persecuted the saints. About that time the king of Portugal banished the Jesuits from his kingdom; and 3 of them were apprehended, Malagrida, Alexander, and Mitnos, who were accused of having approved his murder. At either the trial could not be proceeded in without the consent of the pope, or no proof could be got sufficient to condemn Malagrida; therefore he was delivered to the inquisition, having formerly advanced some propositions concerning on heresy. Two publications which acknowledged, and which give the fullest indications of complete insanity, were the foundations of these suspicions. The one was written in Latin, entitled *Traſatus de vita et imperio Antichriſti*; the other in Portuguese, entitled, "The life of St Anne, composed with the assistance of the Holy Virgin Mary and her most holy Son." They are full of extravagance and absurdity.—This enthusiast pretended to have the gift of miracles. He was tried by the judges of the Inquisition, that God himself had declared him his ambassador, apostle, prophet; that he was united to God by a perpetual union; and that the Virgin Mary, with the consent of Jesus Christ and of the whole Trinity, had declared him to be her son. In short, he confessed, that he felt in the prison, at the age of 22, some emotions very uncommon at that period of life, which at first gave him great uneasiness, but that it had been revealed to him by a vision that these emotions were only the natural effects of an involuntary agitation, wherein there was the same merit as in prayer. For such extravagancies this unfortunate wretch was condemned by the Inquisition; but his death was hastened by a vision which he eagerly revealed. Upon the death of the marquis of Tancourt, commander of Estremadura, mournful discharges were sent in honour of him by the castle of Lisbon, and by all the forts on the banks of the Tagus. Music being heard by Malagrida in his dungeon, supposed, from their happening during the execution, that the king was dead. Next day he demanded an audience from the members of the inquisition, when he told them that he had been revealed by God to show the minister of the holy see that he was not a hypocrite, for the king's death had been revealed to him, and he had seen a vision the torments to which his majesty was condemned for having persecuted the religious of his order. This was sufficient to accelerate his punishment; he was burnt on the 21st Sept. 1761, in his 75th year, not as a conspirator, but as a false prophet, for which he deserved only to have been confined in bedlam. The acts of impiety where he was accused were nothing more than extravagancies, proceeding from a mistaken devotion and an overheated brain.

**MALAGUETTA**, the GRAIN COAST, or the UPPER COAST, a country of Guinea, bounded by Sierra Leona on the W. and the Ivory coast on the SE. extending about 100 miles along the Atlantic. It abounds with lemons, oranges, tea, pain wine, and a peculiarly delicious kind of nuts; but its chief article of commerce is pepper. The people are governed by a king, whom

they hold in great veneration; but they are fond of the Europeans. The Portuguese formerly monopolized the trade of this country, but now share it with the British and Dutch. From their intercourse with the women has sprung a numerous race of mulattoes, whom the Portuguese style *Hidalgos*, or gentlemen, and some of whom have acquired so much education as to have actually commenced clergymen, and preached among their pagan kinsmen.

**MALALEUCA**. See MELALFUCA.

(1.) **MALAMOCCO**, an island and district of Maritime Austria, in the Dogado of Venice, 5 miles long, but not one broad.

(2.) **MALAMOCCO**, a seaport town in the above district, anciently the capital of the Venetians, 5 miles S. of Venice. In 809, it was destroyed by the Franks: in 1105 by fire; and in 1111, by an earthquake. The harbour is very safe, and has two forts strongly garrisoned.

(1.) \* **MALANDERS**. *n. s.* [from *mal andare*, Italian, to go ill.] A dry scab on the pasteron of horses.

(2.) **MALANDERS**, or **MALLENDERS**: See FARRIERY, PART IV. Sect. XI.

\* **MALAPERT**. *adj.* [*mal* and *pert*.] Saucy; quick with impudence; sprightly without respect or decency.—

Peace, master marquis, you are *malapert*.

*Sicak.*

—If thou dar'st tempt me further, draw thy sword. What, what? nay, then I must have an ounce or two of this *malapert* blood from you. *Sbak.*—Are you growing *malapert*? Will you force me make use of my authority? *Dryden.*

\* **MALAPERTLY**. *adv.* [from *malapert*.] Impudently; saucily.

\* **MALAPERTNESS**. *n. s.* [from *malapert*.] Liveliness of reply without decency; quick impudence; sauciness.

**MALATE**, a salt formed by the combination of the MALIC ACID with various bases. See CHEMISTRY, *Vocab.* II.

**MALATHIA**, or } an ancient town of Asiatic  
**MALATIA**, } Turkey, capital of Armenia Minor, on the W. side of the Euphrates, near its source; with an archbishop's see. It was the birth-place of ABULFARAGIUS. Lon. 43. 25. E. Lat. 30. 8. N.

**MALAVISTA**, a town in the isle of Cuba.

\* To **MALAXATE**. *v. a.* [*malaxo*.] To soften, or knead to softness, any body.

\* **MALAXATION**. *n. s.* [from *malaxate*.] The act of softening.

**MALAYANS**, or } the people of Malacca. See  
**MALAYS**, } COOK, N° III; and MALACCA, N° 2.

**MALBY**, the name of 3 towns of Sweden, in W. Gothland: 1st, 21 miles S. of Christianstadt: 2d, 26 miles SE. of Uddevalla; and 3d, 35 miles NE. of it.

**MALCHIN**, a town of Mecklenburg, on the Peene, 10 miles N. of Wahren. Lon. 13. 12. E. Lat. 53. 0. N.

**MALCOLM**, the name of 4 kings of the Scots. See SCOTLAND.

**MALCOLME**, the rev. David, F. A. S. London, a late learned clergyman of the church of Scotland;

Scotland; who was minister of Duddingston, near Edinburgh, prior to 1741. He had paid particular attention to the study of languages and antiquities; in consequence of which he was admitted a member of the London Antiquarian Society. He published *Essays and Letters*, at Edinburgh, in 1739, which display great knowledge of the Celtic and Hebrew languages. These were intended as an introduction to his great work of a *Celtic Dictionary*, but which, it is to be regretted, he did not finish. They are commended by Mr Pinkerton, and quoted with respect by M. Gebelin, in his *Monde Primitif*, and by M. Bulet, in his *Memoirs Celtiques*.

**MALCONTENTA**, a town of Maritime Austria, in the Dogado, W. of Venice.

**MALDEGHEM**, a town of the French republic, in the dep. of Lys; 10 miles E. of Bruges.

(1.) **MALDEN**, a town of the Batavian republic, in the dep. of the Rhine, and late prov. of Gelders and county of Zutphen; 7 miles E. of Berkeloe.

(2.) **MALDEN**, or **MALDON**, a town of Essex, seated on an eminence at the conflux of the Chelmer and Blackwater, where they enter the sea. It was the first Roman colony in Britain, and the seat of some of the ancient British kings. It was besieged, plundered, and burnt by queen Boadicea; but the Romans repaired it. It was again ruined by the Danes, but rebuilt by the Saxons. It is governed by 2 bailiffs, 6 aldermen, 18 capital burgesses, a steward, recorder, and above 400 commoners, who all vote for its members of parliament. It has a convenient haven for vessels of 400 tons; and drives a good trade in coals, iron, corn, and deals. It has 2 parish churches, and a large library for the use of the minister and the neighbouring clergy. Here is a grammar school, a charity workhouse, a market on Saturday, and a fair on the 18th Sept. **MALDEN WATER** is navigable up to the town, which lies 10 miles E. of Chelmsford, and 27 N.E. of London. Lon. o. 41. E. Lat. 51. 46. N.

(3.) **MALDEN WATER**. See **BLACKWATER**.

**MALDIVE**, or } **ISLANDS**, a cluster of small  
**MALDIVA**, } islands in the Indian ocean,  
100 miles SW. of Ceylon. They are about 1000 in number, and extend from Lat. 2° S. to 7° N. They are generally black low lands, surrounded by rocks and sands. The natives are of the same complexion with the Arabians, profess the Mahometan religion, and are subject to one sovereign. The channels between the islands, are very narrow, and some of them are fordable. They produce neither rice, corn, nor herbage; but the natives live upon cocoa-nuts, and other fruits, roots, and fish. They have little or nothing to barter with, except the shells called *cowries*, with which they abound.

**MALDON**. See **MALDEN**, N° 2.

**MALDONAT**, John, a Spanish Jesuit, born in 1524. He was accused of heresy, and of procuring a fraudulent will, in seducing the president St Andre at Paris to bequeath his estate to the Jesuits. Peter Gondi acquitted him of the first charge, and the parliament of Paris of the other. He retired after these troubles to Bourges, but went to Rome by order of pope Gregory XIV.

to take care of the publication of the Septuagint, and there, after finishing his commentary on the Gospels in 1582, he died in the beginning of 1584. He also wrote Commentaries on Jeremiah, Ezechiel, and Daniel; a treatise on the Sacraments, on grace, on original sin; and several other pieces printed at Paris in 1677, in folio. His style is clear, lively, and easy. He does not feebly follow the scholastic divines; but is pretty free, and sometimes singular, in his sentiments.

(1.) \* **MALE**. *n. s.* [*male*, Fr. *males*, Latin] Of the sex that begets, not bears young; not to male.—Which shall be heir of the two *male twins*, who, by the dissection of the mother, were laid open to the world? *Locke*.—You have no *male child*; your daughters are all married to wealthy patricians. *Swift*.

(2.) \* **MALE**. *n. s.* The he of any species—in most the *male* is the greater, and in some few the female. *Bacon*.—There be more *males* than females, but in different proportions. *Graunt's Bill of Mortality*.

(3.) **MALE**, by zoologists, is defined that sex of animals which has the parts of generation situated externally. See **GENERATION**, and **SEX**.

(4.) **MALE** is also, from some resemblance, often applied to inanimate things; as a *male flower*, a *male screw*, &c. See **BOTANY**, *Index*; *Flor.* § 1, N° 2; **MAS PLANTA**, and **SCREW**.

(5.) \* **MALE**, in composition, signifies *ill*; from *male*, Latin; *male*, old French.

(6.) **MALS**, in geography, the principal of the **MALDIVE ISLANDS**. It is 4½ miles in circumference, and has a town, where the king resides.

(6.) \* **MALEADMINISTRATION**. *n. s.* Bad management of affairs.—From the practice of the wisest nations, when a prince was laid aside for *maladministration*, the nobles and people did resume the administration of the supreme power. *Swift*.—A subject denounces his superior for *maladministration*. *Asiatic*.

**MALEBRANCHE**, Nicholas, an eminent French metaphysician, the son of Nicholas Malebranche, secretary to the French king, was born in 1638, and admitted into the congregation of the oratory in 1660. He at first studied languages and history; but afterwards meeting with Des Cartes's *Treatise of Man*, he applied himself entirely to philosophy. In 1699, he was admitted an honorary member of the Royal Academy of Sciences at Paris. Although of a delicate constitution, he enjoyed a pretty good state of health till he died in 1715, aged 77. He read little, but thought a great deal. He despised that kind of philosophy which consists only in knowing the opinions of other men. He could never read two verses together without disgust. He meditated with his windows shut, to keep out the light, which disturbed him. His conversation turned upon the same subjects as his books; but was mixed with so much modesty and deference to the judgment of others, that it was universally desired. His books are famous; particularly his *Recherche de la Verite*, i. e. *Search after truth*; his design in which is, to point out the errors into which we are daily led by our senses, imagination, and passions; and to prescribe a method for discovering the truth, which he does by starting

*seeing all things in God.* And hence speak of human knowledge, compared with which displays itself from the ideal by attending to which, with pure and ideas, he supposes knowledge to be most These sentiments, with his fine man-ling them, made many admire his ge-ilities; but he is at best a visionary

Mr Locke, in his examination of's opinion of seeing all things in God, "acute and ingenious author;" and there are "many very fine thoughts, reasonings, and uncommon reflections, &c.," yet he refutes the chief prin-ciple of his system. Malebranche wrote many works to confirm his doctrine, and to clear up objections.

DISCONTENTED. } *adj.* [*male and con-*  
CONTENTED. } *tent.*] Discontented.

Clarence, how like you our choice, stand penfive, as half *malecontent*.

Discontent! Is it for a wife's sake to part *malecontent*? *Shak.* for securing his state against muti-*malecontented* subjects, who might have a share in the crown, sent a solemn ambassa-ge to France. *Bacon.*—They cannot signalize themselves by *malecontent*-ments, without breaking thro' their virtues. *Addison.*—The usual way in govern-ments is to confine the *malecon-*tent. *Addison.*

DISCONTENTS, *n. f. plur.* Seditious per-sons disaffected to the government. *Try.* It is surprizing that Dr *Johnson* omitted a substantive noun so fre-quent in history.

DISCONTENTEDLY. *adv.* [from *male-*contented.]

DISCONTENTEDNESS. *n. f.* [from *male-*contentedness.] want of affection to the government. They would ascribe the laying down of the crown to a spirit of *malecontentedness*. *Spektor.*

MALEDICTED. *adj.* [*maledictus*, Lat.] *Ac-*curse.

MALEDICTION. *n. f.* [*malediction*, French; Latin.] Curse; execration; denuncia-tion.

Let my life long time on earth main-tened be, the last, worst *malediction*. *Sydney.*

Original cause, divine *malediction*, laid upon these creatures which God made for the use of man, was above the natural capacity. *Hooker.*—In Spain they spent months, during which Bucking-ham received millions of *maledictions*; which, on the prince's arrival in the west, did vanish. *Wotton.*

MALEFACIOUS. *n. f.* [*male facio*, Lat.] A villain.

Maleficious creatures at a play, the very cunning of the scene, are so to the foul, that presently they proclaim'd their *maleficious*. *Shak.*

MALEFACTOR. *n. f.* [*male and facio*, Lat.]

An offender against law; a criminal; a guilty per-son.—

A jailor to bring forth  
Some monstrous *malefactor*. *Shak. Ant. & Cleop.*  
Fear his word,

As much as *malefactors* do your sword. *Rosc.*  
—It is a sad thing when men shall repair to the ministry, not for preferment but refuge; like *male-*factores flying to the altar, only to save their lives. *South.*

If their barking dog disturb her ease,  
Th' unmanner'd *malefactor* is arraign'd. *Dryd.*

The *malefactor* goat was laid  
On Bacchus's altar, and his forfeit paid. *Dryd.*

\* MALEFICK. } *adj.* [*maleficus*, Latin.] Mis-  
\* MALEFIQUE. }chievous; hurtful. *Di&*

MALEMORT, a town of France in the dep. of the mouths of the Rhone; 6 m. S. of Salon.

MALENE, a town of France, in the dep. of Lozere, on the Tarn, 15 miles SW. of Mende.

\* MALEPRACTICE. *n. f.* [*male and practice*.] Practice contrary to rules.

MALESHERBES, a town of France, in the dep. of the Loiret, 13½ miles S. of Estampes.

MALESTROIT, a town of France, in the dep. of Morbihan, 16½ miles ENE. of Vannes.

MALEVAL, a town of France, in the dep. of Rhone and Loire; 15 miles S. of St Etienne.

MALEVILLE, a town of France, in the dep. of Aveiron; 21 miles W. of Rhodéz.

\* MALEVOLENCE. *n. f.* [*malevolentia*, Lat.] Ill will; inclination to hurt others; malignity.—

The son of Duncan  
Lives in the English court; and is receiv'd  
Of the most pious Edward with such grace,  
That the *malevolence* of fortune nothing

Takes from his high respect. *Shak. Macbeth.*

\* MALEVOLENT. *adj.* [*malevolus*, Latin.] Ill-disposed towards others; unfavourable; ma-  
lignant.—

I have thee in my arms  
Though our *malevolent* stars have struggled hard,  
And held us long asunder. *Dryd. K. Arthur.*

\* MALEVOLENTLY. *adv.* [from *malevolence*.] Malignly; malignantly; with ill-will.—The oak did not only resent his fall, but vindicate him from aspersions *malevolently* cast upon him. *Howel.*

MALEXANDER, a town of Sweden in E. Gothland; 25 miles S. of Linkioping.

MALGRATO, a town of the Italian republic, in the department of the Lario, and district of Como; 10 miles NE. of Como.

MALGUENAC, a town of France, in the dep. of Morbihan, 3 miles W. of Pontivy.

MALHERBE, Francis DE, the best French poet of his time, was born at Caen about 1556, of a noble family. He quitted Normandy at 17 years of age; and went into Provence, where he attached himself to the family of Henry Angouleme, the natural son of king Henry II. and was in the service of that prince till he was killed in 1586. Card. de Perron, being informed of his merit and abilities, introduced him to Henry IV. who took him into his service. After that monarch's death, Q. Mary de Medicis settled a pen-sion of 500 crowns upon our poet, who died at Paris in 1628. The best and most complete edi-tion

tion of his works is that of 1666, with Menage's remarks. Boileau considers him as the father of French poetry; but he composed with great difficulty. He was a man of a singular humour and blunt in his behaviour, but without religion. He often said that "the religion of gentlemen was that of their prince." In his last moments he corrected his landlady for speaking bad French.

**MALIC ACID**, an acid abounding in the juice of unripe fruits, particularly in apples; so named from *malum*, Latin, an apple. See **CHEMISTRY**. *Index*; and *Vocab. II.*

(1.) \* **MALICE**, *n. f.* [*malice*, French; *malitia*, Latin.] 1. Badness of design; deliberate mischief. —God hath forgiven me many sins of *malice*, and therefore surely he will pity my infirmities. *Taylor*. 2. Ill intention to any one; desire of hurting. —

Duncan is in his grave;

*Malice* domestick, foreign levy, nothing  
Can touch him further!

*Shak.*

Satan, who late fled before the threats  
Of Gabriel out of Eden, now improv'd  
In meditated fraud and *malice*.

*Milton.*

(2.) **MALICE**, in ethics and law, is a formed design of doing mischief to another; it differs from hatred. In murder, it is malice makes the crime; and if a man, having a malicious intent to kill another, in the execution of his malice kills a person not intended, the malice shall be connected to his person, and he shall be adjudged a murderer. The words *ex malitia premeditata* are necessary to an indictment of murder, &c. And this *malitia premeditata*, or *malice prepenita*, may be either express or implied. Express malice is, when one, with a sedate, deliberate mind, and formed design, kills another; which formed design is evidenced by external circumstances discovering that intention; as lying in wait, antecedent menace, former grudges, and concerted schemes to do him some bodily harm. Besides, where no malice is expressed, the law will imply it; as where a man wilfully poisons another, in such a deliberate act the law presumes malice, though no particular animosity can be proved. And if a man kills another suddenly, without any, or without a considerable provocation, the law implies malice; for no person, unless of an abandoned heart, would be guilty of such an act upon a slight or no count.

\* **To MALICE**, *v. a.* [from the noun.] To regard with ill will. —Obdurate.—

The cause why he is thus ill to *malice*,

Was that his mother which him bore and bred,  
The most unimagined wouldest on the ground,  
Arches by his means, was vanquish'd. *Spens.*

\* **MALICIOUS**, *adj.* [*malicious*, French; *maliciosus*, Latin.] Ill-disposed to any one; intending ill; malicious.—

We must not flit

Our necessary actions in the fear  
To cope *malicious* enmity. —*Shak. Hen. VIII.*  
I grant him honesty,

Sudden, *malicious*, fawning, or ev'ry sin  
That has a name. —*Shak.*

Thou know'st what *malicious* men,  
Eugen, our happy, and of his own  
Deftness, seek to work us woe and shame.

*Milton.*

—The ill appearing to *malicious* in this motto

conspiracy, exacts a more particular regard  
*see on Consumptions.*

\* **MALICIOUSLY**, *adv.* [from *malicious*] malignity; with intention of mischief; intrigue between his majesty and a junco of *maliciously* bent against me, broke out, like to have ended in my utter destruction

\* **MALICIOUSNESS**, *n. f.* [from a Malice; intention of mischief to another  
Not out of envy or *maliciousness*,

Do I forbear to crave your special aid.

**MALICOLLO**. See **MALICOLLO**.

**MALICORNE**, a town of France, in of Sarthe, on the Sarthe; 6 miles N. of Fl

\* **MALIGN**, *adj.* [*maligne*, French; Latin: the *y* is mute or liquefcent.] 1. U able; ill-disposed to any one; maliciouscraft may be by operation of *malign* spirit

If in the constellations war were spr

Two planets, rushing from aspect ma

Of fiercest opposition, in mid sky,

Should combat, and their jarring sph

found.

—Of contempt, and the *malign* hostile it has upon government; every man's e will inform him. *Soub.* 2. Infectious; the body; pestilential.—He that turnet mours back, and maketh the wound bleed endangereth *malign* ulcers and pernici humations. *Baron.*

\* **To MALIGN**, *v. a.* [from the adjective] To regard with envy or malice.—Th practise what mischiefs and villainies the gainst private men, whom they *malign*, b their goods, or murdering them. *Spey*, hardly to be thought that any governo *malign* his successor, as to suffer an evil up which he might timely have kept na strangers conspired together against him *malign* him in the wilderness. *Earl*, it is a pleasure to be envied and b be *malign* standing, and to be desp then is it a pleasure to be great. *Sa* mischief; to hurt; to harm.

\* **MALIGNANCY**, *n. f.* [from *malign*] Malvolence; malice, unfavourableness; some darky over me; the *malignancy* might, perhaps, dissembler yours, and fructive, tendency.—The infection dot a blood, which according to the degree *malicious*, either proves easily curable, proceed in it venial. *Hippocr.*

(1.) \* **MALIGNANT**, *adj.* [*malignans*] 1. Malign; envious; unpropitious; i merciless; intending or effecting ill. *O malignant* and ill-boarding that.

Now art thou come unto a festival

Not trended by his wish to your

son,

His will is most *malignant*, and it fit

Beyond you to your friends.

To word *malignancy*, to bad men br —They have been in other notes to

own represented in a note and *malign* *Bar.* 2. Hostile to life; as, *malign*

—They say, that the cause of the *malignant* vapour that falls upon the peo

Let the learned be

'h' enquiry, where disease could enter in;  
low those *malignant* atoms forc'd their way?

*Dryden.*

1.) **MALIGNANT**, among physicians, (§ 1, *def.*) applied to diseases of a very dangerous nature, generally infectious; such are the dysentery, fever, &c. in their worst stages.

2.) \* **MALIGNANT**. *n. f.* 1. A man of ill intention; malevolently disposed.—Occasion was taken, several *malignants*, secretly to undermine his authority in the church of Christ. *Hooker.* It was a word used of the defenders of the arch and monarchy by the rebel sectaries in the wars.

**MALIGNANTLY**. *adj.* [from *malignant*.] In ill intention; maliciously; mischievously.—  
If he should still *malignantly* remain  
Not foe to the Plebeians, your voices might  
Be curses to yourselves. *Shak.*

**MALIGNER**. *n. f.* [from *malign*.] 1. One regards another with ill will.—I thought it necessary to justify my character in point of cleanliness, which my *maligners* call in question. *Swift.* 2. A scolding censurer.—Such as these are phalot's *maligners*, who pronounce the most general contemplations, needless unprofitable subtleties. *Glanville.*

3.) \* **MALIGNITY**. *n. f.* [*malignité*, French.] Malice; maliciousness.—  
Had not their guilt the lawless soldiers  
Known,  
They made the whole *malignity* their own.

*Tickl.*

4.) **MALIGNITY**, among physicians, signifies the same with contagion. See **CONTAGION**.  
**MALIGNLY**. *adv.* [from *malign*.] Enviously with ill will; mischievously.—  
Wish you think I rally more than teach,  
I praise *malignly* arts I cannot reach;  
I let me for once presume to instruct the times.

*Pope.*

**ALIJAI**, a town of France, in the dep. of Lower Alps; 9 miles SW. of Digne.

**ALILLA**, a town of Sweden, in Smaland.

**ALIN**, a town of Ireland, in Donegal.

**ALINES**. See **MECHLIN**.

**ALIN-HEAD**, a cape of Ireland, and the most northern point of the island; 23 miles N. of Londerry.

**ALIUOTO**, a town of Calabria Citra.

**ALKAR**, a town of Indostan, in Golconda.

**MALKIN**. *n. f.* [from *mal* or *Mary*, and *kin*, diminutive termination.] A kind of mop of clouts for sweeping ovens; thence a useful figure of clouts dressed up; thence a dirty scoundrel. *Hanmer.*

The kitchen *malkin* pins  
Her richest lockram 'bout her reachy neck,  
Lambing the walls to eye him. *Shak.*

(1.) \* **MALL**. *n. f.* [*malleus*, Latin, a hammer.] 1. A kind of beater or hammer.—He took a *mali*, and after having hollowed the handle, and that part which strikes the ball, he enclosed in them several drugs. *Jiddion.* 2. A stroke; a blow. Not in use.—

With mighty *mali*,

The monster merciless him made to fall.

*Fairy Queen.*

Give that rev'rend head a *mali*

Or two, or three, against a wall. *Hudib.*

2. A walk where they formerly played with malls and balls.—*Moll* is, in Islandick, an arca or walk spread with shells.—

This the beau monde shall from the *mali* survey,

And hail with musick its propitious ray. *Pope.*

(2.) **MALL**, or SEA **MALL**. See **LARUS**, N° 2. \* **To MALL**. *v. a.* [from the noun.] To beat or strike with a mall.

**MALLAPILLY**, a town of Indostan, in Mysore.

(1.) \* **MALLARD**. *n. f.* [*mallart*, Fr.] The drake of the wild duck.—

Antony claps on his sea-wings, like a doating mallard,

Leaving the fight in height. *Shak.*

—The birds that are most easy to be drawn are mallard, shoveler, and goose. *Pearson.*—Arm your hook with the line, and cut, so much of a brown mallard's feather as will make the wings. *Walton.*

(2.) **MALLARD**. See **ANAS**, N° 6.

\* **MALLEABILITY**. *n. f.* [from *malleable*.] Quality of enduring the hammer; quality of spreading under the hammer.—Supposing the nominal essence of gold to be a body of such a peculiar colour and weight, with the *malleability* and fusibility, the real essence is that constitution on which these qualities and their union depend. *Locke.*

\* **MALLEABLE**. *adj.* [*malleable*, Fr. from *malleus*, Lat. a hammer.] Capable of being spread by beating: this is a quality possessed in the most eminent degree by gold, it being more ductile than any other metal; and is opposite to friability or brittleness. *Quincy.*—Make it more strong for falls, though it come not to the degree to be *malleable*. *Bacon.*

The beaten soldier proves most manful,

That like his sword endures the anvil;

And justly's held more formidable,

The more his valour's *malleable*. *Hudibras.*

—If the body is compact, and bends or yields inward to pressure without any sliding of its parts, it is hard and elastic; if the parts slide upon one another, the body is *malleable* or soft. *Newton.*

\* **MALLEABLENESS**. *n. f.* [from *malleable*.] Quality of enduring the hammer; malleability; ductility.—The bodies of most use that are sought for out of the earth are the metals, which are distinguished from other bodies by their weight, fusibility, and malleableness. *Locke.*

\* **To MALLEATE**. *v. a.* [from *malleus*, Lat.] To hammer; to forge or shape by the hammer.—He first found out the art of melting and malleating metals, and making them useful for tools. *Derham.*

**MALLENDERS**. See **FARRIERY**, Part IV, S. S. XI.

(1.) MALLEOLI, or PYROBOLI, in the ancient art of war, were bundles of combustible materials, set on fire to give light in the night, or to annoy the enemy; when they were employed for the latter purpose they were shot out of a bow, or fixed to a javelin, and thus thrown into the enemy's engines, ships, &c. in order to burn them. Pitch was always a principal ingredient in the composition.

(2.) MALLEOLI, in anatomy, the ancle bones. See ANATOMY, § 158.

MALLERE, a town of the French republic, in the dept. of MARENGO, and late duchy of Monterrat; 9 m. NW. of Savona, and 25 S. of Acqui.

(1.) MALLETT, or MALLOCH, David, an English poet, but a Scotman by birth, born about 1700. By the penury of his parents, he was compelled to be janitor of the high school at Edinburgh; but he surmounted the disadvantages of his birth and fortune; for when the Duke of Montrose applied to the college of Edinburgh for a tutor to educate his sons, Malloch was recommended. When his pupils went abroad, they were entrusted to his care; and having conducted them through their travels, he returned with them to London. While residing in their family, he began to give specimens of his poetical talents. In 1733, he published a poem on *Verbal Criticism*; in 1740, he wrote a Life of Lord Bacon, which was prefixed to an edition of his works; but forgot to mention that Bacon was a philosopher. The old duchess of Marlborough assigned in her will the task of writing the Duke's life, to Glover and Mallet, with a reward of 1000*l.* and a prohibition to insert any verses. Glover is said to have rejected the legacy with disdain, so that the work devolved upon Mallet; who had also a pension from the duke's son to promote his industry, and was continually talking of the discoveries he had made, but left not when he died any historical labours behind him. When Frederick prince of Wales was driven from the palace, and kept a separate court by way of opposition, to increase his popularity by patronizing literature, he made Mallet his under secretary, with a salary of 200*l.* a year. Thomson likewise had a pension; and they were associated in the composition of the masque of *Alfred*, which, in its original state, was played at Cusden in 1740. It was afterwards almost wholly changed by Mallet, and brought upon the stage of Drury Lane in 1751, but with no great success. He had before published two tragedies; *Furydice*, acted at Drury Lane in 1731; and *Mylapba*, acted in 1739. It was dedicated to the prince, and well received, but never revived. His next work was *Amyntor and Theodora* (1747), a long story in blank verse; in which there is elegance of language and vigour of sentiment. In 1753, his masque of *Britannia* was acted at Drury Lane, and his tragedy of *Eleira* in 1763; when he was appointed keeper of the book of entries for ships in the port of London. In the beginning of the French war, in 1756, when the nation was exasperated by ill success, he was employed to turn the public vengeance upon Adm. Byng, and wrote a letter of accusation under the character of a *Plain Man*. This paper was with great industry dispersed, and Mallet was reward-

ed with a considerable pension, which he continued to his death. Towards the end of 1763, he went with his wife to France; but, his health declining, he returned alone to England, and died in April 1765. He was twice married, and by his first wife had several children; his second wife was the daughter of a nobleman's who had a considerable fortune, which she took care to retain in her own hands. His stature was diminutive, but being regularly formed, he had a pleasing appearance, till he grew corpulent, was agreeable in his conversation elegant and easy.

(2.) MALLET, Miss, a daughter of the Duke of Devonshire, who married an Italian of rank, named Maffei, and wrote a tragedy, called *Almira*, which was acted at Drury-Lane.

(3.) MALLET, Edmund, was born at London in 1713, and enjoyed a curacy near it, till 1740, when he went to Paris to be professor of French in the college of Navarre, of which he was elected D. D. Boyer, Bp. of Mirepoix had been at first much prejudiced against him for his doctrine and morals. Jansenism was imputed to him by his enemies, and the name of *Ecclesiastical* was given to him, which went by the name of *Ecclesiastical*, and was imputed to him of impiety; both imputations equally false. He died at Paris in 1755, at the age of 42. The principal of his works are, 1. *Principes de la lecture des Poëtes*, 1745, 2 vols, 12mo. 2. *Sur l'Etude des Belles Lettres*, 1747, 12mo. 3. *Sur les bienséances oratoires*, 1753, 12mo. 4. *Discours pour la lecture des Orateurs*, 1755, 3 vols, 12mo. 5. *Histoire des Guerres civiles de France sous le Règne de Francois II. Charles IX. Henri III.* &c. translated from the Italian of D'Avila.—Mallet was like his mind and manners, was easy and moderate; and his attachment to his friends, his moderation, gentleness, and modesty, rendered him truly amiable. He was employed to write the articles on theology and the bell in the *Encyclopédie*; and these were well received. He was preparing two important works, *Histoire generale de nos Guerres depuis le commencement de la Monarchie*; and *Une Histoire de la Guerre de Trente*, in opposition to that of Father Paucan; he died at Paris, in 1755.

(4.) \* MALLET, *n. f.* (*mallevus*, Lat.) A hammer.—The vessel soddered up with iron was struck with a wooden mallet, and then pressed. *Boyle*.—

Their left-hand does the calking iron.  
The rattling mallet with the right they use.

(5.) MALLETS are much used by artificers in work with chisels, as sculptors, maçons, a cutters, whose mallet is ordinarily round; carpenters, joiners, &c. who use it square. There are several sorts of mallets used for different purposes on ship-board. The caulking mallet is employed to drive the oakum into the joints of a ship, where the edges of the planks are driven to each other in the sides, deck, or bottom. The head of this mallet is long and cylindrical, and is hooped with iron to prevent it from splitting in the exercise of caulking. There is also the hammer mallet, used in serving the rigging, by being spun yarn more firmly about it than could be done by hand, which is performed

lowing manner: the spun yarn being previously rolled up in a large ball or clue, 2 or 3 turns it are passed about the rope, and about the dy of the mallet, which for that purpose is furnished with a round channel in its surface, that conforms to the convexity of the rope intended to be served. The turns of the spun yarn being wound round the mallet, so as to confine it firmly to the rope, which is extended above the deck, the man passes the ball continually about the rope, whilst the other, at the same time, winds the spun yarn by means of the mallet, whose handle acting as a lever strains every turn about the rope as firm as possible.

1.) MALLEVILLE, Claud DE, a French poet, born at Paris, and one of the first members of the French academy. He gained a prize from Voiture and other ingenious men. He became secretary to M. de Bassompierre, to whom he performed some very important services while he was in prison; and with the rewards he received purchased the place of secretary to the king. He was likewise secretary to the French academy, and died in 1647. He wrote sonnets, stanzas, elegies, epigrams, songs, madrigals, and a paraphrase on some of the Psalms. His sonnets were most esteemed.

2.) MALLEVILLE, a town of France, in the department of Lower Loire, 15 miles NW. of Nantes.

MALLEUS. See ANATOMY, *Index*.

MALLICOLLO, one of the New Hebrides, the most considerable of them next to *Espiritu*. It is 18 leagues long from SE. to NW. Its greatest breadth, which is at the SE. end, is 24 leagues; the NW. end is  $\frac{1}{2}$  its breadth, and narrower towards the middle. This contraction is occasioned by a wide and deep bay on the SW. side. It is very fertile, and well inhabited; the land on the sea side is rather low, and lies with a slope from the sea. The natives call it *Mallicollo*, which nearly resembles *Manicollo*, the name which Quiros reported for it 160 years before. The S. coast, which was most attentively examined by captain Cook, is luxuriantly clothed with wood and other vegetables, from the sea-shore to the very summits of the hills. On the NW. it is less woody, and more agreeably intersected by lawns, some of which appeared to be cultivated. Vegetable productions abound in great variety; cocoa nuts, bread-fruit, bananas, sugar canes, yams, eddoes, turmeric; but the fruits are not so good as the Society and Friendly Isles. Hogs and poultry are their domestic animals; the former numerous. A brace of Tahitian puppies was sent them, with a view to stock the country with that species of animal: these they received with strong signs of satisfaction. The woods are frequented by many species of birds. A shark, 9 feet in length, on which the ship's company feasted with great relish: when cut open, it was found to have the bony point of an arrow sticking in its head, having been shot quite through the skull. The wound was healed so speedily, that not the smallest vestige of it appeared on the outside: a piece of the wood still remained sticking to the bony point, but so rotten, as to crumble into dust at the touch. Two red reddish fish of the sea-bream kind were like-

wife caught, on which most of the officers dined. The night following all who had eaten of them were seized with violent pains in the head and bones, attended with a scorching heat all over the skin, and numbness in the joints; even such hogs and dogs as had partaken of these fish gave strong symptoms of being poisoned: one hog, who had eaten of the garbage, swelled to a great size and died at night: several dogs were affected in the same manner; they groaned most pitifully, had violent reachings, and could hardly drag their limbs along. These fish were supposed to have been of the same sort with those which Quiros mentions to have produced similar effects on board his ship. The effects of this poison on the officers continued for near a fortnight, during which time their pains returned every night, their teeth were loose, and their gums and palate excoriated. The natives of Mallicollo are described as the most ugly, ill-proportioned people imaginable, and in every respect different from the other islanders in the South Sea. They are of a very dark colour, and diminutive size; with long heads, flat faces, and monkey countenances; their hair in general black or brown, short and curly, but not so soft and woolly as that of a negro. Their beards are very strong, crisp and bushy, and generally black and short. But what serves to increase their natural deformity is a custom which they have of wearing a belt, or cord round their waist: this rope is as thick as a man's finger, and is tied so tight round their belly, that it would be fatal to a person unaccustomed from infancy to such an unnatural ligature; for it cuts such a deep notch across the navel, that the belly seems in a manner divided, one part being above and the other below the rope. The men go quite naked except a piece of cloth or leaf used as a wrapper. Most other nations invent some kind of covering from motives of shame; but here a roll of cloth, continually fastened to the belt, rather displays than conceals the parts. Besides having the flat broad nose and projecting cheek-bones of a negro, and a very short forehead, many increased their natural ugliness by painting their faces and breasts black. Some few had a small cap on the head made of matted work. They wear bracelets of white and black shells, which press the upper arm so closely, that they seem to have been put on when the wearer was very young: this tends, as well as the belt, to reduce the Mallicolles to that slender shape which characterises them. The depression of their foreheads is supposed to be artificial, as the heads of infants may be squeezed into any kind of form. The first natives that were seen, carried clubs in their hands, and waded into the water, carrying green boughs, the universal sign of peace. They ventured to come within a few yards of the ship's boat, which was sent out; when they dipped their hands into the sea, and gathering some water in their palms, poured it on their heads. The officers in the boat did the same, with which the Indians appeared to be much pleased. They repeated the word *tomarr*, or *tomarro*, continually. The greater part were armed with bows and arrows, and a few with spears. At length they ventured near the ship, and received a few presents of Tahitian

cloth, which they eagerly accepted, and handed up their arrows in exchange, some of which were pointed with wood and some with bone, and daubed with a black gummy stuff which was supposed to be poisoned; but its effects were tried on a dog, without producing any dangerous symptoms. They continued about the ship, talking with great vociferation, but at the same time in such a good-humoured manner as was very entertaining. On looking stedfastly at one of them, he began to chatter with great fluency. Some continued about the ship till midnight; finding, however, at length, that they were but little noticed, for the captain wanted to get rid of them, they returned on shore, where the sound of singing and beating their drums was heard all night. Mr Forster supposes there may be 50,000 inhabitants on this extensive island, which contains above 600 square miles, and appears to be one extensive forest. The natives appear to be a race totally distinct from those of the Friendly and Society Islands; their form, language, and manners, strongly mark this difference. The natives, of some parts of New Guinea and Papua, correspond, in many particulars, with what has been observed of the Mallicollese. They differ likewise very widely from the light-coloured inhabitants of the South Sea, by keeping their bodies entirely free of punctures. Whatever these people saw, they coveted; but they never repined at a refusal. The looking-glasses which were given them were highly esteemed, and they took great pleasure in viewing themselves; so that these ugly people seemed to have more conceit than the beautiful inhabitants of Otaheite and the Society Islands. Early the next morning they came off to the ship in their canoes, and 4 or 5 of them went on board without any arms. They soon became familiar, and, with the greatest ease, climbed up the rigging to the mast-head; when they came down, the captain took them into his cabin, and gave them medals, ribbons, nails, and pieces of red baize. They appeared the most intelligent of any nation that had been seen in the South Sea; they readily understood signs and gestures; and in a few minutes taught the gentlemen of the ship several words in their language, which appeared to be wholly distinct from that general language of which so many dialects are spoken at the Society Islands, the Marquesas, Friendly Isles, Easter Island, and New-Zealand. Their language was not difficult to pronounce, but contained more consonants than any of them. Mr Forster, and some other gentlemen, went on shore, and conversed with the natives, who with great goodwill sat down on the stump of a tree to teach them their language. They were surprised at the readiness of their guests to remember, and seemed to wonder how it was possible to preserve the sound by such means as pencils and paper. They were not only assiduous in teaching, but seemed anxious to learn the language of the strangers, which they pronounced with such accuracy, as led their instructors to admire their extensive faculties and quick apprehension. Observing their organs of speech to be so flexible, they tried the most difficult sounds in the European languages, and had recourse to the com-

mon Russian *stch*, all of which they did at the first hearing without the least error. They learned the English numerals, and repeated rapidly on their fingers; so they wanted in personal beauty was attested in acuteness of understanding express their admiration by kissing hands. Their music is not remarkable for harmony, but seemed to be more lively than the Friendly Islands. Their behaviour to the visitors was, in general, harmless, but they gave them no invitation to stay, and for they seemed not to relish the proximity of powerful people, being probably accus- tomed to acts of violence and outrage from their neighbours. Very few women were seen, but those I saw were no less ugly than the men; they were of a short stature, and their heads, faces, and limbs were painted red. Those who were seen had short pieces of a kind of cloth, or mat, round their waists, reaching nearly to the knees; the rest had only a string round the middle, and a wisp of straw; and the younger ones, I saw, to the age of 10 years, went stark naked like the boys of the same age. The women wore no ornaments in their ears or round the neck and arms, it being fashionable for them to adorn themselves; and wherever this custom prevails, the other sex is commonly despised, and in a state of servility. Here men were seen with bundles on their backs, which contained their children; the men seemed to have little regard for them. None came off to the ship, and they generally kept at a distance when any party landed from the ship. They perforate the cartilage of the nose with the point of a stone, and thrust therein a piece of bone about an inch and a half long, which is fixed like the curvature of a bow. The nostrils are then low, and covered with a palm-leaf, which is enclosed or walled round with bone, the entrance to these was by a square hole at the end. Their weapons are bows and arrows, and clubs about two feet and a half long, made of casuarina wood, commonly knobbed at the ends, and well polished. This weapon they carry on their right shoulder, from a thick rope, which is a kind of gaiter. It appeared to be peculiarly adapted for close engagements, after having emptied the bow. On the left wrist they wear a circular plate, neatly covered, and joined with a string about 5 inches diameter; upon which the violence of the recoiling bow-string serves their arm unhurt. Their arrows are made of a sort of reed; and are sometimes armed with a long sharp point made of the same wood, sometimes with a very hard point made of stone. Some of these are armed with 2 or 3 points, with small prickles on the edge to prevent the arrow from being drawn out of the wound. Their food seems to be principally vegetables, which they apply themselves to husbandry. The number of canoes that were seen along the coast of the ship at one time did not exceed 10, or 12, and Mr Forster, 14, with only 4 or 5 in each; they were small, of indifferent workmanship, and without ornament; but provided with a *outrigger*. After some slight manœuvres

on on the part of the natives, which  
 on in their canoes whilst about the  
 Cook, with a party of marines in  
 ned in the face of 400 or 500 Indi-  
 assembled on the shore. Tho' they  
 ed with bows and arrows, clubs and  
 made not the least opposition; on the  
 ing the captain advance alone, un-  
 only a green branch in his hand, one  
 o seemed to be a chief, giving his  
 ows to another, met him in the wa-  
 llo a green branch. When they met,  
 were exchanged; and the chief led  
 y the hand up to the crowd, to whom  
 ly distributed presents: in the mean  
 iners were landed, and drawn up up-  
 . The captain then made signs that  
 ood, and they by signs gave him per-  
 t down the trees. A small pig was  
 ught and presented to the captain,  
 n gave the bearer a piece of cloth. It  
 l from this instance, that an exchange  
 for various articles of merchandize  
 place; but these expectations proved  
 so more pigs were procured, and on-  
 f a dozen cocoa nuts, and a small  
 fish water. As these islanders were  
 hogs as well as fowls, their backward-  
 with either might be owing to the lit-  
 n in which they held such articles as  
 ed in barter; for they set no value on  
 other kind of iron tools, and held all  
 s of finery equally cheap. They would  
 in exchange an arrow for a piece of  
 ery feldom would part with a bow.  
 g on board what wood had been cut,  
 embarked, and the natives dispersed.  
 ip was about to leave the island, the  
 reumstances took place: "When the  
 us under sail, (says Capt. Cook,) they  
 canoes, making exchanges with more  
 han before, and giving such extraor-  
 ds of their honesty as surpris'd us. As  
 irst had fresh water through the water,  
 e canoes dropt astern after they had  
 eds, and before they had time to deli-  
 return: Instead of taking advantage  
 ur friends at the Society Islands would  
 they used their utmost efforts to get  
 , and deliver what they had already  
 or. One man in particular followed  
 nsiderable time, and did not reach us  
 alin, and the thing was forgotten. As  
 ame along-side, he held up the article,  
 al on board were ready to buy: but  
 o part with it till he saw the person to  
 ud before sold it; and to him he gave it,  
 , not knowing the man again, offered  
 ing in return, which he refused; and  
 what had been given before, at length  
 sensible of the nice sense of honour  
 etuated this Indian." SANDWICH HAR-  
 which Capt. Cook's ship anchored, lies  
 middle of this island on the NE. side; in  
 17° 53' E. Lat. 16° 25' 20" S.  
 CH. See MALLETT, N° 1.  
 T, a town of France, in the dept. of  
 3 miles S. of Caen.

(1.) MALLOW, a manor, and borough town  
 of Ireland, in Cork, above 118 miles from Dub-  
 lin. It was incorporated by charter in 1688, and  
 sends one member to the imperial parliament. It  
 is pleasantly situated on the N. bank of the Black-  
 water, over which there is an excellent stone  
 bridge. It has a good church, a market house,  
 and barracks for a troop of horse. Not far dis-  
 tant is a fine spring of moderately tepid water,  
 which bursts out of the bottom of a fine limestone  
 rock, and approaches very near in all its qualities  
 to the hot-well waters of Bristol; which brings a  
 resort of good company in summer, and has caus-  
 ed it to be called the *High Bath*. Mallow is a post  
 town, and has 5 fairs. It is 14 miles N. of Cork.  
 Lon. 8. 39. W. Lat. 52. 8. N.

MALMAISON, or CHATEAU DE MAISON, the  
 country seat of the First Consul of France, is seat-  
 ed on the Seine, 9 miles from Paris, and 3 from  
 St Germain. At the revolution it belonged to  
 Count Artois. It is elegantly ornamented with  
 columns, pilasters, and other ornaments of archi-  
 tecture, in the Doric, Ionic, and Corinthian or-  
 ders; and finely embellished with pictures, statues,  
 gardens, cascades, fruit-trees, &c. The castle is sur-  
 rounded by a dry fosse and bordered by a terrace.

MALMEDY, a town of the French republic,  
 in the dep. of Curte, and late bishopric of Liege.  
 It was taken by the French, Oct. 19, 1794. It is  
 seated on the Recht, 9 miles S. of Limburg, and  
 40 N. of Luxemburg. Lon. 6. 2. E. Lat. 50. 18.  
 N.

(1.) MALMSBURY, a town of Wiltshire, 95  
 miles from London. It stands on a hill, with six  
 bridge over the river Avon at the bottom; with  
 which, and a brook that runs into it, it is in a  
 manner encompassed. It formerly had walls and a  
 castle, which were pulled down to enlarge the ab-  
 bey, whose abbots sat in parliament. The Saxon  
 King Athelstan granted the town large immunities,  
 and was buried under the high altar of the church,  
 and his monument still remains in the nave of it.  
 The memory of Aldhelm, its first abbot, who was  
 the king's great favourite, and whom he got to be  
 canonized after his death, is still kept up by a  
 meadow near this town, called Aldhelm's Mead.  
 By charter of K. William III. the corporation  
 consists of an alderman, chosen yearly, 12 capital  
 burgesses, and 4 assistants. There is an alms-house  
 for 4 men and 4 women, and near the bridge an  
 hospital for lepers, where it is supposed there was  
 formerly a nunnery. This town drives a conside-  
 rable trade in woollen manufactures, has a mar-  
 ket

justly malted and well ground. When the grain is not sufficiently malted, it is apt to prove hard, so that the water can have but very little power to dissolve its substance; and if it be too much malted, a part of the fermentable matter is lost in that operation. The harder and more stinty the malt is, the finer it ought to be ground; and in all cases, when intended for distillation, it is advisable to reduce it to a kind of finer or coarser meal. When the malt is thus ground, it is found by experience that great part of the time, trouble, and expence of the brewing is saved by it, and yet as large a quantity of spirit will be produced; for thus the whole substance of the malt may remain mixed among the tincture, and be fermented and distilled among it. This is a particular that very well deserves the attention of the malt distiller as that trade is at present carried on; for the dispatch of the business, and the quantity of spirit procured, is more attended to than the purity or perfection of it. The secret of this matter depends upon the thoroughly mixing or briskly agitating and throwing the meal about, first in cold and then in hot water; and repeating this agitation after the fermentation is over, when the thick turbid wash being immediately committed to the still already hot and dewy with working, there is no danger of burning, unless by accident, even without the farther trouble of stirring, which in this case is found needless, though the quantity be ever so large, provided that requisite care and cleanliness be used; and thus the business of brewing and fermenting may very commodiously be performed together, and reduced to one single operation. Whatever water is made choice of, it must stand in a hot state upon the prepared malt, especially if a clear tincture be desired; but a known and very great inconvenience attends its being applied too hot, or too near to a state of boiling, or even scalding with regard to the hand. To save time in this case, and to prevent the malt running into lumps and clods, the best way is to put a certain measured quantity of cold water to the malt first; the malt is then to be stirred very well with this, so as to form a sort of thin uniform paste or pudding; after which the remaining quantity of water required may be added in a state of boiling, without the least danger of making what, in the distillers language, is called a *pudden*. In this manner the due and necessary degree of heat in water, for the extracting all the virtues of the malt, may be hit upon very expeditiously, and with a great deal of exactness, as the heat of boiling water is a fixed standard which may be let down to any degree by a proportionate mixture of cold water, due allowances being made for the season of the year, and for the temperature of the air. This little obvious improvement, added to the method just above hinted for the reducing brewing and fermentation to one operation, will render it practicable to very considerable advantage, and the spirit improved in quality as well as quantity. A much more profitable method, than that usually practised for the fermenting malt for distillation, in order to get its spirit, is the following: take ten pounds of malt reduced to a fine meal, and three pounds of common wheat-meal; add to these two gallons of cold water, and stir

them well together; then add five gallons of water boiling hot, and stir altogether again. Let the whole stand two hours, and then stir it again; and when grown cold, add to it two ounces of solid yeast, and set it by loosely covered in a warmish place to ferment. This is the Dutch method of preparing what they call the *wasch for malt spirit*, whereby they save much trouble and procure a large quantity of spirit: thus commodiously reducing the two businesses of brewing and fermenting to one single operation. In England the method is to draw and mash for spirit as they ordinarily do for beer, only instead of boiling the wort, they pump it into large coolers, and afterwards run it into their fermenting backs, to be there fermented with yeast. Thus they bestow twice as much labour as is necessary, and lose a large quantity of their spirit by leaving the gross bottoms out of the still for fear of burning. All simple spirits may be considered in the three different states of low wines, proof spirit, and alcohol, the intermediate degrees of strength being of less general use; and they are to be judged of only according as they approach to or recede from these. Low wines at a medium contain a sixth part of pure inflammable spirit, five times as much water as spirit necessarily arising in the operation with a boiling heat. Proof goods contain about one half of the same totally inflammable spirit; and alcohol entirely consists of it. Malt low wines, prepared in the common way, are exceeding rank; they have, however, a natural vinosity or pungent agreeable acidity, which would render the spirit agreeable to the palate were it not for the large quantity of the gross oil of the malt that is bound in it. When this oil is detained in some measure from mixing itself among the low wines, the stretching a coarse flannel over the neck of the still or at the orifice of the worm, the spirit becomes much purer in all respects; it is less fulsome to the taste, less offensive to the smell, and less milky to the eye. When these low wines, in the rectification into proof-spirits, are distilled gently, they leave a considerable quantity of this gross fetid oil behind them in the still along with the phlegm; but if the fire be made fierce, this oil is again raised and brought over with the spirit; and being now broken somewhat more fine, it impregnates it in a more nauseous manner than at first. This is the common fault both of the malt distiller and of the rectifier; the latter, instead of separating the spirit from this nasty oil, which is the principal intent of his process, attends only to drawing the phlegm in such quantity behind, that the spirit may be of a due strength as proof or marketable goods, and brings over the oil in a worse state than before. To this inattention to the proper business of the process, it is owing, that the spirit, after its several rectifications, as they are miscalled, is often found more stinking than when delivered out of the hands of the malt distiller. All this may be prevented by the taking more time in the subsequent distillations, and keeping the fire low and regular; the sudden stirring of the fire, and the hasty way of throwing on the fresh fuel, being the general occasion of throwing up the oil by spurts, where the fire is green during the process, has not been so large as to be

ntier in pefence of the old doctor. The academican was afraid to meet his looks ; fooner was the reading finished, than Mawent up to him, and embracing him, faid give my refpects ; you have feen farther into bject than I did."

**LPARTIDO**, a town of Spain, in *Extremadura* 14 miles S. of *Placentia*.

**MALPAS**, a town of *Cheshire*, 166 miles London. It ftands on a high hill, not far he river *Dec*, on the borders of *Shropshire* ; grammar fchool, and an hofpital, and had a caftle. It is called in Latin *Mala Placentia Ill Street*, and was, for the fame reafon, Normans, called *Mal Pas* ; but its three of which it chiefly confifts, are now well ; and it has two reftors, who officiate aldy in its ftately church. It has a good market Monday and 3 annual fairs.

**MALPAS**, a mountain of France, which was rough for the canal of *LANGUEDOC*.

**MALPICA**, a town of Portugal, in *Beira*.

**MALPICA**, a town of Spain in *Galicia*.

**LPIGHI**, *Marcellus*, an eminent Italian anatomift in the 17th century. He l under *Maflari* and *Mariano*. The D. of ny invited him to *Pifa*, to be profeflor of there. In this city he contracted an intacquaintance with *Borelli*, to whom he afall the difcoveries he had made. He went to *Bologna*, the air of *Pifa* not agreeing im. Cardinal *Antony Pignatelli*, who had him while he was legate at *Bologna*, before pope in 1691, under the name of *IN-IT XII*. immediately fent for him to *Rome*, appointed him his phyfician. He died in and his works, with his life, written by f, prefixed, were firft collected and printed don, in fol. in 1667. See *ANATOMY, Index*.

**LPIGHIA**, *BARBADOS CHERRY*, a general trigynia order, belonging to the decanafs of plants ; and in the natural method g under the 23d order, *Tribilate*. The calantaphyllous, with melliferous pores on the at the bafe. There are 5 petals, roundifh, quiculated: the berry unilocular trispermous. are 10 fpecies, all shrubby evergreens of the parts of *America*, rifing with branchy ftems or 10, to 15 or 20 feet high, ornamented oval and lanceolate entire leaves, and large etalous flowers, fucceeded by red cherry-eatable berries, of an acid and palatable. Three of thefe fpecies are reared in our s, and make a fine variety in the ftove. retain their leaves all the year round ; and o flower about the end of autumn, con- in constant fucceffion till the fpring ; afch they frequently produce and ripen their which equals the fize of a fmall cherry. The are of a pale red or purple colour. Thefe are propagated by feeds, which muft be a fpring, in pots of rich earth : then plung- a hot bed ; and when 3 or 4 inches high, feperate fmall pots, watered and plunged in k-bed of the ftove ; where after they have ed a year or two, they may be placed in rt of it. They may even be placed in the air during a month or two of the hotteft

weather in fummer ; but muft be carefully fupplied with water during the whole year.

**MALPLAQUET**, a village of the French republic, in the department of *Gemappes*, and late province of *Auftrian Hainault*, famous for a moft bloody battle fought on the 11th September, 1709, between the French under marfhall *Villars*, and the allies under prince *Eugene* and the D. of *Marlborough*. (See *ENGLAND, § 75*.) The French army amounted to 120,000 men ; and were pofted behind the woods of *La Marte* and *Taniers*, in the neighbourhood of *Malplaquet*. They had fortified their fituation in fuch a manner with lines, hedges, and trees laid acrofs, that they feemed to be quite inacceffible. In this fituation they expected certain victory ; and even the foldiers were fo eager to engage, that they flung away the bread which had been juft given them, though they had taken no fufenance for a whole day before. The allied army began the attack early in the morning, favoured by a thick fog. Their chief impreffion was made upon the left of the enemy ; and with fuch fuccefs, that, notwithstanding their lines and barricadoes, the French were in lefs than an hour driven from their entrenchments. But on the right the combat was fufained with much greater obftinacy. The Dutch, who carried on the attack, drove them from their firft line ; but were repulfed from the 2d with great flaughter. The prince of *Orange*, who headed that attack, perfifted in his efforts with incredible perfeverance and intrepidity, though two horfes had been killed under him, and the greater part of his officers flain and difabled. At laft, however, the French were obliged to yield, *Villars* being dangerously wounded ; but they made an excellent retreat under *Bouffers*, and took poft near *Guefnoy* and *Valenciennes*.

**MALSESINE**. See *MALACESENE*.

(1.) \* **MALT**. *n. f.* [*malt*, *Saxon* ; *mout*, *Dutch*.] Grain fteeped in water and fermented, then dried on a kiln.—Beer hath *malt* firft infufed into the liquor, and is afterwards boiled with the hop. *Bacon*.

(2.) **MALT** denotes barley cured, or prepared to fit it for making a pot-able liquor, under the denomination of *beer* or *ale*. See *BREWING*.

(3.) **MALT, DISTILLERY OF**, is an extenfive article of trade, by which very large fortunes are made. The art is to convert fermented malt liquors into a clear inflammable fpirit, which may be either fold for ufe in the common ftate of a proof ftrength, that is, the fame ftrength with French brandy ; or is rectified into that purer fpirit ufually fold under the name of *spirit of wine* ; or made into compound cordial waters, by being diftilled again from herds and other ingredients. See *BREWING* and *WASH*. To brew with malt in the moft advantageous manner, it is neceffary, 1. That fubject be well prepared ; 2. That the water be fuitable and duly applied ; and, 3. That fome certain additions be ufed, or alterations made, according to the feafon of the year, and the intention of the operator : and by a proper regulation in thefe refpects, all the fermentable parts of the fubject will thus be brought into the tincture, and become fit for fermentation. The due preparation of the fubject confifts in its being juftly

A mixture of both these makes an amber colour; whence several of these liquors take their name. Now, it is certain, the pale malt has most of the natural grain in it, and is therefore the most nourishing; but, for the same reason, it requires a stronger constitution to digest it. Those, who drink much of it, are usually fat and sleek in their bloom, but are often cut off by sudden fevers; or, if they avoid these, they fall early into a disordered old age. The brown malt makes a drink much less viscid, and fitter to pass the several strainers of the body; but, if very strong, it may lead on to the same inconveniences with the pale; though a single debauch wears off much more easily in the brown. Dr Quincy observes, that the best pale malt liquors are those brewed with hard waters, as those of springs and wells, because the mineral particles, wherewith these waters are impregnated, help to prevent the cohesions of those drawn from the grain, and enable them to pass the proper secretions the better; as the viscid particles of the grain do likewise defend these from doing the mischief they might otherwise occasion. But softer waters seem best suited to draw out the substance of high-dried malts, which retain many fiery particles in their contexture, and are therefore best lost in a smooth vehicle. For the differences in the preparation of malt liquors, they chiefly consist in the use of hops, as in beer; or in the more sparing use of them, as in ale. The difference made by hops is best discovered from the nature and quality of the hops themselves: these are known to be a subtle grateful bitter; in their composition, therefore, with this liquor, they add somewhat of an alkaline nature, i. e. particles that are sublime, active, and rapid. By which means, the rosy viscid part of the malt is more divided and subtilized; and are therefore not only rendered more easy of digestion and secretion, but also, while in the liquor, they prevent it from running into such excrements as would make it ripy, vapid, and sour. For want of this, in unhopped drinks, that eluminate sweetness, which they retain after working, soon turns them acid and unfit for use; which happens sooner or later in proportion to the strength they receive from the malt, and the continuation that it has undergone by fermentation. It is a common opinion, that ale is more diuretic than beer; that is, liquor less hopped more than that with a greater quantity of hops in it; which may hold in some constitutions; because ale being more smooth, softening, and relaxing, where urine is to be promoted by enlarging the passage, as in thin, dry constitutions, this is the most likely to effect it. But, where the promoting of urine is to be done by attenuating and breaking the juices, and rendering them more fluid, it is certainly best answered by those drinks which are well hopped. As to the dispute, whether hops tend to breed the stone, Quincy is of opinion, there is but little reason for the affirmative; and, in general, says, that, for *one* constitution damaged by beer, there are *many* spoiled by ale. This last manifestly foils the glands, stiffens the vessels with slime and viscidness, makes the body unwieldy and corpulent, and paves the way for cachexias, jaundice, asthma, and incurable dropsies. The urinary pass-

ges, also, which it is supposed to clog, will, in time, be filled by it with dough and matter of an ill consequence as gravel. The different strength of malt liquors also makes their effects different. The stronger they are, the more viscid parts they carry into the blood; and though the spirituous parts make these imperceptible at first; yet when these are evaporated, which they will be in a few hours, the other will be sensibly felt by pains in the head, nauuseousness at the stomach, and lassitude or listlessness. This those are the most sensible of, who have experienced the extremes of drinking these liquors and wines; for a debauch of wine they find much sooner worn off, and they are much more lively and brisk afterwards, than after drinking malt liquors, whose viscid remains will be long before they be shaken off. Malt liquors are, therefore, in general, the more wholesome for being small; i. e. of such a strength as is liable to convey a small degree of warmth into the stomach, but not so great as to prevent their being proper diet of the necessary food. Indeed, in robust people, or those who labour hard, the viscidities of the drink may be broken into convenient nourishment; but in persons of another habit and way of living, they serve rather to occasion obstructions and distempers. The wholesomeness of malt liquors also depends much upon their age. Age seems to do nearly the same thing as hops; for those liquors which are longest kept are certainly the least viscid; age breaking the viscid parts, and by degrees rendering them smaller, and fit for secretion. But this is always determined according to their strength; in proportion to which they sooner or later come to their full period, as well as decay; for, when ale or beer is kept, all its particles are broken and comminuted as far as they are capable, then they are best; and beyond this, they will be continually on the decay till the finer spirits are entirely escaped, and the remainder becomes vapid and sour.

(1.) MALT, TAX ON. See MALT-TAX.

To MALT, *v. n.* 1. To make malt. 2. To be made malt.—To house it green it will never burn, which will make it *malt* worse. *Macaulay's History.*

(1, 1.) MALTA, a celebrated island of the Mediterranean, situated between Lon. 15° and 19° E. and between Lat. 35° and 36° N. It is about 19 or 20 leagues in length, 9 or 10 in breadth, and 60 in Circumference.

(2.) MALTA, ANCIENT NAMES, PRODUCTIONS AND HISTORY OF. This island was anciently called MELITA; and is supposed by Cluverius, from its situation and other particulars, to be either OENOGIA, or HYPERIA, mentioned by Homer, which last is most probable, as the poet places the mountain Melita in that island. See HYPERIA. The most ancient possessors of Malta, of whom we have any certain account, were the Carthaginians from whom it was taken by the Romans; and yet during the whole time that it continued under the power of these nations, it was almost entirely barren. The soil was partly sandy and partly rocky, having scarcely any depth of earth; and without fertility, that it was hardly capable of producing corn or any other grain except cummin, and Cassia seeds. Its chief products were figs, —

honey, cotton, and some few other fruits or commodities which the inhabitants exchanged for; and in this barren state it seems to have remained till it came into the possession of the knights. It laboured also under great scarcity of water and fuel: upon all which accounts it was till that time but thinly inhabited,

being only about 30 or 40 scattered villages, no city except the capital, called also MALTA and the town and fort of St Angelo, which added the harbour: so that the whole number of inhabitants, of all ages, did not exceed 20, the greatest part of whom were very ignorant. According to an ancient tradition, Malta was first possessed by an African prince named MATHIAS, an enemy to queen Dida; from whom it was taken by the Carthaginians, as may be inferred from several Punic inscriptions to be seen on stones and other monuments yet standing. From the Carthaginians it passed to the Romans, who themselves masters of it at the same time they subdued Sicily. These were driven out by the Arabs in 828; who were driven out of it in their turn by Roger the Norman, earl of Sicily, who took possession of it in 1190; from which it continued under the dominion of the Sicilians till the time of Charles V. when it fell into his power, along with Naples and Sicily. Charles afterwards gave the island of Sicily from the Turks, and gave the island to the knights of Rhodes.

**MALTA, HISTORY, CONSTITUTION, AND GOVERNMENT OF THE KNIGHTS OF.** The knights of Rhodes, afterwards of Malta, originated from a religious military order, called HOSPITALLERS of JOHN OF JERUSALEM. These knights, famous for defending Christendom, had their rise as follows: Some time before the journey of Godfrey of Bouillon into the Holy Land, some Neapolitan merchants, who traded in the Levant, obliged the caliph of Egypt, to build a hospital for those of their nation who came thither on pilgrimage, upon paying an annual tribute. Towards this they built two churches, and received the pilgrims with great zeal and charity. This example being followed by others, they founded a hospital in honour of St John, and an hospital for the sick; whence they took the name of Hospitaliers. A little after Godfrey had taken Jerusalem in 1099, they began to be distinguished by a habit and a cross with 8 points; and, being the ordinary vow, they took another, to defend the pilgrims against the insults of the infidels. This foundation was completed in 1104, in the reign of Baldwin; and so their order became more illustrious.

Many persons of quality entered into it, and the name of hospitaliers into that of knights. When Jerusalem was taken, and the Christians lost their power in the East, the knights retired to ACRE or Ptolemais, which they defended bravely in 1290. Then they followed the king of Cyprus, who gave them permission in his reign, where they staid till 1300. That same year they took Rhodes, under the grand master PHILIPPE DE VILLET, a Frenchman; and next year they fought against an army of Saracens: since the grand masters have used the 4 letters, L. T. i. e. *Fortitudo ejus Rhodum tenet*; and their order was thence called knights of Rhodes.

In 1522, Soliman II. having taken Rhodes, the knights retired into Candia, and thence into Sicily. In 1530, Charles V. gave them the island of Malta; which in 1566, was besieged by Soliman, but gallantly defended by the grand master JOHN DE VALETTE Parisot, and the Turks obliged to quit it with great loss. (See § 5.) The knights consisted of 8 different languages or nations, of which the English were formerly the 6th; but at present there are but 7, the English having withdrawn. The 1st is that of Provence, whose chief is grand commendator of religion: the 2d, of Auvergne; whose chief is marshal of the order: the 3d, of France, whose chief is grand hospitaller: the 4th, of Italy, and their chief, admiral: the 5th, of Arragon, and their chief, grand conservator: the 6th, of Germany, and their chief, grand bailiff of the order: the 7th, of Castile, and their chief, grand chancellor. The chief of the English was grand commander of the cavalry. None are admitted into this order but such as are of noble birth both by father and mother's side for 4 generations, excepting the natural sons of kings and princes. The knights are of two sorts; those who have a right to be candidates for the dignity of grand master, called *grand crosses*; and those who are only *knights assistants*, who are taken from good families. They never marry; yet have continued from 1090 to the present time. The order consists of 3 estates: the knights, chaplains, and servants at arms. There are also priests who officiate in the churches; friar servants, who assist at the offices; and *donnes*, or *de-mi-crosses*; but these are not reckoned constituent parts of the body. This division was made in 1120, by the grand master Raimond du Puy. The government of the order is mixed, being partly monarchical, and partly aristocratical. The grand master is sovereign, coins money, pardons criminals, and gives the places of grand priors, bailiffs, knights, &c. The ordinary council is composed of the grand master and the grand crosses. Every language has several grand priories, and every priory a certain number of commanderies. The knights are received into this order, either by undergoing the trials prescribed by the statutes, or by dispensation. The dispensations are obtained either by the pope's brief, or by a general chapter of the order; and are granted in case of some defect as to the nobility of their pedigree, especially on the mother's side. The knights are received, either as of age, under minority, or pages to the grand master. They must be 16 years old complete before they are received: they enter into the novitiate at 17, and are professed at 18. They sometimes admit infants of one year old; but the expence is about 4000 livres. The grand master has 16 pages who serve him, from 12 to 16 years of age. The knights wear on the left side of their cloak or waistcoat a cross of white waxed cloth, with 8 points, which is their true badge; that of gold being only for ornament. When they go to war against the Turks, they wear a red cloak, with a great white cross before and behind, without points, which are the arms of the religion. The ordinary habit of the grand master is a sort of caftock of tobby cloth, tied about with a girdle, at which hangs a great purse, to denote the charitable institution of the order.

Of 159 large galleys, and carrying above 6000 effective men besides slaves, under Mustapha, an experienced but cruel officer, and directed to the Christians. This formidable armed force, who, falling unexpectedly on detachments, cut off 1500 Turks with the loss of 80 men. Mean time Mustapha, dreading the arrival of the Spanish reinforcement, and desirous to get possession of a harbour where his troops could place themselves in a better posture of defence, attacked the port of St ELME, which was a harbour large enough to contain the whole Turkish fleet. The garrison was soon reduced to the extremity of distress, that the knights sent the grand master for permission to evacuate the place. This he would by no means consent to, and sent them every night fresh supplies of men and ammunition to make up for the dreadful want that was daily made. The Turks, however, whose numbers were increased by the arrival of galleys, with above 2500 troops on board, besides seamen and slaves, under Dragut and Ulanli, two noted corsairs of the most ferocious rage, raised new batteries in the most advantageous situations, and kept up a continual fire on the fort. The besieged, on the other hand, had their courage renewed and excited to the highest pitch, by the arrival of the most zealous and reliable volunteers from the town, under Constantine Prios, a Greek prince, descended from the celebrated SCANDERBEG, who possessed all the heroism of his ancestor, and who voluntarily undertook the defence of the fort, which La Valette accordingly entrusted to him. He also supplied the fort with a new kind of fire-works, called *burn-boops*, consisting of wooden hoops, covered with wool and steeped in oil mixed with nitre and gunpowder; which, when set on fire and thrown among the besiegers, did dreadful execution by striking several Turks and scorching them to death, which occasioned the utmost confusion among the enemy wherever they fell. In spite of these new and dreadful engines of destruction, however, the Turks cast a bridge over the ditch and began to undermine the wall. From the 17th day to the 14th July not a day passed without a rencounter, but the Turks were repeatedly repulsed with the loss of several thousands. At length, by the advice of Dragut, Mustapha adopted the desperate measure of extending his trenches and batteries on the side next the town, though thus exposed his troops to the double fire of the Maltese, both from fort St Elme and St Angelo. And, though Dragut himself was killed in this enterprise, Mustapha succeeded in his great project of cutting off all communication between the fort and the town. On the 21st he made 4 frequent assaults, but was as often repulsed by the redoubtable valour of the knights; but at last on the 28th he took the fort, though not till every man of the Maltese, capable of bearing arms, had perished at his post. The few sick and wounded who remained were barbarously massacred by the Osman victor, who caused them to be ript up and their hearts torn out, and, as an insult to their

religion, their bodies gashed in the form of crosses. In retaliation for this barbarity, La Valette massacred his Turkish prisoners, and putting their heads into his largest cannon, shot them into the Turkish camp. In this siege the order lost about 1500 men, including 130 of their bravest knights; but the loss of the Turks is incalculable. Mustapha, however, being reinforced by Hassem, the son of Barbarossa, with 2500 select soldiers, called the *Braves of Algiers*, resolved to attack fort St Angelo, and entrusted the assault of fort St Michael to Hassem, and his lieutenant Candelissa, an old corsair, who attacked it by sea, while Hassem made his assault by land. But the Christians defended the fort with such determined resolution, that, though equal valour was displayed by the Turks, the latter were everywhere repulsed with immense slaughter, so that of 4000 men scarcely 500 remained. Nor was Mustapha himself more successful in the siege of St Angelo, although at one period a majority of the knights were of opinion, that the town was not tenible, and proposed that the inhabitants should retire into the fort, with the troops and the sacred relics, &c. But this was opposed by La Valette, to whose determined courage and resolution, (though in his seventy first year) the preservation of the town and island was owing. For although Mustapha's troops fought with the most steady bravery, and employed every stratagem that could be devised, and although Philip II. had hitherto delayed to send his promised troops, yet such was the almost incredible heroism of the Knights of Malta, that they withstood all their efforts, and reduced their army from 45,000 to 15 or 16,000. At this crisis, Don Garcia sent over a body of Spaniards, on the report of whose arrival the Turks immediately raised the siege, and embarked. Learning, however, after going on board, that the number of the Spaniards was only 6000, they again disembarked; and gave them battle; but were driven to their ships with the loss of 2000 men, while only 14 were killed on the side of the Spaniards. Such, after 4 months continuance, was the conclusion of the siege of Malta, which will be for ever memorable on account of that extraordinary display of the most heroic valour by which the knights, so few in number, were enabled to baffle the most vigorous efforts which could be made to subdue them by the most powerful monarch in the world. The news of their deliverance gave universal joy to the Christian powers; and the name of the grand master excited every where the highest admiration and applause. Congratulations were sent him from every quarter; and in many states public rejoicings were celebrated on account of his success.

(6.) MALTA, HISTORY OF, TO THE PRESENT PERIOD. After the raising of the above memorable siege, the power of the Turks began to decline, and at last was so much reduced, that they ceased to be formidable to the Christian nations. The knights of Malta had, therefore, no opportunity of displaying their valour, but continued in quiet possession of the island, till the 9th of June 1798; when the French fleet and army, under Adm. Bonyes and Gen. Bonaparte, appeared

before

before Malta, and demanded permission to enter the port. But the knights, having no *La Vallette* at their head, instead of a spirited refusal, sent a jocular kind of answer, granting permission, provided only *two* vessels should enter at a time. But the French, having no time to trifle, and anxious to get forward to EGYPT, made a general landing on different parts of the island, which they quickly over-ran; invested the capital in the evening, and repulsed the besieged, who endeavoured to prevent their approach by a constant fire. Next day, the French landed their artillery, and prepared for a regular siege; but the grand master, after asking and obtaining a suspension of hostilities for 24 hours; surrendered, upon conditions which were thought very favourable: viz. 1st. That he should receive an annual pension of 300,000 livres: 2. That the republic should endeavour to procure him a principality of equal value: 3. That such of the knights as were natives of France might either return to their country, or continue in Malta, where their residence should be considered as residing in the republic: 4. That a pension of 700 livres should be granted them for life: and, 5. That they and the other inhabitants should retain their private property, privileges, and the exercise of their religion: On these terms, Bonaparte took possession of the island on the 12th May, and found in the port and fortrefs, 2 ships of the line, a frigate, 4 galleys, 1200 cannons, 200,000 lb. of powder, and 40,000 muskets; besides other warlike stores; with an immense treasure in gold and jewels, accumulated by superstition, and 4,500 Turkish prisoners, whom he set at liberty. After leaving a garrison of 3,000 troops in it, the French fleet set sail for Egypt, and were only two days gone, when the British fleet under Admiral Nelson arrived in search of them. But not withstanding the total destruction of the French fleet on the coast of Egypt, (See EGYPT, § 34.) the French garrison in Malta stood a tedious siege and blockade by the British fleet under Admiral Nelson, Trowbridge, &c. for about 22 months; but was at last surrendered by capitulation in May 1801, and taken possession of by the British troops. By the treaty of Peace, which followed, in 1801—2, it was agreed to be restored to the Knights of Malta. And in May 1802, Count Tommasi was appointed grand master by Pope Pius VII; but seems not to have accepted of the office: for in Sept. 1802, the Knights of Malta met at Naples, and elected Count Ruspoli grand master, who was then on a tour through Scotland, and has since declined the honour. Malta is at present (Nov. 1802.) still retained by the British on account of some misunderstanding, not yet completely settled, between the British Court and the First Consul of France.

(7.) MALTA, IMPREGNABILITY OF. "The approach of the island (says Dr Brydon) is very easy, although the shore is rather low and rocky. It is every-where made inaccessible to an enemy by a vast number of fortifications. The rock, in many places, has been sloped into the form of a glacis, with strong parapets and intrenchments running behind it. The fortifications are indeed a most stupendous work. All the boasted catacombs of

Rome and Naples are a trifle to the immensities that have been made in this island. Ditches, of a vast size, are all cut out of rock. These extend many miles, and afford astonishment to think that so small a state ever been able to make them. One the island is so completely fortified by nature there was nothing left for art. The rock is of a great height, and absolutely perpendicular to the sea for several miles. On this side there still vestiges of several ancient roads, & tracks of carriages worn deep in the rocks. The roads are now terminated by the precipice the sea beneath; and show, that this island formerly been of a much larger size than at present. It has been often observed, standing the very great distance of mountain that this island has generally been more affected by its eruptions; and it is probable on some of these occasions a great part of it have been shaken into the sea. One half of Ætna is clearly discovered from Malta. I reckon the distance near 200 Italian miles: the people of Malta affirm, that, in great eruptions of the mountain, their whole island is minutely, and from the reflection in the sea there appears a great track of fire all the way from Malta to Sicily. The thundering mountain is likewise distinctly heard. Tombs, not far from the ancient city of Malta are a great work: they are said to extend many miles under ground. Many people have lost in them by advancing too far; the great number of branches making it next to impossible to find the way out again. The great spring of water that supplies the city of Valetta rises near this place; and there is an arch composed of some thousand arches, that it thence to the city. The whole of this work was finished at the private expence of the grand masters."

(8.) MALTA, LAWS OF, RESPECTING DUELLING. "Perhaps (says Dr Brydon) Malta is the only country in the world where duelling is permitted by law. As their whole establishment is founded on the wild and romantic principles of chivalry, they have ever found it too consistent with those principles to abolish duelling; they have laid it under such restrictions only to lessen its danger. These are curious laws. The duellists are obliged to decide their dispute in one particular street of the city; and presume to fight any where else, they are punished by the rigour of the law. But, what is not singular, but much more in their favour, they are obliged, under the most severe penalties, to give up their swords when ordered to do so by the grand master, a *priest*, or a *knight*. Under these limitations, in the midst of a great city, one would think it almost impossible that a duel could be fought in blood; however, this is not the case: it is always painted opposite to the spot where a knight has been killed, in commemoration of his fall. We counted about 20 of these crosses in Malta. Malta is an epitome of all Europe, and sembler of the younger brothers, who are commonly the best, of its first families. It is one of the best academies for politicians

of the globe; besides, where every one is enabled by law as well as custom to demand satisfaction for the least breach of it, people are under necessity of being very exact and circumspect, with regard to their words and actions."

(10.) MALTA, MANUFACTURES OF. The people of Malta manufacture their cotton into a great variety of stuffs. Their stockings are exceedingly fine and have sometimes been sold for ten sequins a pair. Their coverlets and blankets are esteemed all over Europe. Of these the principal manufactures are established in the island of GOZZO.

(11.) MALTA, POWER OF THE GRAND MASTER. "The grand-master (says Dr Brydon,) is absolute, and possesses more power, than sovereign princes. His titles are, *serenissimo high and eminent*; and his household attendance court are all very princely. As he has the disposal of all lucrative offices, he makes of his will what he pleases; besides, in all the courts that compose the jurisdiction of this little nation he himself presides, and has two votes. He is the disposal of 21 commanderies, and one privilege every 5 years; and as there is always a number of expectants, he is very much courted. He is chosen by a committee of 21; which committee is nominated by the 7 nations, three out of each nation. The election must be over within 3 days after the death of the former grand-master; and during these three days, there is scarce a soul that is at Malta: all is cabal and intrigue; and every knight is masked, to prevent their regular attachments and connections from being known: the moment the election is over, the thing returns to its former channel."

(12.) MALTA, PUEBIC BUILDINGS, STATUES, &c. OF. "Not far from the city there is a small church dedicated to St Andrew and just by the church a statue of the saint, with a viper on his hand; said to be placed on the spot, where the house stood, in which he was killed after his shipwreck on the island, and when he shook the viper off his hand into the fire, the viper being hurt by it: at which time, the Maltese us, he cursed all the venomous animals in the island, and banished them for ever. They are certain that there are no venomous animals in Malta. It is even said, that vipers have been brought from Sicily, and died almost immediately after their arrival. Adjoining to the church is a celebrated grotto in which St Paul was imprisoned. It is looked upon with the utmost reverence and veneration. It is exceedingly damp, and produces (I believe by a kind of petrification of water) a whitish kind of stone, which, when reduced to powder, is a sovereign remedy in many cases, and saves the lives of thousands every year."

There is not a house in the island that is provided with it: and there are many boxes sent annually, not only to Sicily and Italy, but likewise to the Levant, and to the East Indies; notwithstanding this perpetual consumption, it never been exhausted, nor even sensibly diminished. It tastes like Epsom magnesia, and has the same effects. They give about a tea-spoonful of it to children in the small-pox and in the measles. It produces a copious sweat about an hour after it is taken. It is esteemed a certain remedy against

the bite of all venomous animals. There is a very fine statue of St Paul, in the middle of this grotto, to which the Maltese ascribe great power. Notwithstanding the supposed bigotry of the Maltese, (says Dr Brydon,) the spirit of toleration is so strong, that a mosque has been lately built for their sworn enemies the Turks. Here the poor slaves are allowed to enjoy their religion in peace. It happened lately that some idle boys disturbed them during their service; they were immediately sent to prison, and severely punished. The police indeed is much better regulated than in the neighbouring countries, and assassinations and robberies are very uncommon; the last of which crimes the grand master punishes with the utmost severity. He is said to be much more relaxed with regard to the first."

(13.) MALTA, RACES IN. "The horse races of Malta (says Dr Brydon) are of a very uncommon kind. They are performed without either saddle, bridle, whip, or spur; and yet the horses are said to run full speed, and to afford a great deal of diversion. They are accustomed to the ground for some weeks before; and although it is entirely covered with rock and pavement, there are very seldom any accidents. They have races of aries and mules performed in the same manner four times every year. The rider is only furnished with a machine like a shoemaker's awl, to prick on his courser if he is lazy."

(14.) MALTA, SURFACE, SOIL, CULTIVATION, AND PRODUCE OF. The aspect of the country is far from being pleasing; the whole island is a great rock of very white free stone; and the soil that covers this rock is, in most places, not above 5 or 6 inches deep; yet, the crop in general is exceedingly abundant, from the copious dews that fall during spring and summer. The whole island produces corn only sufficient to supply its inhabitants for about 5 months; but the crop they most depend upon is the cotton. They begin to sow it about the middle of May, and continue till the middle of June; and the time of reaping is in the month of October and beginning of November. They pretend that the cotton produced from this plant, which is sown and reaped in 4 months, is of a much superior quality to that of the cotton tree: but Dr Brydon, upon comparison, found, that, though this is indeed the finest, that of the cotton tree is by much the strongest texture. The plant rises a foot and an half; and is covered with a number of pods full of cotton: These, when ripe, they cut off every morning before sunrise; for the heat of the sun immediately turns the cotton yellow. The Maltese oranges are reckoned the finest in the world. The season continues for above 7 months, from Nov. till the middle of June; during which time those beautiful trees are always covered with abundance of delicious fruit. Many of them are of the red kind, and much superior to the others, which are rather too luscious. They are produced from the common orange bud, ingrafted on the pomegranate stock. The juice of this fruit is as red as blood, and of a fine flavour. The greatest part of their crop is sent in presents to the different courts of Europe, and to the relations of the chevaliers. The industry of the Maltese in cultivating their island

island is inconceivable. There is not an inch of ground lost in any part of it; and where there was not soil enough, they have brought over shiploads of it from Sicily. The whole island is full of inclosures of free-stone, which give the country a very uncouth and barren aspect; and in summer reflects such a light and heat, that it is exceedingly offensive to the eyes. The inclosures are small and irregular, according to the inclination of the ground; which they are obliged to observe, otherwise the floods would soon carry off their soil.

(14.) MALTA, TOWNS, VILLAGES, HARBOURS, &c. OF. "The island (says Dr Brydon) is covered with country houses and villages, besides 7 cities, as they term them; but there are only two, viz. Valetta, and Citta Vecchia, that deserve that appellation. Every little village has a church, elegantly finished, and adorned with statues of marble, rich tapestry, and a large quantity of silver plate. The city of VALETTA has certainly the happiest situation that can be imagined. It stands upon a peninsula between two of the finest ports in the world, which are defended by almost impregnable fortifications. That on the S. side is the largest. It runs about 2 miles into the heart of the island; and is so very deep, and surrounded by such high grounds and fortifications, that the largest ships of war might ride here in the most stormy weather, almost without a cable. This beautiful basin is divided into 5 distinct harbours, all equally safe, and each capable of containing an immense number of shipping. The mouth of the harbour is scarcely a quarter of a mile broad, and is commanded on each side by batteries that would tear the strongest ship to pieces before she could enter. Besides this, it is fronted by a quadruple battery, one above the other, the largest of which is a *fleur d'eau*, or on a level with the water. These are mounted with about 80 of their heaviest artillery. The harbour on the N. side, although they only use it for fishing, and as a place of quarantine, would, in any other part of the world, be considered as inestimable. It is likewise defended by very strong works; and in the centre of the basin is an island on which they have built a castle and a lazaret. The streets of Valetta are crowded with well dressed people, who have all the appearance of health and affluence. The principal inn is like a palace; the principal villas, particularly those of the grand master and the general of the galleys, which lie contiguous, are nothing great or magnificent; but are admirably contrived for a hot climate, where, of all things, shade is the most desirable. The orange groves are indeed very fine, and the fruit they bear superior to any thing of the kind in Spain or Portugal." See § 13.

(15.) MALTA, TROOPS, POPULATION, SHIPPING, &c. OF. "The land force of Malta is equal to the number of men in the island fit to bear arms. They have about 500 regulars belonging to the ships of war; and 150 compose the guard of the prince. Malta and Gozzo contain about 150,000 inhabitants. The men are exceeding robust and hardy. They will row for 10 or 12 hours without intermission, and without even appearing to be fatigued. Their sea force consists of 4 galleys, 3 galliots, 4 ships of 60 guns, and a

frigate of 36, besides a number of quick little vessels called *scampavias*, literally *rs*. Their ships, galleys, and fortifications, only well supplied with excellent artillerie they have likewise invented a kind of ord their own, unknown to all the world. For the rocks are not only cut into fortifi but likewise into artillery, to defend the cations, being hollowed out, in many pla to the form of immense mortars. The c said to be about a barrel of gunpowd which they place a large piece of wood, n actly to fit the mouth of the chamber. they heap a great quantity of cannon ball or other deadly materials; and when an ship approaches the harbour, they fire th into the air: and they say it produces a v effect; making a shower for 200 or 30 round, that would sink any vessel."

(II.) MALTA, the capital of the abov now called Valetta. See § 14, and VAL  
MALT-BRUISER, or BRUISING-MILL, been found by repeated experiments, th ing malt is a more advantageous method old one of grinding and flouring. By there is not only less waste, but the mal better fitted for giving out all its virtues. lately, therefore, become a practice to malt between rollers, by means of a p paratus, of which various constructions h invented. As the best contrivance of th said to be the bruising mill of Mr Wit have given a figure of it on Plate CC where AAAA is the frame; B, the large or roller; C, the small one; D, the b the shoe; F, the frame that supports the G, a fly-wheel; H, the windlas. To engine, it is directed to screw the large: to the small one, and not to feed 100 t the shoe, which is regulated by pins t strings fixed to them. It is evident, th two smooth surfaces are opposed to eac a distance which can be regulated a neither grain nor any other similar sub pass between them without being bruise being the principle on which the bru acts, the meally substance, which is the part of malt, is entirely removed from th husk which contains it, and all the virtu malt are with ease extracted by the w manner superior to what is effected v grain is only cut by grinding. The ope at the same time so expeditiously perfor two men can with ease bruise a bushel of a minute.—By the same engine may also ed oats and beans for horses. A great pa corn given these animals, it is well b swallowed whole, and often passes thro in the same state; in which case, they ca ceive any nourishment from the grains unbroken: but when bruised in this c eases mastication; and every grain being p for nutrition, a much less quantity will of be found to be sufficient. For bruising b two regulating screws must be unscrewed and the fly-wheel requires to be then set in with the hand, on account that the mill

a little space apart, and will not turn each before the beans come between them.

**MALDRINK.** *n. f.* [*malt and drink.*] All *brinks* may be boiled into the consistence of *sy* syrup. *Floyer.*

**MALTDUST.** *n. f.* [*malt and dust.*]—*Malt-dust* enricher of barren land, and a great improver of barley. *Mortimer.*

**ALTESE,** the people of Malta. See **MALTA.**

**MALTFLOOR.** *n. f.* [*malt and floor.*] A floor of malt.—Empty the corn from the cistern into *malt-floor.* *Mort.*

**MALTHORSE.** *n. f.* [*malt and horse.*] It seems we been, in *Shakespeare's* time, a term of reproach for a dull dolt.—You peasant swain, you fellow, you *malthorse* drudge. *Shak.*—Mome, *orse,* capon, coxcomb, idiot, patch. *Shak.*

**MALTHUS,** Daniel, Esq. a late admired English writer; who translated, 1. *The Sorrows of Werter.* 2. *Essay on Landscape;* and, 3. *Paul and Virginia.* He died at Atbury, in Feb. 1800.

**MALTMAN.** **MALTYSTER.** *n. f.* [*from malt.*] who makes malt.—

Mr Arthur the *maltster!* how fine it will be found. *Swift.*

He came home in the chariot by his lady's side, but he unfortunately taught her to drink wine, of which she died; and Tom is now a *tyman maltster.* *Swift.*

**MALTON,** a town of Yorkshire, in the north, seated on the Derwent, over which there is a good stone bridge. It is composed of two parts, the New and the Old; and is well inhabited, accommodated with good inns, and sends members to parliament. Lon. o. 30. W. 4. 8. N.

**MALTOY,** a town of Indostan, in Berar.

**MALT-TAX,** is the sum of 750,000*l.* raised yearly by parliament since 1697, by a duty of 10*s.* the bushel of malt, and a proportionable tax on certain liquors, such as cyder and perry, which might otherwise prevent the consumption of them. This is under the management of the commissioners of the excise. In 1760, an additional perpetual excise of 3*d.* per bushel was put upon malt; and in 1763, a proportional excise laid upon cyder and perry, but new-moulded in 1766. See **EXCISE,** § 2.

**MALVA,** the **MALLOW,** a genus of the polyandrous order, belonging to the monadelphica class of plants; and in the natural method ranking under the 37th order, *Columniferae.* The calyx is five-lobed; the exterior one triphyllous; the arilliferous and monospermous. There are 24 species; consisting of herbaceous perennials, biennial and annuals, for medical, economical, and ornamental uses; rising with erect stalks from a half a yard to 10 or 12 feet high, garnished with large, roundish, lobed leaves, and quintuple flowers. They are all raised from seed.

**MALVA COMMUNIS,** the *common mallow.* The ancients reckoned the first of the 4 emollient herbs; they were formerly in some esteem as being good for loosening the belly; at present, decoctions of them are sometimes employed in dysentery, heat, and sharpness of urine; and, in general, for obtunding acrimonious humours: their principal use is in emollient glysters, cataplasms, &c. **VOL. XIII. PART II.**

and fomentations. The leaves enter the official decoction for glysters, and a conserve is prepared from the flowers.

2. **MALVA CRISPA,**

3. **MALVA MAURISIANA,** and } when macerated like HEMP,

4. **MALVA PERUVIANA,** } afford a thread

superior to hemp for spinning, and which is said to make more beautiful cloths and stuffs than even flax. From the *crispa*, which affords stronger and longer fibres, cords and twine have also been made. From these species, likewise, a new sort of paper has been fabricated by M. de l'Isle. On this invention, Mess. Lavoisier, Sage, and Berthollet, in name of the *Academie de Sciences* observe, That "it is not probable the paper made by M. de l'Isle will be substituted for that made from rags, either for the purpose of printing or writing. Yet paper from the mallows may be used for these purposes, if we can judge from a volume printed on it presented to the academy. The great utility of M. de l'Isle's invention is for furniture, which consumes a great quantity of rags; and his papers have a natural hue, much more solid than can be given by colouring matter, and this hue may serve as a ground for other drawings."

\* **MALVACIOUS.** *adj.* [*malva*, Latin.] Relating to mallows.

**MALVANA,** a town of Ceylon, 12 miles E. of Colombo.

**MALVASIA,** an island of European Turkey, on the E. coast, famous for **MALMSEY** and other wines: 50 miles S.E. of Misitra, and 75 S. of Athens. **NAPOLI** is the capital.

**MALVENTRE,** an island on the W. coast of Sardinia, 5 miles S. of Cosia.

**MALVERN,** the name of a district, 2 towns, and several hills, chiefly in Worcestershire: viz.

1. **MALVERN CHACE,** an extensive district of England, containing 7115 acres in Worcestershire, (besides 241 acres called the Prior's Land,) 619 in Herefordshire, and 103 in Gloucestershire.

2. **MALVERN GREAT,** a town of Worcestershire, in which was formerly an abbey, whereof nothing remains but the gateway, and church, now parochial. Part of it was a religious cell for hermits before the Conquest; and the greatest part, with the tower, built in the reign of William I. Its outward appearance is very striking. It is 171 feet in length, 63 in breadth, and 63 in height. In it are ten stalls; and it is supposed to have been rebuilt in 1171. The nave only remains in part, the side aisles being in ruins. The windows have been beautifully enriched with painted glass, and in it are remains of some very ancient monuments.

3. **MALVERN HILLS,** lofty mountains in the SW. part of Worcestershire, rising like stairs, one above another, for about 7 miles, and dividing that county from Herefordshire. On these hills are two medicinal springs, called *holy wells*, one good for the eyes, and the other for cancers. They run from N. to S. the highest point 111 feet above the surface of the Severn at Hanley, and appear to be of lime-stone and quartz. On the summit of these hills is a camp with a treble ditch, supposed to be Roman, and situated on the Herefordshire side of the hills.

4. MALVERN, LITTLE, a town of Worcestershire, seated in a cavity of the above hills, 3 miles from Great Malvern. It had an elegant abbey and church. Henry VII. his queen, and his two sons, were so delighted with this place, that they beautified the church and windows, part of which remain, though mutilated. In the lofty S. windows of the church are historical passages of the Old Testament; and in the N. windows are pictures of the principal events of our Saviour's life, from his birth to his ascension. Our Saviour's passion is painted in the E. window of the choir, at the expense of Henry VII. who is often represented, with his queen. In the W. window is a noble piece of the day of judgment, not inferior to the paintings of Michael Angelo.

\* MALVERSATION. *n. f.* [Fr.] Bad shifts: mean artifices; wicked and fraudulent tricks.

MALVEZZI, Virgil, marquis of Malvezzi, was born at Bologna, in 1599, and became LL. D. in 1619. He was well versed in literature, music, law, physic, and mathematics. He served also in a distinguished post in the army of Philip IV. of Spain, and was employed by him in some important negotiations. He died at Bologna, in 1654, leaving several works in Spanish and Italian. His *Discourses on the First Book of Tacitus* have been translated into English.

MALUS, in botany. See PYRUS, N° 3.

MALWA, an extensive province of Hindoostan, belonging to the Marhattas; bounded on the N. by Agimere and Agra; E. by Allahabad; S. by Candeeih; and W. by Guzerat. Ougein and Indore are the capitals of two Marhatta chiefs, between whom and the paishwah of the W. Marhattas it is divided.

MALZIEU, a town of France, in the dep. of Lozere; 4½ miles NE. of St Chely, and 21 NW. of Mende.

\* MAM. MAMMA. *n. f.* [*mamma*, Latin; this word is said to be found for the compellation of *mother* in all languages; and is therefore supposed to be the first syllable that a child pronounces.] The fond word for mother.—

Poor Cupid sobbing scarce could speak;

Indeed, *mamma*, I did not know ye;

Alas! how easy my mistake!

I took you for your Sister's Chloë. *Pris.*

—Little mothers and nurses are great impediments to servants: the remedy is to bribe them, that they may not tell tales to papa and *mamma*. *Scott.*

MAMALICHES, a dynasty that reigned in Egypt. See that article, § 19, 20, 21, and 25, III.

MAMARAGHTY MOUNTAIN, mountains of Ireland, in Mayo; 12 miles WNW. of Castlebar.

MAMERS, an ancient town of France, in the dep. of Sarthe, seated on the Dive, 14 miles W. of Belême, and 16 SE. of Alençon. Lon. 0. 26. E. Lat. 48. 22. N.

MAMBRUN, Peter, a learned French Jesuit, born in Clermont, in 1727. He was one of the most perfect imitators of Virgil in Latin poetry, and his poems are of the same species: Thus he wrote *Eclogues*; *Georgics*, or 4 books on the culture of the soil and the understanding; together with a heroic poem intitled *Constantine, or Ulpianus overthrown*. He showed also great critical abili-

ties in a Latin *Peripatetical dissertation on try*. He died in 1661.

MAMERS. See MAMARS.

MAMERTINI, a mercenary band of who passed from Campania into Sicily at quest of Agathocles. When they were in vice of Agathocles, they claimed the privilege of voting at the election of magistrates at 8 and had recourse to arms to support demands. The sedition was appeased by forcing men, and the Campanians were to leave Sicily. In their way to the coast they received with great kindness by the people, and soon returned perfidly for he. They conspired against the inhabitants, and all the males in the city, married the daughters, and rendered themselves of the place. After this violence they assumed the name of Mamertini, and called their city TUM, or MAMERTIUM, from a province which in their language signified *martial*. The Mamertines were afterwards defeated by Hiero, and totally disabled to repair the affairs.

MAMERTIUM. See last article.

MAMMA. See MAM.

MAMMÆ. See ANATOMY, *Index*.

MAMMÆA. See ALEXANDER SEV

MAMMALIA, in natural history, the of animals in the Linnæan system, divided into orders. See ZOOLOGY.

(1.) MAMMÆA, or the } a genus of

(2.) MAMMEE TREE, } gynia orde

ing to the polyandria class of plants; a natural method ranking with those of 5 order is doubtful. The corolla is tetra; the calyx diphyllous; the berry very intransperous. There are two species; evergreen trees of the hot parts of Asia, and both adorned with large, ovate leaves, and large quadripetalous flocceded by large round edible fruit of a quietly rich flavour. They are propagated, sowed in small pots of light earth in the bark bed, where they will grow up; give gentle waterings, and about August plant them into separate pots a size bringing them into the bark bed, and giving water till fresh-rooted. In this country never be taken out of the stove.

(2.) \* MAMMEE TREE. *n. f.* The plant hath a rofaceous flower, which afterwards comes an almost spherical fleshy fruit, of two or three seeds inclosed in hard rind. *Miller*.

\* MAMMET. *n. f.* [from *mam* or *mammet*, a figure dressed up. *Harris*.—

Kate, this is no wench

To play with *mammets*, and to tisk with

\* MAMMEFORM. *n. f.* [*mamma*, from *mamma* and *forma*, Latin.] Having the shape or ducts.

\* MAMMILLARY. *n. f.* [*mammilla*, from *mammilla*, Latin.] Belonging to the paps.

\* MAMMOCK. *n. f.* A large thick ice. The ice was broken into large *mammock* flojage.

To MAMMOCK. *v. a.* [from the noun.] To break; to pull to pieces.—I saw him run like a gilded butterfly; and he did so for his life, and did tear it! Oh, I warrant, how he mammoct it! *S. v.*

(\*) MAMMON. *n. f.* [Syriack.] Riches.

(\*) MAMMON, the god of riches, according to the authors; though others say that the word is for such a deity. Our Saviour says, We will not serve God and mammon; that is, be religious and worldly minded at the same time. Milton, by poetic licence, makes Mammon one of the fallen angels.

(\*) MAMMOTH, } OF AMERICAN ELEPHANT,  
(\*) MAMMUTH, } a huge animal now unknown, but extinct, to which have belonged those bones, and skeletons of vast magnitude, which have been often found in different parts of Asia, Russia, Germany, and North America. Specimens of them may be seen in the Imperial cabinet at Petersburg; in the British, Dresden, and the Leverian museums, and in that of the Royal Society. A description of the mammoth is given by Muller, in the *Recueil des Voyages Tart.* "This animal, he says, is 4 or 5 yards long and about 30 feet high. His colour is grey."

His head is very long, and his front very small. On each side, precisely under the eyes, there are two horns, which he can move and cross at pleasure. In walking he has the power of extending and contracting his body to a great degree."

Isbrandes Ides gives a similar account, and acknowledges that he never knew any person who had seen the mammoth alive. Mr Pennant, however, thinks it "more than probable, that it still exists in some of those remote parts of the vast new continent, impenetrated yet by Europeans." The Ohio Indians have the most absurd and ridiculous traditions respecting these animals, and pretend that it required an exertion of omnipotent power to extirpate them. Sir Isaac Sloane, Gmelin, Daubenton, Buffon, and eminent naturalists are of opinion that these gigantic bones and tusks have really belonged to elephants; and many modern philosophers have held the mammoth to be as fabulous as the unicorn. The great difference in size they endeavour to account for as arising from difference of sex, and climate; and the cause of their being found in those northern parts of the world where elephants are no longer natives, nor can they long exist, they attribute to the great revolutions which have happened in the earth, by earthquakes and inundations. In 1767, Dr Hunter, with the assistance of his brother Mr James Hunter, investigated more particularly this part of natural history, and proved, that these fossil bones and tusks are not only larger than the greatest of elephants, but that these tusks are twisted, or have more of the spiral curve, than elephants teeth; and that the thigh and jaw bones differ in several respects from those of the elephant; but what put the matter beyond all doubt was the shape of the grinders, which appeared to belong to a carnivorous animal, or to an animal of the mixed kind; and to be very different from those of the elephant, which is known to be of the graminivorous kind.

Some have supposed these fossil bones to belong to the HIPPOPOTAMUS, but there are many reasons against this supposition, as the hippopotamus is even much smaller than the elephant, and has such remarkably short legs, that his belly reaches within 3 or 4 inches of the ground. North America seems to be the quarter where the remains abound most. On the Ohio, and in many parts farther north, tusks, grinders, and skeletons of unparalleled magnitude, which can admit of no comparison with any animal at present known, are found in vast numbers, some lying on the surface of the earth, and some a little below it. (See LICKS, § 2.) A Mr Stanley, taken prisoner by the Indians near the mouth of the Tennessee, relates, as Mr Jefferson informs us, that after being transferred through several tribes, from one to another, he was at length carried over the mountains W. of Missouri to a river which runs W.; that these bones abounded there; and that the natives described to him the animal to which they belonged as still existing in the northern parts of their country; from which description he judged it to be an elephant. Bones of the same kind have been found some feet below the surface of the earth, in salines on the North Holston, a branch of the Tennessee, about Lat. 36½° N. It appears to be generally acknowledged, that the tusks and skeletons are much larger than those of the elephant, and the grinders many times greater than those of the hippopotamus, and essentially different in form. Wherever these grinders are found, there also we find the tusks and skeleton; but no skeleton of the hippopotamus nor grinders of the elephant. Mr Jefferson urges the following among other decisive arguments, that the mammoth is quite a different animal: 1. "The skeleton of the mammoth bespeaks an animal of 5 or 6 times the cubic volume of the elephant, as M. de Buffon has admitted. 2. The grinders are 5 times as large, are square, and the grinding surface fluted with 4 or 5 rows of blunt points: whereas those of the elephant are broad and thin, and their grinding surface flat. 3. I have never heard an instance of the grinder of an elephant being found in America. 4. From the known temperature and constitution of the elephant, he could never have existed in those regions where the remains of the mammoth have been found. The elephant is a native only of the torrid zone and its vicinities; if, with the assistance of warm apartments and warm clothing, he has been preserved in life in the temperate climates of Europe, it has only been for a small portion of what would have been his natural period, and no instance of his multiplication in them has ever been known. But no bones of the mammoth have been ever found farther S. than the salines of the Holston, and they have been found as far N. as the Arctic circle." Mr Jefferson concludes, that "To whatever animal we ascribe these remains, it is certain such a one has existed in America, and that it was the largest of all the terrestrial beings of which any traces have ever appeared." *Notes on the State of Virginia*, p. 65.

MAMOSA, a town of Naples, in the prov. of Basilicata, 19 miles SW. of Turin.

MAMRE, an Amorite, brother of Aker and Eschol.

phol, and friend of Abraham. (Gen. xiv. 13.) See ANZA. Mamre dwelt near Hebron, and communicated his name to great part of the country round about. Hence we read (ch. xiii. 18. xxxii. 17, &c.) that Abraham dwelt in Mamre, and in the plain of Mamre. But it is observed, that what we translate the *plain*, should be rendered the *oak*, of Mamre, because the word *elon* signifies an *oak* or *tree of long duration*. Sozomen says, that this tree was still extant, and famous for pilgrimages and annual feasts, even in Constantine's time; that it was about six miles from Hebron; that some of the cottages which Abraham built were still standing near it; and that there was a well likewise of his digging, whereunto both Jews, Christians and Heathens did at certain seasons resort, either out of devotion or for trade, because there was held a great mart. To these superstitious Constantine the Great put a stop.

MAM-TOR, a mountain of Derby, on the Peak, near Castleton, with lead mines in it.

MAMTRASNA, mountains of Ireland, in Galway, 15 miles S. of Castlebar.

(1, 1.) \* MAN. *n. f.* [*man, man*, Saxon.] 1. Human being.—The king is but a *man* as I am; the violet smells to him as it doth to me. *Shak.*—All the west bank of Nilus is possessed by an idolatrous *man-eating* † nation. *Brerewood.*—

Then was *man* design'd,

Conscious of thought. *Dryden.*

Nature in *man* capacious souls hath wrought,  
And given them voice expressive of their thought;

In *man* the God descends, and joys to find

The narrow image of his greater mind. *Creech.*  
—A combination of the ideas of a certain figure, with the powers of motion, and reasoning joined to substance, make the ordinary idea of a *man*. *Locke.*

On human actions reason though you can,  
It may be reason, but it is not *man*. *Pope.*

2. Not a woman.—

Bring forth *men* † children only!  
For thy undaunted metal should compose  
Nothing but males. *Shak.*

I had not so much of *man* in me,  
But all my mother came into mine eyes,  
And gave me up to tears. *Shak.*

—Every *man* † child shall be circumcised. *Gen.*  
xvii. 10.—

Ceneus, a woman once, and once a *man*,  
But ending in the sex she first began. *Dryd.*

—A long time since the custom began, among  
people of quality, to keep *men* † cooks of the  
French nation. *Swift.* 3. Not a boy.—

The nurse's legends are for truths receiv'd,  
And the *man* dreams but what the boy be-  
hev'd. *Dryden.*

3. A servant; an attendant; a dependant.—

Thank'd be I that keep a *man*,  
Who ended hath this bloody strife:

For if my *man* must praises have,  
What then must I that keep the knave?  
My brother's servants  
Were then my fellows, now they are m

—Such gentlemen as are his majesty's own  
servants should be preferred to the charge  
majesty's ships; choice being made of me-  
lour and capacity rather than to employ  
men's *men*. *Raleigh.*—

I and my *man* will presently go ride  
Far as the Cornish mount.

5. A word of familiar address, bordering  
tempt.—

You may partake of any thing we do  
We speak no treason, *man*. *Shak. Rich.*

6. It is used in a loose signification like the  
*on*, one, any one.—The same young slob-  
ed boy doth not love me, nor a *man* can  
him laugh. *Shak. Hen. IV.*—A *man* in at  
may discover the assertion to be impossible  
*Div. Dial.*—He is a good-natured *man*,  
give as much as a *man* would desire. *Sir*

—By ten thousand of them a *man* shall  
ble to advance one step in knowledge.

—Our thoughts will not be directed wha-  
to pursue, nor be taken off from those t-  
once fixed on; but run away with a *man*  
suit of those ideas they have in view. I  
*man* would expect to find some antiqui-  
all they have to show of this nature is at  
trum of a Roman ship. *Addison.*—A *man*  
make a pretty landscape of his own pl-

*Addison.* 7. One of uncommon quality  
Manners maketh *man*. *William of Wicth*

I dare do all that may become a *man*.  
Who dares do more is none,

When you durst do it, then you were  
And, to be more than what you were,  
Be so much more the *man*. *Shak.*

He tript me behind, being down,  
rail'd,

And put upon him such a deal of *man*  
That worthied him. *Shak. I.*

—Will reckon he should not have been  
he is, had he not broke windows, and  
down constables, when he was a your  
*Spectator.* 8. A human being qualified in  
ticular manner.—Thou art but a youth  
*man* of war from his youth. 1 *Sam.* xv

Individual.—In matters of equity betw  
and *man*, our Saviour has taught us a  
neighbour in the place of myself, and  
the place of my neighbour. *Watts's Le*  
Not a beast.—

Thy face, bright Centaur, autumn's  
tain,

The softer season suiting to the *man*.

11. Wealthy or independant person: to  
some refer the following passage of *Sa*  
others to the sense next foregoing.—The

† In this, and in numberless other instances throughout his Dictionary, Dr Johnson has denied all lexicographical propriety, by adducing compound words as authorities and examples of the primitive. Scarcely the word MAN does not occur in seldom in the English language, to have quoted Man-eating, as an example. It is a distinct word, as he himself has stated Man-e

†† In these three quotations, the words man and men are evidently used as adjectives, not as MALE. Dr JOHNSON should therefore have made a distinct article of MAN, adj. as in the MALE.

monster make a man; any strange beast there  
 is a man. *Shaksp. Tempest*.—What poor man  
 could not carry a great burthen of gold to be made  
 man for ever. *Tillotson*. 12. When a person is not  
 in senses, we say, he is not his own man. *Ains-*  
*worth*. 13. A moveable piece at chess or draughts.

MAN of war. A ship of war.—A Flemish  
 man of war lighted upon them, and overmastered  
 them. *Carrew's Survey of Cornwall*.

1.) MAN, the head of the animal creation, is a  
 being who feels, reflects, thinks, contrives, and  
 acts; who has the power of changing his place  
 on the earth at pleasure; who possesses the fa-  
 culty of communicating his thoughts by speech;  
 who has dominion over all other creatures on  
 the face of the globe. Animated and enlighten-  
 ed by a ray from the Divinity, he surpasses in dig-  
 nity every material being. He spends less of his  
 life in solitude than in society, and in obedience  
 to those laws which he himself has framed.

2.) MAN, in zoology. See HOMO.

3.) MAN, CONSTITUTION AND ANIMAL FUNC-  
 TIONS OF. See ANATOMY.

4.) MAN, DESCRIPTION OF, BY LINNÆUS.

The body, which seldom reaches six feet in  
 height, is erect, and almost naked, having only  
 a few scattered hairs, except in some small spots  
 afterwards noticed, and when first born is  
 wholly naked. The head is shaped like an egg:

the scalp being long, and covered with hair; the  
 forehead broad; the top of the head flat; and  
 the hind head protuberant. The face is naked,  
 the brow or fore head flattened and qua-  
 drangular; the temples are compressed, with  
 the angles pointing upwards and backwards  
 towards the hairy scalp. The eye-brows are pro-  
 nounced, and covered with hairs which, shed-  
 ding downwards, cover each other like tiles; and be-  
 tween the inner extremities of the two eye-brows  
 there is a smooth, shallow furrow or depression,  
 a line with the nose. The upper eye-lid is  
 weak, but the lower one hardly moves, and  
 they are planted at their edges with a row of stiff  
 curved hairs, named *eyelashes*. The eye-balls

are round, having no suspending muscle as in  
 those of most quadrupeds; the pupil, or opening  
 to the sight, is circular; and the eye has no  
*membrana nictitans*. The upper parts of the cheeks  
 are prominent, softish, and coloured with a red  
 tinge; their outer parts are flattened; the lower  
 parts are hollowed, lax, and expansile. The nose  
 is prominent, and compressed at the sides; its ex-  
 tremity or point is higher than the rest, and blunt;  
 the nostrils are oval, open downwards, with thick-  
 ened edges, and are hairy on their insides. The  
 upper lip is almost perpendicular, and is furrowed  
 in the middle, from the division between the nos-  
 trils to the edge of the lip; the under lip is erect,  
 thicker and more prominent than that above;  
 they have a smooth red protuberance, surround-  
 ing the mouth at their edges. The chin is pro-  
 nounced, blunt and gibbous. In males, the face  
 round the mouth is covered with hair, called  
 a beard, which first appears about puberty in  
 curls on the chin. The teeth in both jaws  
 are distinguished into 3 orders; the *incisors*  
 are erect, parallel, and wedge-like, of the kind  
 called *incisors*, or *cutting teeth*; they stand close

to each other, and are more equal and rounder  
 than in other animals; the *tusks*, called in man  
*eye-teeth* and *corner-teeth*, of which there is only  
 one on each side of the fore teeth in each jaw, are  
 a little longer than the fore teeth, but much less  
 so than in other animals, and they are placed  
 close to the other teeth; the *grinders*, of which  
 there are 5 on each side in both jaws, are blunt,  
 and divided on their upper surface into pointed  
 eminences; but these are not so remarkable as in  
 other animals. The ears are placed on the sides  
 of the head; are of an oblong rounded figure,  
 with a semicircular bend on their anterior edges;  
 they lie flat to the head, are naked, arched at the  
 margin on their upper and posterior edges, and  
 are thicker and soft at the under extremities. The  
 trunk of the body consists of the neck, breast,  
 back, and belly. The neck is roundish, and shorter  
 than the head; its vertebrae, or chine bones,  
 are not, as in most animals, connected by a sus-  
 pensory ligament; the nape is hollowed; the  
 throat, immediately below the chin, is hollowed  
 at its upper part, and protuberant in the middle  
 a little lower down. The breast is somewhat  
 flattened both before and behind; on the fore  
 part there is a cavity or depression where it joins  
 with the neck; the arm-pits are hollow and hairy;  
 the pit of the stomach is flat: on the breast are  
 two distant, round, protuberant mammae, or  
 dugs, each having a cylindrical obtuse wrinkly  
 projecting nipple, which is surrounded by a dark-  
 er coloured circle called the *areola*. The back is  
 flat, having protuberances on each side at the  
 shoulder-blades, with a furrow or depression be-  
 tween them. The abdomen or belly is large and  
 protuberant, with a hollow at the navel; the epi-  
 gastric region, or situation of the stomach, is flat;  
 the hypogastric regions, or sides of the belly, are  
 protuberant; the groin flatish and hollowed.  
 The pubes is hairy; the pelvis, or basin, is wider  
 above, and grows narrower below. The male  
 parts are external and loose; the penis cylindri-  
 cal; the scrotum roundish, lax, and wrinkled,  
 being divided in the middle by a longitudinal  
 ridge or smooth line, which extends along the  
 whole perineum: The female parts are compre-  
 ssed and protuberant, having labia, nymphæ, cly-  
 toris, and hymen; and, in adults, secreting the  
 catamenia. There is no external tail. The limbs  
 consist of arms and hands instead of fore legs; and  
 of thighs, legs, and feet. The arms are placed  
 at a distance from each other; they are round,  
 and about a foot in length from the joint of the  
 shoulder to the elbow; the fore arm, or cubit,  
 contains two bones, and is obtusely prominent;  
 the *ulna*, which forms the principal thickness of  
 the member, is round, and somewhat flattened  
 on the inside. The hands are broad, flat, and  
 rounded; convex on the outside or back of the  
 hand, and concave on the inside or palm. Each  
 hand has five fingers, one of which, named the  
*thumb*, is shorter and thicker than the rest, and is  
 placed at some distance from them; the others  
 are near each other, and placed parallel, the outer  
 or *little finger* being the smallest; the 2d, named  
*index* or *fore finger*, and the 4th, called the *ring*  
*finger*, is next in length and in size; and the 3d,  
 or *middle finger*, is the longest; the point of this

last, when the arm and hand hang down, reaches to the middle of the thigh. The nails are rounded and oval, being flatly arched, or convex upwards; and each has a femiunar whitish mark at the root or lower extremity. The lower limbs are placed close together, having brawny muscular haunches and swelling fleshy hips; the knees are obtuse, bend forwards, and have hollow hams behind. The legs, which are nearly of the same length with the thighs, are of a muscular make behind, where they swell out into what is called the *calf*: they are lean, and free of flesh on the shins or fore parts, and taper downwards to the ankle, which have hard hemispherical projections on each side, named the *ankle-bones* or *malleoli*. The heel is thick, prominent, and gibbous, being longer and broader than in other animals, for giving a firm support to the body; it joins immediately with the sole of the foot. The feet are oblong, convex above, and flattened on the soles, which have a transverse hollow about the middle. Each foot has 5 toes, somewhat bent downwards, and gibbous or swelled underneath at their extremities; they are all placed close together, the inner or great toe being thicker and somewhat shorter than the rest; the 2d and 3d are nearly of equal length; and the 4th and 5th are shorter than the others, the last mentioned or little toe being the shortest and smallest. The toe nails resemble those on the fingers, which are already described. Thus man differs from the other animals in his erect posture and naked skin, having a hairy scalp, being furnished with hair on the eye-brows and eyelashes, and having, when arrived at puberty, the pubes, breast, arm-pits, and the chin of the males, covered with hair. His brain is larger than that of any other animal, even the most enormous; he is provided with an *uvula*, and has organs of speech. His face is placed in the same parallel line with his body; he has a projecting compressed nose, and a prominent chin. His feet in walking rest on the heel. He has no tail; and, lastly, the species is distinguished from other animals by some peculiarities of the female constitution."

(6.) MAN, DIGNITY AND SUPERIORITY OF, ABOVE ALL OTHER ANIMALS. Anatomists have employed much pains in the study of the material part of man, and of that organization which determines his place in the animal creation. From tracing and combining his different external parts; from observing that his body is in some places covered with hair; that he can walk upon his hands and his feet at the same time, in the manner of quadrupeds; that, like certain animals which hold their food in their paws, he has two clavicles; that the female brings forth her young alive, and that her breasts are supplied with milk; from these circumstances we might be led to assign man a place in the class of viviparous quadrupeds. But such an arrangement would be defective, arbitrary, and absurd. Man is not a quadruped: of all the animals, he alone can support himself, continually and without rest, in an erect posture. In this majestic and dignified attitude, he can change his place, survey this earth which he inhabits, and turn his eyes towards the vault of heaven. By a whole and

easy gait he preserves an equilibrium in several parts of his body, and transports himself from one place to another with different degrees of celerity. To man alone nature has denied wings; but still he is her master-piece, the work which came from the hands of the Almighty, the sovereign and the chief of an universe in miniature, the centre which unites the universe together. The form of his organs whercof are constructed in such a manner as to produce a much greater effect than of other animals, announces his power. Nothing demonstrates the excellence of his mind and the immense distance placed by the Creator between man and beast. Man is a reasonable being; brutes are deprived of every noble faculty. The weakest and most ignorant of the human race is able to manage the most sagacious quadruped; he commands it, and it is subservient to his use. The operations of his mind are purely the effect of mechanical impressions, and continue always the same; human work is not tired without end, and infinitely diversified in manner of execution. The soul of man is independent, and immortal. He is fitted for the study of science, and the cultivation of art, the exclusive privilege of examining events which have existence, and of holding conversation with his fellow-creatures by language, particular motions of the body, and characters mutually agreed upon. It arises that physical pre-eminence which he possesses over all animals; and hence that power which he exercises over the elements, and so to govern nature itself. Man, therefore, is superior in his kind; but the individuals differ greatly from one another in figure, stature, colour, manners, and dispositions. The work which man inhabits is covered with the productions of his industry and the work of his hands; it is his labour, in short, which gives a value to the whole terrestrial mass.

(7.) MAN, INFANTILE STATE OF. (says M. Buffon) exhibits such a striking image of our weakness, as the condition of an infant immediately after birth. Incapable of using its organs, it needs assistance of every kind in the first moments of our existence, we are in a state of pain and misery, and are more helpless than the young of any other animal. Immediately after birth, the infant passes from one element to another: When it leaves the gentle warm tranquil fluid by which it was completely surrounded in the womb of the mother, it is exposed to the impressions of the air, and immediately feels the effects of that active element. The air acting upon the olfactory nerves, and the organs of respiration, produces a shock like sneezing, by which the breast is opened, and the air admitted into the lungs. In the first time, the agitation of the diaphragm upon the viscera of the abdomen, and the movements are thus for the first time discharged, the intestines, and the urine from the bladder. The air dilates the vessels of the lungs, and the blood is carried to a certain degree, is coagulated by the spasm of the dilated fibres, and the blood is converted into a solid fluid. The infant now respires

culates sounds, or cries. Most animals are blind for some days after birth. Infants open their eyes to the light the moment they come into the world; but they are dull, fixed, and commonly blue. The new-born child cannot distinguish objects, because he is incapable of fixing his eyes upon them. The organ of vision is yet imperfect; the cornea is wrinkled; and perhaps the retina is too soft for receiving the images of external objects, and for communicating the notion of distinct vision. At the end of forty days, the infant begins to hear and to smile. At the same time it begins to look at bright objects, and frequently to turn its eyes towards the fire, a candle, or any light. Now likewise begins to weep; for its former cries and groans are not accompanied with tears. Smiles and tears are the effect of two internal sensations, one of which depend on the action of the mind, and the other is peculiar to the human race, and is used to express mental pain or pleasure; while sobs, motions, and other marks of bodily pain or pleasure, are common to man and most of the quadrupeds. The size of an infant born at the time is commonly 21 inches; and that *fœtus*, which nine months before was an imperceptible point, now weighs 10 or 12 lb. and sometimes 15. The head is large in proportion to the body; and this disproportion, which is still greater in the first stage of the *fœtus*, continues during the period of infancy. The skin of a new born child is of a reddish colour, because it is so fine and transparent as to allow a slight tint of the colour of the blood to shine through. The form of the body and members is by no means perfect at birth; all the parts appear swollen. At the end of three days, a kind of diarrhoea generally comes on, and at the same time milk is to be found in the breasts of the infant, which may be squeezed out by the fingers. The swelling decreases as the child grows up. The young of quadrupeds can of themselves find their way to the teat of the mother: it is not so with man. The breast is not given to infants till 12 hours after birth, when the mother, to nurse her child, must raise it to her breasts: and, in its feeble period of life, the infant can express its wants only by its cries. New born children have a need of frequent nourishment. See LACTATION, and NURSING. The teeth usually begin to appear about the age of 7 months. The cutting of the teeth, although a natural operation, does not follow the common laws of nature, which acts continually on the human body without occasioning the smallest pain or even producing any sensation. Here a violent and painful effort is made, accompanied with cries and tears. Children at this time lose their sprightliness and gaiety; they become fretful, restless, and fretful. The gums are red and swelled; but they afterwards become firm, when the pressure of the teeth is so great as to stop the circulation of the blood. Children often put their fingers to their mouths, that they may relieve the irritation which they feel there. Some give them, by putting into their hand a bit of wood or of coral, or of some other hard and smooth body, with which they rub the gums at the affected part. This pressure, being opposed

to that of the teeth, calms the pain for a moment, contributes to make the membrane of the gum thinner, and facilitates its rupture. Nature here seems to act in opposition to herself; and an incision of the gum must sometimes take place, to allow a passage to the tooth. For the period of dentition, number of teeth, &c. see ANATOMY, *Ind.* Till 3 years of age, the life of a child is very precarious. In the two or three following years it becomes more certain, and at 6 or 7 years of age, a child has a better chance of living than at any other period of life. From the bills of mortality published at London, it appears, that of a certain number of children born at the same time, one half die within the three first years: according to which, one half of the human race are cut off before they are 3 years of age. But the mortality among children is not nearly so great every where as in London. *M. Dupre de Saint Maur*, from a great number of observations made in France, has shown that half of the children born at the same time are not extinct till 7 or 8 years have elapsed. Children begin learning to speak about the age of 12 or 15 months. Some children at two years of age articulate distinctly, and repeat whatever is said to them; but most children do not speak till the age of 2½ or 3 years, and often later. The life of man and of other animals is measured only from the moment of birth: they enjoy existence, however, previous to that period, and begin to live in the state of a *FŒTUS*. This state is described and explained under the article ANATOMY.

(8.) MAN, LENGTH OF THE LIFE OF. *Man*, says Haller in his *Physiology*, has no right to complain of the shortness of life. Throughout the whole of living beings, there are few who unite in a greater degree all the internal causes which tend to prolong its different periods. The term of gestation is very considerable; the rudiments of the teeth are very late in unfolding; his growth is slow, and is not completed before about 20 years have elapsed.—The age of puberty, also, is much later in man than in any other animal. In short, the parts of his body being composed of a softer and more flexible substance, are not so soon hardened as those of inferior animals. *Man*, therefore, seems to receive at his birth the seeds of a long life: if he reaches not the distant period which nature seemed to promise him, it must be owing to accidental causes foreign to himself. Instead of saying that he has finished his life, we ought rather to say that he has not completed it. The natural and total duration of life is in some measure proportioned to the period of growth. A tree or an animal which soon acquires its full size, decays much sooner than another which continues to grow for a longer time. If it is true that the life of animals is 8 times longer than the period of their growth, we might conclude that the boundaries of human life might be extended to a century and a half. It does not appear that the life of man becomes shorter in proportion to the length of time the world has existed. In the days of the *Patriarchs*, the ordinary life of a human being did not exceed 70 or 80 years. Nothing of Jewish lived beyond that period. When the *Romans*, however, were attacked by *Nephtalim*, there

were found in the empire, in that age of effeminacy, ten men aged 120 and upwards. Among the princes of modern times, the late Frederick the Great of Prussia lived to the age of 74. George II. of Britain lived to that of 77. Louis XIV. lived to the same age. Stanislaus king of Poland and duke of Lorraine exceeded that age. Pope Clement XII. lived to the age of 80. George I. of Britain attained the age of 83. M. Boniare has collected divers instances of persons who lived to the age of 110 and upwards. See LONGEVITY, 9 4, 5.

(9.) MAN, MOTIONS PRODUCED IN THE FEATURES OF, BY THE PASSIONS. In the looks of no animal are the expressions of passion painted with such energy and rapidity, and with such gentle gradations and shades, as in those of man. In certain emotions of the mind, the blood rises to the face, and produces blushing; and in some others, the countenance turns pale. These two symptoms, the appearance of which depends on the structure and the transparency of the reticulum, especially redness, constitute a peculiar beauty. In our climates, the natural colour of the face of a man in good health is white, with a lively red suffused upon the cheeks. Paleness of the countenance is always a symptom of deficient health. Notwithstanding the general similitude of countenance in nations and families, there is a wonderful diversity of features. No one, however, is at a loss to recollect the person to whom he intends to speak, provided he has once fully seen him. One man has liveliness and gaiety painted in his countenance, and announces beforehand, by the cheerfulness of his appearance, the character which he is to support in society. The tears which bedew the cheeks of another man would excite compassion in the most unfeeling heart. Thus the face of man is the rendezvous of the symptoms both of his moral and physical affections: tranquillity, anger, threatening, joy, smiles, laughter, malice, love, envy, jealousy, pride, contempt, disdain, indignation, irony, arrogance, tears, terror, astonishment, horror, fear, shame or humiliation, sorrow and affliction, compassion, meditation, particular convulsions, sleep, death, &c. &c. The difference of these characters, and the various impressions made by them, form the principles of the science of PHYSIOGNOMY. (See that article.) When the mind is at ease, all the features of the face are in a state of profound tranquillity. Their proportion, harmony, and union, point out the serenity of the thoughts. But when the soul is agitated, the human face becomes a living canvas, whereon the passions are represented with equal delicacy and energy, where every emotion of the soul is expressed by some feature, and every action by some mark; the lively impression of which anticipates the will, and reveals by pathetic signs our secret agitation, and those intentions which we are anxious to conceal. It is particularly in the eyes that the soul is painted in the strongest colours and with the most delicate shades. The different colours of the eyes are, dark hazel, light hazel, green, blue, gray, and whitish gray. The most common of these colours are hazel and blue, both of which are often found in the same eye. Eyes

which are commonly called black, are only dark hazel; they appear black in consequence of being contrasted with the white of the eye. Whenever there is a tint of blue, however slight, it becomes the prevailing colour, and outshines the hazel, with which it is intermixed, to such a degree, that the mixture cannot be perceived without a very narrow examination. The most beautiful eyes are those which appear black or blue. In the former, there is more expression and vivacity; in the latter, more sweetness and perhaps delicacy. Next to the eyes, the parts of the face by which the physiognomy is most strongly marked, are the eye-brows. Being of a different nature from the other parts, their effect is increased by contrast. They are like a shade in a picture, which gives relief to the other colours and forms. The forehead is one of the largest parts of the face, and contributes most to its beauty. Every body knows of how great importance the hair is in the physiognomy, and that baldness is a very great defect. When old age begins to make its approach, the hair which first falls off is that which covers the crown of the head and the parts above the temples. The hair of the lower part of the temples, or of the back of the head, seldom completely falls off. Baldness is peculiar to men: women do not naturally lose their hair, though it becomes white as well as that of men at the approach of old age. The nose is the most prominent feature of the face. But as it has very little motion, and that only in the most violent passions, it contributes less to the expression than to the beauty of the countenance. The nose is seldom perpendicular to the middle of the face, but for the most part is turned to one side or the other. The cause of this irregularity, which, according to the writers, is perfectly consistent with beauty, and which even the want would be a deformity, appears to be frequent pressure on one side of the cartilage of the child's nose against the breast of the mother when it receives suck. At this early period of life, the cartilages and bones have acquired very little solidity, and are easily bent, as may be observed in the legs and thighs of some individuals, who have been injured by the folds of the swaddling clothes. Next to the eyes, the mouth and lips have the greatest motion and expression. These motions are under the influence of the passions. The mouth, which is set off by the vermilion of the lips and the enamel of the teeth, marks, by the various forms which it assumes, their different characters. The organs of the voice likewise gives animation to this feature, and communicates to it more life and expression than is possessed by any of the rest. The cheeks are uniform features, and have no motion or expression excepting from that involuntary redness or paleness with which they are covered in different passions, such as shame, anger, pride, and joy, on the one hand; and fear, terror, and sorrow, on the other. In different passions, the whole head assumes different positions, and is affected with different motions. It hangs forward during shame, humility, and sorrow; it hangs to one side in languor and compassion; it is elevated in pride, and fixed in obstinacy and self-conceit; in astonishment it is thrown backwards; and

ves from side to side in contempt, ridicule, and indignation. The particular effects of the great passions on the features have been already quoted from M. Le Brun's accurate description of them. See DRAWING, and *Figures EX.* and *CXX.*

10.) MAN, MOTIONS PRODUCED IN THE LIMBS BY THE PASSIONS. The arms, hands, and every part of the body, contribute to the expression of the passions. In joy, for instance, all the members of the body are agitated with quick and easy motions. In languor and sorrow, the arms hang down, and the whole body remains still and immoveable. In admiration and surprise, this total suspension of motion is likewise observed. In love, desire, and hope, the head and arms are raised to heaven, and seem to solicit the reward for good; the body leans forward as if to reach it; the arms are stretched out, and seem to embrace before-hand the beloved object. On the contrary, in fear, hatred, and horror, the arms seem to push backward and repel the object of aversion; we turn away our head and eyes as if to avoid the sight of it; we recoil in order to quit it.

11.) MAN, PERIOD OF ADOLESCENCE AND PUBERTY OF. The period of infancy, (see § 7.) which extends from the moment of birth to about 12 years of age, is followed by that of adolescence. This begins, together with puberty, at the age of 12 or 14, and commonly ends in girls at 15, and in boys at 18, but sometimes not till 23, or 25 years of age. According to its etymology from the Latin *adolescens*, it is commonly understood when the body has attained its full height. The age of puberty is announced by several marks. The first symptom is a kind of numbness and stiffness in the groins, accompanied with a new and peculiar sensation in these parts which distinguishes it from the rest. There, as well as in the armpits, small tubercles of a whitish colour appear, which are the germs of a new production of a kind of hair, by which these parts are afterwards to be distinguished. The voice, for a considerable time is hoarse and unequal; after which it becomes fuller, deeper, and graver, than it was before. This change may easily be distinguished in boys; but not so in girls, because their voices are naturally hoarse. These marks of puberty are common to both sexes; but there are marks peculiar to each, such as the discharge of the menses, and the swelling of the breasts, in girls; the beard, and the emission of semen, in boys; in short, the feeling of sexual desire, and the appetite which unites the sexes. Among all races of mankind, the signs arrive at puberty sooner than the males; and the age of puberty is different in different nations, and seems partly to depend on the temperature of the climate and the quality of the food. In all the southern countries of Europe, and in almost the greatest part of the girls arrive at puberty about 12, and the boys about 14 years of age.

But in the northern parts, and in the countries girls scarcely arrive at puberty till they are 15, and boys not till they are 16 or 17. In all climates, girls, for the greatest part, have attained complete maturity at 15, and boys at 20

years of age. At the age of adolescence and of puberty, the body commonly attains its full height. About that time, young people shoot out several inches almost at once. But no part of the human body increases more quickly and more perceptibly than the organs of generation in both sexes. In males, this growth is nothing but an unfolding of the parts, an augmentation in size; but in females, it often occasions a shrinking and contraction, which have received different names from those who have treated of virginity. See VIRGINITY. Marriage is a state suitable to man, where he may lawfully and virtuously make use of those new faculties which he has acquired by puberty. At this period of life, the desire of producing a being like himself, that irresistible attraction which unites the sexes and perpetuates the race, is strongly felt. By connecting pleasure with the propagation of the species, our Creator has provided most effectually for the continuance of his work. *Increase and multiply*, is his express command, and one of the natural functions of life. See MARRIAGE. According to the ordinary course of nature, women are not fit for conception till after the first appearance of the menses. When these stop, which generally happens between 40 and 50 years of age, they are barren ever after. Their breasts then shrink and decay, and the voice then becomes feebler. Some, however, have become mothers before they have experienced any menstrual discharge; and others have conceived at the age of 60, and sometimes at a more advanced age. Such examples, though not infrequent, must be considered as exceptions to the general rule; but they are sufficient to show that the menstrual discharge is not essential to generation. The age at which man acquires the faculty of procreating is not so distinctly marked. In order to the production of semen, the body must have attained a certain growth, which generally happens between 12 and 18 years of age. At 60 or 70, when the body begins to be enervated by old age, the voice becomes weaker, the semen is secreted in smaller quantities, and it is often unproductive. There are instances, however, of old men who have procreated at the age of 80 or 90. Boys have been found who had the faculty of generating at 9, 10, or 11 years of age; and young girls who have become pregnant at the age of 7, 8, or 9. But such facts, which are very rare, ought to be considered as extraordinary phenomena in the course of nature. PREGNANCY is the time during which a woman carries in her womb the fruit of conception. It begins from the moment the prolific faculty has been reduced into act, and all the conditions requisite in both sexes have concurred to form the rudiments of a male or female foetus; and it ends with delivery. See ANATOMY, *Index*; and MIDWIFERY. At the age of puberty, or a few years after, the body attains its full stature. Some young men grow no taller after 15 or 16, and others continue to grow till the age of 20 or 25. At this period they are very slender: but by degrees the members swell and begin to assume their proper shape; and before the age of 30, the body in men has attained its greatest perfection with regard to strength, constit-

ence, and symmetry. Adolescence ends at the age of 20 or 25; and at this period (according to the division which has been made of the years of man's life into different ages) MANHOOD begins. It continues till the age of 30 or 35.

(12.) MAN, PERIOD OF MATURITY, AND PROPER FORM OF. The body having acquired its full height during the period of adolescence, and its full dimensions in youth, remains for some years in the same state before it begins to decay. This is the period of MANHOOD, which extends from the age of 30 or 35 to that of 40 or 45 years. During this stage, the powers of the body continue in full vigour, and the principal change which takes place in the human figure arises from the formation of fat in different parts. Excessive fatness disfigures the body, and becomes a very cumbersome and inconvenient load. The body of a well-shaped man ought to be square, the muscles strongly marked, the contour of the members boldly delineated, and the features well defined. In women, all the parts are more rounded and softer, the features are more delicate, and the complexion brighter. To man belong strength and majesty; gracefulness and beauty are the portion of the other sex. For the structure essential to each, see ANATOMY.

(13.) MAN, PROBABILITIES OF THE DURATION OF THE LIFE OF. Of these, M. Daubenton has given, in the *Encyclopédie Méthodique*, a table, constructed from that in the 7th vol. of the *Supplément à l'Histoire Naturelle de M. de Buffon*. The following is an abridgment of it: Of 23,994 children born at the same time,

	there will probably DIE,	and REMAIN,
In one year	- 7998	$\frac{1}{3}$ or 15,996.
In 8 years	- 11,997	$\frac{1}{2}$ or 11,997.
In 38 years	- 15,996	$\frac{1}{4}$ or 7,998.
In 50 years	- 17,995	$\frac{1}{5}$ or 5,998.
In 61 years	- 19,995	$\frac{1}{6}$ or 3,999.
In 70 years	- 21,595	$\frac{1}{7}$ or 2,399.
In 80 years	- 22,395	$\frac{1}{8}$ or 599.
In 90 years	- 23,914	$\frac{1}{9}$ or 79.
In 100 years	- 23,992	$\frac{1}{10}$ or 2.

(14.) MAN, PROGRESSIVE DECAY OF, FROM MANHOOD, TO OLD AGE AND DEATH. From the above table it appears, that a very small number of men pass through all the periods of life, and arrive at the natural goal. Innumerable causes accelerate our dissolution. No sooner has the body attained its utmost perfection, than it begins to decline. Its decay is at first imperceptible; but in progress of time the membranes become cartilaginous, the cartilages acquire the consistence of bone; the bones become more solid, and all the fibres are hardened. The first traces of this decay begin about the age of 40, and sometimes sooner; this is the *age of decline*. It extends from 40, or 45, to 60, or 65 years of age. At this time of life, the diminution of the fat is the cause of those wrinkles which begin to appear in the face and some other parts of the body. The skin not being supported by the same quantity of fat, and being incapable from want of elasticity, of contracting, sinks down and forms folds. A remarkable change takes place also in vision. In the vigour of our days, the crystalline lens, being thicker and more diaphanous than the humours of the

eye, enables us to read letters of a very racter at the distance of 8 or 10 inches. the age of decline comes on, the quar humours of the eye diminishes, they clearness, and the transparent cornea be convex. To remedy this inconvenience what we wish to read at a greater dist the eye: but vision is thereby not much because the image of the object becom and more obscure. Another mark of t of life is a weakness of the stomach, at tion, in most people who do not take exercise in proportion to the quantity of their food. At 60, 63, or 65 years c signs of decline become more and m and indicate *old age*. This period com tends to the age of 70, sometimes to . When the body is extenuated and bent l man becomes *crazy*. Craziness therefore but an *infirm old age*. The eyes and st become weaker and weaker; leanness the number of the wrinkles; the bear hair become white; the strength and th begin to fail. After 70, or at most 8 age, the life of man is nothing but laborow; Such was the language of Mo 3000 years ago. (Psal. xc, 10.) Son strong constitutions, and in good health age for a long time without decrepitud the age of 100 or upwards; but such in not very common. The signs of decrep a striking picture of weakness, and an approaching dissolution of the body. T ry totally fails; the nerves become hard ed; deafness and blindness take place; of smell, of touch, and of taste, are; the appetite fails; the necessity of e more frequently that of drinking, are; after the teeth fall out, mastication is i performed, and digestion is very bad: t inwards; the edges of the jaws can no proach one another; the muscles of the become so weak, that they are unable support it; the body sinks down; the sp outward; and the vertebræ grow toget anterior part; the body becomes extre the strength fails: the decrepid wretch to support himself; he is obliged to re seat, or stretched in his bed: the bladde paralytic: the intestines lose their spri; culation of the blood becomes slower; t of the pulse no longer amount to the 70 or 80 in a minute as in the vigour a are reduced to 24 and sometimes fewe tion is slower; the body loses its heat; lation of the blood ceases; death follow drama of life is at an end. As in women the cartilages, the muscles, and every of the body, are softer and less solid th men, they require more time in harden degree which is supposed to occasion de men of course ought to live longer t This reasoning seems to be confirmed l ence; for, by consulting the bills of m appears, that after women have passed age they in general live longer than men arrived at the same age. After death t ration of the body begins to be dissolv

: parts relax, corrupt and separate. This is induced by an intestine fermentation, which occasions PUTREFACTION, and reduces the body to atile alkali, fetid oil, and earth.

15.) MAN, RATIONAL, MORAL, SOCIAL, AND RELIGIOUS, PRINCIPLES OF. See EDUCATION, LANGUAGE, LAW, LOGIC, METAPHYSICS, MORAL PHILOSOPHY, RELIGION, THEOLOGY, &c.

16.) MAN, RESTORATION OF THE POWERS OF SLEEP.

M. Daubenton observes (*Nouv. Encyc.*) that a cessation from exercise is not alone sufficient to restore the powers of the body when

they are exhausted by fatigue. The springs, though in action, are still wound up while we are asleep, even when every movement is suspended.

Deep nature finds that repose which is suited to wants, and the different organs enjoy a temporary relaxation. This is that wonderful state

which man, unconscious of his own existence, sunk in apparent death, repairs the loss which faculties has sustained, and seems to assume a new existence.

In this state of drowsiness and repose, the senses cease to act, the functions of the mind are suspended, and the body seems abandoned to itself.

The external symptoms of sleep, such alone are the object of our attention, are easily distinguished. At the approach of sleep, the eyes begin to wink, the eye-lids fall down, the head nods and hangs down: its fall astonishes the sleeper; he starts up, and makes an effort to

we away sleep, but in vain; a new inclination, stronger than the former, deprives him of the power of raising his head, his chin rests upon his breast, and in this position he enjoys a tranquil sleep. See SLEEP; also DREAMS, § 7.

17.) MAN, SENSES OF. See ANATOMY, Ind.

18.) MAN, STATURE OF. The common stature of man is about 5 feet and 3, 4, 5, 6 or 7 inches; that of women about 5 feet and 2, 3, or 4 inches. Men below 5 feet are of a small stature. The Laplanders do not exceed 4 feet and a half; and the natives of some other countries are still shorter.

Women attain their full height sooner than men. Hercom computes, that in the temperate climates of Europe, the medium stature of men is about 5 feet and 3 or 4 inches. He adds, that in Switzerland the inhabitants of the plains are taller than those of the mountains. It is difficult to ascertain with precision the actual limits of the human stature. In surveying the inhabited earth, we find greater differences in the statures of individuals than in those of nations. In the same climate, among the same people, and sometimes in the same family, there are men whose stature is either too tall or too diminutive. See GIANT and DWARF.

19.) MAN, STRENGTH AND AGILITY OF. Although the human body is externally much more delicate than that of any other animal, yet it is very nervous, and perhaps stronger in proportion to its size than that of the strongest animals. We are assured that the porters at Constantinople carry burdens of 900 pounds weight. A thousand wonderful stories are related of the Hottentots and other savages concerning their agility in running. Civilized man knows not the full extent of his powers, nor how much he loses by the effeminacy and inactivity by which they are

weakened and destroyed. He is contented even to be ignorant of the strength and vigour which his members are capable of acquiring by motion, and by being accustomed to severe exercises, as is observed in runners, tumblers, and rope-dancers.

The conclusion is therefore, founded on the most just and indisputable induction and analogy. The attitude of walking is less fatiguing to man than that in which he is placed when he is stopped in running. Every time he sets his foot upon the ground, he passes over a more considerable space; the body leans forwards, and the arms follow the same direction; the respiration increases, and breathing becomes difficult. Leaping begins with great inflections of the members; the body is then much shortened, but immediately stretches itself out with a great effort. The motions which accompany leaping making it very fatiguing.

(20.) MAN, VARIETIES IN THE COLOUR, FORM, AND CHARACTER OF. See COMPLEXION, § 2—7; and HOMO, § I, and II.

(II, i.) MAN, or the ISLE OF MAN, an island in the Irish sea, lying about 21 miles N. of Anglesey, as far W. of Lancashire, nearly equidistant from Galloway on the SE. and 27 miles E. of Ireland.

Its form is long and narrow, stretching from the NE. of Ayr Point to the Calf of Man on the SE. at least 30 miles. Its breadth in some places is more than 9 miles, in most places 8, but in some not above 5, containing about 160 square miles.

(ii.) MAN, ANCIENT NAMES OF. The first author who mentions this island is Cæsar; for there can be as little doubt, that, by the MONA, in his *Commentaries*, as lying in the midst between Britain and Ireland, we are to understand Man; as that the MONA of Tacitus, which had a fordable strait between it and the continent, can be applied only to ANGLESEY. Pliny has set down both islands; MONA, by which he intends Anglesey, and MONABIA, which is Man. In Ptolemy we find MONAÆDA, or MONAIDA, i. e. the farther or more remote Mona. Orosius styles it MENAVIA; tells us, that it was not extremely fertile; and that this, as well as Ireland, was then possessed by the Scots. Bede, who distinguishes clearly two Menavian islands, names this the northern *Mendavia*, and Anglesey the southern. In some copies of Nennius, this isle is denominated *Eubonia*; in others *Manavia*; but both mean *Man*. Alured of Beverley also speaks of it as one of the Menavian islands. The Britons, in their own language, called it *Menaw*, more properly *Main aw*, i. e. a little island, which seems to be latinized into *Manavia*. There are clear proofs that this small isle was early inhabited, and as well known to the rest of the world as either Britain or Ireland.

(iii.) MAN, CLIMATE, MOUNTAINS, MINERALS, SOIL, AND PRODUCE OF. This island, from its situation in the mouth of the channel, is very beneficial to Britain, by lessening the force of the tides, which would otherwise break with far greater violence than they do at present. It is frequently exposed to very high winds; and at other times to mists, which, however, are not at all unwholesome. The air is sharp and cold in winter; the frosts short; and the snow, especially on the coast, seldom lies long on the ground. There is a ridge of mountains runs almost the length of the

island, which afford good water from the rivulets and springs; the highest rises about 280 yards. There are quarries of good stone, and red free-stone, with some mines of lead, copper, and iron. The soil towards the N. is dry and sandy; of consequence unfruitful, but not unimprovable; the mountains, which may include near two thirds of the island, are bleak and barren; yet afford excellent peat, and contain several kinds of metals. In the valleys there is as good pasture, hay, and corn, as in any of the northern counties; and the S. part of the island is as fine soil as can be wished. They have marl and lime-stone sufficient to render even their poorest lands fertile; excellent slate, rag-stone, black marble, and some other kinds for building. They have vegetables of all sorts, and in the utmost perfection; potatoes in immense quantities, and tolerable fruit. They have also hemp, flax, large crops of oats and barley, and some wheat.

(iv.) MAN, DIVISIONS, AND CIVIL GOVERNMENT OF. The most general division of this island is into N. and S. and it contains 17 parishes, of which five have market towns, the rest villages. Its division with regard to its civil government, is into six shirelings, every one having its proper coroner, who is in the nature of a sheriff, is intrusted with the peace of his district, secures criminals, brings them to justice, &c. The lord chief justice Coke says, "their laws were such as are scarce to be found any where else." In July 1786, a copper coinage for the use of the island was issued from the Tower of London.

(v.) MAN, ECCLESIASTICAL GOVERNMENT OF. The inhabitants of this isle are of the church of England; and the bishop is styled *Bishop of Sodor and Man*. This bishoprick was first erected by Pope Gregory IV. and for its diocese had this isle and all the Hebrides, or Western Islands of Scotland; but which were called *Sodor* by the Danes, who went to them by the north, from the Swedish *Sodor, Sall or Chor Islands*, from which the title of the bishop of Sodor is supposed to originate. The bishop's seat was at Rushin, or Castletown, in the isle of Man, and in Latin is entitled *Sodorensis*. But when this island became dependent upon England, the Western Islands withdrew themselves from the obedience of their bishop, and had a bishop of their own, whom they entitled also *Sodorensis*, but commonly *Bishop of the Isles*. The patronage of the bishopric was given, together with the island, to the Stanleys by King Edward IV. and came by an heiress to the family of Athol; and, on a vacancy thereof, they nominated their designed bishop to the king, who dismissed him to the Abp. of York for consecration.—By act 33d of Hen. VIII. this bishoprick is declared in the province of York.

(vi.) MAN, HISTORY OF. In the close of the first century the Druids were expelled by Julius Agricola from the southern Mona, and took shelter in the northern. This island they found well planted with firs, but they introduced oaks. No histories record this, but we learn it from more certain authority, great woods of fir having been discovered interred in the bowels of the earth, and here and there small groves of oaks; but as these trees are never met with intermixed, it is

plain they never grew together; and as the firmer are by far the most numerous, we may presume that they were the natural produce of the country. The Druids gave the people a gross government, and wile laws, but withal a very superstitious religion. It is also very likely that they hindered them, as much as they could, from having any correspondence with their neighbours; which is the reason that, though the island is mentioned by so many writers, not one of them, before Orofius, says a word about the inhabitants. A little before his time, that is, in the beginning of the 3rd century, the Scots had transported themselves thither from Ireland. The traditionary history of the natives of Man begins at this period. They stile this first discoverer *Mannan Mac Lur*; and they say that he was a magician, who kept the country covered with mists, so that the inhabitants of other places could never find it. But the ancient chronicle of Ireland informs us, that the true name of this adventurer was *Oghinhuu*, the son of Alladius, a prince in their island; and that he was surnamed *Mannanan*, from his having first entered the island of Man, and *Mac Lur*, i. e. *the son of the sea*, from his great skill in navigation. He promoted commerce; and is said to have given a good reception to St Patrick, by whom the natives were converted to Christianity. The princes who ruled after him seem to have been of the same line with the kings of Scotland, with which they had great intercourse, assisting their monarchs in their wars, and having the education of their princes confided to them in times of peace. (In the beginning of the 7th century, Edwin, king of Northumberland, invaded the Manxian islands, ravaged Man, and kept it for some time, when, Beda assures us, there were not about 300 families; which was less than a third part of the people in Anglesey, though Man was but a third of the size of that island. The whole line of their princes they derive from Ori, who, they say, was the son of the king of Norway; and that there were 12 princes of this house who reigned in Man. The old constitution, settled by the Druids, while they swayed the scepter, was perfectly restored; the country was well cultivated and well peopled; their subjects were equally versed in the exercise of arms and in the knowledge of the arts of peace: in a word, they had a considerable naval force, an extensive commerce, and were a great nation, though inhabiting only a little isle. Guttred the son of Ori built the castle of Ruffyn, A. D. 950, which is a strong place, has a large palace, and has subsisted now above 200 years. Macao was the 9th of these kings, and maintained an unsuccessful struggle against Edgar, who reduced all the little sovereignties of the different parts of Britain to own him for their lord; and, upon the submission of Macao, made him his high-admiral, by which title (*Archiepiscopus*, in the Latin of that age) he succeeded that monarch's charter to the abbey of Gloucestershire. After the death of Edward the Confessor, when Harold II. had defeated the Norwegians at the battle of Stamford, there was amongst the fugitives one Goddard Crownan, the son of Harold the Black, of Iceland, who took shelter in the isle of Man. This isle was then governed by a

ard, who was a descendant from Macao, gave him a very kind and friendly recep-

Goddard Crownan, during the short stay he made in the island, perceived that his name was universally hated by his subjects; which he thought him with hopes that he might expel the king and become master of the island. This he accomplished, after having defeated and killed the son of Goddard, who had succeeded his father. Upon this he assigned the North of the island to the natives, and the South to his people; becoming thus the founder of the reign of princes. However unjustly he acquired the kingdom, he governed it with spirit and prudence; made war with success in Ireland; gained several victories over the Scots in the Isles; and, making a tour through his dominions, died in the island of Islay. He left behind him 3 sons. The eldest was breaking out between the two eldest, both dying in a few years, Magnus king of Norway came with a powerful fleet, possessed himself of Man and the isles, and held them as he lived; but, being slain in Ireland, the king invited home Olave, the youngest son of Goddard Crownan, who had fled to the court of England, and had been honourably treated by the king.

II. There were in all 9 princes of this island who were feudatories to the kings of England, and often resorted to their court, were received, and had pensions bestowed upon them. Henry III. in particular, charged Olave, king of Man, with the defence of the coasts of Ireland; and granted him annually for that service 40 marks, 100 measures of wheat, and 100 pipes of wine. Upon the demise of Magnus the last king of this isle, without heirs male, Alexander III. king of Scots, who had conquered the other isles, seized likewise upon this; which the king of that kingdom came into the hands of Edward I. who directed William Huntercumbe, a knight of that isle for him, to restore it to John Balliol, who had done homage to him for the kingdom of Scotland. But there still remained a lady of the name of *Aspirica*, who claimed this sovereignty, as the nearest of kin to the deceased Magnus, and able to obtain nothing from John Balliol, she pleaded to King Edward, as the superior lord. Upon this application, by his writ, which is still extant, commanded both parties, in order to determine their right, to appear in the king's court.

The progress of this suit does not appear; but this lady, by a deed of gift, conveyed the island to Sir Simon de Montacute; and, after disputes, invasions by the Scots, and other accidents, the title was examined in parliament, the 7th of Edward III. and solemnly adjudged to William de Montacute; to whom, by letters patent, dated the same year, that monarch recalled his claim what he ever. In the succeeding reign of William de Montacute, earl of Salisbury, the island was given to Sir William Sereop, afterwards earl of Hereford; and, upon his losing his head, it was given by Henry IV. to Henry Percy, earl of Northumberland; who, being attainted, had, by the king of that name, all his lands restored, except the isle of Man; which the same monarch granted to Sir John Stanley, to be held by him of the king, his heirs and successors, by homage; and

a cast of falcons to be presented at every coronation. Thus it was possessed by this noble family, who were created earls of Derby, till the reign of queen Elizabeth; when upon the demise of earl Ferdinand, who left 3 daughters, it was, as lord Coke tells us, adjudged to those ladies, and from them purchased by William earl of Derby, the brother of Ferdinand, from whom it was claimed by descent, and adjudged to the duke of Athol. See § vii.

(vii.) MAN, INHABITANTS, LANGUAGE, POPULATION, AND REVENUE OF. The inhabitants of Man, though far from being unmix'd, were, perhaps, till within the course of the last century, more so than any other under the dominion of the crown of Great Britain: to which they are very proud of being subjects, though, like the inhabitants of Jersey and Guernsey, they have a constitution of their own, and a peculiarity of manners naturally resulting from a long enjoyment of it.—The Manks tongue is the only one spoken by the common people. It is the old British, mingled with Norse, or the Norwegian Language, and the modern language. The clergy preach, and read the common prayer in it. In ancient times they were distinguished by their stature, courage, and great skill in maritime affairs. They are at this day a brisk, lively, hardy, industrious, and well-meaning people. Their frugality defends them from want: and though there are few that abound, there are as few in distress; and those who are, meet with a cheerful unfeigned relief. On the other hand, they are choleric, loquacious, and, as the law till lately was cheap, and unincumbered with solicitors and attorneys, not a little litigious. The revenue, in the earl of Derby's time, amounted to about 2,500*l.* a-year; from which, deducting his civil list, which was about 700*l.* the clear income amounted to 1800*l.* At this time, the number of his subjects was computed at 20,000.—The sovereign of Man, though he has long ago waived the title of *king*, was still invested with regal rights and prerogatives; but the distinct jurisdiction of this little subordinate royalty, being found inconvenient for the purposes of public justice, and for the revenue (it affording a commodious asylum for debtors, outlaws, and smugglers), authority was given to the treasury, by stat. 12 Geo. I. c. 25. to purchase the interest of the then proprietors for the use of the crown: which purchase was at length completed in 1765, and confirmed by stat. 5. Geo. III. c. 26. and 39.; whereby the whole island and all its dependencies (except the landed property of the Athol family), their manorial rights and emoluments, and the patronage of the bishopric and other ecclesiastical benefices, are unalienably vested in the crown, and subjected to the regulations of the British excise and customs.

(viii.) MAN, QUADRUPEDS, BIRDS, AND FISH OF. Hogs, sheep, goats, black cattle, and horses, are numerous; and though small in size, yet if the country was thoroughly cultivated, the breeds might be improved. The rabbits and hares are very fat and fine; tame and wild fowls are in great plenty; and in the high mountains are antics of eagles and hawks. They also feed a small species of swine, called *putts*, whose flesh is esteemed excellent.

excellent pork. The rivulets afford salmon, trouts, eels, and other fresh-water fish; on the coasts are caught cod, turbot, ling, halibut, all sorts of shell-fish, and herrings, of which the natives made anciently great profit, though this fishery is of late much declined.

(ix.) MAN, TRADE OF. The trade of this island was very great before 1726; but lord Derby farming out his customs to foreigners, the insolence of those farmers drew on them the resentment of the government of England, who, by an act of parliament, deprived the inhabitants of an open trade with this kingdom. This naturally introduced a clandestine commerce, which they carried on with England and Ireland with prodigious success, and an immense quantity of foreign goods was run into both kingdoms, till the government, in 1765, thought proper to put an entire stop to it, by purchasing the island of the duke of Athol, and permitting a free trade with England.

(III.) MAN, an island in the South Pacific Ocean, Lon. 151. 25. E. Lat. 4. 0. S.

(IV.) MAN, a river in Nottinghamshire.

(V.) MAN OF WAR. See § 1. def. 14; SHIP, and SHIP-BUILDING.

(VI.) MAN OF WAR BIRD. See PELICANUS, N° 1.

\* To MAN. v. a. [from the noun.] 1. To furnish with men.—

Your ships are not well *mann'd*;

Your mariners are muleteers, or reapers. *Shak.*

There stands the castle by yon tuft of trees,

*Mann'd* with three hundred men. *Shak.*

A navy, to secure the seas, is *mann'd*;

And forces sent. *Daniel.*

—It hath been agreed, that either of them should send certain ships to sea well *mann'd*. *Hayward.*

—Their ships go as long voyages as any; and are for their burdens as well *manned*. *Raleigh.*—He had

*manned* it with a great number of tall soldiers. *Bacon.*

—They *man* their boats, and all young men arm.

*Waller.*—The Venetians could set out 30 men of

war, 100 gallies, and ten galeasses; though I cannot

conceive how they could *man* a fleet of half

the number. *Addison.*—Timoleon forced the Car-

thaginians out, though they had *manned* out a fleet

of 200 men of war. *Arbutnot.* 2. To guard

with men.—

See, how the surly Warwick *mans* the wall.

*Shakesp.*

The summons take of the same trumpet's call,

To fall from one port, or *man* one publick

wall. *Tate.*

3. To fortify; to strengthen.—

Advise how war may be best upheld,

*Mann'd* by her two main nerves, iron and gold,

In all her equipage. *Milton.*

—Theodosius having *mann'd* his soul with proper

reflexions, exerted himself in the best manner he

could, to animate his penitent. *Spektator.* 4. To

tame a hawk.—

Another way I have to *man* my haggard,

To make her come, and know her keeper's

call;

That is, to watch her. *Shak.*

5. To attend; to serve; to wait on as a *man* or

servant.—Thou whore'son mandrake, thou art fitter

to be worn in my cap than to wait at my

heels: I was never *manned* with ag  
*Shak.*—

They distil their husbands land

In decoctions, and are *mann'd*

With ten empiricks in their cham

Lying for the spirit of amber.

6. To direct in hostility; to point;

obsolete word.—

*Man* but a rush against Othello

And he retires.

The conditions of weapons and their  
ient are, that they may serve in all weid-  
that the carriage may be light and  
*le*. *Bacon*.—Very long tubes are, by  
their length, apt to bend, and shake by  
o as to cause a continual trembling in  
ts, whereas by contrivance the glasses  
7 *managable*. *Newton*. 2. Governable;

**VAGEABLENESS.** *n. f.* [from *manage*.]  
Accommodation to easy use.—This dis-  
t may be imputed to the greater or less  
or *manageableness* of the instruments  
*Boyle*. 2. Tractableness; easiness to be

**VAGEMENT.** *n. f.* [*menagement*, Fr.]  
act; administration.—An ill argument  
d with deference, will procure more  
n the profoundest science with a rough,  
and noisy *management*. *Locke*.—The  
*management* of the earl of Godolphin was  
ause of the union. *Swift*. 2. Prudence;  
ractice.—

with what *management* their tribes di-  
c;  
ick to you, and some to t'other side.

*Dryden.*  
e; transaction; dealing.—He had great  
nt with ecclesiastics in the view of be-  
red to the pontificate. *Addison*.

**VAGER.** *n. f.* [from *manage*.] 1. One  
he conduct or direction of any thing.—  
*manager* of the rabble, so long as they

have but ears to hear, needs never enquire whe-  
ther they have any understanding. *Soub.*—The  
*manager* opens his sluice every night, and distri-  
butes the water into the town. *Addison*.—

An artful *manager*, that crept between  
His friend and shame.

*Pope.*  
2. A man of frugality; a good husband.—A prince  
of great aspiring thoughts: in the main, a *ma-*  
*nager* of his treasure. *Templ.*—The most severe  
censor cannot but be pleased with the prodigality  
of Ovid's wit; though he could have wished, that  
the master of it had been a better *manager*. *Dryd.*

\* **MANAGERY.** *n. f.* [*menagerie*, French.]  
1. Conduct; direction; administration.—They  
who most exactly describe that battle, give so ill  
an account of any conduct or discretion in the  
*managery* of that affair, that posterity would re-  
ceive little benefit in the most particular relation  
of it. *Clarendon*. 2. Husbandry; frugality.—The  
court of Rome has, in other instances, so well  
attested its good *managery*, that it is not credible  
crowns are conferred gratis. *Decay of Piety*. 3.  
Manner of using.—No expert general will bring a  
company of raw, untrained men into the field,  
but will, by little bloody skirmishes, instruct them  
in the manner of the fight, and teach them the  
ready *managery* of their weapons. *Decay of Piety*.

MANAN, an island of the United States, on  
the coast of Maine, 30 miles in circumference.

MANANGHERA, a river in Madagascar.

MANAR, an island on the NW. coast of Cey-  
lon; first settled by the Portuguese in 1560, and  
taken by the Dutch in 1658. It gives name to  
the Gulf.

(1.) MANASSEH, [מנשה, Heb. *i. e.* not for-  
gotten.] the eldest son of Joseph, and grandson of  
the patriarch Jacob, (Gen. xli. 50, 51.) was born  
A. M. 2290, and A. A. C. 1744.

(2.) MANASSEH, the 15th king of Judah, the  
son and successor of Hezekiah. His acts are re-  
corded in 2 Kings xx. xxi. and a Chr. xxxiii.

(3.) MANASSEH, THE TRIBE OF, the descen-  
dants of the patriarch. They came out of Egypt,  
in number 32,200 men, fit for battle, upwards of  
20 years old, under the conduct of Gamaliel son  
of Pedahzur. *Numb.* ii. 20, 21. This tribe was  
divided at their entrance into the land of Canaan.  
One half had its portion beyond the Jordan,  
and the other half on this side of it. The half tribe  
of Manasseh which settled beyond the river pos-  
sessed the country of Bashan, from the river Jab-  
bok to mount Libanus, (*Numb.* xxii. 33, 34, &c.)  
and the other half tribe of Manasseh on this side  
Jordan, obtained for its inheritance the country  
between the tribe of Ephraim on the S. and the  
tribe of Issachar on the N. having the river Jordan  
on the E. and the M-diterranean sea on the  
W. *Josh.* xvii. xvii.

MANATI, in zoology. See TRICHEGUS, N° 2.

\* **MANATION.** *n. f.* [*manatio*, Latin.] The  
act of issuing from something else.

MANAFOULIN, an island of N. America in  
lake Huron, 100 miles long, and 8 broad.

MAN-BOTE, in the Anglo-Saxon laws, com-  
pensation for killing a man. In King Ina's laws  
rates are fixed for the expiation of this crime, ac-  
cording to the quality of the person slain.

MANCA, in English antiquity, was a square  
piece

site of the present *Castlefield*, at MANCHESTER. Relics of the castle wall and ditch are still visible. *Knock Castle* was the seat of the Roman *Castrum*. See MANCHESTER, N° 1.

MANCHESTER, a village in Warwickshire, anciently a Roman Station on Watling-Street, where ancient Roman coins are still found. It lies near Atherstone.

(1.) MANCHA, a mountainous province of Spain, in New Castile, between the Guadana and Andalusia. The natives are remarkable for cheerfulness, and excel in music and dancing.

(2.) MANCHA, a town of Spain, in Jaen.

(1.) \* MANCHE. *n. f.* [French.] A Beete.

(2.) MANCHE, I.A. See CHANNEL, N° 1.

(1.) MANCHESTER, a large, populous, and flourishing town of Lancashire, seated on a hill, near a navigable canal, at the conflux of the Irk and the Irwell, 3 miles from the Mersey. Mr Whitaker thinks, that the station was first occupied by the Britons about A. A. C. 500, but that it first received any thing like the form of a town 450 years after, when the Britons of Cheshire made an irruption into the territories of their southern neighbours, and alarmed the Sefuantii,

or inhabitants of Lancashire, so much, that they built forts to defend their country. Its British name was MANCENION; which was changed by the Romans, who conquered it under Agricola, A. D. 79, into MANCUNIUM; whence the present name. It is adorned with many fine buildings and 600 streets. It has a spacious market place, a college; and an exchange. The fustain manufactory, called *Manchester cottons*, for which it has been famous for 200 years, has been much improved by some recent discoveries in dyeing and printing. These with the great variety of other manufactures, called *Manchester goods*, of which

less than 60 mills upon it. tion with the Mersey, Dec, 1 gation extends above 500 mile counties. See MERSEY.

4½ miles NE. of Nogaro, and 16½ SW. of  
m.

MANCIPATE. *v. a.* [*mancipio*, Lat.] To  
; to bind; to tie.—Although the regular  
nature is seldom varied, yet the meteors,  
are in themselves more unstable, and less  
ated to stated motions, are oftentimes em-  
to various ends. *Hale's Origin of Mankind.*

MANCIPATIO, a term used in the ancient  
law, which may be thus explained: Every  
and such a regal authority over his son, that  
the son could be released from his subjec-  
d made free, he must be three times over  
d bought, his natural father being the ven-  
The vendee was called *pater fiduciarius*. Af-  
fictitious bargain, the *pater fiduciarius* sold  
ain to the natural father, who could then,  
till then, *manumit* or make him free. The  
ary sale was called *mancipatio*; and the act  
g liberty or setting him free after this was  
*mancipatio*.

MANCIPATIO also signifies the selling or a-  
g of certain lands by the balance, or money  
y weight, and five witnesses. This mode  
ation took place only among Roman citi-  
d that only in respect to certain estates  
d in Italy, which were called MANCIPIA.

MANCIPATION. *n. f.* [from *mancipate*.] Sla-  
involuntary obligation.

\* MANCIPLE. *n. f.* [*manceps*, Lat.] The  
d of a community; the purveyor; it is par-  
ly used of the purveyor of a college.—  
heir *manciple* fell dangerously ill,  
d must be had. *Miller of Trompington.*

MANCIPLE means also a clerk of the kit-  
An officer in the inner temple was ancient-  
alled, of whom Chaucer, the ancient Eng-  
et, some time a student of that house, thus

: anciple there was within the temple,  
which all caterers might take ensample.

MANCORA, a town of Peru, in Piura.

MANCUNIAM, in ancient geography, a town  
BRIGANTES in Britain; now called MAN-  
ER.

MANCUS, [from *manu custus*,] in antiquity, an  
Saxon gold coin, equal in value to 2½ solidi,  
ence; and in weight to 55 Troy grains.  
ft account of this coin, that occurs in the  
history, is about the close of the 8th cen-  
an embassy of Kenwulf king of Mercia to  
l. requesting the restoration of the jurisdic-  
the see of Canterbury: this embassy was  
d by a present of 120 mancuses. Ethel-  
so sent yearly to Rome 300 mancuses: and  
oins are said to have continued in some  
r other, till towards the conclusion of the  
government. The heriots of the nobility  
essy estimated by this standard in Canute's  
It came originally from Italy, where it was  
*ducat*: and is supposed to have been the  
with the drachma or *millarenfis* current in  
zantine empire.

MANCUSA. See MANGA.

.. XIII. PART II.

MANDAL, a town and river of Norway;

(1.) \* MANDAMUS. *n. f.* [Lat.] A writ grants  
ed by the king, so called from the initial word.

(2.) A MANDAMUS issues out of the court of  
king's bench, and is sent to a corporation, com-  
manding them to admit or restore a person to his  
office. This writ also lies where justices of the  
peace refuse to admit a person to take the oaths,  
to qualify himself for any post or office; or where  
a bishop or archdeacon refuses to grant a probate  
of a will, to admit an executor to prove it, or to  
swear a church warden, &c.

MANDANE, the mother of Cyrus. See PERSIA.

MANDANES, an Indian prince and philoso-  
pher, who for the renown of his wisdom was in-  
vited by the ambassadors of Alexander the Great  
to the banquet of the son of Jupiter. A reward  
was promised him if he obeyed, but he was threat-  
ened with punishment in case of a refusal. Equal-  
ly unmoved by both, the philosopher disdained  
them with observing, that though Alexander ruled  
over a great part of the universe, he was not  
the son of Jupiter; and that he gave himself no  
trouble about the presents of a man who possessed  
not wherewithal to content himself. "I despise  
his threats (added he); if I live, India is sufficient  
for my subsistence; and to me death has no ter-  
rors, for it will only be an exchange of old age  
and infirmity for the happiness of a better life."

MANDAR, a town of Celebes.

(1.) \* MANDARIN. *n. f.* A Chinese noble-  
man or magistrate.

(2.) MANDARINS, a name given to the magis-  
trates and governors of provinces in China, who  
are chosen out of the most learned men, and  
whose government is always at a great distance  
from the place of their birth. See CHINA, § 17.

(3.) MANDARIN TONGUE, the learned language  
of the Chinese. Besides the language peculiar to  
every province, this is common to all the learned  
in the empire, and is in China what Latin is in  
Europe. It is the language of the court. See  
CHINESE, § 16.

MANDAT. See MANDATS.

\* MANDATARY. *n. f.* [*mandataire*, Fr. from  
*mando*, Latin.] He to whom the pope has, by  
his prerogative, and proper right, given a man-  
date for his benefice. *Asliffe*.

(1.) \* MANDATE. *n. f.* [*mandatum*, Lat.] 1.  
Command.—Her force is not any where so appa-  
rent as in express *mandates* or prohibitions, espe-  
cially upon advice and consultation going before.  
*Hooker*.—The necessity of the times cast the pow-  
er of the three estates upon himself, that his *man-  
dates* should pass for laws, whereby he laid what  
taxes he pleased. *Howell's Vocal Forest*. 2. Pre-  
cept; charge; commission, sent or transmitted.—

Who knows,

If the scarce bearded Cæsar have not sent  
His powerful *mandate* to you. *Shak.*

This Moor,

Your special *mandate*, for the state affairs,  
Hath hither brought. *Shak. Othello*.

He thought the *mandate* forg'd. *Dryd.*

This dream all powerful Juno sends, I bear  
Her mighty *mandate*. *Dryden*.

(2.) MANDATE, in law, is a judicial command-  
ment to do something. See MANDAMUS.

M m m m

(2.) MANE

their credit on the *whole* national property, as the assignats had been, they were bottomed upon so much of it, as was equivalent in value to the amount of the mandats issued. A list of the lands thus appropriated, which could be immediately acquired by the holders of mandats, was printed, and copies dispersed through the republic. The mandats thus operated a temporary restoration of the credit of the republic. See REPUBLIC.

MANDATUM, in Roman antiquity, was a fee or retainer given the *procuratores* and *advocati*. It was a necessary condition, without which they had not the liberty of pleading.

(1.) MANDEL, a river of the French republic, in the late prov. of Flanders, running into the Lys, 3 miles above Deinse.

(2.) MANDEL, a town of the French republic, in the dep. of Escout, 6 miles S. of Courtray.

MANDELLO, a town of the Italian republic, in the dept. of the Lario, on the E. bank of lake Como.

(1.) MANDERSCHEIT, a ci-devant county of Germany, in the circle of the Lower Rhine, and electorate of Triers, between the diocese of Triers and the duchy of Juliers. It is now included in the dep. of the Rhine and Moselle.

(2.) MANDERSCHEIT, a town of the French republic, in the dep. of the Rhine and Moselle, and ci-devant electorate of Triers; late capital of the above county. Lon. 6. 32. E. Lat. 50. 20. N.

(1.) MANDEVILLE, Bernard DE, M. D. an eminent writer of the 18th century, born in Holland, where he studied physic, and took his degree. He afterwards came over into England, and in 1714 published a poem, entitled, *The Grumbling Hive, or Knaves turned Honest*; upon which he afterwards wrote remarks, and published the whole at London, 1722, in 8vo. under the title

the capital of the Mandubii; 5 n. beliard; now in the dep. of Mari

\* MANDIBLE. *n. f.* [*mandibu*] jaw; the instrument of manduc only the crocodile moveth the upper *mandible* did make an the cranium. *Grew's Museum.*

tle. Every town has an alkadi, power; for most of them havir

fields of clear ground, one for co for rice, the alkadi appoints the

people. The men work the co the women and girls the rice gro

all equally labour, so he equally amongst them; and in case any others supply them. This alkadi

rels, and has the first voice in al town affairs." Some of these M are fittled at Galam, far up the S and write Arabic tolerably; and

res, hatchets, reaping hooks, spades, shears, and dyers, &c.

LANDOLA, a sea port town of Maritime

ANDRAGORA, in botany. See ATROPA.

ANDRAGORITIS, a surname of Venus.

ATROPA, N<sup>o</sup> 4.

\*) MANDRAKE. *n. f.* [*mandragoras*, Latin; *fragore*, Fr.] The flower of the *mandrake* con-

sists of one leaf in the shape of a bell, and is divid-

ed at the top into several parts; the root is said to

resemble a dog to the human form. The re-

ason of tying a dog to this plant, in order to root

it, and prevent the certain death of the per-

son who dares to attempt such a deed, and of the

poison emitted by it when the violence is offered,

is equally fabulous. *Miller*.—Among other vir-

tues the *mandrake* has been falsely celebrated for

bringing barren women fruitful: it has a sopor-

ific quality, and the ancients used it when they

would cure a narcotick of the most powerful kind.

— Would curses kill, as doth the *mandrake's*

groan,

could invent as bitter searching terms,

curst, as harsh, and horrible to bear. *Shak.*

Not poppy, not *mandrake*,

nor all the drowsy syrups in the world,

shall ever med'cine thee to that sweet sleep. *Shak.*

And shrieks like *mandrakes*, torn out of the

earth,

that living mortals, hearing them; run mad. *Shak.*

Go, and catch a falling star,

and with child a *mandrake* root. *Donne.*

\*) MANDRAKE, in botany. See ATROPA and

ATROPA.

\*) MANDRE, a town of France, in the dep-

artment of Meuse; 12 miles S. of Vancouleurs.

\*) MANDRE SOUS VAIRIF, a town of France,

in the dep. of Vosges, 10 miles N. of Marche.

\*) MANDRILL. *n. f.* [*mandrin*, French.] An

instrument to hold in the lathe the substance to be

turned.—This *mandrel* is a shank, or *pin-mandrel*.

\*) A MANDREL is a kind of wooden pulley,

member of the turner's lathe. Of these there

are several kinds; as *Flat Mandrels*, which have

one or more little pegs or points near the verge,

are used for turning flat boards on. *Pin Man-*

*drils*, which have a long wooden shank to fit stiff

into a round hole made in the work to be turned.

*Screw Mandrels*, which are hollow of themselves,

are used for turning hollow work. *Screw Man-*

*drils*, for turning screws, &c.

\*) MANDRILL, and } Two villages of Maritime

ANDRIOLA, } Austria, near Padua.

\*) MANDUCATION. *n. f.* [*manducatio*, Lat.]

Eating.—*Manducation* is the action of the lower

jaw in chewing the food, and preparing it in the

mouth before it is received into the stomach.

Quincy.—Our *manducation* must be spiritual, and

so must the food, and consequently it cannot be

natural flesh. *Taylor*.

(1.) \* MANE. *n. f.* [*maene*, Dutch.] The hair

which hangs down on the neck of horses, or o-

ther animals.—*Dametas* was tossed from the sad-

dle to the *mane* of the horse, and thence to the

ground. *Sidney*.—A currie comb, *maine* comb, and

whip for a jade. *Tusser*.—

The weak wanton Cupid

Shall from your neck unclose his am'rous fold;

And, like a dew-drop from the lion's *mane*.

Be shook to air. *Shak.*

—The horses breaking loose, ran up and down

with their tails and *manes* on a light-fire, *Knolles's*

*History of the Turks*.—

A lion shakes his dreadful *mane*,

And angry grows. *Wallis*.

For quitting both their swords and reins,

They grasp'd with all their strength the *manes*. *Hudibras*.

(2.) The MANE of a horse should be long, thin,

and fine; and if frizzled, so much the better.

(1.) \* MANEATER. *n. f.* [*man* and *eat*.] A can-

nibal; an anthropophagite; one that feeds upon

human flesh.

(2.) MAN-EATER. See ANTHROPOPHAGI, and

CANNIBAL.

\* MANED. *adj.* [from the noun.] Having a

mane.

MANEGE, or MENAGE, *n. f.* the exercise of

riding the great horse; or the ground set apart

for that purpose; which is sometimes covered,

for continuing the exercise in bad weather; and

sometimes open, to give more freedom both to the

horseman and horse. See HORSEMANSHIP. The

word is borrowed from the Italian *maneggio*; or,

a *manu agendo*, i. e. *acting with the hand*.

MANERBIO, a town and territory of the Italian

republic, in the dep. of Mella, and late prov.

of Bresciano, on the Mella. The town contained

3000 souls in 1797; the district 5000, with 4 pa-

rishtes.

MANERIUM. See MANOR.

(1.) MANES, or MANICHÆUS, one of the Per-

sian Magi, who having embraced Christianity,

mingled his own philosophical opinions with its

doctrines, and thus became the founder of the

Manichæan system. See MANICHEES. *Manes*

flourished about A. D. 277. St Epiphanius says,

his original name was *Cubricus*, and that he chan-

ged it for *Manes*, which, in the Persian or Baby-

lonish language, signifies *wealth*. A rich widow,

whose servant he had been, dying without issue,

left him a great deal of wealth; after which he

assumed the title of the *apostle* or *envoy of Jesus*

*Christ*. He next assumed that of the PARACLETE,

whom Christ had promised to send; which Au-

gustine explains by saying, that *Manes* endeavoured

to persuade men, that the Holy Ghost did per-

sonally dwell in him with full authority. He left

several disciples, and among others Addas, Tho-

mas, and Hermas. These he sent in his lifetime

into several provinces to preach his doctrine.

Manes.

M m m m

**Manes**, having undertaken to cure the son of Sapor king of Persia, and not succeeding, was put in prison upon the young prince's death, whence he made his escape; but was apprehended soon after, and slayed alive. However, the oriental writers, cited by D'Herbelot and Hyde, tell us, that Manes, after having been protected in a singular manner by K. Hormizdas, who succeeded Sapor, but who was not able to defend him against the united persecutions of the Christians, the Magi, the Jews, and the Pagans, was shut up in a strong castle to preserve him from his enemies. They add, that after the death of Hormizdas, Varanes I. his successor, first protected Manes, but afterwards gave him up to the fury of the Magi, whose resentment against him was owing to his having adopted the Sadducean principles, as some say; while others attribute it to his having mingled the tenets of the Magi with the doctrines of Christianity. However, it is certain that the Manicheans celebrated the day of their master's death. It has been a subject of much controversy whether Manes was an impostor. The learned Dr Lardner has examined the arguments on both sides; and though he does not incline to deny that he was an impostor, he does not discern evident proofs of it. He acknowledges, that he was an arrogant philosopher and a great schemist; that he was much too fond of philosophical notions, which he endeavoured to bring into religion; nevertheless, he observes, that every bold dogmatist is not an impostor. St Epiphanius gives a catalogue of several pieces published by Manes, and adds extracts out of some of them. These are the *Mysteries, Chapters, Gospel, and Treasury*.

(2.) **MANES**, the 1st K. of Lydia. See *LYDIA*, § 2.

(3.) \* **MANES**. *n. f.* [Latin.] Ghost; shade; that which remains of man after death.—

Hail, O ye holy *manes*! hail again,  
Paternal asses! *Dryden*.

(4.) **MANES**, is a poetical term, signifying the shades or souls of the deceased. The heathens used a variety of ceremonies and sacrifices to appease the manes of those who were deprived of burial. See *LEMURES* and *LEMURIA*.

(5.) **MANES DII** were the same with *INFERI*, or the infernal gods, who tormented men; and to these the heathens offered sacrifices to alluage their indignation. The heathen theology is a little obscure with regard to these gods Manes. Some hold, that they were the souls of the dead; others, that they were the *GENII* of men; which last opinion suits best with the etymology of the word. The heathens, in fact, used the word in several senses; sometimes for ghosts of the departed, sometimes for the infernal or subterraneous deities; and in general for all divinities that presided over tombs. The evocation of the manes of the dead seems to have been very frequent among the Thessalians; but it was expressly prohibited by the Romans. See *LARES*.

**MANETHO**, an ancient Egyptian historian, who pretended to take all his accounts from the sacred inscriptions on the pillars of Hermes Trismegistus. He was high priest of Heliopolis under Ptolemy Philadelphus, at whose request he wrote his history in Greek; beginning from their

gods, and continued it down to near th Darius Coddomanus. His history of I celebrated work, often quoted by Jot other ancient authors. Julius African abridgement of it in his *Chronology*. I works is however lost; and there onl some fragments extracted from Julius I which are to be found in Eusebius *Cbro*

**MANFALOUT**, or } a town of Egi  
**MANFLOT**, } W. bank of ti  
**MANFRED**. See **MANFREDONIA**,  
**PLES**.

**MANFREDI**, Euface, a celebrated n cian, born at Bologna in 1674, where l lected mathematical professor in 1698. made a member of several academies, i red great reputation by his *Ephemerid* 4to, as well as by other works. He die

**MANFREDONIA**, a port town of 2 the Gulph of Venice, built on the ruins ciant Sipontum. See *SIPONTUM*. It re name from its founder King **MANFR** transplanted hither the few inhabitant mained at Sipontum, and attracted oth to it by various privileges and exemp order to found it under the most favour ces, he called together all the famous of astrology (a science in which both h father placed great confidence), and ca to calculate the happiest hour and minu ing the first stone. He himself drew traced the walls and streets, superint works, and by his presence and largesit the workmen to finish them in a t time. The port was secured from sic pier, the ramparts were built of the materials, and in the great tower was bell of so large a size, as to be heard or plain of Capitanata, in order to alarm th in case of an invasion. Charles of An wards removed the bell to Bari, and of the shrine of St Nicholas, as a thankf the recovery of one of his children. In all the precautions taken by Manfred to brilliant fortune to his new city, neithe ertions nor the horoscopes of his astrolo been able to render it opulent or powe present, (Mr Swinburn says,) it scarce inhabitants, though most of the corn from the province is shipped off here, an trade carried on with Venice and Gr which reason there is a lazaretto establi 1620, the Turks landed and pillaged Mar All sorts of vegetables abound here, fo and succulency vastly superior to those continual waterings in the cineritious soi ples. Fish are plentiful and cheap. It is NE. of Naples, and 150 SE. of Ancona. 12. E. Lat. 41. 36. N.

\* **MANFUL**. *adj.* [man and ful.] Bol daring.—

A handful

It had devour'd, it was so *manful*.

\* **MANFULLY**. *adv.* [from *manful*.] stoutly.—Artemisia behaved herself *man* great fight at sea, when Xerxes stood by ard. *Abbot*.—

I flew him *manfully* in fight,  
Without false 'vantage. *Shak.*  
He that with this Christian armour *manfully*  
fights against, and repels, the temptations and  
assaults of his spiritual enemies; he that keeps  
conscience void of offence, shall enjoy peace  
here, and for ever. *Ray on Creation.*

\* **MANFULNESS.** *n. f.* [from *manful*, Stout-  
ness; boldness.

**MANGALORE**, a town of Indostan, in Cana-  
on the coast of Malabar, where a treaty of  
peace was signed between the British and Tip-  
o Sultan, in 1784. It has a good harbour and  
is a trade. The Portuguese have a factory in it,  
and a warehouse for rice, &c. The people are  
Malabars and partly Mahometans. It is 124 m.  
NW. of Seringapatam. Lon. 72. 42. E. Lat.  
5. 50. N.

1.) \* **MANGANESE.** *n. f.* [*manganēsa*, low-  
tin.] *Manganese* is a name the glassmen use for  
many different substances, that have the same ef-  
fect in clearing the foul colour of their glass: it  
is properly an iron ore of a poorer sort. *Hill.*—  
*Manganese* is rarely found but in an iron vein.  
*Woodward.*

2.) \* **MANGANESE, MAGNESIA NIGRA, OR  
BLACK MAGNESIA**, is a dark coloured mineral, or  
kind of Pseudo-Loadstone, dug up in Germany,  
Italy, and in Mendip hills, in Somersetshire. It  
is employed in glass-works for purifying glass, by  
taking away the colour it has already, or by sur-  
adding a new colour to it. It is also used in  
making earthen ware to which it communicates a  
black colour. It has sometimes been called *the  
soul of glass*. See **CHEMISTRY, Index**, and **GLASS-  
MAKING, Sect. III**, and **XIV**.

3.) **MANGANESE, COMBINATIONS OF.** See  
**CHEMISTRY, Index**.

4.) **MANGANESE, DISCOVERY, PROPERTIES,  
AND PHENOMENA OF.** This substance, called  
*the glass-maker's manganese*, is the calx of a new  
metal, whose properties were first investiga-  
ted by Mr Scheele in the *Stockholm Memoirs* for  
1774; and afterwards more fully by Dr Gahn,  
and several other chemists. Its colour is of a dusky  
white; and its surface uneven and irregular,  
owing to its imperfect fusion. It is bright and  
shining when first broken, but tarnishes by expo-  
sure to air much sooner than any other metallic  
calx. Its specific gravity is 6.850: it equals,  
in weight, does not exceed, iron in hardness, as well as  
in ductility of fusion. When reduced to powder,  
it becomes maguetical, though large pieces of it  
are not so. When exposed to the air, it soon  
changes into a blackish brown powder, some-  
times heavier than the regulus itself; and this ef-  
fect is sooner produced in a moist than a dry air.  
When united with manganese is very malleable,  
and scarce any traces of the red colour are to be  
seen on the surface when polished, but the mix-  
ture sometimes has a green efflorescence by age.  
Its decomposition by air is very remarkable. A  
piece of it newly made, when put into a dry bot-  
tle well corked, remained perfect for six months;  
afterwards, when exposed only for two days  
to the open air of a chamber, contracted a brown  
colour on the surface, and became so friable as to  
fall into powder between the fingers, the

internal parts only retaining an obscure metallic  
splendour, which also disappeared in a few hours.  
See **CHEMISTRY, Index**. Mr Scheele laboured ex-  
ceedingly to decompose this substance, and to  
discover its component parts; but he candidly  
acknowledges, that he did not succeed in this in-  
vestigation according to his wish. And as the whole  
of his experiments and conclusions were made up-  
on the exploded hypothesis of **PHLOGISTON**, it  
is unnecessary to recapitulate them.

5.) **MANGANESE, EXPERIMENTS WITH, AND  
EFFECTS OF, ON GLASS FLUXES, &c.** Mr Scheele  
enumerates the effects of Manganese on glass fluxes  
as follows: 1. A colourless glass flux becomes  
constantly more or less red on addition of manga-  
nese, according to the quantity. 2. If the flux  
be a little alkaline, the colour will approach to  
violet. 3. Arsenic, gypsum, and calx of tin, de-  
stroy the red colour in these glasses, and thus ren-  
der them clear. 4. If glass coloured red by manga-  
nese be fused in a crucible with powdered char-  
coal, the colour disappears during the efferve-  
scence without the addition of gypsum or calx of  
tin; but on keeping the glass a long time in fu-  
sion upon charcoal, by means of the blow-pipe,  
the colour does not disappear. Nay, if the col-  
ourless glass be kept in this state for a short time  
upon charcoal, it grows red again. 5. By add-  
ing a little sulphur, the colour disappears; and  
the same thing takes place on the addition of any  
metallic calx or any neutral salt containing the  
vitriolic acid. But all metals whose calces colour  
glass, while they deprive it of that which it has  
received from the manganese, communicate their  
own peculiar colour to it. If to such a colour-  
less glass globule, nitre, even in the smallest quan-  
tity, be added, it presently grows red again; and  
the same thing happens if such a colourless glass  
globule be kept in fusion for a few minutes upon  
an iron plate; and thus the red colour may be  
made to appear and disappear as often as we  
please. Mr Scheele also made the following ex-  
periment, to determine whether the green colour  
of bottle glass proceeds from iron or not. Having  
melted green glass by the blow-pipe on a piece of  
the same substance, left, in using a crucible, he  
should have been deceived by the iron it contain-  
ed, he poured upon it a large quantity of mu-  
stic acid; and having extracted a tincture, and  
poured into it a few drops of the solution of Prus-  
sian alkali, it assumed a bluish colour. Hence  
he concludes, that iron, nearly in its metallic  
form, is present in common green glass; for its  
calx always gives a yellowish colour to glass,  
and manganese added to a solution of iron in ac-  
ids destroys the green colour, substituting a yel-  
low one in its room; and in like manner, when  
added to green glass in fusion takes away its col-  
our. The same effect is produced by manganese,  
if added in proper quantity; though, according  
to the experiments of Mr Scheele, somewhat of a  
yellowish colour ought to have been communi-  
cated by it; and he is of opinion that it was really  
so, though the quantity of iron was too small to  
render it distinctly visible. It is also remarkable,  
that the rays of light passing through glass of this  
kind, when nearly red hot, appear of a yellowish  
colour. Mr Engstrom's experiments on this sub-

ject are somewhat different from those of Mr Scheele. Having melted manganese and borax together upon a piece of charcoal, the glass at first assumed the common colour of manganese; but this was repeatedly destroyed, and made to appear without adding any thing. During the operation he took notice of the following phenomena: 1. When a small quantity of manganese was taken, the colour was light, but with a larger it became nearly black; and whatever colour it assumed on the first fusion was manifested also at the second, when it was made to reappear. 2. Manganese, on being melted with borax, effervesces violently; which ceases, however, as soon as the manganese is dissolved. 3. To make the colour of the glass disappear, it was necessary only to direct the blue flame of the candle upon the glass, and that equally and constantly, but not very violently. On blowing more faintly, and allowing the brown flame to touch the place, the colour returned. 4. About the time that the glass becomes colourless, a kind of section or partition is observed in it; and as soon as the colour disappears, the blowing must be immediately discontinued, so that the brown flame shall not afterwards touch the glass. When it is taken out with the forceps, it appears perfectly colourless. 5. This destruction of the colour seems not to happen suddenly, but by degrees; for when the blowing was now and then discontinued before the true mark had appeared, the glass was generally lighter than before, though not quite colourless. Though our author had been able to discharge the colour thus from glass, and to make it reappear, it seemed doubtful whether this could be done frequently; for having blown the blue flame violently against some glass, the colour of which he had already twice discharged and made to reappear, he found that it could not again be discharged even by constant blowing for an hour. In another experiment, having added a large quantity of manganese, he found that the glass retained its colour even in the utmost heat he could give it, though it always became colourless when warm, but regained its colour in the cool. In both these experiments the violence of the flame had dispersed and driven off some small globules, which always remained colourless: the reason of this he thinks is, that manganese, or its colouring part, has a strong attraction for a small part only of borax; and that, by means of a violent heat, the superfluous part may be separated, and the rest unite more closely with the earthy particles. The same thing happened likewise with the small globules, which sometimes remained after the mass was taken away, fixed to the charcoal by the violence of the flame. "If this is really the case (says he), it would follow, that, by repeating the experiment, some of these particles would always separate if a sufficiently strong flame was applied, and it would be impossible to expel the red colour afterwards. I dare not, however, advance this conjecture, though it is grounded on some experiments as a matter of certainty." Cronstedt observes, that manganese communicates a colour both to glasses and saline solutions. Borax, which has dissolved it, becomes transparent, and assumes a reddish brown

or hyacinthine colour; the microcosmic salt becomes transparent, of a crimson colour, and mottles in the air. In compositions for glass it becomes violet with the fixed alkali; but if a great quantity of manganese be added, the glass is in thick lumps and looks black; by scorification with lead the glass obtains a reddish brown colour. Manganese deflagrates with nitre; and the residuum, when thus deflagrated, communicates a deep red colour to its lixivium. The calx, when reckoned to be light, weighs as much as an iron ore of the same texture. It ferments with vitreous compositions, and still more when melted with the microcosmic salt. The colours communicated by manganese to glasses are easily destroyed by the calx of tin or arsenic, and likewise vanish of themselves in the air. According to Dr Brunnich, manganese, when melted with zinc, assumes a green colour. Tin unites very readily with manganese; but zinc not without great difficulty, perhaps on account of its volatility and inflammable nature. White arsenic adheres to it, and reduces it to a metallic form. By simple calcination a blackish powder is produced; but if the ignition be continued for 12 days, it acquires a dark green colour; producing also, sometimes, one of a white or reddish colour. All these various calces, by means of a sufficient degree of heat in a common crucible, run into a yellowish red glass, which is pellucid, unless from too great thickness.

(6.) MANGANESE, NATIVE. The surprising facility of decomposition of manganese, (see § 4.) might lead us to suppose that no such thing as native manganese could exist in the earth. In the *Journal de Physique* for Jan. 1786, however, M. de Peyrouse gives an account of a native regulus of manganese, the properties of which are as follow: 1. In appearance it very much resembles the artificial regulus. (See CHEMISTRY, § 826.) 2. It dirties the fingers by handling. 3. None of its particles are in the least affected by the magnet. 4. It is composed of laminæ having a kind of divergence among themselves. 5. Its metallic brilliancy is the same with that of the artificial regulus, and it has a partial malleability. 6. When repeatedly hammered, it exhibits a kind of exfoliation, forming itself into very thin leaves. 7. Its opacity and density are so completely similar to the artificial regulus, that were it not for the matrix in which the latter is imbedded, it would be in a manner impossible to distinguish them. This regulus is not found in large masses, or in any solid continuous body, but only in clots or lumps inclosed and intermixed with the powdery or calciform ore. These lumps are somewhat flattened or compressed in their form like the artificial ones, though for the most part they are of a larger size. This powdery magnesian ore, in which the reguline lumps are imbedded, has an argentine lustre, as if the materials had been subjected to some violent heat upon the spot. This regulus was found among the iron mines of Sem, in the valley of Fardos, in the late county of Foix, (now in the department of the Ariège,) near the Pyrenean mountains.

(7.) MANGANESE, ORES OF. See CHEMISTRY, § 828. Manganese is found in a calciform form

colours. M. de Magellan observes, that acid is the only mineralizer of this femi-dry slate. The black manganese seems decayed particles of that which is indurated; the latter is met with either pure, or in lumps seemingly composed of concentric strata, but very rarely, it is met with colour. Cronstedt informs us, that he found this from Norway. He found it derived from the common kind by giving colour to borax in the fire. By calcination it assumes a reddish brown colour. The ore, above mentioned, contains but a very small portion of iron. Rinman found it both white crystals and in round masses in the quartz, and adhering to glauz-blende: it is rather less than limestone, the texture, and the substance scarcely magnetic; it affords a colourless solution in acid, from which mild alkalis throw its precipitate turning black with heat and its itself. The white ore has also been stated on the surface of some iron ores, and hæmatites. Mr Rinman also met the form of calcareous spar of the common, somewhat shining, and covered over with a sooty powder. It is found in pieces, transparent at the edges, but enough to strike fire. This consists of bedded in zeolite. It melts *per se* with a blow-pipe into a whitish grey porous with the addition of calcined borax net colour to glass. According to Kirwan, some of the white sparry iron ores may be composed of manganese, as they contain less semimetal than of iron. Red man-uid to be found in Piedmont; but Cronstedt saw it. He was credibly informed variety is free from iron, and gives rather violet colour to glass. Mr Kirwan has this kind has less fixed air and more white kind. It is also joined with earth, calcareous earth, ponderous spar. It is found either loose or semi-indurated matrix of calcareous spar, on talc, or hæmatites or other iron ores. It is likewise in heavy hard masses of lamellar, or equable texture, or crystallized in rhomboids, or short brittle needles. It is also met with in a state of union.

This is black, with a metallic splen-our, is the kind commonly employed in earthenware and potteries. There are several varieties of this stone in the mountains round Bath and Mendip hills, of which the Bristol potters use great quantities. The black ores of manganese are little from the brown ones. They are found either crystallized as the red ores, in masses, some of which have a metallic lustre; but others are dull, earthy, and mixed in quartz, or in a loose earthy matrix. Its specific gravity is about 4000. The black ore is met with either solid and of a crystalline, steel-grained, radiated, or crystalline: Perigord stone belongs to this species. See PERIGORD, § 2. BLACK WADDER is a dark brown colour, partly in powder,

and partly indurated and brittle. If  $\frac{1}{2}$  lb. of it be dried before the fire, and then suffered to cool for an hour, and 2 oz. of linseed oil afterwards added, mixing the whole loosely like barm with flour, little clots will be formed, and, in something more than half an hour the whole will grow hot, and at last burst into flame. The heat of the room in which this experiment was tried might be about 30° of Fahrenheit, and the heat to which it was exposed in drying about 130°. According to Wedgwood's Analysis, this ore contains 43 parts of manganese, as much iron,  $4\frac{1}{2}$  of lead, and near 5 of micaceous earth. Mr Scheele found manganese existing in the ashes of vegetables: (See CHEMISTRY, § 825;) but not equally in all; for he found that wood ashes contain much more than those of the THYMUS SERPILLUM.

(8.) MANGANESE, OXYDES OF. See CHEMISTRY, *Index*.

\* MANGCORN. *n. f.* [*mengen*, Dutch, to mingle.] Corn of several kinds mixed: as, wheat and rye. It is generally pronounced *mungcorn*.

(1.) \* MANGE. *n. f.* [*démangeaison*, Fr.] The itch or scab in cattle.—The sheep died of the rot, and the swine of the *mange*. *Ben Jonson*.—

Tell what crisis does divine

The rot in sheep, or *mange* in swine? *Hudibras*.

(2.) MANGE. Dogs are subject to the mange from being fed too high, and allowed no exercise or any opportunity of refreshing themselves with dog-grass; or by being starved at home, which will cause them to eat the vilest stuff abroad, such as carrion, or even human excrement; or by want of water, and sometimes by not being kept clean in their kennel, or by foundering and melting in their grease. Any of these will heat the blood to a great degree, and make them mangy. The cure may be effected by giving brimstone powdered fine, either in milk or mixed up with butter, and rubbing them well every day for a week with an ointment made up of some of the brimstone and pork lard, to which add a small quantity of oil of turpentine. Or, boil 4 ounces of quicksilver in two quarts of water to half the quantity; bathe them every day with this water, and let them have some of it to lick till the cure is perfected. Or, a small quantity of trooper's ointment rubbed on the parts on its first appearance will cure it. It will also free lousy puppies from their lice. Or, take 2 oz. of euphorbium; flour of sulphur, Flanders oil of bays, and soft soap, each 4 oz. Anoint and rub the dog with it every other day; give him warm milk, and no water. The cure will be performed in about a week. Or, take two handfuls of wild cresses, and as much elecampene, and also of the leaves and roots of roerb and sorrel, and 2 lb. of the roots of foderles: boil these well together in lee and vinegar; strain the decoction, and put into it 2 lb. of grey soap, and when it is melted, rub the dog with it 4 or 5 days, and it will cure him.

(3.) MANGE, in horses. See FARRIERY, Part III, Sect. XIV, § III.

MANGEART, Thomas, a Benedictine of the congregation of St Vanne and St Hippolyte, whose learning was an ornament to his order, and procured him the offices of antiquarian, librarian, and counsellor, to Charles duke of Lorraine. He was

preparat

preparing a very considerable work when he died, A. D. 1763, before he had quite finished his book; which was published by Abbé Jacquin, in 1763, in folio, entitled, *Introduction à la science des Médailles, pour servir à la connoissance des Dieux, de la Religion, des Sciences, des Arts, et de tout ce qui appartient à l'Histoire ancienne, avec les preuves tirées des Médailles*. The elementary treatises on the numismatic science were not sufficiently extensive, and the particular dissertations were by far too prolix. This learned Benedictine has collected into a single volume all the principles contained in the former, and all the ideas of any consequence, which are to be found scattered through the latter. His work may serve as a supplement to Montfaucon's *Antiquity explained*. He likewise wrote a volume of *sermons*; and a *Treatise on Purgatory*; Nancy, 1739, 2 vols 12mo.

MANGEEA, or MANGYA, a populous island in the South Sea, discovered by Capt. Cook, in 1777. Lon. 201. 53. E. Lat. 21. 57. S.

MANGEL-WURZEL, or the ROOT OF SCARCITY, a root much celebrated as food for both men and cattle. It is a species of *Beta*. See BETA, § II, N<sup>o</sup> 1. It is a biennial plant; the root is large and fleshy, sometimes a foot in diameter. It rises above ground several inches, and is thickest at the top, tapering gradually downward. The colours of the roots vary; being white, yellow, and red. It is good fodder for cows, and produces great plenty of leaves, which are very palatable and wholesome for cattle. It is chiefly cultivated in Germany.

MANGENOT, Lewis, a canon of the temple at Paris, where he was born A. D. 1694, and died in 1768, aged 74. He was a social poet, and an amiable man. But though lively and agreeable in his conversation, his character leaned somewhat towards civilised misanthropy. His Poems were published at Amsterdam in 1776, and contain two eclogues, natural, simple, and elegant; tables, some of which are well composed; tales, which are by no means licentious; moral reflections, sentences, madrigals, &c. &c.

(1.) \* MANGER. *n. f.* [*manger*, French.] The place or vessel in which animals are fed with corn.—A chubbil cur got into a *manger*, and there lay growling to keep the horses from their provender. *L'Étrange*.

(2.) A MANGER is a raised trough under the rack in a stall, for receiving the grain that a horse eats.

(3.) MANGER, in a ship of war, is a small apartment, extended athwart the lower deck immediately within the haufeholes, and fenced on the after-part by a partition, which separates it from the other part of the deck behind it. This partition serves as a fence against the water, which occasionally gushes in at the haufeholes, or falls from the wet cable whilst it is heaved in by the capstan. The water, thus prevented from running off, is immediately returned into the sea by several small channels, called *scuppers*, cut through the ship's side within the manger. The manger is therefore particularly useful in giving a contrary direction to the water that enters at the haufeholes, which would otherwise run aft in great streams upon the lower deck, and render it

extremely wet and uncomfortable, tempestuous weather, to the men sleep in different parts thereof.

MANGERTON, mountains of Iry; 6 miles S. of Killarney.

MANGET, John James, an emigrant, born at Geneva, in 1652. The Brandenburg made him his first physician in which post he continued till he died in 1742. He wrote many works known of which are, 1. *Æ collecti Pharmacopœias*, in folio. 2. *Bibliotheca cutico-medica*. 3. *Bibliotheca anatomica chemica*. 5. *Bibliotheca chirurgicalis* of all the authors who had medicine, in 4 vols folio. All these Latin. Daniel le Clerc, the author of *Physic*, assisted him in writing them.

MANGHAGE, a mountain in AN

MANGHASIA, a river of ANOSSI

MANGIFERA, the MANGO TREE

a genus of the monogynia order, of the pentandria class of plants, and of the natural method ranking with those of which is doubtful. The corolla is pentapetalous kidney-shaped. There is but one native of many parts of the East Indies has been transplanted to Brazil and parts of America. It grows to a large tree, the wood is brittle, the bark rough which leaves are 7 or 8 inches long, and 2 inches broad. The flowers are produced in panicles at the ends of the branches, and are supported by large oblong kidney-shaped pedicels, when fully ripe, is greatly esteemed in countries where it grows; but in Europe only the unripe fruit brought over in attempts to propagate the plant have proved ineffectual; and Mr Miller is of opinion the stones will not vegetate unless they are sown soon after they are ripe. He thinks that the young plants ought to be boxed with earth; after which they may be transplanted to the stove.

\* MANGINESS. *n. f.* [from *mangle* and *ness*; infection with the mangle.]

To MANGLE. *v. a.* [*mangle*, French, I wanting; *manus*, Latin.] To lacerate or tear piece-meal; to butcher.—

—Ours may you suspect  
Who they should be, that thus kill  
you?

Your dishonour  
*Mangle* true judgment.

Thoughts my tormentors arm'd  
with flings,

*Mangle* my apprehensive tenderness

**MANICAMP,** a town of France, in the dept. of Oise; 5 miles E. of Noyon.

**MANICHEÏ,** } a sect of ancient heretics,  
**MANICHEANS,** or } who asserted two prin-  
**MANICHEES,** } ciples; so called from

their author *Manes* or *Manicheus*. See **MANES**, N° 1. This heresy had its first rise about A. D. 277, and spread principally in Arabia, Egypt, and Africa. St Epiphanius treats of it at great length. It was a motley mixture of the tenets of Christianity with the ancient philosophy of the Persians, in which Manes had been instructed during his youth. He combined these two systems, and applied and accommodated to Jesus Christ the characters and actions which the Persians attributed to the God MITHRAS. He established two principles, a good and an evil one: the first a most pure and subtle matter, which he called *light*, did nothing but good; and the second a gross and corrupt substance, which he called *darkness*, nothing but evil. This philosophy is very ancient; and Plutarch treats of it at large in his *Isis and Osiris*. Our souls, according to Manes, were made by the good principle, and our bodies by the evil one; these two principles being, according to him, coeternal, and independent of each other. Each of these is subject to the dominion of a superintendent being, whose existence is from all eternity. The being who presides over the *light* is called *God*; he that rules the land of *darkness* bears the title of *hyie* or *demon*. The ruler of the *light* is supremely happy, and in consequence thereof benevolent and good: the prince of *darkness* is unhappy in himself, and desirous of rendering others partakers of his misery, and is evil and malignant. These two beings have produced an immense number of creatures, resembling themselves, and distributed them through their respective provinces. After a contest between the ruler of *light* and the prince of *darkness*, in which the latter was defeated, this prince of *darkness* produced the first parents of the human race. The beings engendered from this original stock, consist of a body formed out of the corrupt matter of the kingdom of darkness, and of two souls; one of which is sensitive and lustful, and owes its existence to the evil principle; the other rational and immortal, a particle of that divine light which had been carried away in the contest by the army of darkness, and immersed into the mass of malignant matter. The earth was created by God out of this corrupt mass of matter, in order to be a dwelling for the human race, that their captive souls might by degrees be delivered from their

N a n a corporeal

were accomplished, he returned to his throne in the sun, appointing apostles to propagate his religion, and leaving his followers the promise of the Paraclete or Comforter, who is Manes the Persian. Those souls who believe Jesus Christ to be the son of God, renounce the worship of the god of the Jews, who is the prince of darkness, and obey the laws delivered by Christ, and illustrated by Manes the comforter, are gradually purified from the contagion of matter; and their purification being completed, after having passed through two states of trial, by water and fire, first in the moon and then in the sun, their bodies return to the original mass (for the Manicheans denied the resurrection of bodies), and their souls ascend to the regions of light. But the souls of those who have neglected the salutary work of purification, pass after death into the bodies of other animals or natures, where they remain till they have accomplished their probation. Some, however, more perverse and obstinate, are consigned to a severer course of trial, being delivered over for a time to the power of malignant aerial spirits, who torment them in various ways. After this, a fire shall break forth and consume the frame of the world; and the prince and powers of darkness shall return to their primitive seats of anguish and misery, in which they shall dwell for ever. These mansions shall be surrounded by an invincible guard, to prevent their ever renewing a war in the regions of light. Manes borrowed many things from the ancient Gnostics; on which account many authors consider the Manicheans as a branch of the Gnostics. In truth, the Manichean doctrine was a system of philosophy rather than of religion. They made use of amulets, in imitation of the Basilidians; and are said to have made profession of astronomy and astrology. They denied

pass for apostolical writings, and are suspected to have forged several to maintain their errors. The rascals, which Manes prescribed most extravagantly rigorous austerities, he divided his disciples into two orders, which comprehended the perfect and feeble, under the names of the *elect*; and the *bearers*. The elect were obliged to observe entire abstinence from flesh, and all intoxicating drink, wedlock, and gratifications; and to live in a state of penury, nourishing their bodies with bread, herbs, pulse, and meagre meats. The bearers themselves of all the comforts of life, with moderate indulgence of nature, were to beget children from a variety of innocent and honest marriages. The auditors were allowed to possess lands, and wealth, to feed the poor, and to be free of the bonds of conjugal tenderness. The general assembly was granted them with many other conditions of penance. The general assembly was headed by a president, Jesus Christ. There were joined to them 12 apostles, and these were followed by 72 disciples. The images of the 72 disciples were placed in the churches, and the bishops had presbyters or deacons, and all the members of these orders were chosen out of the class of the elect. Their dress was simple and plain; and they were to be seen reading the scriptures, and performing the offices of piety, at which both the auditors and bearers were to be present. They observed baptism; and kept the Lord's day as a fast. They likewise kept the

menian, and an adherer to it; who took upon him to suppress the reading of all other books but the Evangelists and the Epistles of St Paul, and he explained in such a manner as to make contain a new system of Manicheism. He by discarded all the writings of his predecessors, rejecting the chimeras of the Valentiniens, their 30 sons; the fable of Manes, with respect to the origin of rain and other dreams; but retained the impurities of Basilides. In this he reformed Manicheism, inasmuch that Followers made no scruple of anathematizing Man, Buddas, called also *Addas* and *Tere-* the contemporaries and disciples, as some and, according to others, the predecessors masters of Manes; and even Manes himself,antine being now their great apostle. After seduced an infinite number of people, he at last stoned by order of the emperor. This prevailed in Bosnia and the adjacent provinces at the close of the 15th century; propagated doctrines with confidence, and held their religious assemblies with impunity.

**MANICORD,** or } a musical instrument in MANICORDON, } form of a spinet; with 50 stops, and 70 strings; which, like those in CLARICHORD, are covered with little pieces of cloth, to deaden as well as to soften their sound, and it is also called the *dumb spinet*. The strings bear on 5 bridges.

\*) \* **MANIFEST.** *adj.* [*manifestus*, Lat.] 1. open; open; not concealed; not doubtful; apparent.—They all concur as principles, they all their forcible operations thereon, although not a like apparent and *manifest* manner. *Hooker*. but which may be known of God is *manifest* them; for God hath shewed it unto them. *Rom.* —He was fore ordained before the foundation of the world, but was *manifest* in these last days for you. 1 *Pet.* i. 20.—

He full  
resplendent all his father *manifest*  
express'd. *Milton's Paradise Lost*.  
Thus *manifest* to fight the God appear'd. *Dryd.*  
I saw, I saw him *manifest* in view,  
his voice, his figure, and his gesture knew. *Dryd.*  
Detected: with *of*.—  
Calisto there stood *manifest* of shame,  
and, turn'd a bear, the northern star became. *Dryden*.

..) \* **MANIFEST.** *n. f.* [*manifeste*, Fr. *manifesto*, an.] Declaration; or publick protestation.—  
You authentick witnesses I bring,  
If this my *manifest*: that never more  
his hand shall combat on the crooked shore. *Dryden*.

To **MANIFEST.** *v. a.* [*manifestis*, Fr. *manifest-* Lat.] To make appear; to make publick; to explain; to discover.—  
Thy life did *manifest*; thou lov'dst me not;  
and thou wilt have me die assured of it. *Shak.*  
He that loveth me I will love, and *manifest* my-  
to him. *Job*, xiv. 21.—He was pleased himself  
to shame, and *manifest* his will in our flesh. *Wood-*

This perverse commotion  
If *manifest* thee worthwhile 'no be heir  
all things. *Milton's Paradise Lost*.

Were he not by law withstood,  
He'd *manifest* his own inhuman blood. *Dryden*.  
—It may be part of our employment in eternity,  
to contemplate the works of God, and give him  
the glory of his wisdom *manifested* in the creation. *Ray on Creation*.

\* **MANIFESTATION.** *n. f.* [*manifestation*, Fr. from *manifest*.] Discovery; publication; clear evidence.—Though there be a kind of natural right in the noble, wise and virtuous, to govern them which are of servile disposition; nevertheless, for *manifestation* of this their right, the assent of them who are to be governed seemeth necessary. *Hooker*.—As the nature of God is excellent, so likewise is it to know him in those glorious *manifestations* of himself in the works of creation and providence. *Tillotson*.—The secret manner in which acts of mercy ought to be performed, requires this publick *manifestation* of them at the great day. *Asterb.*

\* **MANIFESTIBLE.** *adj.* [properly *manifestable*.] Easy to be made evident.—This is *manifestible* in long and thin plates of steel perforated in the middle, and equilibrated. *Brown*.

\* **MANIFESTLY.** *adv.* [from *manifest*.] Clearly; evidently; plainly.—We see *manifestly*, that sounds are carried with wind. *Bacon*.—Sects, in a state, seem to be tolerated, because they are already spread, while they do not *manifestly* endanger the constitution. *Swift*.

\* **MANIFESTNESS.** *n. f.* [from *manifest*.] Perspicuity; clear evidence.

(1.) \* **MANIFESTO.** *n. f.* [Italian.] Publick protestation; declaration.—It was proposed to draw up a *manifesto*, setting forth the grounds and motives of our taking arms. *Addison*.

(2.) A **MANIFESTO** is a publick declaration made by a prince in writing, showing his intentions to begin a war or other enterprise, with the motives that induce him to it, and the reasons on which he founds his rights and pretensions.

\* **MANIFOLD.** *adj.* [*many and fold*.] 1. Of different kinds; many in number; multiplied; complicated.—

When his eyes did her behold,  
Her heart did seem to melt in pleasures *manifold*. *Spenser*.

Terror of the torments *manifold*,  
In which the damned souls he did behold. *Spenser*.  
If that the king

Have any way your good deserts forgot,  
Which he confesseth to be *manifold*,  
He bids you name your griefs. *Shak. H. IV.*  
—If any man of quality will maintain upon Edward earl of Glo'ster, that he is a *manifold* traitor, let him appear. *Shak.*—They receive *manifold* more in this present time, and in the world to come life everlasting. *Luke*. xviii. 30.—To represent to the life the *manifold* use of friendship, see how many things a man cannot do himself. *Bacon's Essays*.—My scope in this experiment is *manifold*. *Boyle*.—We are not got further than the borders of the mineral kingdom, so very ample is it, so various and *manifold* its productions. *Woodward's Nat. Hist.* 2. *Milton* has an uncommon use of it.—

They not obeying  
Incurr'd, what cou'd they less? the penalty;  
And *manifold* in sin deserv'd to fall. *Milton*,  
N n n n a \* **MANI-**

MANILLA. SEE MANILLA, IN 1, 2.

MANILHA, a town of Spain, in Grenada.

MANILIUS, Marcus, a Latin poet, whose poem lay buried in some German libraries, and was not heard of until Poggius, about 1580, published it from some old MSS. he found there. There is no account to be found of him but what can be drawn from his poem, which is called *Astronomicum*; and contains a system of the ancient astronomy and astrology, together with the philosophy of the Stoics. It consists of 5 books; but there was a 6th, which has not been recovered. From the style, and no mention of the author being found in ancient writers, it is probable he died young. It is collected, however, that he was a Roman of illustrious extraction, and lived under the reign of Augustus, whom he invokes, though not by name, yet by circumstances and character that suit no other emperor. The best editions of Manilius are, that of Joseph Scaliger in 1600, and that of Bently at London in 1738.

MANILLA, MANILA, LUCONIA, or LUZON, the largest of the PHILIPPINE ISLANDS, in the East Indies, subject to Spain. It had the name of *Lucon* from a custom that prevailed among the natives of beating, or bruizing their rice in wooden mortars, before they either boiled or baked it; *Lucon*, in their language signifying a mortar. Its situation is remarkably happy, lying between the E. and W. continents, and having China on the N. at the distance of 60 leagues; the islands of Japan on the NE. about 250 leagues from the nearest of them; the ocean on the E. the other islands on the S. and on the W. Malacca, Patana, Sam, Cambodia, Cochin-China, and other provinces of India, the nearest at the distance of 300 leagues. The middle of this island is in Lat. 15° N. the E. point in 15° 38', and the most northern

rice grows even on the tops without being watered; and th so plentiful, that the Indians v as not to pick it up, though it where under their feet. Their ing mountains, but the face c from being disfigured by their are 40 different sorts of pain t cellent cocoas, wild cinnamon, some say wild cloves also; ebo the best cassia, and in such plen their hogs with its fruit; all ki prodigious quantities of gold, a grise. There are several forts island beside, the Spaniards, at Tagaleze, the Pintadoes, or pai Ilayas or Tinglianos, and the N GALIANS, who are thought to descent, are a modest, tractal poised people. The PINTADOES strong, active, and of an excellen TINGIANI, TINGLIANOS, or mo some suppose to be descended f are brave and humane. The I are held to be the Aborigines o barbarous and brutal to the la they kill a Spaniard, they make and drink out of it. This isla several provinces, containing d chief of which are MANILLA, govia, Bondo, Passacao, Ibaio con, or Bagatao, Lampon, Fer Playahonda, Cavite, Mindora, layan.

(2.) MANILLA, the capital of lies on the SE. side of it, where into the sea, and forms a noble in compass, which the Spania

It is inhabited by the Chinese merchants, called *neglers*. In proportion to the size of the place, the number of churches and religious houses is very great. Only small vessels can come up to Manila; but 9 miles S. of it is the town and port Cavite, defended by the castle of St Philip, and capable of receiving the largest ships. Here stands the arsenal where the galleons are built, which there are from 300 to 600 or 800 men constantly employed, who are relieved every month, and while on duty are maintained at the king's expence. By an earthquake, in 1745, a third part of the city was destroyed, and 3000 people perished in the ruins. In the German war, Spain having entered into an engagement with France, in consequence of the family compact, it was found expedient by Britain to declare war also against Spain. Whereupon a force was sent out from our India settlements, particularly Madras, for conquest of the Philippine Islands, under General Draper and Admiral Cornish; who, after a siege of 12 days, took Manila on the 6th Oct. 1762 by storm; but, to save so fine a city from destruction, agreed to accept a million Sterl. as a ransom, a part of which, it is said, was never paid. A Spanish viceroy resides in this city, and lives as a sovereign prince. The government is said to be one of the best under the king of Spain. When the city was taken, the archbishop, who is a legate of pope in this part of the world, was also destroyed. Five large ships, loaded with the riches of the east, as diamonds from Golconda, cinnamon from Ceylon, pepper from Sumatra and Java, cloves and nutmegs from the Moluccas and Banda Islands, camphire from Borneo, benjamin and cloves from Cambodia, silks, tea, and china ware from China, &c. sail from this port annually to Acapulco in Mexico, and return freighted with silver, making 400 per cent profit. This city is governed by two alcaldes: the rest of the cities and great towns have each an alcaide, and in every village there is a corregidore. Appeals from their sentences are made to the royal court at Manila, in which there are 4 judges, and a fiscal; each of these judges has a salary of 3300 dollars per annum. The viceroy is resident; and has a salary of 4000 dollars, but no vote; yet if the judges are equally divided, the president names a doctor of the civil law, who, in virtue of his appointment, has a decisive voice. The fiscal in right of his office is protector of the people, in consideration of which he receives 6000 dollars a-year. The Indians, who are in subjection, pay tribute in the following proportions: single men from 18, (if they continue single,) 50, pay five rials by way of capitation; as single women from 2, to 30: married men pay 10 rials. There are 250,000 Indians, subject to the king of Spain, of whom two thirds hold immediately from the king, and the rest from lords or proprietors, who pay 4 rials each. The royal revenue is computed at about half a million of dollars. The garrison consists of about 800 or 900 men, and there are about 3000 more in the city of the Philippines. The viceroy is captain general, with a salary of about 4000 dollars.

**MANILLE**, *n. f.* in commerce, a large brass in the form of a bracciet, either plain or en-

graven, flat or round. Manilles are the principal commodities which the Europeans carry to the coast of Africa, and exchange with the natives for slaves. These people wear them as ornaments on the small of the leg, and on the thick part of the arm above the elbow. The great men wear manilles of gold and silver; but these are made in the country by the natives.

**MANILLON**, a township of Pennsylvania, in Fayette county.

**MANINGCABO**, a kingdom of Sumatra, with its capital, on the SW. coast of the island.

**MANINGTREE**, a market town of Essex, on the Stour; 11 miles W. of Harwich, and 60 NE. of London. Lon. 1. 12. E. Lat. 52. 0. N.

**MANIOC**, **MANIHOT**. See **JATROPHA**, N° 5.

\* **MANIPLE**. *n. f.* [*manipulus*, Lat.] 1. A handful. 2. A small band of soldiers.

(2.) **MANIPLE**. See **MANIPULE**.

\* **MANIPULAR**. *adj.* [*manipulus*, Latin.] Relative to a manipule.

**MANIPULARII**. See next article.

(1.) **MANIPULE**, } among the Romans, was  
(1.) **MANIPULUS**, } a small body of infantry, which in the time of Romulus consisted of 100 men; and in the time of the consuls, and first Cæsars, of 200. The word properly signifies a *bandful*; (See **MANIPLE**;) and according to some, was first given to the bandful of hay which they bore at the end of a pole, to distinguish themselves, before the custom was introduced of bearing an eagle for their ensign; and hence also the phrase, a *bandful of men*. But Vegetius, Modestus, and Varro, gave other etymologies of the word: the last derives it from *manus*, a little body of men following the same standard. According to the former, this corps was called *manipulus*, because they fought hand, in hand or all together. Each manipule had two centuries or captains, called **MANIPULARII**, to command it; one whereof was lieutenant to the other. Each cohort was divided into three manipules, and each manipule into two centuries. Aulus Gellius quotes Cincius, an old author, who lived in the time of Hannibal (whose prisoner he was), and who, writing on the art of war, observes, that then each legion consisted of 60 centuries, of 30 manipules, and of 10 cohorts. Varro and Vegetius mention it as the least division in the army, only consisting of the 10th part of a century; and Spartan adds, that it contained only 10 men. This shows that it was not always the same.

(2.) **MANIPULUS**, in ecclesiastical affairs, an ornament worn by the priests, deacons, and subdeacons in the Romish church. It consists of a little fillet in form of a stole, 2 or 4 inches broad, and made of the same stuff with the chasuble; representing a handkerchief, which the priests in the primitive church wore on the arm, to wipe off their tears for the sins of the people. There still remains a mark of this usage in a prayer rehearsed by those who wear it; *Miserere, Domine, portare manipulum sicut S. dicitis*. The Greeks and Maronites wear two manipules, one on each arm.

(3.) **MANIPULUS**, among physicians, is used to signify a handful of herbs or leaves, or so much as a man can grasp in his hand at once; and is often denoted by the abbreviature, **M**, or **m**.

**MANIS**, the **SCALY LIZARD**, in zoology; a genus of quadrupeds belonging to the order of bruta, the characters of which are these: They have no fore teeth; the tongue is long and cylindrical; the snout is long and narrow; and the body is covered with hard scales. There are two species. See *Plate CCV. fig. 6 and 7.*

1. **MANIS PENTADACTYLA**, the *five-toed or short-tailed manis*, with 5 toes on each foot. The head is smaller than the neck; the eyes are very small; the length of the body, including the tail, is from 6 to 8 feet. The whole body is covered with hard scales, excepting the under part of the head and neck, the breast, the belly, and the internal side of each leg. Betwixt the scales of this animal there are some hairs like the bristles of a hog, brownish at the points. The scales are of a reddish colour, very hard, convex above, and concave below. All the parts which want scales are naked. The scales are unconnected; and the animal can raise or lower them at pleasure, like the quills of the porcupine. When irritated, he erects his scales, and rolls himself up like a hedgehog. In this situation, neither the lion, tiger, nor any other animal can hurt him. It is said to destroy the elephant by twisting itself round his trunk, and compressing that tender organ with its hard scales. It feeds on lizards and insects; turns up the ground with its nose; walks with its claws bent under its feet; grows very fat; and is esteemed delicate eating; and makes a noise like a kind of snorting. It is a mild inoffensive creature, is slow of motion, and has no other method of escaping the pursuit of man, but by concealing itself in crannies of rocks, and in holes which they dig in the ground, and where they bring forth their young. It is a native of the East Indies, and is very rare. Mr Pennant conjectures that it may be a native of Guinea; the **QUOULLI** of the Negroes, which, Des Marchais says, grows to the length of 8 feet, of which the tail is 4. It lives in woods and marshy places; feeds on ants, which it takes by laying its long tongue across their paths, which is covered with a viscous saliva, so that the insects which attempt to pass over it cannot extricate themselves.

2. **MANIS TETRADACTYLA**, the *four-toed or long-tailed manis*, with 4 toes on each foot. This species is very similar to the former; only the tail is much longer in proportion; and such parts as want scales, instead of being naked, are covered with a soft hair. It inhabits Guinea, and is also found in the East Indies.

**MANIVA**, a populous mountain of the Italian republic, in the dep. of the Mincio, and district of Verona. See **GIULEMO**.

\* **MANKILLER**. *n. f.* [*man and killer.*] Murderer.—

To kill *mankillers* man has lawful pow'r,  
But not th' extended licence to devour. *Dryd.*

(1.) \* **MANKIND**. *n. f.* [*man and kind.*] 1.

The race or species of human beings.—  
From them I will not hide

My judgments, how with *mankind* I proceed. *Milton.*

Ere while perplex'd with thoughts what  
would become

Of me and all *mankind.* *Milton.*

—Plato witnesseth, that soon after *mankind* began to increase, they built many cities. *Raleigh.*

All *mankind* alike require their grace,  
All born to want; a miserable race. *Ps.*

2. Resembling man not woman in form or stature.—

A *mankind* witch! hence with her, out  
door:

A most intelligency bawd!

(2.) **MANKIND**. See **HOMO**, and **MAN**, N<sup>o</sup> 1.

**MANKS**, the inhabitants of the Isle of Man. See **MAN**, N<sup>o</sup> II.

\* **MANLESS**. *adj.* [*man and less.*] Without men; not manned.—Sir Walter Raleigh was wont to say, the Spaniards were suddenly done away with squibs; for it was no more but a tagem of fire-boats *manless*, and sent upon the Armada at Calais by the favour of the wind in the night, that put them in such terror, as they cut their cables. *Bacon.*

**MANLEY**, Mrs, the celebrated writer of the *Atalantis*, was the daughter of Sir Roger Manley, the reputed author of the first volume of the *Fish Spy*, and born in Guernsey. She lost her parents very early; and having been deluded into a false marriage by her guardian, who was her cousin, and afterwards deserted her, she was patronized by the duchess of Cleveland, mistress of Charles II. But the duchess, being a woman of a very fickle temper, grew tired of Mrs Manley in 6 months; and discharged her upon a suspicion, that she intrigued with her son. After this she wrote her first tragedy, called *Royal Mischief*, which was acted with great applause in 1698; and her apartment being frequented by men of wit and gaiety, she soon engaged in amours, and was taken into keeping. She now became as licentious in her writings as in her morals; for, she wrote 4 vols, entitled *Memoirs of the New Atalantis*; in which she was not only very free in her wretched tales of love adventures, but satirized the characters of many distinguished personages, who had had a principal concern in the Revolution. A prosecution was commenced against her for this work; but those in power being ashamed to bring a woman to trial for a few amorous trifles, she was discharged; and, a total change of ministry ensuing, Mrs Manley lived in high reputation and society, amusing herself with the conversation of wits and writing plays, poems, and letters. After this she wrote *Lucius K. of Britain*, a tragedy; *Letters*, and other works. She died in 1714.

**MANLIEU**, a town of France, in the dep. of Puy de Dome; 7 miles E. of Issoire.

\* **MANLIKE**. *adj.* [*man and like.*] Having the complexion and proper qualities of man.—Such a right *manlike* man, as nature, often errs, yet shows she would fain make. *Sidney.*

\* **MANLINESS**. *adj.* [*from many.*] Dignity; bravery; stoutness.—Young master, willing to shew himself a man, lets himself loose to all irregularities; and thus courts credit and *manliness* in the casting off the modesty he has till then been kept in. *Locke.*

(1.) **MANLIUS**, a township of New York in Onondago county.

(2.) **MANLIUS CAPITOLINUS**, Titus, the renowned Roman consul and general, who lived

the capitol when it was attacked by the Gauls in the night; being alarmed by the cries of geese, which were ever after held sacred. But being afterwards accused of aspiring at the sovereignty, he was thrown from the Tarpeian rock. See ROME.

(3.) MANLIUS TORQUATUS, Titus, a celebrated consul and Roman general; had great wit, but a difficulty in expressing himself, which induced Manlius Imperiosus, his father, to keep him almost by force in the country. Pompey, tribune of the people, enraged at this instance of severity, formed a design of accusing Manlius the father before the judges; but young Manlius being informed of it, went to that tribune, and, with a poniard in his hand, made him swear that he would not proceed in that accusation against him to whom he owed his life. At length Manlius was made military tribune, and killed a soldier of the Gauls in single combat, from whose neck he took a gold chain, whence he was surnamed *Torquatus*. He was consul in the war against the Latins; when he barbarously ordered his own son to be beheaded, for fighting contrary to his orders, though he had gained the victory. He conquered the enemies of the republic, and was several times made consul; but at last refused the consulship, saying, That it was no more possible for him to bear with the vices of the people, than it was for the people to bear with his severity.

(1.) \* MANLY, *adj.* [from *man*.] 1. Manlike; becoming a man; firm; brave; stout; undaunted; undismayed.—

As did Æneas old Anchises bear,

So I bear thee upon my *manly* shoulders. *Shak.*

Let's briefly put on *manly* readiness,

And meet it th' hall together. *Shak.*

Serene and *manly*, harden'd to sustain.

The load of life, and exercis'd in pain. *Dryd.*

See great Marcellus! how inur'd in toils,

He moves with *manly* grace. *Dryd.*

2. Not womanish; not childish.—

I'll speak between the change of man and boy

With a reed voice; and turn two mincing steps

Into a *manly* stride. *Shak.*

(2.) \* MANLY, *adv.* [from *man*.] With courage like a man.

(1.) MANNA, in sacred history, a miraculous kind of food which fell from heaven for the support of the Israelites in their passage through the wilderness, being in form of coriander seeds, its colour like that of bdellium, and its taste like honey. Asaph styles it, the *bread of heaven*, and the *food of angels*, Psal. lxxviii. 24, whether to insinuate that the angels fed and prepared this food, or that angels themselves, if they had need of any food, could not have any more agreeable than manna. The author of the *Book of Wisdom* says, *Wis.* 20. 21. that manna so accommodated itself to every one's taste, that every one found it pleasing to him; and that it included every thing that was agreeable to the palate and fit for good nourishment; which expression some have taken in the literal sense, though others understand them figuratively. Critics are divided about the original of the word *manna*. Some think that *man* is put instead of the Hebrew word *mab*, which signifies

“What is this?” and that the Hebrews, then first seeing that new food which God had sent them, cried to one another, *מַה בָּנוּ* *man-bu*, instead of *mab-bu*, *What is this?* Mr Saumaïse and others maintain, that the Hebrews very well knew what manna was; and that, seeing it in great abundance about their camp, they said one to another, *מַה בָּנוּ*, *This is manna*. They imagine that the manna which God sent the Israelites was nothing else but that fat and thick dew which still falls in Arabia, which presently condensed, and served for food to the people; that this is the same thing as the wild honey, mentioned *Matth.* iii. 4. wherewith John the Baptist was fed; and that the miracle did not consist in the production of any new substance, but in the exact and uniform manner in which the manna was dispensed for the maintenance of such a great multitude. But the Hebrews and Orientals believe, that the fall of the manna was wholly miraculous. The Arabians call it the *sugar-plums of the Almighty*; and the Jews pronounce a curse against all who deny the interposition of a miraculous power. Our translation, and some others, make Moses fall into a contradiction in relating this miracle, by rendering it thus: And when the children of Israel saw it, they said one to another, *It is manna*; for they *knew not what it was*: *Exodus* xvi. 15. Whereas the Septuagint, and several authors, ancient and modern, have translated the text according to the original: “The Israelites seeing this, said one to another, *What is this?* for they knew not what it was.” The word by which they asked, *what is this?* was in Hebrew *man*, which signifies likewise *meat ready provided*; and therefore it was always afterwards called *man* or *manna*. Whether this manna had those extraordinary qualities in it or not, which some imagine, it was truly miraculous; because, 1. It fell but six days in the week. 2. It fell in such a prodigious quantity, as sustained nearly three millions of souls. 3. There fell a double quantity every Friday, to leave them the next day, being sabbath. 4. What was gathered on the first 5 days stunk and bred worms if kept above one day; but that which was gathered on Friday kept sweet for two days. And, lastly, It continued falling while the Israelites abode in the wilderness, but ceased as soon as they came out of it, and had got corn to eat in the land of Canaan.

(2.) \* MANNA, *n. f.* *Manna* is properly a gum, and is honey-like juice concreted into a solid form, seldom so dry but it adheres to the fingers: its colour is whitish, or brownish, and it has sweetness, and with it a sharpness that renders it agreeable: *manna* is the product of two different trees, both varieties of the ash: when the heats are free from rain, these trees exude a white honey juice, which concretes into what we call *manna*. It is but lately that the world were convinced of the mistake of *manna* being an aerial produce, by an experiment being made by covering a tree with sheets in the *manna* season, and the finding as much *manna* on it afterwards as on those which were open to the air and dew. *III.*—It would be well inquired, whether *manna* doth fall but upon certain herbs, or leaves only. *Bacon's Nat. Hist.*—

The *manna* in heaven will suit every man's palate.  
*Locke.*

(3.) MANNA, in geography, a town in the isle of Sumatra, on the SW. coast, 300 miles SE. of Indrapour.

(4.) MANNA, in the materia medica, the juice of certain trees, of the ash kind, (see N° 2 and 5,) either naturally concreted on the plants, or exsiccated and purified by art. There are several sorts of manna in the shops. The larger pieces, called *flake manna*, are usually preferred; though the smaller grains are equally good, provided they are white, or of a pale yellow colour; very light, of a sweet, not unpleasant taste, and free from any visible impurities. Some injudiciously prefer the fat honey-like manna, but this has either been exposed to a moist air, or damaged by sea or other water. This kind of manna is said to be sometimes counterfeited by a composition of sugar and honey mixed with a little scammony; there is also a factitious manna, which is white and dry, said to be composed of sugar, manna, and some purgative ingredient, boiled to a proper consistence. This may be distinguished by its weight, solidity, untransparent whiteness, and by its taste, which is different from that of manna. Manna is a mild, agreeable laxative; and may be given with safety to children and pregnant women; though in some constitutions, it produces flatulencies and distensions of the viscera; but these inconveniences may be prevented by the addition of any grateful warm aromatic. It operates so weakly, that it does not produce the full effect of a cathartic, unless taken in large doses; and hence it is rarely given in this intention by itself. It may be commodiously dissolved in the purging mineral waters, or joined to the cathartic salts, fenna, rhuubarb, or the like. Geoffroy recommends, acuating it with a few grains of emetic tartar; by this management, he says, bilious ferum will be plentifully evacuated, without any nausea, gripe, or other inconvenience. Vallisnièni says, that the efficacy of this drug is greatly promoted by a substance which is itself very slow of operation, *diversella*. See CAUSTIC, p. III, N° 2.

(5.) MANNA TREE, a species of the ash, and a native of Calabria. See PRAXINUS. The shoots of this tree are much shorter, and the joints closer together, than those of the common ash; the small leaves are shorter, deeper sawed on their edges, and of a lighter green. The flowers come out from the side of the branches, which are of a purple colour, and appear in the spring before the leaves come out. This tree is of humble growth, seldom rising more than 15 or 16 feet high in this country. A great quantity of fine manna is gathered at Carini in Sicily, oozing from a kind of ash tree with a bark similar to that of the ebony, and a leaf somewhat like the acer. M. de Mon, who, in his *Travels in Sicily*, gives an account of this manna, says, it is produced from young trees about 7 or 8 years old, when only about 3 feet high. Incisions are then made horizontally in the bark, and from these the manna flows. These are made from the earth to the top of the tree, and are repeated every two days from the end of July till the circulation is stopped in the course of the year, or till the manna becomes

worse in quality. It exudes first as a liquor extremely light, pleasant to the taste, of an agreeable flavour, which is cooled by the heat of the sun, and assumes a somewhat resembling stalactites. This kind, and by the people of that country *labyrinthary* or *cane manna*. The other is a thicker, more glutinous, and less agreeable coloured liquor, which is received on the Indian fig, placed for that purpose on the tree. This also congeals by the heat of the sun, though it is more heavy, purgative, and of less value, than the former. It is called *manna*: in this part only resides the disagreeable flavour observable in manna; manna is of an agreeable flavour, and is not so violent to the stomach. It is got off from the tree by bending and shaking it. In some countries it must be gathered every day, which by the quantity and renders it of inferior value. When the stem of the tree is entirely cut down with incisions, they cut it down close to the ground; after which it pushes out new or two stems of which are preserved, and in proper age produce manna as before. Manna is propagated by seeds, and afterwards it is gathered by shaking it. The wood is hard and heavy, of a bitter taste, and recommended in the dropsy, only in hot climates, and requires to be dried to the north winds to make it productive. De Non is of opinion, that it might be introduced into France, and would produce manna in Provence. The Sicilian manna is dearer, and is more generally known and cultivated, than that of Calabria, though it does not grow in any other part of the country excepting about Carini, where it is a small tree.

(1.) MANNER, *n. f.* (*maniere*, Fr.) A way; method.

Find thou the *manner*, and the man; Possession, more than conquest, is man's.

2. Custom; habit; fashion.—As the custom is, *New Test.* 3. Certain degree of excellence. It is in a *manner* done already.

—The bread is in a *manner* common. 1. 5.—If the envy be general in a *manner*, the ministers of an estate, it is truly upon itself. *Bacon.*

This universe we have possess'd, and In a *manner* at our will.

—Augustinus does in a *manner* consist. *Baker.* 4. Sort; kind.—All *manner* of fowls here in arms against God's peacemaker's. *Shakspeare.*

A love that makes breath poor, and unable:

Beyond all *manner* of so much I love you.—What *manner* of men were they when *Judges.*—The city may flourish in trade *manner* of outward advantages. *Shakspeare.*—Mien; cast of the look.—Air and countenance more expressive than words. *Chrysostom.*—We have a native dignity in their *manner* of procuring them more regard by a look, than can obtain by the most impudens or *Rich. Chryso.* 6. Peculiar way; custom; pretence.—It can hardly be imagined how

ference was in the humour, disposition, and *mour*, of the army under Essex, and the other of our lordship, which I have endeavoured to express after your *manner*, have made whole poems mine to pass with approbation. *Dryd. Jew.*—A man is known by his company, so a man's company may be known by his *manner* of expressing himself. *Swift.* 7. Way; mode: of things. The temptations of prosperity insinuate themselves after a gentle, but very powerful, *manner*. *Verbury.* 8. *Manners* in the plural: character by the mind.—His princes are as much distinguished by their *manners* as by their dominions. *Adm.* 9. General way of life; morals; habits.—A kind of music have most operation upon *mners*; as, to make them warlike; to make them soft and effeminate. *Bacon.*—Every fool carries more or less in his face the signature of his *mners*, more legible in some than others. *L'Espe.*

We bring our *manners* to the best abodes, and think what pleases us must please the gods. *Dryden.*

In the plural.] Ceremonious behaviour; stulticity.—

The time will not allow the compliment, which very *manners* urge. *Shak.*

These bloody accidents must excuse my *manners*,

that so neglected you. *Shak.*

Our griefs and not our *manners* reason now. *Shak.*

Ungracious wretch, that for the mountains and the barbarous caves, where *manners* ne'er were preach'd. *Shak.*

Dear Kate, you and I cannot be confined with the weak lit of a country's fashion: we are the *ers* of *manners*, Kate. *Shak.*—

Good *manners* bound her to invite the stranger dame to be her guest that night. *Dryden.*

Some but the careless and the confident would rudely into the presence of a great man: and we, in our applications to the great God, that to be religion, which the common reason of mankind will not allow to be *manners*? *b.*—

Your passion bends force against your nearest friends; which *manners*, decency, and pride, have taught you from the world to hide. *Swift.* To take in the MANNER. To catch in actual commission of a crime.—If I melt into melancholy while I write, I shall be taken in the manner; I fit by one too tender to these impressions. *Mad's Letters.*

(-) MANNER, in painting, a habitude that a painter acquires in the 3 principal parts of painting, management of colours, lights, and shadows; which is either good or bad according as the painter is practised more or less after the truth, with judgment and study. But the best painter is he who has no manner at all. The good or bad which he makes is called *goute*.

(-) MANNER, (j 1, def. 10.) or GOOD MANNERS, according to Swift, is the art of making people easy with whom we converse. "Who-

ever makes the fewest persons uneasy; is the best bred person in the company. As the best law is founded upon reason, so are the best manners. And as some lawyers have introduced unreasonable things into common law; so likewise many teachers have introduced absurd things into good manners. One principal point of this art is to suit our behaviour to the 3 several degrees of men; our superiors, our equals, and inferiors. For instance, to press either of the two former to eat or drink is a breach of manners; but inferiors must be thus treated, else it will be difficult to persuade them that they are welcome. Pride, ill-nature, and want of sense, are the 3 great sources of ill manners; without some one of these defects, no man will behave himself ill for want of experience; or of what, in the language of fools, is called *knowing the world*."

"I dety (proceeds our author) any one to assign an incident, whercin reason will not direct us what we are to say or to do in company, if we are not misled by pride or ill-nature. Therefore, I insist that good sense is the principal foundation of good manners; but because the former is a gift which very few among mankind are possessed of, therefore all the civilized nations of the world have agreed upon fixing some rules for common behaviour, best suited to their general customs, or fancies, as a kind of artificial good sense to supply the defects of reason." After descending at some length, with his usual satirical humour, on "the impertinencies of the ceremonial behaviour," that is often affected among ladies of rank, as well as by "young travellers just arrived from abroad;" and showing that "there is a *pedantry in manners*, as well as in arts and sciences," Dean Swift adds, "I make a difference between GOOD MANNERS and GOOD BREEDING; although, in order to vary my expression, I am sometimes forced to confound them. By the first, I only understand the art of remembering and applying, certain settled forms of general behaviour. But *good breeding* is of a much larger extent: for besides an uncommon degree of literature, sufficient to qualify a gentleman for reading a play, or a political pamphlet, it taketh in a great compass of knowledge; no less than that of dancing, fighting, gaming, making the circle of Italy, riding the great horse, and speaking French; not to mention some other secondary or subaltern accomplishments, which are more easily acquired. So that the difference between good breeding and good manners lieth in this, That the former cannot be attained to by the best understandings without study and labour; whereas a tolerable degree of reason will instruct us in every part of good manners without other assistance." See BREEDING, § 2.

\* MANNERLINESS. *n. s.* [from *manner's*.] Civility; ceremonious complaisance.—Others out of *mannerliness* and respect to God, though they deny this universal suit of the universe, yet have devised several systems of the universe. *Hud.* (1.) \* MANNERLY. *adj.* [from *manner*.] Civil; ceremonious; complaisant.— Tut; tut; here's a *mannerly* forbearance. *Shak.*

Let me have What thou think'st meet, and I will *mannerly*. *Shak.*

—Fools make a mock at sin, affront the God whom we serve, and vilify religion; not to oppose them, by whatever *wannery* names we may palliate the offence, is not modesty but cowardice, and a traitorous desertion of our allegiance to Christ. *Rogers.*

(2.) \* **MANNERLY**. *adv.* Civilly; without rudeness.—

When we've supp'd,  
We'll *mannerly* demand thee of thy story. *Shak.*

\* **MANNIKIN**. *n. f.* [*man* and *ikin*, German]. A little man; a dwarf.

**MANNINGTREE**. See **MANINGTREE**.

\* **MANNISH**. *adj.* [from *man*.] Having the appearance of a man; bold; masculine; impudent.—Nature had proportioned her without any fault; yet altogether seem'd not to make up that harmony that Cupid delights in; the reason whereof might seem a *manness* countenance, which overthrew that lovely sweetness, the noblest power of womankind, far fitter to prevail by parley than by battle. *Sidney.*—

A woman, impudent and *manness* grown,  
Is not more loath'd than an effeminate man.

*Shak.*  
When *manness* Nevis, that two-handed whore,  
Astride on horse back hunts the Tuscan boar.

*Drjden.*  
**MANNORY**, Lewis, advocate of the parliament of Paris, was born in that city in 1696, and published 18 vols 12mo of *Pleadings and Memoirs*. A great number of singular cases occur in this collection; and they are rendered the more striking by the agreeable manner in which they are stated. He was Travenol's counsel in his process against **VOLTAIRES**, and was very satirical against that poet; who took revenge by describing him as a mercenary babler, who sold his pen and his abuse to the highest bidder. Mannory, would certainly have been more esteemed both as an advocate and as a writer, if he had paid more attention to his style and had been less prolix; if he had thought more deeply, and been more sparing of his pleader's art, in causes where nothing was required but knowledge and sound reasoning. He published also a translation into French of F. Puce's *Exercice de la plume en Louis XIV*; and very judicious *Observations on the Sentiments of Voltaire*. In company he was full of wit and spirit, but sometimes too saucy and severe. He died in 1777.

**MANOELET**, a town of France, in the dep. of Oise, 3 miles N. of St. Hippolite.

**MANOEUVRE**, *n. f.* in a military sense, consists solely in distributing equal motion to every part of a body of troops, to enable the whole to form, or change their position, in the most expeditious and best method, to answer the purposes required of a battalion, brigade, or line, of cavalry, artillery, or infantry. It has always been lamented, that men have been brought on service without being informed of the uses of the different manoeuvres they have been practising; and, having no idea of anything but the uniformity of the parade, instantly fall into disorder and confusion when they lose the step, or see a deviation from the straight line they have been accustomed to at exercise. It is a pity to see so much attention given to show, and so little to instruct the

troops in what may be of use to them vice. No manoeuvre should be executed in the presence of the enemy, unless protected by a division of the troops.

**MANOMETER**, *n. f.* [from *manos*, and *metros*, to measure,] or **MANOSCOPIUM** instrument to show or measure the alterability or density of the air. The manometer differs from the **BAROMETRE** in this, The only serves to measure the weight of a sphere, or of the column of air over it; former, the density of the air in which which density depends not only on the state of the atmosphere, but also on the heat and cold, &c. Authors, however, generally found the two together; and Mr Boy gives a very good manometer, under the name of a *statical barometer*. See **BAROMETRE**, of this kind of manometers were made by Col. Roy, in his attempts to correct the defect of the barometer, and are described in the *Trans.* Vol. LXXVII. p. 489. They were of various lengths, from 4 to upwards of 10 feet; they consisted of straight tubes, which were commonly from one 1/8th to one 1/4th inch diameter. The capacity of the tube was carefully measured, by making a column of silver, about 3 or 4 inches long, move from one end to the other. These spaces were severally marked, with a fine-edged file; and transferred from them to long pasteboard, for the subsequent construction of scales respectively belonging to each. The tube attached to one end of the manometer glass-house, was of the form of a pear point being occasionally open, dry or could be readily admitted, and the bulb gain, without any sensible alteration in the quantity of air. The air was confined by a column of silver, long or short, and with the bulb upward or upwards, according to the nature proposed experiment. Here it might be observed, that, from the adhesion of the quicksilver tube, the instrument will not act truly, if it be in a vertical position; and even the bulb necessary to give it a small degree of motion, will remain in equilibrium, between the pressure of the atmosphere on one side, and the elastic force of the confined air on the other. Pounded sea and water were used to fix the point on the tube; and by means of the bulb the air was further condensed, perena sometimes 10 or 12 degrees below zero. The manometer and manometer were then put into a vessel among water, which was heated or cooled, till the bulb was having sufficient time, and motion being given to the manometer, a boiling point was marked there; this the fire was removed, and the pressure of the tube of quicksilver, care to every 10 degrees of temperature, and the manometer, were successively marked and applied to the manometer. It is to be observed that both instruments, while in the water, in circumstances perfectly similar, the bulb and bulb were at the bottom of the vessel. In order to be certain that no air had

side of the quicksilver during the operation, manometer was frequently placed a second time in melting ice. If the barometer had not altered between the beginning and end of the experiment, the quicksilver always became stationary at or near the first mark. If any sudden change had taken place in the weight of the atmosphere during that interval, the same was noted, allowance made for it in afterwards proportioning the spaces. Long tubes, with bores truly cylindrical, or of any uniform figure, are scarcely to be met with. Such however as were used in these experiments, generally tapered in a pretty regular manner from one end to the other. When the bulb was downwards, and the tube narrowed at that way, the column of quicksilver confining the air lengthened in the lower half of the scale, and diminished the pressure above the mean. In the other half, the column being shortened, the pressure was diminished below the mean. In this case the observed spaces both ways from the mean were diminished in the inverse ratio of the heights of the barometer at each space, compared with its mean height. If the bore widened towards the bulb when downwards, the observed spaces, each way from the centre, were augmented in the same inverse ratio; but in the experiments on air less dense than the atmosphere, the same being upwards, the same equation was applicable with contrary signs: and if any extraordinary irregularity took place in the tube, the corresponding spaces were proportioned both ways at that point, whether high or low, that answered to the mean. The observed and equated geometrical spaces being thus laid down on the board containing the measures of the tube; and  $212^{\circ}$  of the thermometer, in exact proportion to the sections of the bore, were constructed along of them: hence the coincidences with each other were easily seen; and the number of thermometer degrees answering to each manometer space readily transferred into a table prepared for the purpose."

\*) MANOR. *n. f.* [*manoir*, old French; *manor*, low Latin; *maner*, Armorick.] *Manor* signifies, in common law, a rule or government which an lord hath over such as hold land within his fee. In the beginning, there was a certain commodity of ground granted by the king to some man worth, for him and his heirs to dwell upon, and to exercise some jurisdiction. But whosoever possesses these manors, the liberty belonging to them is real and predial, and therefore remains, though the owners be changed. In these days, manor rather signifies the jurisdiction and royal incorporeal, than the land or site: for a man may have a manor in gross, as the law terms it, which is the right and interest of a court-baron, and the perquisites thereto belonging. *Cowel.*—My parks, my walks, my manors that I had, when now forsake me; and of all my lands nothing left me?

*Shak. Henry VI.*

Some say they broke their backs with laying manors on them  
 And this great journey.

*Shak. Rich. II.*

(2.) MANOR, [from *maneo*, to stay, as being the usual residence of the owner,] seems to have been a district of ground held by lords or great persons; who kept in their own hands so much land as was necessary for the use of their families. These lands were called *terre dominicales*, or *demesne lands*; being occupied by the lord, or *dominus manerii*, and his servants. The other, or *tenemental* lands, they distributed among their tenants; which, from the different modes of tenure, were called and distinguished by two different names.—First *book land*, or charter land, which was held by deed under certain rents and free services, and in effect differed nothing from free socage lands: and hence have arisen most of the free-hold tenants who hold of particular manors, and owe suit and service to the same. The other species was called *folk lands*, which was held by no assurance in writing, but distributed among the common folk at the pleasure of the lord, and resumed at his discretion; being indeed land held in villeinage. See VILLENAGE. The residua of the manor, being uncultivated, was termed the *lord's waste*, and served for public roads, and for common of pasture to the lord and his tenants. Manors were formerly called BARONIES, as they still are *lordships*; and each lord or baron was empowered to hold a domestic court, called the COURT BARON, for redressing misdemeanors and offences within the manor, and for settling disputes of property among the tenants. This court is an inseparable ingredient of every manor; and if the number of suitors should so fall, as not to leave sufficient to make a jury or homage, that is, two tenants at the least, the manor is said to be left. (See COURT, § 4.) In early times, the king's greater barons, who had a large extent of territory held under the crown, granted out frequently smaller manors to inferior persons to be held of themselves; which therefore now continue to be held under a superior lord, who is called in such cases the *lord paramount* over all these manors; and his feignory is frequently termed an *honour*, not a manor; especially if it hath belonged to an ancient feudal baron, or hath been at any time in the hands of the crown. In imitation whereof, these inferior lords began to carve out and grant to others still more minute estates, to be held as of themselves, and were so proceeding downwards *in infinitum*, till the superior lords observed, that, by this method of subinfeudation, they lost all their feudal profits of wardships, marriages, and chevages, which fell into the hands of these mesne or middle lords, who were the immediate superiors of the *terre tenant*, or him who occupied the land; and also that the mesne lords themselves were so impoverished thereby, that they were disabled from performing their services to their own superiors. This occasioned, first, that provision in the 32d chapter of *magna charta*, 9 Hen. III. that no man should either give or sell his land without reserving sufficient to answer the demands of his lord; and, afterwards, the statute of Westminster, 3. or *quia emptores*, 18 Edw. I. c. 1. which directs, that, upon all sales, or feoffments of land, the fee should hold the same, not of his immediate feoffor, but of the chief lord of the fee, of whom

such feoffer himself held it. But these provisions not extending to the king's own tenants *in capite*, the like law concerning them is declared by the statutes of *prærogativa regis*, 17 Edw. II. c. 6. and of 34 Edw. III. c. 15. by which last all subinfeudations, previous to the reign of Edward I. were confirmed; but all subsequent to that period were left open to the king's prerogative. Hence it is clear, that all manors existing at this day, must have existed as early as Edward I. for it is essential to a manor, that there be tenants who hold of the lord; and, by the operation of these statutes, no tenant *in capite* since the accession of that prince, and no tenant of a common lord since the statute of *quia emptores*, could create any new tenants to hold of himself. See **VILLENAGE**.

(3.) **MANOR**, in geography, a mountainous parish of Scotland, in Peebles-shire, 9 miles long from SW. to NE. and 3 broad; containing 18,110 acres. The soil in the low ground is excellent, and produces good crops of oats, barley, pease, potatoes and turnips. The air is pure. The population, in 1791, was 229; decrease 91, since 1755: the number of sheep was 8,700; horses 90; and black cattle 190.

(4.) **MANOR**, a river in the above parish.

**MANOS**, a town of Cuba, 20 miles E. of Havannah.

**MANOSCOPE**. See **MANOMETER**.

**MANOSQUE**, a populous town of France, in the dep. of the Lower Alps, and ci-devant prov. of Provence; with a castle, on the Durance; 10 miles S. of Forcalquier, 15 W. of Apt, and 350 S. by E. of P. Lon. 5. 55. E. Lat. 43. 51. N.

**MANOT**, a town of France, in the dep. of Charente, 3 miles S. of Confolent.

**MANOU**, a town of France, in the dep. of Eure and Loire, 12 miles S. of Verneuil.

**MANPURY**, a town of Indostan in Doob.

\* **MANQUELLER**. *n. f.* [*man* and *exceller*, Saxon.] A murderer; a mankiller; a manslayer. —This was not Kayne the *manqueller*, but one of a gentler spirit and milder sex, to wit a woman. *Cæsar*.

**MANQUELLING**. *n. f. Obs.* Homicide; man-killing. See **HOMICIDE**, § 1; and **MANSLAUGHTER**.

**MANRESA**, or **MANRES**, an ancient town of Spain, in Catalonia, 15 miles SE. of Cardona, and 25 NW. of Barcelona. Lon. 1. 56. E. Lat. 41. 36. N.

**MANS**, or **Le Mans**, an ancient and rich town of France, capital of the dep. of the Sarthe, as it was formerly of the ci-devant county of Maine. It contains a cathedral, 15 churches, and about 14,000 citizens, but was formerly much more populous. Its poultry, wax, and stuffs are famous. It is seated on a high hill near the confluence of the Sarthe and the Huisne, 25 miles S. of Angoum, and 75 W. by N. of Orleans. Lon. 0. 18. E. Lat. 47. 58. N.

**MANSA**, or **MANSUS**. See **MANSER**, § 2.

**MANSARGAR**, a large lake of Asia, in Thibet, from which the southernmost head of the Ganges issues. It is 115 miles in circumference. Lon. 79. 25. E. Lat. 23. 15. N.

**MANSBURG**, a town of Germany, in Carinthia, 3 miles SSW. of S. m.

(1.) \* **MANSE**. *n. f.* [*mansio*, Lat.] land. 2. A parsonage-house.

(2.) **MANSE**, **MANSUS**, **MANSA**, or in ancient law-books, denotes an *emphyteuticon*, either with or without land. 3. **MANOR**, and **MANSION**.

(3.) **MANSE**, **CAPITAL**, *Mansum* *C. manor-bouff*, or lord's court. See **MA**

(1, 2.) **MANSFELD**, a city of Ger capital of a county of the same name, in of Upper Saxony. Lon. 12. 55. E. Lat.

(3.) **MANSFELD**, Peter Ernest, count descended from one of the most illustrious families in Germany. In 1552, he was taken at Ivoy, where he commanded. He was afterwards of great service to the Catholics in the battle of Montcontour, and was employed in the most delicate and important affairs of the utmost delicacy and importance made governor of Luxembourg, he secured tranquillity in that province, while the Netherlands was a prey to the horrors of the war. He was afterwards appointed to the command of the Netherlands, and made 27 the Empire. He died at Luxembourg, 21, 1604, aged 87. His mausoleum in the chapel bearing his name, at Luxer is an admirable work. To his military talents united a taste for the sciences; but, like most heroes ancient and modern, he was greedy and lavish of blood. Abbe Schannat writes his life in Latin; Luxembourg, 1707.

(4.) **MANSFELD**, Charles, prince of, lived the above, signalized himself in the wars of the Netherlands and Hungary; and died without issue, after having beaten the Turks who had besieged the city of Gran, which he saved.

(5.) **MANSFELD**, Ernest DE, the illegitimate son of the count (Nº 3.) by a lady of Malines, educated at Brussels in the Roman Catholic religion. He was employed in the service of Spain in the Netherlands, and in the emperor's army in Hungary, together with his brother Charles count of Mansfeld. He was promoted on account of his bravery by Rodolphus to his father's posts and possessions in the Spanish Netherlands having been refused him on promise, he, in 1610, joined the Protestants. Being now become a most dangerous enemy of the house of Austria, who called *Antichristianity*, he set himself in the head of the rebels in Bohemia, and his rebellion of Pilsen in 1619. Though he and his army were defeated in several battles, he persisted in the palatinate, took several places, Alsace, made himself master of Hague, defeated the Bavarians. At length he was defeated by Wallstein, at Dassow, in April. He gave his remaining troops to the duke of Prussia, intending to pass into the Venetian territories, but died in a village between Zara and Trieste, A. D. 1626, aged 46. Nani thus describes him: "He was bold, intrepid in danger, and a skilful negotiator of his age. He possessed natural eloquence, and knew how to insinuate himself into the hearts of those whom he wished to gain. He was greedy of others' wealth, and careless of his own. He was full of val-

ither lands nor money at his death." die in his bed, he dressed himself in his domestic, and in this position. But of all his actions, the most extraordinary: having got at Cazal, in whom he placed the Chief, he gave him 300 rix dollars to count Buquoy, with a letter, "Cazal being attached to you I send him to you, that you may it of his services." Ernest is de- ed one of the greatest generals of

ELD, Henry Francis, count of, was use with the former, and signalized wars for the Spanish succession. He on the 8th June 1715, aged 74, rince of the Empire, a grandee of rthral general of the emperor's ar- of artillery, ambassador to France eflident of the Aulic council, and ain to the emperor.

IELD, a town of Nottinghamshire, f Sherwood, 140 miles from Lon- nciently a royal demefne. It has a urfdlay, and two fairs. By an an- f this manor, the heirs were declar- on born. It is a well built town, reat trade in malt. Its market is with corn, cattle, &c. It has a cha- 36 boys.

IELD, Earl of. See MURRAY.  
E, a town of France, in the dep- miles W. of La Fieche.

A, a town of Spain in Leon, 15 con. Lon. 4. 55. W. Lat. 42. 30. N. O, a term often mentioned in iting ins on the public roads to e distance of 18 miles from each o- us.) In the lower ages, it came to amment for one night. Lumpri-

), or MANSUS, was sometimes also ne sense with *bide*; that is, for as one plough could till in a year.

SION. *n. f.* [*manfo*, Latin.] 1. The a manor. 2. Place of residence; —All these are but ornaments of ark within you, which being de- heaven, could not elsewhere pick a *manfon*. *Sidney*.—A fault no less be it were true, than if some king his *manfon* house by the model of ace. *Hooker*.—

his wife, to leave his babes,  
and his titles in a place,  
ce himself does fly. *Shak.*  
fun wants thee, Adam; rise. *Milton.*  
his provided thee. *Dryden.*  
abode:—  
ets near our princes sleep,  
grave their *manfions* keep. *D-nham.*  
IN (§ 1. *def.* 1.) is otherwise call'd *hage*, or *manse*, or chief *manor*; *hage*.

(3.) MANSION is also used for a dwelling house in the country. See MANSE.

(1.) \* MANSLAUGHTER. *n. f.* [*man* and *slaughter*.] 1. Murder; destruction of the human species.—The whole pleasure of that book standeth in open *manflaughter* and bold bawdry. *Afcbam's Schoolmajter*.—

To overcome in battle, and subdue Nations, and bring home spoils with infinite *Manflaughter*, shall be held the highest pitch Of human glory. *Milton.*

2. [In law.] The act of killing a man not wholly without fault, though without malice; punished by forfeiture.—When a man, throwing at a cock, killed a bystander, I ruled it *manflaughter*. *Foster*.

(II.) MANSLAUGHTER, (§ 1, *def.* 2.) may be either voluntarily, upon a sudden heat; or involuntarily, but in the commission of some unlawful act. These were called, in the Gothic constitutions, *bo- micidia vulgaris*; *que aut casu, aut etiam sponte committuntur, sed in subitaneo quodam iracundie calore et impetu*. Hence, in *manflaughter* there can be no accessories before the fact; because it must be done without premeditation.

1. MANSLAUGHTER, INVOLUNTARY, differs from homicide excusable by misadventure, in this: That misadventure always happens in consequence of a lawful act, but this species of *manflaughter* in consequence of an unlawful one. As if two persons play at sword and buckler, unless by the king's command, and one of them kills the other: this is *manflaughter*, because the original act was unlawful; but it is not murder, for the one had no intent to do the other any personal mischief. So where a person does an act, lawful in itself but in an unlawful manner, and without due caution and circumspection; as when a workman flings down a stone or piece of timber into the street, and kills a man; this may be either misadventure, *manflaughter*, or murder according to the circumstances under which the original act was done. If it were in a country village, where few passengers are, and he calls out to all people to have a care, it is misadventure only: but if it were in London, or other populous towns, where people are continually passing, it is *manflaughter*, though he gives loud warning; and murder, if he knows of their passing and gives no warning at all, for then it is malice against all mankind. In general, when an involuntary killing happens in consequence of an unlawful act, it will be either murder or *manflaughter* according to the nature of the act which occasioned it. If it be in prosecution of a felonious intent, or in its consequences naturally tending in bloodshed, it will be murder; but if no more was intended than a mere civil trespass, it will only amount to *manflaughter*.

2. MANSLAUGHTER, VOLUNTARY:—If upon a sudden quarrel two persons fight, and one of them kills the other, this is *manflaughter*: and so it is, if they upon such an occasion go out and fight in a field; for this is one continued act of passion: and the law pays that regard to human frailty, as not to put a hasty and deliberate act upon the same footing with regard to guilt. So also if a man be greatly provoked, as by pulling his

his nose, or other great indignity, and immediately kills the aggressor; though this is not excusable *se defendendo*, since there is no absolute necessity for doing it to preserve himself; yet neither is it murder, for there is no previous malice; but it is manslaughter. But in this, and in every other case of homicide upon provocation, if there be a sufficient cooling-time for passion to subside and reason to interpose, and the person so provoked afterwards kills the other, this is deliberate revenge, and not heat of blood; and accordingly amounts to murder. So if a man takes another in the act of adultery with his wife, and kills him directly upon the spot; though this was allowed by the law of Solon, as likewise by the Roman civil law (if the adulterer was found in the husband's own house), and also among the ancient Goths; yet in England it is not absolutely ranked in the class of justifiable homicide, as in case of a forcible rape, but it is manslaughter. It is, however, the lowest degree of it; and therefore in such a case the court directed the burning in the hand to be gently inflicted, because there could not be a greater provocation. Manslaughter, therefore, on a sudden provocation, differs from excusable homicide *se defendendo* in this: That in one case there is apparent necessity, for self-preservation, to kill the aggressor; in the other no necessity at all, being only a sudden act of revenge.

(III.) MANSLAUGHTER, PUNISHMENT OF. As to the punishment of this degree of homicide: The crime of manslaughter amounts to felony, but within the benefit of clergy; and the offender shall be burnt in the hand, and forfeit all his goods and chattels. But there is one species of manslaughter, which is punished as murder, the benefit of clergy being taken away from it by statute; namely, the offence of mortally stabbing another, though done upon sudden provocation. See SPARRING.

\* MANSAYER. *n. f.* [*man* and *slay*.] One that has killed another.—Cites for refuge for the *maniliv. r. Numb. xxxv. 6.*

MANSLE, a town of France, in the dep. of Charante, 12 miles N. of Angouleme.

MANSORA, or } a town of Egypt, on the E.

MANSOURA, } bank of the Nile. The Syrian Christians, settled in it, are the chief traders, and export rice, salammouac, &c. The ovens for hatching chickens are numerous. See HATCHING, § 1.

MANSTEIN, Christopher Herman DE, was born at Petersburg, Sept. 1, 1711, and served long with great distinction as a colonel in the Russian armies. In 1745, he went into the service of the king of Prussia; was appointed major-general of infantry in 1754; and distinguished himself on all occasions by his bravery and military knowledge. He was wounded at the battle of Kolin, and soon after killed near Lauteritz, in 1758. He devoted his leisure moments to study, and was acquainted with almost all the languages of Europe. He wrote *Historical, Political, and Military Memoirs of Russia*, in French; published at Lyons, 1772, in 2 vols, 8vo. with plans and charts. These memoirs commence with the death of Catherine I. 1725, and end in 1744. His

was an eye-witness, or had a very intellige, of all the events contained supplement is added, which goes times of the ancient Czars, treats able length on Peter I. and gives an military and naval force, trade, &c. tentive empire. Mr Humme caused th to be translated into English, and London; and soon after a German was published at Hamburgh; a Fr was published by M. Huber at Leipl and a new and enlarged edition in 17

\* MANSUETE. *adj.* [*mansuetus*, I.] gentle; not ferocious; not wild.—Tl only in domestick and *mansueti* birds; might be thought the effect of ricum situation, but also in the wild. *Ray on 2*

\* MANSUETUDE. *n. f.* [*mansuetus* *factus*, Lat. Tameness; gentleness. The angry lion did present his paw Which by consent was given to man

(1.) MANSUS. See MANSE.

(2.) MANSUS PRESBYTERI, is a par vicarage house for the incumbent to. This was originally, and still remains, a part of the endowment of a parish chur ther with the glebe and tithes. It is c called *Presbyterium*. See PRESBYTERY.

MANT, a town of France, in the Landes, 12 miles S. of St Sever, and Pau.

(1.) MANTA, a town of the French in the department of the Po, ci-devant pi of Piedmont, and marquissate of Saluzzo, the Maritime and Cottian Alps. It th on an eminence, and had anciently its own. It lies 2 miles S. of Saluzzo.

(2.) MANTA, in ichthyology; a fat itioned by Ulloa and others, as exceedi ful to the pearl-fishers, and which seems same with that which Pliay has desig the name of *nubes* or *nebula*: *Ipsi fiant res) et nubem quandam crassissimam super or norum piscium similem, prementem eos, an a reciprocando et ob filios praxucatos lineis au ber: sese; quia nisi percussa ita, non recedunt et parvoris, ut arbitror, opere. Nub sine nebulam (cujus nomine id malum inter animalia baul ullam reperit ququam Nat. lib. ix. cap. 46.) This account is same with that which the divers in the seas give of the manta, and the name or the cloud, is perfectly applicable to really seems to be a cloud to those who water below it: the swimmers likewise knives, or sharp sticks, to defend them gainst these fish. The strength of this great, that it will not only strangle a ma it embraces or winds itself about, but it been seen to take the cable of an anchor; it from the place where it had been cal been called *manta*, because, when it leat upon the sea, it seems like a fleece of w ing upon the water.*

(3.) MANTA BAY, a bay of Peru, at of the equator, formerly famous for

narrow and long. The head is small, flat, with two filiform short antennæ. On the sides of the head are situated two large polished eyes. The thorax is subciliated, long, narrow, margined, with a longitudinal rising in the middle, and a transverse depression at one third of its length. The elytra, which cover two thirds of the insect, are veined, reticulated, crossed one over the other, and cover the wings, which are veined, and diaphanous. The hinder legs are very long, the middle ones shorter; and the foremost pair of thighs are terminated with spines, the rest winged, as it were, with membranaceous lobes. The top of the head has the shape of an awl; is membranaceous, often split in two at the extremity. It is a native of China.

(1.) \* MANTLE. *n. f.* [*mantell*, Welsh.] A kind of cloak or garment thrown over the rest of the dress.—

We, well-cover'd with the night's black mantle,

At unawares may beat down Edward's guard,  
And seize himself. *Shak.*

—Poor Tom drinks the green mantle of the standing pool. *Shak.*—

The day begins to break, and night is fled,  
Whose pitchy mantle over-veil'd the earth. *Shak.*

—Their actions were disguised with mantles of religion, and justice. *Hayward.*—The herald and children are clothed with mantles of fatten; but the herald's mantle is streamed with gold. *Bacon.*

By which the beauty of the earth appears,  
The divers-colour'd mantle which she wears.

Before the heav'ns thou wert, and at the voice  
Of God, as with a mantle didst invest  
The rising world of waters dark and deep. *Milt.*  
—Upon loosening of his mantle the eggs fell from him at unawares, and the eagle was a third time defeated. *L'Esfrange.*—

Gently has he laid  
The mantle o'er thy sad distress. *Prior.*

A spacious veil from his broad shoulders flew,  
That set th' unhappy Phaeton to view;  
The flaming chariot and the steeds it shew'd,  
And the whole fable in the mantle glow'd. *Addis.*

(2.) MANTLE. See MANTEL, § 1 and 2.

(3.) MANTLE, or MANTLING, in heraldry, that appearance of folding of cloth, flourishing, or drapery, which in any achievement is drawn about a coat of arms. See HERALDRY, Ch. IV. Sect. V.

(1.) \* To MANTLE. *v. a.* [from the noun.] To cloke; to cover; to disguise.—

As the morning steals upon the night,  
Melting the darkness; so the rising senses  
Begin to chace the ignorant fumes, that mantle  
Their clearer reason. *Shak.*

I left them  
I' th' filthy mantled pool beyond your cell,  
There dancing up to th' chins. *Shak.*

(2.) \* To MANTLE. *v. n.* [The original of the signification of this word is not plain. *Skinner* considers it as relative to the expansion of a mantle: as, the hawk mantles; she spreads her wings like a mantle.] 1. To spread the wings as a hawk in pleasure.—

The swan with arch'd neck,

Between her white wings mantling,  
Her state with oary feet.

2. To joy; to revel.—

My frail fancy fed with full delight  
Doth bathe in bliss, and mantleth me

3. To be expanded; to spread luxuriant  
The pair that clad  
Each shoulder broad, came mantling  
breast  
With regal ornament.

The mantling vine  
Lays forth her purple grape. *Mih.*

I saw them under a green mantling:  
You'll sometimes meet a top, of which  
Whose mantling peruke veils his emj

And where his mazy waters flow,  
He gave the mantling vine to grow.

4. To gather any thing on the surface;  
There are a sort of men, whose vi  
Do cream and mantle like a standing p  
—It drinketh fresh, flowereth, and m  
ceedingly. *Bacon.*—

From plate to plate your eye-balls  
And the brain dances to the mantling;  
5. To ferment; to be in sprightly agit  
When mantling blood  
Flow'd in his lovely cheeks.

MANTLE-PIECE, or } *a. f.* See MA  
MANTLE TREE, } and 2.

MANTLING, *n. f.* See MANTLE;  
MANTO, in fabulous history, the  
Tiresias, and like her father strongly inq  
prophecy. She was in so great est  
the Argives pillaged Thebes, they th  
could not acquit their vow to Apollo,  
crating to him the most precious thi  
plunder, without offering to them thi  
man. She was therefore sent to the  
Delphi. But this did not engage her i  
of continency; or, if it did, she observ  
ill: for she bore a son called *Amphion*  
meon, who had been generalissimo of  
which took Thebes; and a daughter a  
*spibone*. These children were the fruits  
mour carried on during the madness o  
seized Alcmeon, after he had put his  
death. Virgil says she went into Italy;  
son who built MANTUA.

MANTOIS, a late county of France,  
cluded in the dep. of the Seine and Oise.

MANTOUA, or } in ancient and mo  
(1.) MANTUA, } graphy, a city of th

republic, capital of the dep. of the Mi  
was anciently a town of GALLIA TRANS  
and situated on the Mincius, a river run  
the lake Benacus. It is said to have been  
about 300 years before Rome, by Bianor o  
the son of MANTO; and was the ancient  
of Etruria. When Cremona, which had  
ed the interest of Brutus, was given to th  
of Octavius, Mantua also, which wa  
neighbourhood, shared the common cal  
many of the inhabitants were tyrannical  
ved of their possessions. Virgil, who wa  
them and a native of the town, applied th  
to Augustus, and obtained it on account

al talents. It is still called MANTUA, and is the capital of the late duchy, N° 4. It is a large city, having 8 gates and about 20,000 inhabitants. The streets are broad and straight, and the houses well built. It is very strong by situation as well as by art; lying in the middle of the lake, N° 4. There is no access to the city but by two causeways which cross this lake, and which are strongly fortified: so that the city is supposed to be one of the strongest fortresses in Italy; and the allies in 1745, though their army was in the duchy, durst not undertake the siege.

It was besieged, however, by the French in 1796 and 97. It was first invested by order of Napoleon Bonaparte on the 4th June, 1796. On the 17th July the garrison made a sortie, but were obliged to retreat with the loss of 600 men. On the 25th the French opened their trenches, and on the 29th Gen. Wurmsler attacked the French, destroyed their trenches, relieved the garrison, the siege, and took 140 pieces of cannon, 1000 provisions, &c. But on the 24th of August the French under general Scherzer, blockaded the town; and on the 15th Sept. the Austrians retired into it, with a loss of 500 men, 20 cannons, &c. and took fort St. George. (See GEORGIO, ST, N° 7.) On the 23d Gen. Wurmsler made a 3d sortie, with the loss of 200 men; and at last after having been reduced to such straits, that 5000 horses were killed and eaten during the siege, he surrendered the town by capitulation, on the 2d Feb. 1797, with 559 cannons, 17,115 small arms, a vast quantity of other military stores, and the whole remainder of his army. In July 1799, Mantua was besieged by the Austrians under Gen. Kray, whom it at last surrendered; and was retained by the emperor till the peace, in 1802. It was famous for its silk manufactures, which are now much decayed. The air in summer is unwholesome. It lies 22 miles SW. of Verona; 35 of Parma; 70 WSW. of Venice, and 70 ESE. of Milan. Lon. 10. 47. E. Lat. 45. 10. N.

MANTUA, or the MANTUAN, a country in the north-west part of Italy, lying along the Po, and divided into two parts. It was bounded N. by the Veronese; on the S. by the dukes of Reggio, Modena, and Mirandola; on the E. by Ferrara; and W. by the Cremonese. It is 50 miles long, and 25 broad; is fruitful in corn, pastures, flux, fruits, and excellent wine. In 1707 the last duke of Mantua, being a vassal of the empire, took part with the French in the war relating to the succession of Spain; for which reason he was put under the ban of the empire, and died at Venice in 1728. He having no issue, the emperor kept the Mantuan in his hands, and the duke of Savoy had Montferrat confirmed to them by subsequent treaties. After the death of the emperor in 1740, the emperor's daughter, Mary Theresa, late empress, kept possession of the Mantuan; and the emperor's son, Francis, who had the administration of the empire. The Mantuan comprehended the duchies of Mantua, Guastalla, and Sabbioneta; the counties of Castiglione, Solferino, and Belfiore; and the county of Novellara. The principal

rivers are the Po, the Oglio, and the Mincio; and the principal town is Mantua. This country now forms part of the department of the Mincio in the Italian republic.

(3.) MANTUA, a district of the Italian republic, in the dep. of the Mincio, comprehending part of the late duchy; (N° 23) and containing 83,002 citizens in May 1801. Mantua (N° 1.) is the capital.

(4.) MANTUA, LAZZO DI, or the LAKE OF MANTUA, a lake of the Italian republic, in the dep. of the Mincio, and formed by the river Mincio. It is 26 miles in circumference, and 2 broad. It has 4 different ramifications, called the Lakes of MEZO, FAVOLO, SOPRA, and SOTTO. It was of great importance during the siege of Mantua, (which it surrounds,) both to the French and Austrians; but in summer, when the water is low, its exhalations are noxious.

(5.) \* MANTUA, *n. f.* [this is perhaps corrupted from *mantua*, Fr.] A lady's gown.—

Not Cynthia, when her *mantua's* pin'd a-wry,

E'er felt such rage, resentment, and despair,  
As thou, sad virgin! for thy ravish'd hair. *Pope.*  
—How naturally do you apply your hands to each other's lappets, ruffles, and *mantuas*. *Swift.*

\* MANTUAMAKER, *n. f.* [*mantua* and *maker*.] One who makes gowns for women:—by profession a *mantuamaker*: I am employed by the most fashionable ladies. *Addison.*

(1.) MANTUAN, Raptist, a famous Italian poet, born at Mantua in 1448. He took his name from the town, being a natural son. In his youth, he applied to Latin poetry, which he cultivated all his life. He entered among the Carmelites, and became general of the order; though he quitted that dignity upon some disgust in 1515, and died the year following. The duk of Mantua, some years after, erected a marble statue to his memory crowned with laurel, and placed it next to Virgil. His works were collected and published at Paris, in 3 vols. folio in 1713, with the commentaries of St. Marthe, S. Brant, and I. Badius.

(2.) MANTUAN. See MANTUA, N° 1.

(3.) \* MANUAL, *adj.* [*manu*, Latin; and *manus*, French.] 1. Performed by the hand.—The speculative part of painting, without the assistance of *manus* operation, can never attain to that perfection which is its object. *Dryden's Description.* 2. Used by the hand.—The treasurer obliged himself to procure some declaration under his majesty's sign *manual*. *Clarke.*

(4.) \* MANUAL, *n. f.* A small book, such as may be carried in the hand.—This *manua* of laws, filed the common law contains but few heads. *Hall.*—In those prayers which are recommended to the use of the devout persons of your church, in the *manua* and offices allowed them in our own language, they would be careful to have nothing they thought scandalous. *Stillingfleet.*

(5.) MANSUAL, *n. f.* is a service book used in the church of Rome, containing the rites, directions to the priests, and prayers used in the administration of the sacrament; the form of blessing holy water, and the service used in processions.

(6.) MANUAL EXERCISE, in the army, consists in the observance of certain words, or commands

*Arms.* The equal squareness of the shoulders, and body, to the front, is the first, and great principle of the position of the soldier:—The heels must be in a line, and closed:—The knees straight without stiffness:—The toes turned out, so that the feet may form an angle of about 60 degrees: The arms hang near the body, but not stiff; the flat of the hand, and little finger, touching the thigh, and the thumbs as far back as the seams of the breeches:—The elbows and shoulders are to be kept back:—The belly rather drawn in; and the breast advanced, but without constraint;—The body to be upright, but inclining rather forwards, so that the weight of it may bear chiefly on the fore part of the feet;—The head to be erect; and neither turned to the right nor to the left; the eyes alone will be glanced to the right. The body of the soldier being in this position, the firelock is to be placed in his left hand, against the shoulder; his wrist to be a little turned out, the thumb alone to appear in front; the 4 fingers to be under the butt; and the left elbow to be rather bent inwards, so as not to be separated from the body, or to be more backward or forward than the right one:—The firelock must rest on the hand, not on the end of the fingers; and be carried in such a manner as not to raise, advance, or keep back one shoulder more than the other; the butt must therefore be forward, and as low as can be permitted without constraint; the fore part a very little before the front of the thigh; and the hind part of it pressed by the wrist against the thigh:—It must be kept steady, and firm before the hollow of the shoulder; should it be drawn back or carried too high, the one shoulder would be advanced, the other kept back, and the upper part of the body would be distorted, and not square with respect to the limbs

along the sling, the wrist upon the point of the left thumb of the eyes. 3d. Bring down the quick motion, as low as the right foot at the same instant, so that may touch the left heel.—The position is to be totally supported.—the body to rest entirely on the knees to be straight. V. *Shoulder* By a turn of the right wrist, bring its proper position on the shoulder above, the left hand grasping the right hand, bringing it back by the side. VI. *Charge* 1 motion throw the firelock from across the body, to a low diagonal *Port Arms.* 1. Turn the lock upwards, so that the barrel meets the point of the left shoulder, and proportionally depressed: the right small of the butt, and the left the swell, close to the lower pipe both hands pointing towards the muzzle. Make a half-face to the right, the firelock to nearly a horizontal the muzzle inclining an inch from the right wrist resting against the hollow just below the hip.—N. B. The *charge* is the position which the soldier takes from the shoulder, or after firing to advance on an enemy, whom he attacks with fixed bayonets; a command for that purpose is, *Charge*. 2d. The position of the charge is taken by the front rank, when arrived at a certain distance from the body to be

he small of the butt under the lock with the hand, bringing the butt in front of the groin, keeping the lock somewhat turned out: at which they bring the left arm under the lock at the third they quit the right hand. In *rig arms* from the *support*, the motions are easily reversed.—The motions in the manoeuvre will, in future, be performed slowly in heretofore, leaving three seconds between each motion, except that of *fixed bayonets*, which a longer time must be given. The manoeuvre is not to be executed by one word, or signal, each separate word of command is to be given by the officer who commands the body performing it. In regard to the motions of *securing*, *fixing*, and *trailing*, as well as those of *piling*, will be sufficient for the soldiers to be ordered to perform them in the most convenient, and swiftest method. *Returning bayonets* is to be done in the *order*, in the same manner as *fixing*.

The *manual* and *platoon exercise* will not make a regular part of a review, but will be gone through, when particularly called for by the reviewing General. (See *PLATOON*.) Companies posted with shouldered arms, are permitted to *support*, but not to slope them. At the approach of an officer, they immediately *fix* their arms; and put themselves into their proper position, which is not to be done at the time he passes, but by the time he is within the ranks of their post, so that they may be perfectly ready before he comes up. Corporals commanding with reliefs, or commanding detachments or divisions, will carry their arms *advanced* which purpose a soldier, when promoted to a higher rank, must be taught the position of *advanced*. There are some peculiar words of command for the manual exercise of the grenadiers, and also for the *artillery*.

**NUBALISTA.** See *BALLISTARI*, and *BALISTA*.

**NUBIAL.** *adj.* [*manubie*, Lat.] Belonging to *spoils*; taken in war. *Dict.*

**NUBLES**, a river of Spain, in Arragon, runs into the *Xalon*, at *Areca*.

**NUBRIUM.** *n. f.* [Latin.] A handle.—In the *sucker* move easily enough up and down the cylinder by the help of the *manubrium*, the *manubrium* be taken off, it will require considerable strength to move it. *Boyle*.

**NUDUCTION.** *n. f.* [*manuductio*, Latin.] Done by the hand.—We find no open tract, but *manuduction*, in this labyrinth. *Brown's Errors*.—That they are carried by the *manuduction* of a rule, is evident from the constant *direction* of their motion. *Glanville*.—This is a *manuduction* to all kind of sin. *South*.

**NUDUCTOR**, [from *manus*, Lat. hand, and *duco*, I lead,] an ancient officer in the Latin Church, who, from the middle of the choir, gave the *direction* for the choiristers to sing, and marked the *measure*, beat time, and regulated the music. The Greeks called him *MESACHOROS*, because he was in the middle of the choir.

**NUFACTORY**, *n. f.* a place where *manuductions* are carried on to a considerable extent.

**MANUFACTURE.** *n. f.* [*manus* and *facio*,

Lat. *manufacture*, Fr.] 1. The practice of making any piece of workmanship. 2. Any thing made by art.—

Heav'n's pow'r is infinite: earth, air, and sea,  
The *manufacture* mass, the making pow'r obey.

*Dryden*.

—The peasants are clothed in a coarse kind of canvas, the *manufacture* of the country. *Addison*.

(2.) A MANUFACTURE is a commodity produced from raw or natural materials, either by the work of the hand or by machinery; though the word literally means only work made by the hand.

\* To MANUFACTURE, *v. a.* [*manufacturer*, Fr.] 1. To make by art and labour; to form by workmanship. 2. To employ in work; to work up: as, we manufacture our wool.

\* MANUFACTURER, *n. f.* [*manufacturier*, Fr. *manufacturus*, Lat.] A workman; an artificer.—In the practices of artificers and the *manufacturers* of various kinds, the end being proposed, we find out ways of composing things for the several uses of human life. *Watts*.

\* To MANUMISE, *v. a.* [*manumitto*, Lat.] To set free; to dismiss from slavery.—A constant report of a danger so imminent run through the whole castle, even into the deep dungeons, by the compassion of certain *manumised* slaves. *Knolles*.—  
He presents

To thee, renown'd for piety and force,

Poor captives *manumis'd*.

*Waller*.

(1.) \* MANUMISSION, *n. f.* [*manumission*, Fr. *manumissio*, Latin.] The act of giving liberty to slaves.—Slaves wore iron rings until their *manumission* or preferment. *Brown's Vulg. Errors*.—The pileus was somewhat like a night-cap, as the symbol of liberty, given to slaves at their *manumission*. *Arbutnot*.

(2.) MANUMISSION is derived from the Latin, *manus*, hand, and *mittere*, to send; *quia servus mittebatur extra manum seu potestatem domini sui*. Some authors define manumission an act by which a lord enfranchises his tenants, who till that time had been his vassals, and in a state of slavery inconsistent with the sanctity of the Christian faith. Among the Romans, the manumission of slaves was performed 3 ways: 1. When, with his master's consent, a slave had his name entered in the census or public register of the citizens. 2. When the slave was led before the praetor, and that magistrate laid his wand, called *vindicta*, on his head. 3. When the master gave the slave his freedom by his testament. *Servius Tullus* is said to have set on foot the first manner; and *P. Valerius Publicola* the 2d. A particular account is given of the 3d, in *Justinian's Institutes*. It was not necessary that the praetor should be on his tribunal to perform the ceremony of manumission: he did it any where, in his house, in the street, &c. He laid the rod on the slave's head, pronouncing these words, *Dico eum liberum esse more Quiritum*, "I declare him a freeman, after the manner of the Romans." This done, he gave the rod to the licitor, who struck the slave with it on the head, and afterwards with his hand on his face and back; and the notary or scribe entered the name of the new freed man in the register, with the reasons of his manumission. The slave had likewise his head shaved.

\* To MANUMIT. *v. a.* [*manumitto*, Lat.] To release from slavery.—*Manumit* and release him from those drudgeries to vice, under which those remain who live without God. *Gov. of the Tongue.*

Thou wilt beneath the burthen bow,  
And glad receive the *manumitting* blow,

On thy thrif'd flavin' head. *Dryd. Jew.*

MANUPPELLA, a town of Naples, in Abuzzo Citra, 8 miles S. of Civita.

\* MANURABLE. *adj.* (from *manure*.) Capable of cultivation.—This book gives an account of the *manurable* lands in every manor. *Hale's Orig.*

\* MANURANCE. *n. f.* (from *manure*.) Agriculture; cultivation. An obsolete word, worthy of revival.—Although there should none of them fall by the sword, yet they being kept from *manurances*, and their cattle from running abroad, by this hard restraint they would quickly devour one another. *Spenser on Ireland.*

(1.) \* MANURE. *v. f.* (from the verb.) Soil to be laid on lands; dung or compost to fatten land.

When the Nile from Pharian fields is fled,

The fat *manure* with heav'nly fire is warm'd.

*Dryden.*

—Mud makes an extraordinary *manure* for land that is findy. *Mortimer's Husbandry.*

(2.) MANURE. See RURAL OECONOMY.

\* To MANURE. *v. a.* [*manourer*, Fr.] 1. To cultivate by manual labour.—

They mock our scant *manuring*. *Milton.*

2. To dung; to fatten with composts.—Fragments of shells, reduced by the agitation of the sea to powder, are used for the *manuring* of land. *Woodward.*

3. To fatten as a compost.—

The corps of half her senate

*Manure* the fields of Theffaly, while we

Sit here, delib'rating in cold debates. *Cato.*

\* MANUREMENT. *n. f.* (from *manure*.) Cul-

use in the sciences. As the ancient codes now remain on Egyptian paper, or on wood only to consider those that are made of vellum, *membranes* written on our paper, *chairs* are in most esteem. With respect to these codes are written in capital letters, or in half small letters. Those of the ancients. There are no inscriptions, no letters different from the beginning of any word, no letters that are half square, no letters that are Gothic characters, as the form of the letters. Some round letters are not so ancient as are not older than the 9th or 10th century. They are likewise in the preceding, and are frequent in the country, into Lombardy, Franco-Gaulic, Saxon, and the ancient Greek books, the letters are divided into the periods of a discourse, by lines; and called, in Latin, *versus*, from the reason these lines are still more *versus* than *lines*. At the end of the number of verses put down the number of verses listed; that the copies might be listed; and it is in this sense used by Trebonius, when he says, that he has written 100,000 *verse versus*. likewise *vel probæ vel determi-* nate perfect, not only with reg-

UTIUS, Aldus, the first of the celebrated printers, who were as illustrious as for uncommon skill in their art. He was born at Bassano in Italy a little before the middle of the 15th century; and hence he is called *Bassanus*, though generally by the name of *Aldus*. He was the first Greek neatly and correctly; and much reputation by it, that what he printed was proverbially said to come from the press of Aldus." He published a grammar; with Notes upon Horace, &c. He died at Venice, in 1516.

PAULUS, Paul, the son of Aldus, (N<sup>o</sup> 2) a printer, but was more learned than his father, and acquired, by continual reading, a purity in writing Latin, that no other allows a Roman could not exceed. He placed him at the head of the apostrophe, and gave him the charge of the Vatican. His Epistles are highly laboured, and correct; but contain more words than he had however a very profound knowledge of antiquity; and he published, in his father's works, with Commentaries, &c. Venice, 1523. He also published a book, *De Lexibus Romanorum*; which is his master-piece. He died in 1574.

ALDUS, Aldus, the Younger, the son of the first, esteemed one of the greatest geniuses of his time. Clement VII. directed in the direction of the Vatican print-works, probably the profits of that place were all, as Manutius was obliged, to acknowledge, to his father, his uncle, and he collected with extraordinary industry which contained 80,000 volumes. He died in 1577, without any other reputation due to his merit. He published Commentaries on Cicero. 2. A treatise on the Latin and Italian, which are es-

Of or belonging to the Isle of Manx language, &c. See MAN,

See MANRESA.

NY. *adv.* comp. *more*, superl. *most*. n.] 1. Consisting of a great number; more than few.—Our enemy, the conquerors of our country, slew many of them. 2. 24.—When many atoms descend in the same cause which makes them be light in proportion to their weight on the Soul.—

That thy prayers are heard, and

of his seizure many days of grace, wherein thou may'st repent, and act with many deeds well done.

Milton. *et.* never give the least directions to appeal to the bishop of Rome for a decision of the many differences which, in his time, happened among them. Tillotson. number indefinite, or comparative.—

Both men and women, as many as were willing-hearted, brought bracelets. *Exod.* xxxv. 22.—

This yet I apprehend not, why to those Among whom God will deign to dwell on earth,

So many and so various laws are given; So many laws argue so many sins. *Milton.*

3. Powerful: with *too*, in low language.—They come to vie power and expence with those that are too high and too many for them. *L'Estrange.*

(2.) \* MANY. *n. f.* [This word is remarkable in the Saxon for its frequent use, being written with twenty variations: *mannegeo, mannego, mannegeo, manigo, manigo, manigo, manio, maniu, mannygo, mannegeo, manigu, manige, manigo, mannegeo, manigo, manegu, menigo, menigo, manigu, manio, maniu, Lye.*] 1. A multitude; a company; a great number; people.—

After him the rascal many ran, Heaped together in rude rabblement. *Spenser.*

O thou fond many! with what loud applause

Did'st thou beat heav'n with blessing Bolingbroke. *Shak.*

I had a purpose now To lead our many to the holy land;

Lest rest and lying still might make them look Too near into my state. *Shak.*

A care-craz'd mother of a many children. *Shak.*

—The vulgar and the many are fit only to be led or driven, but by no means fit to guide themselves. *South.*—

There parting from the king, the chiefs divide, And wheeling East and West, before their many ride. *Dryden.*

—He is liable to a great many inconveniencies every moment of his life. *Tillotson.*—Seeing a great many in rich gowns, he was amazed to find that persons of quality were up so early. *Addison.* 2. Many, when it is used before a singular noun, seem to be a substantive. In conversation, for many a man they say a many men.—

Thou art a collop of my flesh, And for thy sake have I shed many a tear. *Shak.*

—He is beset with enemies, the meanest of which is not without many and many a way to the wreaking of a malice. *L'Estrange.*—

Broad were their collars too, and every one Was set about with many a costly stone. *Dryden.*

Many a child can have the distinct clear ideas of two and three long before he has any idea of infinite. *Locke.* 3. Many is used much in composition.

(3.) MANY. We have formerly noticed, under the article, DICTIONARY, § 4, at the word GREAT, a most anomalous, if not ungrammatical, though common, use of the word many, which seems to set at defiance all the rules of syntax to construe it. Examples of this anomalous use occur frequently in the best English authors, in such expressions as these—"a great many persons,"—"a good many people," &c. That this word, as well as numberless others in all languages, is very properly and grammatically used, sometimes as a substantive noun, as in the above quotations from Spenser, Shakspere and Dryden, (§ 2. def.

2.) and sometimes as an *adjective*, we readily admit; but the anomaly, we complain of, is the use of it as *both an adjective and a substantive*, in one and the same clause, as in the above examples, and in Dr Johnson's quotation from Tillotson; (§ 2. *def.* 1.) where, at the same instant that it is used as a substantive to *great* or *good*, it is also used as an adjective to *persons*, *people* and *inconveniences*. Dr Ash ranks it as an *ellipsis*, but this cannot be admitted, as it is impossible by any *supplement* to render these expressions grammatical, and the Dr does not attempt it. The absurdity, too, of using the *singular* article *a* along with their *plural nouns*, is self-evident. These anomalies might be easily avoided, either by omitting the article and adjective *a great* before *many*, as in most cases *many* will express the whole idea sufficiently; or, if *greatness* is necessary to be expressed, by using *number of* or *multitude of*, instead of *many* after *great*. While numerous innovations are daily making by modern writers, tending to corrupt and debase our Language, (See ENGLISH LANGUAGE, *Pref.* and LANGUAGE, *Sec.* VIII.) Some attempts might surely be made by our Literati, to get rid of a few anomalous and ungrammatical expressions unparalleled in any other language.

MANYAN, a river of Wales, in Denbighshire.

\* MANYCOLOURED. *adj.* [*many* and *colour*.] Having various colours.—

Hail *manycoloured* messenger, that ne'er  
Do'st disobey the voice of Jupiter! *Shak.*

He hears not me, but on the other side,  
A *manycolours'd* peacock having spy'd,  
Leaves him and me. *Donne.*

The hoary majesty of spades appears;  
Puts forth one manly leg, to fight reveal'd,  
The rest his *manycolour'd* robe conceal'd. *Pope.*

\* MANYCORNERED. *adj.* [*many* and *corner*.] Polygonal; having corners more than twelve; the geometricians have particular names for angular figures up to those of twelve corners.—

Search those *many-corner'd* minds,  
Where woman's crooked fancy turns and winds. *Dryden.*

MANYFOLD, a river of Staffordshire, which runs into the Dove, 3 miles N. of Ashbourn.

\* MANYHEADED. *adj.* [*many* and *head*.] Having many heads.—Some of the wiser, seeing that a popular licence is indeed the *manyheaded* tyranny, prevailed with the rest to make Musidorus their chief. *Sidney.*—

The proud Dueffa came  
High mounted on her *manyheaded* beast. *F. Q.*

The *manyheaded* beast hath broke,  
Or shaken from his head, the royal yoke. *Denham.*

That form'd his manhood to subdue  
The hydra of the *manyheaded* hissing crew. *Dryden.*

\* MANYLANGUED. *adj.* [*many* and *language*.] Having many languages.—

He, wand'ring long, a wider circle made,  
And *manylanguage'd* nations has survey'd. *Pope.*

\* MANYPEOPLED. *adj.* [*many* and *people*.] Numerously populous.—

He from the *many-peopl'd* city flies. *Sundys.*

\* MANYTIMES, an adverbial phrase. Often;

frequently.—They are Roman catholick in the device and legend, which are both *manytimes* taken out of the Scriptures. *Addison.*—

MANZALE, or MENZALEH, a town and lake of Egypt, 20 miles SSE. of Damietta.

(1.) MANZANARES, a river of Spain, in New Castile, which runs into the Henares, 8 miles below Madrid. See MADRID, N° 1.

(2, 3.) MANZANARES, two towns of Spain, in New Castile, the one 21 miles N. of Madrid; the other 21 E. of Ciudad Real.

MANZANEDA, a town of Spain, in Galicia.

MANZANELLO, a town of Spain, in Leon.

MANZAT, a town of France, in the dep. of Puy de Dome, 9 miles NW. of Riom.

MAON, in ancient geography, a town of the tribe of Judah, on the SE. towards the Dead Sea. It gave name to the *wilderness of Maon*, 1 Sam. xxii.

(1.) \* MAP. *n. f.* [*mappa*, low Latin.] A geographical picture on which lands and seas are delineated according to the longitude and latitude.

—Zelmane earnestly entreated Dorus, that he would bestow a *map* of this little world upon her. *Sidney.*—I will take a *map* of Ireland, and lay it before me, and make mine eyes my schoolmaster, to give my understanding to judge of your plot. *Spenser.*—Old coins are like so many *maps* for explaining the ancient geography. *Addison.*—

O'er the *map* my finger taught to stray,  
Cross many a region marks the winding way;  
From sea to sea, from realm to realm I rove,  
And grow a mere geographer by love. *Titch.*

(2.) MAP. See GEOGRAPHY, *Sec.* IX.

\* To MAP. *v. a.* [*from* the noun.] To delineate; to set down.—I am near to the place where they should meet if Pisanio have *map'd* it right. *Shak.*

(1.) MAPLE. See ACER.

(2.) MAPLE SUGAR. See SUGAR.

(3.) \* MAPLE TREE. *n. f.* [*acer*.] The *maple-tree* hath jagged or angular leaves; the seeds grow two together in hard-winged vessels: there are several species; the greater *maple* is falsely called the lycamore tree: the common *maple* is frequent in hedge-rows. *Miller.*—

The plantane round,  
The carved holme, the *maple* seldom inward found. *Spear.*

—Of the rottenest *maple* wood burnt to ashes they make a strong lye. *Mortimer.*

MAPLETOFT, Dr John, descended from a good family in Huntingdonshire, was born in 1631. He studied physic; was educated in Trinity college, Cambridge; and in 1675 was chosen professor of medicine at Gresham college. He translated Dr Sydenham's *Observationes Medicæ circa morborum acutorum historiam et curacionem* into Latin, and Sydenham dedicated them to him. He married in 1679, and soon after studied civinity; took orders; obtained the vicarage of St Lawrence Jewry, with the lectureship of St Christopher's in London; and having been a benefactor to Sion college, was, in 1707, elected president. He continued to preach till he was above 80 years of age; and in 1710, published *The principles and duties of the Christian religion* &c. 8vo. and sent a copy to every house in

s other pieces on moral and  
s, there are in the *Appendix* to  
his Latin lectures on the origin  
icine.

: public games of the Roman  
in hung out at the prætor's or  
rate's feat. as a signal for the  
rfions to begin. The mappa  
e MAPPARIUS, from the con-  
er great officer. Notice was  
found of trumpet; but Nero  
roduced the mappa, by throw-  
t of the window to satisfy the  
noisy at the delay of the sports  
nner.

in Roman antiquity, the officer  
nal to the gladiators to begin  
ing a handkerchief that he had  
emperor or other magistrate.

*Dryden.*

A, in ancient geography, the ca-

pital of Sogdiana; now thought to be *Samarcand*,  
a city of Ubec Tartary, the royal residence of  
Tamerlane. See SAMARCAND.

MARACAPA, a district of S. America, in Ter-  
ra Firma, and in the province of Cumana.

(1.) MARACAYBO, a rich and considerable  
town of South America, and capital of the pro-  
vince of Venezuela, seated near a lake of the same  
name. It carries on a great trade in skins, and  
chocolate, which is the best in America; and they  
have likewise very fine tobacco. It was taken by  
the French buccaneers in 1666 and 1678. Lon.  
70. 45. W. Lat. 10. 0. N.

(2.) MARACAYBO, a lake in South America,  
200 miles long and 100 broad, which discharges  
itself by a river into the North Sea. It is well  
defended by strong forts; which, however, did  
not hinder Sir Henry Morgan, a buccaneer, from  
entering it, and plundering several Spanish towns  
on the coast, after defeating a squadron sent out  
against him.

MARACCI, Lewis, a learned Italian, born at  
Lucca, in 1612. He was a priest, and acquired  
great reputation by publishing an edition of the  
Koran, at Padua, in Arabic and Latin, in 2 vols  
fol. He also assisted in publishing the Bible in A-  
rabic, at Rome, in 3 vols fol. He died in 1700.

MARAGNAN, a province of Brazil, in South  
America, which comprehends a fertile populous  
island, 112 miles in circumference. The French  
settled here in 1612, and built a town; but they  
were soon driven from thence by the Portuguese,  
who have possessed it ever since. The town is  
little, but strong; and has a castle, a harbour, and  
a bishop's see. The climate is very agreeable and  
wholesome, and the soil produces plenty of all the  
necessaries of life. Lon. 54. 35. W. Lat. 2. 0. S.

MARAGNON, a name of the river AMAZON.

MARALDI, James Philip, a learned mathema-  
tician and astronomer, of the academy of sciences  
at Paris, born in the county of Nice, in 1665.  
He was the son of Francis Maraldi and Angela  
Catharine Cassini, the sister of the famous astron-  
omer. His uncle Cassini sent him to France in 1687,  
where he acquired great reputation by his learn-  
ing and observations. He made a catalogue of  
the fixed stars, which is more exact than Bayer's;  
and has given a great number of interesting obser-  
vations in the *Memoirs of the Academy*; particu-  
larly on bees and petrifications. He also assisted his  
uncle in constructing the great meridian through  
France. He died in 1729.

MARANA, John Paul, an ingenious writer of  
the 17th century, of a distinguished family, born  
at Genoa; where he was educated, and made great  
progress in the sciences. Having been engaged in  
the conspiracy of Raphael della Terra, to deliver  
up Genoa to the duke of Savoy, he was in 1670,  
when 28 years of age, imprisoned in the tower of  
that city. Being liberated in 1674, he was order-  
ed to write the history of that conspiracy; but,  
when finished, it was prevented from being pub-  
lished. When the republic of Genoa was at var-  
iance with the court of France, Marana, who had  
always an inclination for that court, was afraid  
of being imprisoned a 2d time; and retired to  
Monaco, where he again wrote the history of the  
conspiracy in Italian; and, in 1682, went to Lon-

ons to get it printed. From Lyons he went to Paris, where his merit soon acquired him powerful friends. He spent the rest of his life in a tranquil mediocrity, devoted to study and the society of men of learning; and died in 1693. His history of the conspiracy contains many interesting anecdotes, no where else to be found. He also wrote several other works; the best known of which is *the Turkish Spy*, in 6 vols 12mo, which was in 1742 augmented to 7. Of this ingenious work there is an excellent English translation.

(1.) \* MARANATHA. *n. f.* [Syriack.] It signifies, the Lord comes, or, the Lord is come: it was a form of the denouncing or anathematizing among the Jews. St Paul pronounces, If any love not the Lord Jesus Christ, let him be *anathema maranatha*, which is as much as to say, May'st thou be devoted to the greatest of evils, and to the utmost severity of God's judgments; may the Lord come quickly to take vengeance of thy crimes. *Calver.*

(2.) MARANATHA. See ANATHEMA.

(1.) MARANHÃO, or MARANNON, a fertile island of Brasil, at the mouth of 3 rivers, on the coast of the province, (N<sup>o</sup> 2.) about 14 leagues in circumference, with a strong fort. It was taken by the French from the Portuguese in 1712, but soon recovered by the latter. St Louis is the capital; besides which it has about 27 hamlets, containing about 250 people each; or 6750 souls in all.

(2.) MARANHÃO, } a province of Brasil, fo  
MARANHON, or } named from the above  
MARANNON, } island, belonging to the  
Portuguese, who first settled in it, in 1599. The climate is mild and serene. The natives go naked, and are long-lived. St Philip is the capital.

(1.) MARANO, a town and fort of Maritime Austria, in the prov. of Friuli, with a strong citadel; seated in a marsh at the bottom of the Gulf of Venice, which renders it difficult of access.

(2.) MARANO, a town of Naples, in Lavora.

MARANS, a rich town of France, in the dep. of Lower Charente, and late territory of Aunis; seated among salt marshes, near the Sevre, 3 miles from the sea. It carries on a great trade in corn. Lon. o. 57. W. Lat 46. 20. N.

MARANT, or *Amarant*, a town of Persia, in Adirbeitzan, containing about 2500 houses, each with a garden, 50 miles N. of Tauris. The natives say that Noah was buried in it.

MARANTA, INDIAN ARROW-ROOT, a genus of the monogynia order, belonging to the monandria class of plants; and in the natural method ranking under the 8th order, *Scitamineæ*. The corolla is ringent and quinquefid, with two segments alternately patent. There are 3 species, viz.

1. MARANTA ARUNDINACEA, } all herbaceous
2. MARANTA COMOSA, and } perennial exo-
3. MARANTA GALANGA, } tics of the Indies,

kept here in hot-houses for curiosity: they have thick, knotty, creeping roots, crowned with long, broad, arundinaceous leaves, ending in points, and upright stalks, half a yard high, terminated by bunches of monopetalous, ringent, five-parted flowers. They are propagated by parting the roots in spring, and planting them in pots of light, rich earth, and then plunging them

in the bark-bed. The root of the *G.* used by the Indians to extract the virulence by their poisoned arrows; for it has its name of *arrow-root*. The *A. CEA*, or *starch plant*, rises to two feet, pointed leaves, small white flowers, and it is cultivated in gardens and in provins in the West Indies; and the starch is from it by the following process described by Wright: "The roots when a year old well washed in water, and then beat deep wooden mortars to a pulp. This into a large tub of clean water. Then well stirred, and the fibrous part by the hands, and thrown away. The n being passed through a hair sieve, or co is suffered to settle, and the clear water off. At the bottom of the vessel is a w which is again mixed with clean water ed: lastly, the mass is dried on sheets, and is pure starch."—A decoction of roots (the Doctor informs us) makes ar ptifin in acute diseases.

MARANZANO, a town of Maritim in the late republic of Venice; 4 miles' nice.

MARASCA, a town of the Italian in the dep. of Upper Po, and diocesis of (late Cremonese) seated on a canal of the

(1.) \* MARASMUS. *n. f.* [*μαρασμος*], from A consumption, in which persons waste their substance. *Quincy.*—

—A *marasmus* imports a consumption of a fever; a consumption or withering of t by reason of a natural extinction of the na Pining atrophy,

*Marasmus*, and wide-wasting pestilence and an extenuation of the body, caused an immoderate heat. *Harvey.*

(2.) MARASMUS is an atrophy in its la MARASONA, a town of European in Livadia, anciently called MARATHO consisting only of a few houses and gate MARATHON.

MARAT, John Paul, one of these b gents in the French revolution, whose and ferocious zeal for liberty, led them to its best friends, when their political sentim not agree in every punctilio with their who, by thus disgracing and ruining the liberty, and cutting off its most zealous d in France, laid the foundation for that w and enormous despotic power, since after now (1802) exercised by Gen. Bonaparte REVOLUTION, FRENCH.) If any man ca assassination, this bloody deputy to the N Convention was deservedly assassinated in h house, while bathing, by Charlotte Corday, evening of the 13th July, 1793. See C Marat was a most violent enemy to the Bill and on the 12th April 1793, proposed "to minate the conspirators." As a man of lett was the conductor of an inflammatory J, which increased the discontents of the peop contributed much to the bloody scenes th lowed. His character is thus drawn by the piler of the *New Annual Register*, for 17 "Whatever might have been the amb: 1801

ere is ample reason to conclude, that avas-  
 as not among his vices, since he is univer-  
 elieved to have died poor. If this is the  
 irat will appear in the character of an en-  
 e; and it will probably be no unfair con-  
 to say that his enthusiasm approached to  
 y. As to his talents, he seems to have been  
 a man of activity than of genius; rather  
 than profound, and possessing more pene-  
 than judgment.—To reject religion is too  
 only to throw off humanity. The gentle  
 miable affections are admirably cherised  
 proved by pure Christianity: had the lead-  
 riots of France been Christians, their cause  
 have been less sullied with human blood.  
 was among the most savage and inexorable  
 in; and whatever his pretensions to repub-  
 lictue, it is impossible to respect the memo-  
 man, who appears, in so many instances,  
 e been callous to the dictates of humanity.”  
 MARAT, or MARAT LE GRAND, a town of  
 in the dep. of the Meuse, 7 miles N. of  
 Duc.

RATHON, in ancient geography, one of  
 ni or hamlets of Attica; about 12 miles  
 f Athens, towards Boeotia, near the sea.  
 ain of Marathon, famous for Miltiades's  
 over the Persians, by which the liberties  
 ens and other cities of Greece were saved,  
 ; and narrow, but consists chiefly of level  
 l, and therefore admits the operations of ca-  
 which formed the main strength of the bar-  
 army, and with which the Greeks were ve-  
 rily provided. Here the Persians, under  
 pitched their camp, by the advice of Hip-  
 e banished king of Athens, who had fol-  
 he expedition, and had a perfect knowledge  
 country. The Persian army consisted of  
 o infantry, and 10,000 horse. The Athe-  
 were in the utmost consternation. They  
 pon the first appearance of the Persian fleet,  
 implore assistance from the other nations  
 ee; but some had submitted to Darius,  
 hers trembled at the very name of the Per-  
 The Lacedæmonians alone promised troops;  
 rious obstacles prevented them from inar-  
 forming a junction with those of Athens.  
 ity therefore could only rely on its own  
 h, but it possessed 3 brave generals, viz.  
 les, Aristides, and Themistocles, who, by  
 etric exertions, kindled the flame of the  
 heroism in the minds of the Athenians.  
 were immediately made. Each of the ten  
 furnished 1000 foot soldiers with a coun-  
 e. No sooner were the troops assembled  
 y marched into the plain of Marathon,  
 the inhabitants of Platæa in Boeotia sent  
 reinforcement of 1000 infantry. Scarcely  
 re two armies in sight of each other, when  
 les proposed to attack the enemy. Aristi-  
 l several others warmly supported this mea-  
 ut the rest, terrified at the excessive dis-  
 tion of the armies, were for waiting for the  
 ra from Lacedæmon. Opinions being dis-  
 they had recourse to that of the polemarch,  
 f of the militia, to decide the matter. Mil-  
 idressed him, with the ardour of a man  
 impressed with the importance of the ex-  
 . XIII. PART II.

isting circumstances: “ Athens (said he) is on the  
 point of experiencing the greatest of vicissitudes:  
 Ready to become the first power of Greece, or  
 subjected to the tyranny and fury of Hippias.  
 From you alone, Callimachus, the now awaits  
 her destiny. If we suffer the ardour of the troops  
 to cool, they will shamefully bow beneath the  
 Persian yoke; but if we lead them on to battle,  
 the gods and victory will favour us. A word  
 from your mouth must now precipitate your coun-  
 try into slavery or preserve her liberty.” Calli-  
 machus gave his suffrage, and the battle was re-  
 solved on. To ensure success, Aristides, and the  
 other generals after his example, yielded to Mil-  
 tiades the honour of the command which belong-  
 ed to them in rotation. Miltiades drew up his  
 troops at the foot of a mountain, on a spot of  
 ground scattered over with trees to impede the  
 Persian cavalry. The Platæans were placed on  
 the left wing; Callimachus commanded the right;  
 Aristides and Themistocles were in the centre,  
 and Miltiades every where. An interval of nearly  
 a mile separated the Grecian army from that of  
 the Persians. At the first signal the Greeks ad-  
 vanced over this space running. The Persians,  
 astonished at a mode of attack so new, for a mo-  
 ment remained motionless; but to the impetuous  
 fury of the enemy they soon opposed a more fe-  
 date and not less formidable fury. After an ob-  
 stinate conflict of some hours, victory began to de-  
 clare for the Grecian army. The right wing dis-  
 persed the enemy in the plain, while the left drove  
 them back on a morass that had the appearance of  
 a meadow, in which they stuck fast and were lost.  
 Both these bodies of troops now flew to the suc-  
 cour of Aristides and Themistocles, ready to give  
 way before the slower of the Persian troops in  
 the centre. From this moment the rout became  
 general. The Persians, repulsed on all sides, found  
 their only asylum in the fleet. The conquerors  
 pursued them with fire and sword, and took,  
 burnt, or sunk the greater part of their vessels:  
 the rest escaped by dint of rowing. The Persians  
 lost about 6400 men; the Athenians only 192.  
 Miltiades was wounded; Hippias was left dead  
 on the field, as were Steisus and Callimachus,  
 two of the Athenian generals. Scarcely was the  
 battle over, when a soldier, worn out with fatigue,  
 resolved to carry the first news of the victory to  
 the magistrates of Athens, and without quitting  
 his arms, he runs, flies, arrives, announces the  
 victory, and falls dead at their feet. This battle  
 was fought on the 6th of Boædromion, in the 48  
 year of the 72d Olympiad, or 25th Sept. A. A. C.  
 490. The next day 1000 Spartans arrived, who,  
 in 3 days and nights, had marched 1200 stadia.  
 The Athenians neglected nothing to eternise the  
 memory of those who fell in the battle. It had  
 been usual to inter the citizens who perished in  
 war, at the public expence, in the Ceramicus;  
 without the city; but these were deemed uncom-  
 monly meritorious. They were buried, and a  
 barrow was created on the spot where their brave-  
 ry had been manifested. Their names were en-  
 graven on half columns erected on the plain of  
 Marathon. In the intervals between them were  
 erected trophies bearing the arms of the Persians.  
 An artist of eminence painted all the circumstan-

ees of the battle in one of the most frequented porticoes of the city: Miltiades was there represented at the head of the generals, exhorting the troops to fight for their country. Pausanias examined the field of battle about 600 years after this event; and found, on the barrow of the Athenians, pillars containing the names of the dead under those of the tribes to which they belonged; another for the Plataeans and slaves; and a distinct monument of Miltiades, who survived the battle. The Marathonians worshipped those who were slain in the battle. Many centuries have elapsed since the age of Pausanias; but the principal barrow still towers above the level of the plain. It is of light fine earth, and has a bush or two growing on it. Dr Chandler informs us, that he enjoyed a pleasing and satisfactory view from the summit; and looked, but in vain, for the pillars on which the names were recorded, lamenting that such memorials should ever be removed. At a small distance northward is a square basement of white marble, perhaps part of the trophy.

MARATIA, INFERIOR and SUPERIOR, 2 towns of Naples, in the prov. of Basilicata; the latter 7 and the former 8 miles WSW. of Lauria.

MARATISTS, a name given to those furious and sanguinary political zealots, who, like MARAT, during the FRENCH REVOLUTION, expected to establish the liberty of France, by extirpating all who differed from them in their political opinions; and who thus disgraced the cause of freedom, as much as a similar sanguinary spirit formerly disgraced that of religion.

MARATTAS. See MARHATTAS.

MARATTI, Charles, a celebrated painter, born at Camorano, near Ancona, in 1625. He came a poor boy to Rome, when only 11 years old; and at 12 recommended himself to Andrew Sacchi, by his drawings after Raphael in the Vatican. Sacchi took him into his school, where he continued 25 years till his master's death. His fine ideas of beauty and grace occasioned his being generally employed in painting madonas and female saints. From the finest statues and pictures, he made himself master of the most perfect forms, and the most charming airs. He produced a noble variety of draperies, more artfully managed, more richly ornamented, and with greater propriety than even the best of the moderns. He was inimitable in adorning the head, in the disposal of the hair, and the elegance of the hands and feet. In his younger days he etched a few prints, with equal spirit and correctness. It would be tedious to enumerate the celebrated paintings done by him. He made several admirable portraits of kings, popes, and cardinals, from whom he received the highest testimonies of esteem. Innocent XI. appointed him keeper of the paintings in his chapel and the Vatican. Maratti erected two noble monuments for Raphael and Hannibal, at his own expence, in the pantheon. To his abilities in painting he added many virtues, particularly extensive charity. He died at Rome in 1713, aged 83.

MARAUDERS, *n. f.* in a military sense, means a party of soldiers, who, without any order, go into the neighbouring houses and villages, when the army is either in camp or garrison, to plunder and destroy, &c. Marauders are a disgrace to the

camp, to the military profession, and do better quarter from their officers than to the poor peasants, &c.

MARAUDING, *part.* See last article.

MARAVEDI, a little Spanish copper worthsome what more than a French denier half a farthing English. The Spaniards count by maravedis, both in commerce and finances, though the coin itself is no longer among them. Sixty-three maravedis are equal to a rial of silver; so that the rial, or eight rials, contains 504; and the pistole of pieces of eight, 2016 maravedis. This fineness of the coin produces vast numbers in the accounts and calculation; inasmuch that a stranger or correspondent would think himself indebted several millions for a commodity that cost a few pounds. In the laws of Spain, we find several kinds of maravedis; Alphonso's maravedis, white maravedis, maravedis of good maravedis Combrenos, black maravedis, &c. maravedis. When we find maravedis alone without any addition, it is to be understood those mentioned above. The rest are different value, fineness of metal, time, &c. Maraferts, that this coin is older than the rial, that it came from the Goths; that it was formerly equal to a third part of the rial, and frequently of 12 times the value of the present maravedi. Under Alphonso XI. the maravedis were ten times, under Henry II. ten times, under John III. five times, and under John II. two times an half, the value of the present maravedi.

MARAWAR, a province of Indostan, lying on the coast opposite Ceylon; 60 miles long and 40 broad; in alliance with Britain. adporum is the chief city.

MARAZION. See MERRAZION.

(1.) MARBACH, a river in Suabia.

(2-4.) MARBACH, three towns of Austria on the Danube, 3 miles W. of Aggsbach: 1. NE. of Steyregg; 3. 2 miles W. of Zwettl.

(5.) MARBACH, a town of Upper Saxony, Erzgebürg, 3 miles SW. of Noisen.

MARBELLA, a town of Spain, in Andalusia, at the mouth of the Verde, 30 miles NE. of Malaga, and 28 SW. of Malaga. Lon. 5. Lat. 36. 25. N.

MARBEUF, a town of Corsica.

(1.) \* MARBLE. *n. f.* *lapis bre.* Fr. *marbre*. 1. Stone used in statues and elegant buildings, capable of a bright polish, and in a manner calcing into lime.—

He plies her hard, and much rain weathers marble.

Thou marble hew'ft, ere long to part withal  
And houses rear't it, unmindful of thy fall.

Some dry their corn infected with the  
Then grind with marbles, and prepare to

—The two flat sides of two pieces of marble more easily approach each other, when there is nothing but water or air, than if there is a diamond between them; not that the pieces of the diamond are more solid, but because the water, being more easily separable, gives less resistance to the approach of the two pieces of marble.

e balls supposed to be of marble, with children play.—*Marbles* taught them per and the laws of motion; nut-crackers the he leaver. *Arbutus* and *Pope*. 3. A stone able for the sculpture or inscription; as, *ford marbles*.

**MARBLE**, *adj.* 1. Made of marble.—*Johnson's* fate revert is mine, *Marble* love took flesh and blood, that I worshipping'd as divins, beauty, now 'tis understood, ears to have no more of life, that whereof he fram'd his wife. *Waller*. egrated, or stained like marble.—Shall I see h'd inventions? shall I labour to lay *marbours* over my ruinous thoughts? or rather, the pureness of my virgin mind be stain-me keep the true simplicity of my word.—The appendix shall be printed by itself, 1, and with a *marble* cover. *Swift*.

**MARBLE**, in natural history, a genus of being bright and beautiful stones com- of small separate concretions, moderately not giving fire with steel, fermenting with dible in acid menstrua, and calcining in t fire.—The Latin word *marmor*, is deri- om the Greek *μαρμαριον*, to *shine*, or *glit-* the colours by which marbles are disti- nd are almost innumerable; but the most re- ble are, 1. The black marble of Flanders. n yellow. 3. Yellow with some white veins. low with black dendrites. 5. Yellow with figures resembling ruins. 6. Black and yel- 7. Black and white. 8. Pale yellow, with a blackish grey colour. 9. Yellow, white, 1. 10. Pale yellow. 11. Olive colour, with coloured cross lines, and dendrites. 12. ish red. 13. Flesh-coloured and yellow. mmon red marble. 15. Crimson, white, y. 16. Reddish brown lumps, on a whitish . 17. Bluish grey. 18. Snowy white.— rieties of marble, numerous as they are, een improperly augmented by virtuosos, me people who collect specimens for the gain. The Italians are particularly curi- this way; and most of the names imposed arbles are given by them. Every marble t from an unknown place is called by them when distinguished by a number of bright s, it is called *BROCATELLO*, or *brocattellato*. they want some of the originals to com- whole set of marbles, they either substitute which have the nearest resemblance to or, lastly, they stain white marbles accord- their own fancy, and impose them on the as natural. The finest solid modern mar- e those of Italy, Blankenburg, France, and rs. Very fine marble is also found in some Western Islands of Scotland. Those of ny, Norway, and Sweden, are of an infe- nd, being mixed with a kind of scaly lime- and even several of those above mentioned rty mixed with this substance, though in rior degree. Cronstedt, however, men- a new quarry of white marble in Sweden, from the specimens he had seen, appeared xcellent. The specific gravity of marble is 700 to 2800; that of *Carriera*, a very fine

Italian marble, is 2717.—Black marble owes its colour to a slight mixture of iron. Mr Bayen found some which contained 5 per cent of the metal; notwithstanding which, the lime prepared from it was white, but in time it acquired an ochry or reddish yellow colour. Marble, when chemically examined, appears to consist of calca- reous earth united with much fixed air; and is, like limestone or chalk, capable of being convert- ed into a strong quicklime.—Dr Black derives the origin of marbles, as well as limestone and mar- le, from the same source, *viz.* from the calcareous matter of shells and lithophyta. In one kind of limestone known by the name of *Portland stone*, and consisting of round grains united together, it was supposed to be composed of the spawn of fish; but comparisons of other phenomena have explained it. It is plain that it has been produced from a calcareous sand, which is found on the shore of some of the islands in the southern cli- mates. By the constant agitation the softer parts are worn off, and the harder parts remain in the form of particles that are highly polished, and which are afterwards gradually made to concrete together by causes of which we have yet no know- ledge.—There are indeed some few of the lime- stones and marbles in which we cannot discover any of the relics of the shells; but there are many signs of their having been in a dissolved or liqui- fied state; so we cannot expect to see the remains of the form of the shells: but even in many of the marbles that have the greatest appearance of a complete mixture, we still find often the confu- sed remains of the shells of which they have been originally composed. We should still find it dif- ficult to conceive how such masses should have derived their origin from shells; but, considering the many collections that we have an opportunity of seeing in their steps towards this process, and a little concreted together, so that by their going a step farther they might form limestone and mar- bles, we may see the possibility of their being all produced in the same manner. Thus vast quan- tities of shells have been found in the ci-devant province of Turin in France; and indeed there is no place where they have not been found. The lithophyta likewise seem to be a very fruitful source of this kind of earth. In the cold climates, where the moderate degree of heat is not so pro- ductive of animal life, we have not such an oppor- tunity of observing this: but in the hot climates, the sea, as well as the land, swarms with innume- rable animals; and, at the bottom, with those that produce the corals and madripores. We learn from the history of a ship that was sunk in a storm in the Gulf of Mexico, the vast growth there is of these bodies. About 30 years after, they attempted to dive into it to get out a quan- tity of silver; but they found great difficulty in getting it, from the ship being overgrown with coral. Sir Hans Sloan, in the *Philosophical Trans- actions*, and in his history of Jamaica, observes, that the ship's timber, the iron, and money, were all concreted by the growth of the calcareous matter. So in a tract of many thousands of years the quantity of it should be very great; and as this is going on through a very great extent of the bottom of the sea, it will produce very extensive

as well as massy collections of calcareous matter. According to Sir William Hamilton, many variegated marbles and precious stones are the produce of volcanoes. See *Phil. Trans.* vol. lviii, 12.

(4.) MARBLE, ARTIFICIAL. The fluids, whereof they make statues, busts, basso-relievos, and other ornaments of architecture, ought to be marble pulverized, mixed in a certain proportion with plaster; the whole well sifted, worked up with water, and used like common plaster. See *Stucco*.

A kind of artificial marble is also made of the flaky felsites, or a transparent stone resembling plaster; which becomes very hard, receives a tolerable polish, and may deceive a good eye. This kind of felsites resembles Muscovy talc. Another kind is formed by corrosive tinctures, which, penetrating into white marble to the depth of a line or more, imitate the various colours of dearer marble. There is also a preparation of brimstone in imitation of marble. To do this, provide a flat and smooth piece of marble; on this make a border or wall, to encompass either a square or oval table, which may be done either with wax or clay. Then having several sorts of colours, as white lead, vermilion, lake, orpiment, masticot, finalt, Prussian blue, &c. melt on a slow fire some brimstone in several glazed pipkins; put one particular sort of colour into each, and stir it well together; then having before oiled the marble all over within the wall, with one colour quickly drop spots upon it of larger and less size; after this, take another colour and do as before, and so on till the stone is covered with spots of all the colours you design to use. When this is done, consider what colour the mass or ground of the table is to be; if of a grey colour, then take fine sifted ashes, and mix it up with melted brimstone; or if red, with English red ochre; if white, with white lead; if black, with lamp or ivory black. The brimstone for the ground must be pretty hot, that the coloured drops on the stone may unite and incorporate with it. When the ground is poured even all over, put a thin wafered board upon it, while the brimstone is hot, making also the board hot, which ought to be thoroughly dry, to cause the brimstone to stick the better to it. When the whole is cold, take it up, and polish it with a cloth and oil, and it will look very beautiful.

(5.) MARBLE, COLOURING OF. This is a nice art; and, to succeed in it, the pieces of marble on which the experiments are tried, must be well polished, and free from the least spot or vein. The harder the marble is, the better will it bear the heat necessary in the operation; therefore alabaster and the common soft white marble are very improper for performing these operations upon. Heat is always necessary for opening the pores of marble, so as to render it fit to receive the colours; but the marble must never be made red hot; for when the texture of it is injured, and the colours are burnt, and lose their beauty. Too small a degree of heat is as bad as one too great; for, in this case, though the marble receives the colour, it will not be fixed in it, nor strike deep enough. Some colours will strike even cold; but they never sink in so well as when a just degree of heat is used. The proper degree is that which, without making the marble red, makes the liquor boil

upon its surface. The menstruums used to fix in the colours must be varied according to the nature of the colour to be used. A linum sale with horse's or dog's urine, with four parts of quick lime and one of pot ashes, is excellent for some colours; common ley of wood ashes is very good for others; for some, spirit of wine is best; and lastly, for others, oily liquors, or common white wine. The colours which succeed best with the peculiar menstruums, are these: blue dissolved in six times the quantity of spirit of wine, or of the urinous lixivium, and limes, dissolved in common ley of wood ashes. A decoction of saffron, and that colour made of buckthorn berries, called by painters *sap green*, both fix well when dissolved in urine and quick lime; red tolerably well when dissolved in spirit of wine. Vermilion, and a very fine powder of cochineal, also succeed very well in the same liquor. Bezoar's blood succeeds in spirit of wine, as does also a tincture of logwood in the same spirit. Alkanet root gives a fine colour; but the only menstruum to be used for it is oil of turpentine; for neither spirit of wine, nor any lixivium, will do well. There is another kind of *sanguis draconis*, commonly called *dragon's blood in tears*, which mixed with urine, gives a very elegant colour. There are other colours which must be laid on dry and unmixed. These are, dragon's blood of the pink kind, for a red; gamboge for a yellow; gess wax, for a green; common brimstone, pitch, and turpentine, for a brown colour. The matter in these experiments must be made considerably hot, and then the colours are to be rubbed on, or in the lump. Some of these colours, when once given, remain immutable, others are easily changed or destroyed. Thus, the red colour given by dragon's blood, or by a decoction of logwood, will be wholly taken away by oil of turpentine, and the polish of the marble not hurt by it. A fine gold colour is given in the following manner: take crude sal armoniac, vitriol, and vespergrise, of each equal quantities. White vitriol succeeds best; and all must be thoroughly mixed in fine powder. The staining of marble to all the degrees of red or yellow, by solutions of dragon's blood or gamboge, may be done by reducing these gums to powder, and grinding them with the spirit of wine in a glass mortar. But, for finer attempts, no method is so good as mixing a little of either of these powders with spirit of wine in a silver spoon, and holding it over burning charcoal. A fine tincture may thus be extracted, and, with a pencil dipped in this, the finest traces may be made on the marble while cold, which on heating it afterwards, either on a fire, or in a baker's oven, will sink very deep, and remain distinct on the stone. It is very easy to make the ground colour of the marble red or yellow, and leave white veins in it. This is to be done by covering the pieces where the whiteness is to remain with some white paint, or even with a or 2 thick sheets of paper; either of which will prevent the colour from penetrating. All the degrees of red are to be given to marble by this gum; and a slight tincture of it, without the assistance of heat to the marble, gives only a pale pink colour; but the stronger tinctures give it deep red; to make

ince of heat adds greatly. The addition of le pitch to the tincture, gives it a tendency ackness, or any degree of deep red that may eared. A blue colour may be given also to ie by dissolving turnfol in lixivium, in lime urine, or in the volatile spirit of urine; but has always a tendency to purple, made in r of these ways. A better blue is furnished he Canary turnfol, which needs only to be lved in water, and drawn on with a pencil: netrates very deeply into the marble, and the ar may be increased, by drawing the pencil ed afresh several times over the same lines. colour is apt to diffuse itself irregularly, but e kept in regular bounds, by circumfcribing ies with beds of wax, or any such substance. ould always be laid on cold, and no heat even afterwards to the marble. One great tage of this colour is, that it is easily added rbles already stained with other colours, is beautiful tinge, and lasts a long time.

MARBLE, ELASTIC, an extraordinary spe- rossil which has surprised all the naturalists ave seen it. There are several tables of it ved in the house of Prince Borghese at Rome, own to the curious. F. Jaquer, a cele- d mathematician, has given a description in *Encyclopædie* of Paris. There are 5 or 6 s of it; their length is about 2½ feet, the h about 10 inches, and the thickness a little an three. They were dug up, says Abbe s, in the food of Mondragone; the grain is of Carrarese marble, or of the finest Greek. seem to have suffered some attack of fire. are very dry, do not yield to external im- on, rebound to the hammer, like other com- us marble, and are perhaps susceptible of a e. Being set on end, they bend, oscillating ward and forward; when laid horizontally, aised at one end, they form a curve, beginning ds the middle; if placed on a table, and a of wood, or any thing else is laid under y they make a salient curve, and touch the with both ends. Notwithstanding this flexi- y they are liable to be broken if indiscretely led; and therefore one table only, and that he best, is shown to the curious. Formerly were altogether in the prince's apartment on round floor.

MARBLES, ARUNDEL, marbles with a chro- of the city of Athens, inscribed on them (as supposed) many years before our Saviour's ; presented to the university of Oxford by as earl of Arundel, whence the name. See DELIAN MARBLES.

MARBLES FOR PLAYING, or MARBLE ES, are mostly imported from Holland; where said they are made by breaking the stone after, or other substance, into pieces or chips suitable size; these are put into an iron mill h turns by water: there are several parti- s with rasps within, cut sloatways, not with s, which turn constantly round with great eels; the friction against the rasps makes rround, and as they are formed, they fall out rrent holes, into which size or chance throws s. They are brought from Nuremberg to

Rotterdam down the Rhine, and from thence dis- perked over Europe.

\* To MARBLE, *v. a.* [*marbrer*, French, from the noun. To variegate, or vein like marble.— Very well flecked *marbled* paper did not cast any of its distinct colours upon the wall with an equal diffusion. *Boyle*.—

Marian

*Marbled* with sage the hard'ning cheese the profess'd,

And yellow butter Marian's skill profess'd. *Gay*.

(1.) MARBLED, *adj.* veined or clouded, re- ssembling marble. See MARBLING.

(2.) MARBLED CHINA WARE, a species of por- celain or china ware, which seems to be full of cemented flaws. It is called by the Chinese, who who are very fond of it, *shoo tebi*. It is generally plain white, some-times blue, and has exactly the appearance of a piece of China, which had been first broken, and then had all the pieces cemented in their places again, and covered with the origi- nal varnish. The manner of preparing it is easy. Instead of the common varnish of the China ware, which is made of what they call *oil of stone* and *oil of fern* mixed together, they cover this with a simple thing made of a sort of coarse agates, calcined to a white powder, and separated from the grosser parts by water, after long grinding in mortars. When the powder has been thus pre- pared it is left moist, or in form of a sort of cream, with the last water that is suffered to remain in it, and this is used as the varnish. Our crystal would serve full as well as those coarse agates. The oc- casion of the singular appearance of this sort of porcelain is, that the varnish never spreads evenly, but runs into ridges and veins. Those often run naturally into a sort of mosaic work, which can scarce be taken for the effect of chance. If the marbled China be desired blue, they first give it a general coat of this colour by dipping the vessel into a blue varnish; and when this is thoroughly dry, they add another coat of this agate oil.

(3.) MARBLED PAPER. See MARBLING, § 1.

\* MARBLEHEARTED, *adj.* [*marble* and *heart*.] Cruel; insensible hard hearted.—

Ingratitude! thou *marblehearted* fiend,

More hideous, when thou shew'st thee in a child

Than the sea monster.

*Shak.*

(1.) MARBLING, *n. s.* the art of preparing and colouring marbled paper. There are several kinds of marbled paper; but the principal difference of them lies in the forms in which the colours are laid on the ground: some being disposed in whirls or circumvolutions; some in jagged lengths; and others only in spots of a roundish or oval figure. The general manner of managing each kind is, nevertheless, the same; being the dipping the paper in a solution of gum-tragacanth, or, as it is commonly called, *gum-dragon*; over which the colours, previously prepared with ox- gall and spirit of wine, are first spread. The pec- uliar apparatus necessary for this purpose, is a trough for containing the gum-tragacanth and the colours; a comb for disposing them in the figure usually chosen; and a burnishing stone for polishing the paper. The trough may be of any kind of wood;

woody, and must be somewhat larger than the sheets of paper for marbling which it is to be employed; but the sides of it need only rise about two inches above the bottom; for by making it thus shallow, the less quantity of the solution of the gum will serve to fill it. The comb may be also of wood, and 5 inches long, but should have brass teeth, which may be about two inches long, and placed at about a quarter of an inch from each other. The burnishing stone may be of jasper or agate; but as those stones are very dear when of sufficient largeness, marble or glass may be used, provided their surface be polished to a great degree of smoothness. The solution of gum tragacanth must be made, by putting a sufficient proportion of the gum, which should be white and clear from all foulnesses, into clean water, and letting it remain a day or two, frequently breaking the lumps and stirring it till the whole appear dissolved and equally mixed with the water. The consistence of the solution should be nearly that of strong gum water used in miniature painting; and if it appear thicker, water must be added; or if thinner, more of the gum. When the solution is thus brought to a due state, it must be passed through a linnen cloth; and being then put into the trough, it will be ready to receive the colours. The colours employed for red are carmine, lake, rose-pink, and vermilion; but the two last are too glaring, unless they be mixed with rose-pink or lake, to bring them to a softer cast; and carmine and lake are too dear for common purposes. For yellow, Dutch pink and yellow ochre may be employed: for blue, Prussian blue and verditer: for green, verdigrise, a mixture of Dutch pink and Prussian blue, or verditer, in different proportions: for orange, the orange lake, or a mixture of vermilion, or red lead, with Dutch pink:—for purple, rose-pink and Prussian blue. These colours should be ground with spirit of wine till they be of a proper fineness; and then, at the time of using them, a little fish-gall, or the gall of a beast, should be added, by grinding them over again with it. The proper proportion of the gall must be found by trying them; for there must be just so much as will suffer the spots of colour, when sprinkled on the solution of the gum-tragacanth, to join together, without intermixing or running into each other. The solution of the gum tragacanth must then be poured into the trough; and the colours, being in a separate pot, with a pencil appropriated to each, must be sprinkled on the surface of the solution, by shaking the pencil, charged with its proper colour, over it; and this must be done with the several kinds of colour desired, till the surface be wholly covered. When the marbling is proposed to be in spots of a simple form, nothing more is necessary: but where the whirls or snail-shell figures are wanted, they must be made by a quill; which must be put among the spots to turn them about, till the effect be produced. The jagged lengths must be made by the comb, which must be passed through the colours from one end of the trough to the other, and will give them that appearance; but if they be desired to be pointed both ways, the comb must be again passed through the trough in a contrary direction

or if some of the whirls or snail shell figures be required to be added, they may be yet made by the means before directed. The paper should be previously prepared for receiving the colours, by dipping it over-night in water; and laying the sheets on each other with a weight over them. The whole being thus ready, the paper must be held by two corners, and laid in the most gentle and even manner on the solution covered with the colours; and there softly pressed with the hand, that it may bear every-where on the solution: after which it must be raised and taken off with the same care, and then hung to dry across a proper cord, subtended near at hand for that purpose; and in that state it must continue till it be perfectly dry. It then remains only to give the paper a proper polish: in order to which, it is first rubbed with a little soap; and then must be thoroughly smoothed by the glass polishers, such as are used for linen, and called the *calender glass*. After which it should be again rubbed by a linnisher of jasper or agate; or, of glass highly polished, for on the perfect polish of the paper depends in a great measure its beauty and value. Gold or silver powders may be used, where desired, along with the colours, and require only the same treatment as them, except that they must be first tempered with gum-water.

(2.) MARBLING OF BOOKS, or PAPERS, is performed thus: Dissolve 4 oz. of gum arabic into two quarts of fair water; then provide several colours mixed with water in pots or shells; and, with pencils peculiar to each colour, sprinkle them by way of intermixture upon the gum-water, which must be put into a trough or some broad vessel; then with a stick curl them, or draw them out in streaks, to as much variety as may be done. Having done this, hold the book or books close together, and only dip the edges in, on the top of the water and colours, very lightly; which done, take them off, and the plain impression of the colours in mixture, will be upon the leaves; doing the ends and the front of the book in the same manner.

(3.) MARBLING THE COVERS OF BOOKS is performed by forming clouds with aqua-fortis or spirit of vitriol mixed with ink, and afterwards glazing the covers. See BOOK-BINDING.

MARBOEUF, a town of France, in the dep. of Eure, 12 miles N. of Conches.

MARBURG. See MARBURG.

MARC ANTONY. See ANTONIUS, N° 5.

(1.) MARCA, Peter DE, one of the greatest ornaments of the Gallican church, was born in Bearn, of an ancient family, in 1594. He first studied the law, was made president of the parliament of Bearn, and, going to Paris in 1639, was made a counsellor of state. His literary merits appear from his *History of Bearn*. By the king's order he published a work, *De concordia sacrorum et imperii, sive de libertatibus ecclesie Gallie*, a refutation of a book that appeared under the title of *Optatus Gallus*; and on this account, when, on the death of his wife, he was nominated Bishop of Conferans, the pope refused the bulls in his favour, until by another book he explained all he had said on behalf of the state, to the satisfaction of the papal power. He obtained his

mation, after 7 years suspenſe, in 1648; tranſlated to the archbiſhopric of Toulouſe; and was made miniſter of ſtate in 1658. He made Abp. of Paris in 1662; and died ſoon after. His *Poſthumous works*, with pre- notes, &c. were publiſhed by M. Baluze. cenſured for accommodat- ing his learning to his views of intereſt and ambition.

MARCA, an iſland in the Adriatic, 5 miles Ragufa.

MARCARIA, a town of the Italian republic, dep. of the Mincio, and diſtrict of Mantua, 20 miles S.W. of Mantua. Two years from this town a battle was fought between the French and Auſtrians on the 5th Dec. 1800, in the latter were defeated with the loſs of 10,000 men killed and wounded, 360 priſoners, and 1000 carts. The loſs of the French was only 33 men and wounded.

\* MARCASITE. *n. f.* The term *marcaſite* is very improperly uſed by ſome for biſ- muth and by others for zink: the more accurate name however always expreſs a ſubſtance diſtinct from either of theſe by it, ſulphureous and black. The *marcaſite* is a ſolid hard foſſil, commonly found among the veins of ores, or in ſtrata of ſtone: the variety of forms this mi- neral is in almoſt endless. There are how- ever three diſtinct ſpecies of it; one of a gold colour, another of a bright ſilver, and a third of a dead white: the ſilvery one ſeems to be ſometimes meant by the writers on the *Materia Medica*. *Marcaſite* is very frequent in the mines of Saxony, where the workmen call it mundick, and in Germany, where they extract vitriol from it. *Hill*.—The writers on mine- ralogy give the name pyrites and *marcaſites* indiffe- rently to the ſame ſort of body. I reſtrain the name of pyrites wholly to the nodules, or thoſe found lodged in ſtrata that are ſeparate: *marcaſite* is part of the matter that either con- ſtitutes the ſtratum, or is lodged in the perpendi- cular ſiſures. *Woodward*.—The acid ſalt diſſolved in water is the ſame with oil of ſulphur per cam- phora, and abounding much in the bowels of the earth and particularly in *marcaſites*, unites itſelf with other ingredients of the *marcaſite*, which are ſometimes iron, copper, and earth, and with ſometimes alſo alum, vitriol, and ſulphur: the earth alone it compounds alum; with vitriol alone, and metal and earth together, it compounds vitriol; and with the bitumen and ſulphur it compounds ſulphur: whence it comes to paſs that *marcaſites* abound with thoſe three ſalts. *Newton*.—

*Marcaſites* in various figures wait, and ripen to a true metallick ſtate. *Garth*.

MARCASITE, in mineralogy, is a name which has long been given indifferently to all ſorts of ores, pyrites, and ſemimetals. It ſeems to be confined to pyrites, and ſometimes propoſes to confine it to ſuch pyrites regularly formed. See PYRITES.

MARCAÛ, a town of France, in the dep. of Vendee; 7½ miles S. of Poitiers.

MARCELL, G. advocate to the Parliament of Paris. French chronological writer of the 17th century. He publiſhed, 1. *Tablettes chronologiques*

*contenant avec ordre, l'etat de l'Eglife en Orient et en Occident*. Amſt. 1696, 16mo. 2. *Tablettes chronologiques contenant la ſuite des Papes, empereurs et rois, qui ont regné depuis la naiſſance de Jeſus Chriſt en Europe, juſq au preſent: 2410*. Paris, 1699; elegantly engraved, on copper: both dedicated to Lewis XIV.

MARCELLAN, a town of France, in the dep. of Herault, 5 miles NE. of Agde.

MARCELLIANISM, the doctrines and opinions of the

MARCELLIANS, a ſect of ancient heretics, who flouriſhed about the end of the 2d century, ſo called from MARCELLUS of Ancyra, their leader, who was accuſed of reviving the errors of Sabellius. Some, however, are of opinion that Marcellus was orthodox, and that his enemies, the Arians, fathered their errors upon him. St Epiphanius obſerves, that there was a great deal of diſpute with regard to the real tenets of Marcellus; but that, as to his followers, it is evident they did not own the three hypoſtaſes: for Marcellus conſidered the Son and Holy Ghoſt as two emanations from the divine nature, which, after performing their reſpective offices, were to return again into the ſubſtance of the Father; an opinion altogether incompatible with the belief of three diſtinct perſons in the Godhead.

MARCELLINO, a town of Naples in Calabria Citra, 5 miles E. of Scalea.

MARCELLINUS. See AMMIANUS.

MARCELLO, Benediſt, a celebrated muſician, deſcended from one of the moſt illuſtrious families in Venice. He lived in the beginning of the 18th century, and compoſed anthems, cantatas, and other works, which the connoiſſeurs rank as high as any of the muſical compositions which the Italian ſchool has produced. "He is the Pin- dar of muſic, ſays M. de la Borde. In boldneſs and regularity of deſign, he is the Michael Angelo of it. In analyzing his works, we diſcover a profound knowledge and great addreſs; but there is a difficulty attending the execution of them which is almoſt inſurmountable. It requires a voice poſſeſſed of great powers, and accuſtomed to the moſt extraordinary intervals." The chief of the family was the amballaſſador of Venice to the Porte in 1770.

(1.) MARCELLUS, Marcus Claudius, a famous Roman general, who, after the firſt Punic war, conducted an expedition againſt the Gauls. Here he obtained the *Spolia Opima*, by killing with his own hand Viridomarus the king of the Gauls. This ſucceſs rendered him popular, and ſoon after he was entrusted to oppoſe Hannibal in Italy. He was the firſt Roman who obtained ſome advantage over this celebrated Carthaginian, and ſhewed his countrymen that Hannibal was not invincible. The troubles which were raiſed in Sicily by the Carthaginians at the death of Hieronymus, alarmed the Romans; and Marcellus, in his 3d conſulſhip, was ſent with a powerful force againſt Syracuſe. He attacked it by ſea and land; but his operations proved long ineffectual, and the invention and induſtry of Archimedes baffled all the efforts, and deſtroyed all the tremendous machines and military engines of the Romans during three ſucceſſive years. The perseverance of Mar-

cellus.

cellus at last obtained the victory. After this conquest, Marcellus was called to oppose Hannibal a 2d time. In this campaign he behaved with greater vigour than before; the greatest part of the towns of the Samnites, which had revolted, were recovered by force of arms, and 3000 of the soldiers of Hannibal made prisoners. Some time after, in an engagement with the Carthaginians, Marcellus had the disadvantage; but on the next day a more successful skirmish vindicated his military character and the honour of the Roman soldiers. Marcellus, however, was not sufficiently vigilant against the snares of his adversary. He imprudently separated himself from his camp, and was killed in an ambuscade, in the 60th year of his age, in his 5th consulship, A. U. C. 544. His body was honoured with a magnificent funeral by the conqueror, and his ashes were conveyed in a silver urn to his son. Marcellus claims respect for his private as well as public virtues; and his humanity will ever be remembered, when at the surrender of Syracuse, he wept that multitudes were to be exposed to the barbarity and rapacity of an incensed soldiery, which the policy of Rome and the laws of war rendered inevitable.

(2.) MARCELLUS. See MARCELLIANS.

MARCGRAVE. See MARGRAVE.

(1.) \* MARCH, *n. f.* [from *Mars*.] The third month of the year.—*March* is drawn in tawny, with a fierce aspect, a helmet upon his head, to show this month was dedicated to Mars. *Peacocks*

(2.) MARCH, MARTIUS, § 1. See MONTH, and YEAR. Among the Romans, March was the first month; and in some ecclesiastical computations, that order is still preserved; particularly in reckoning the number of years from the incarnation of our Saviour, from the 25th of March. Romulus divided the year into months; to the first of which he gave the name of his supposed father *Mars*. Ovid, however, observes, that the people of Italy had the month of March before Romulus's time; but that they placed it very differently, some making it the 3d, others the 4th, some the 5th, and others the 10th month of the year. In this month the Romans sacrificed to ANNA PERENNA; began their comitia; adjudged their public farms and leases; the mistresses served the slaves and servants at table, as the masters did in the Saturnalia; and the vestals renewed the sacred fire. This month was always under the protection of Minerva, and consisted of 31 days. The ancients held it, as well as May, an unhappy month for marriage.

(3.) \* MARCH, *n. f.* [*marcher*, Fr.] 1. Military movement; journey of soldiers.—These troops came to the army harried with a long and wearisome *march*, and cast away their arms and garments, and fought in their shirts. *Bacon*.—

Their *marches* to begin, and thither tend, *Blackm.*

2. Grave and solemn walk.—

Water was smooth, but Dryden taught to  
joil

The varying verse, the full resounding line,  
The long majestic *march*, and energy divine.

*Pope.*

3. Deliberate or laborious walk.—We came to the

roots of the mountain, and had a very to  
some *march* to gain the top of it. *Addison*.  
4. Signals to move.—The drums presently  
ing up a *march*, they make no longer stay,  
forward they go directly. *Kestler*. 5. *March*  
without singular. [*marchus*, Gothic; *march*,  
on; *marche*, French.] Borders; limits; ends

They of those *marches*

Shall be a wall sufficient to defend

Our island from the pifering borders. *Sh.*  
—The English colonies were enforced to keep  
continual guards upon the borders and *marches*  
round them. *Davies*.—It is not fit that a king  
an island should have any *marches* or borders  
the four seas. *Davies on Ireland*.

(4.) MARCH, in the military art. In the *marches*  
of the Jewish armies, they made use of trumpets,  
to the different sounds of which they pre-  
pared them by packing up their baggage, putting  
themselves in readiness, and attending at the stan-  
dards to wait the signal for marching. The *Bib-  
bins* suppose that the Israelites marched in the  
same order they were placed in their camp. The  
Greeks never *marched* against their enemies in  
favourable omens encouraged their entrance.  
An eclipse of the moon, or any untoward accident,  
or the intervening of what they esteemed an un-  
lucky day, entirely prevented their march. Be-  
of all the Greeks the Lacedaemonians were the  
most nice and scrupulous. The heavenly bodies  
directed all their motions; and it was an un-  
bearable maxim with them never to *march* before the  
full moon. The Greeks are particularly remem-  
bered by Homer for marching in good order and un-  
found silence; whereas the Barbarian forces were  
all noise, clamour, and confusion. The *marches*  
of the Roman armies were performed with the greatest  
order and dispatch, inasmuch that their unexpec-  
ted presence often damped the spirits of their ene-  
mies. The Roman soldiers were inured to the  
military pace, that is, to walk 20 miles in three  
hours, though they carried burdens of double  
weight. Of all the mechanical parts of war, in  
modern times, none is more essential than that of  
marching. It may be justly called the *key* which  
leads to all sublime motions and manoeuvres of  
an army; for they depend entirely on this point.  
A man can be attacked in 4 different ways; on the  
front, on both flanks, and in the rear; but he can  
defend himself, and annoy the enemy, only when  
placed with his face towards him. Hence it fol-  
lows, that the general object of marching is  
reduced to three points only; to march forward,  
and on both sides, because it is impossible to do  
it for any time backwards, and by that means  
face the enemy wherever he presents himself.  
The different steps to be made use of are 1. *Slow*,  
fast, and oblique. The first is proper in *manoeuvring*,  
when at a considerable distance from the ene-  
my, and when the ground is unequal, that the  
line may not be broke, and a regular fire kept up  
without intermission. The 2d is chiefly necessary  
when you want to anticipate the enemy in occu-  
pying some post, in passing a defile, and, above  
all, in attacking an entrenchment, to avoid being  
long exposed to the fire of the artillery and small  
arms, &c. The 3d step is of infinite con-  
sequence, both in the infantry and cavalry; *column*

ed and formed into lines, and, *vice versa* into columns, by this kind of step, in and in less time, than by any other coming out of a defile, you may in the line without presenting the flank to the enemy, with safety, because you can with ease and safety protect the motion of the troops, while they are out of the defiles, and forming. They may be equally executed, when a column is formed in order to advance or retreat, as a point of infinite consequence, and established as an axiom. The order of the troops must be so disposed, that they may arrive at their rendezvous, if possible, in a day. The quarter-master general, or with an able engineer, should reconnoitre the country, to obtain a perfect knowledge of the enemy, before he forms his routes. The army generally receives several. The quarter-masters, camp and pioneers, parade according to order immediately after, commanded by the quarter-master general or his deputy. They clear the roads, level the ways, make the way for the march of the army, &c. For instance, beats a drum, the *assembly* of the army is to march in 20 minutes after. The *general*, the village, and the rear-guards, quarter and rear-guards, join the *ve corps*; and the army pack up their baggage, beating the *assembly*, the tents are taken, and sent with the baggage to the rear, &c. The companies draw up in files, and the rolls are called. At the signal, the drummers are to beat a march, and the companies march out from their files, form battalions as they advance the line, and then halt. The files are formed into columns by the adjutant, and the order of march, &c. is given by the general officers who lead the columns. The columns generally march by regiments or squadrons; heavy artillery always keeps the great centre of the columns, escorted by a company of infantry and cavalry. The field-piece follows the columns. Each soldier goes with 36 rounds of powder and 36 leaden balls; one of which is to be fixed in the barrel of his firelock. The routes must be so disposed, that no columns cross one another on

the way, in geography, a town of Cambray, in the province of Flanders, 26 miles N. of London.

MARCH. *v. n.* [*marcher*, Fr. for *varicarium* from *Mars*, Junius. 1. To move in

— Well *march* we on,  
In obedience where 'tis truly ow'd *Shak.*  
In battle array with his power ad-  
vanc'd. *Jud.* i. 13.—Maccabeus *marched*  
with five and twenty thousand persons.

— when, some days before his death,  
PART II.

He ordered me to *march* for Utica,  
Wept o'er me.

*Addison.*  
2. To walk in a grave, deliberate, or stately manner.—Plexirtus finding that if nothing else, famine would at last bring him to destruction, thought better by humbleness to creep where by pride he could not *march*. *Sidonius*.—

Doth York intend no harm to us,  
That thus he *marcheth* with thee arm in arm?  
*Shak.*

Our bodies, ev'ry footstep that they make,  
*March* towards death, until at last they die.  
*Davies.*

Like thee, great son of Jove, like thee,  
When clad in rising majesty,  
Thou *marchest* down o'er Delos' hills. *Prior.*  
The power of wisdom *march'd* before. *Popc.*

(2.) \* To MARCH. *v. a.* 1. To put in military movement.—Cyrus *marching* his army for divers days over mountains of snow, the dazzling splendor of its whiteness prejudiced the sight of very many of his soldiers: *Boyle.* 2. To bring in regular procession.—

*March* them again in fair array,  
And bid them form the happy day: *Prior.*

(1.) MARCHAND, John Lewis, a native of Lyons, who shares with the celebrated *D'Aquin* the glory of having carried the art of playing on the organ to the highest perfection. When very young he went to Paris; and happening to be in the chapel of the college of Lewis XIV. when they were waiting for the organist, he offered to supply his place. His playing gave so great satisfaction, that the Jesuits kept him in the college, and supplied him with every necessary to perfect his talents. He continued to play the organ of their chapel; and though many advantageous places were offered him, he refused to accept them. This disinterested conduct was not solely owing to gratitude, but to a whimsical and independent disposition. He died at Paris in 1732, aged 63. He composed two books of Pieces for the Harpsichord, much esteemed by the connoisseurs.

(2.) MARCHAND, Prosper, was brought up at Paris, in the profession of a bookseller, and in the knowledge of books. He corresponded with several learned men, among whom was Bernard the continuator of the *Nouvelles de la Republique des Lettres*, and furnished him with the literary anecdotes of France. Marchand, having embraced the Protestant religion, went to join Bernard in Holland, where he might be at liberty to profess his opinions. By his knowledge of books, he was so eminently distinguished, that he was consulted from all parts of Europe. He was also one of the principal authors of the *Journal Littéraire*, and furnished excellent extracts for the other journals. He died at an advanced age, June 14, 1756; and left his fortune to a society instituted at the Hague, for the education of poor people. His library and MSS. were left by his will to the university of Leyden. He wrote, 1. *The History of Printing*, a work, full of erudition and critical discussions; Hague, 1740, 4to. Abbe Meicier, of Saint-Leger de Soissons, gave, in 1775, 4to, a supplement to this history, which is equally curious and accurate. 2. *An Historical Dictionary, or Memoirs Critical and Li-*

is, and from a *marchioness* a queen, and tends to crown my innocence with the martyrdom. *Bacon*.—The lady *marchioness*, solicited very diligently the timely on of her husband. *Clarendon*.

MARIPANE. *n. s.* [*massipans*, French.] A sweet bread, or biscuit.—

g whose ridge such bones arc met, omfits round in *marchpane* ict. *Sidney*.  
MARINA, a town of Etruria, 30 miles E. ce.

MARANA SILVA, in ancient geography, a sed between the Rauraci and the Danube, is navigable; a part of the HERCYNIA: wartzwald, or the BLACK FOREST, in of Suabia, near the rise of the Danube tar.

MARANISI, a town of Naples, in Lavora, N. of Naples.

MARCIANUS I. emperor of Constantinople, a Thrace, born of an obscure family. Af- for some time served in the army as a soldier, he was made private secretary to e officers of Theodosius. His address ts raised him, and on the death of Theo- . A. D. 450, he was invested with the purple. He showed himself active and and when Attila, the barbarous king of s, demanded the annual tribute, which dly predecessors had regularly paid, he d, that "he kept his gold for his friends, iron was the metal which he had prepa- is enemies." In the midst of universal y Marcianus died, after a reign of 6 years, th year of his age, as he was making pre- against the barbarians that had invaded His death was long lamented; and in- merit was so great, that his reign has d the golden age. He married Pulcheria of Theodosius. In the years of his ob- : found a man who had been murdered; he humanity to give him a private bur- which circumstance he was accused of icide, imprisoned, and condemned to nd the sentence would have been execu- not the real murderer been discovered.

MARCINUS II. emperor of the east, reigned 9.

MARCID. *adj.* [*marcius*, Lat.] Lean; pin- iced.—A burning colliquative fever, the ts being melted away, the heat continu- upon the drier and fleshy parts, nto a *marcid* fever. *Harvey*.—

on his own fish pours the noblest oil; o your *marcid* dying herbs assign'd, rank sinell and taste betrays its kind. *Dryd*.

MARIGLIANO, a town of Naples, in Lavo- NE. of Naples.

MARIGNY, a town of France, in the dep. and Loire; 12 miles SW. of Charolles.

MILLAC, a town of France, in the dep. te; 13½ miles NNW. of Angoulême.

MILLE, a town of France, in the dep. of ; 6 miles E. of Mayenne.

MARCIANUS, the founder of the MARCIONITES, f Pontus, and son of a bishop. He at first ssession of the monastical life, but was ex- cated by his father, who would never

admit him again into the communion of the church, not even on his repentance. On this he abandoned his own country, and retired to Rome, where he began to broach his doctrines. He laid down two principles, the one good, the other evil; between these he imagined an intermediate kind of deity of a mixed nature, who was the cre- ator of this inferior world, and the god and legis- lator of the Jewish nation. The other nations, who worshipped a variety of gods, he supposed to be under the empire of the evil principle.

These two conflicting powers exercise oppressions upon rational and immortal souls; and therefore the supreme God, to deliver them from bondage, sent to the Jews a being more like unto himself, his son Jesus Christ, clothed with a certain shadowy resemblance of a body: this celestial mes- senger was attacked by the prince of darkness, and by the god of the Jews, but without effect. Those who follow the directions of this celestial conductor, mortify the body by fastings and au- sterities, and renounce the precepts of the god of the Jews, and of the prince of darkness, shall af- ter death ascend to the mansions of felicity and perfection. The rules which Marcion prescribed to his followers were excessively austere, expressly prohibiting wedlock, wine, flesh, and all the external comforts of life. Marcion denied the real birth, incarnation, and passion of Jesus Christ, and held them to be all apparent only. He denied the resur- rection of the body; and allowed none to be baptized but those who preserved their contin- ence; but these might be baptized 3 times. In many things he followed the sentiments of the he- retic Cerdon, and rejected the law and the pro- phets. He pretended the gospel had been corrup- ted by false prophets, and allowed none of the e- vangelists but St Luke, whom also he altered in many places as well as the epistles of St Paul, a great many things in which he threw out. In his own copy of St Luke he threw out the two first chapters entire.

MARCIANISTÆ, } a very ancient and po-  
MARCIONISTS, or } pular sect of heretics,  
MARCIONITES, } who, in the time of St  
Epiphanius, spread over Italy, Egypt, Palestine,  
Syria, Arabia, Persia, and other countries: so  
named from their author MARCIAN.

MARCITÆ, } a sect of heretics in the 3d cen-  
MARCITES, } tury, who also called themselves  
the *perfecti*, and made profession of doing every  
thing with a great deal of liberty and without any  
fear. This doctrine they borrowed from Simon  
Magus, who however was not their chief; for  
they were called *Marcites* from one Marcus, who  
conferred the priesthood, and the administration  
of the sacraments, on women.

MARCHIUS, Caius. See CORIOLANUS.

MARCK, a town of France, in the dep. of the  
Straits of Calais; 6 miles E. of Calais.

(1.) MARCO, a town of the Italian republic,  
in the dep. of Panaro, and district (late duchy) of  
Modena.

(2.) MARCO, a small town of Tyrol, 6 miles  
SW. of Roveredo; where there are strong defiles,  
which however were forced by the French, Sept.  
4th, 1796.

(3.) MARCO POLO, or PAULO. See PAULO.  
R I T T 2 (4-8.) MARCO.

(4-8.) MARCO, Sr, 5 towns of Naples; 1. in Calabria Citra: 2, and 3. in Capitanata: 4. in Otranto: and, 5. in Principato Ultra.

(9.) MARCO, Sr, a town of Maritime Austria, one mile S. of Capo d'Istria.

MARCOMANNI, an ancient people of Germany, who seem to have taken their name from their situation on the marches, E. of the Upper Rhine, and N. of the Danube. Cluverius allots to them the duchy of Wurtemberg, a part of the palatinate between the Rhine and the Neckar, the Brisgau, and a part of Suabia, lying between the springs of the Danube and the Bregentz: they afterwards removed to the country of the Boii, whom they drove more to the E. occupying what is now called *Bohemia*.—*Strabo, Velleius.*

MARCOSIANS, or COLOBARIANS, an ancient sect in the church, a branch of the VALENTINIANS. St Irenæus speaks at large of the leader of this sect, Marcus, who was reputed a great magician. The Marcosians had a great number of apocryphal books which they held for canonical. Out of these they picked several idle fables touching the infancy of Jesus Christ, which they put off for true histories. Many of these fables are still in use and credit among the Greek monks.

\* MARCOUR. *n. f.* [*marcor*, Lat.] Leanness; the state of withering; waste of flesh.—Considering the exolution and languor ensuing the action of venery in some, the extenuation and *marcour* in others, it much abridgeth our days. *Brown's F. E.*—A *marcour* is either imperfect, tending to a lesser withering, which is curable; or perfect, that is, an entire wasting of the body, excluding all means of cure. *Harvey.*

MARCULUS, among the Romans, a knocker or instrument of iron to knock at the doors with.

(1.) MARCUS, a phenomenon of the Romans.

(2.) MARCUS ANTONIUS. See ANTONIUS, N. 2.

MARDI, a people of ancient Persia, who inhabited a mountainous country on the confines of Media. They were conquered by Alexander. See *ARABIAN*, § 14.

MARDICK, or ) a town of France, in the dep.

MARDIKE, } of the North, 4 miles W. of Dunkirk; famous for its canal and forts, which were destroyed, after the treaty of 1717. Lon. 51. 20. E. Lat. 51. 0. N.

MAKDIKERS, or TOPASSES, a mixed breed of Dutch, Portuguese, Indians, and other nations, incorporated with the Dutch at Batavia, in the East Indies.

(1.) \* MARE. *n. f.* [*mare*, Sax.] 1. The female of a horse.—

A pair of courfers born of heav'nly breed,  
Whom Circe stole from her celestial fire,  
By substituting *mares*, produc'd on earth,  
Whose wombs conceiv'd a more than mortal birth.

*Dryden.*

2. [From *mara*, the name of a spirit imagined by the nations of the north to torment sleepers.] A kind of torpor or stagnation, which seems to press the stomach with a weight; the night hag.—

Mab, his merry queen by night,  
Besides young folks that lie upright,  
In colder times the *mare* that height,  
Which plagues them out of measure. *Drayton.*

—Mushrooms cause the incubus, or the stomach. *Bacon's Nat. Hist.*

(2.) MARE, (§ 1, *def. 1.*) See EQUUS and HORSE, § 1, 8. Before a mare is o should be in the house about 6 weeks, or time she should be well fed with good oats well sifted; and to render her cow more certain, near a quart of blood m from each side of her neck, about 3 or fore covering. Another method to h in season and make her retain, is to gi 8 days before you bring her to the h two quarts of hemp seed in the morn much at night; and if she refuses to mingle it with a little bran or oats, or her fast for a while: and if the stallion it, it will greatly contribute to generati covering, let her, for 3 or 4 weeks, hav diet as before, and be kept clean in with her feet well pared and thin she cannot readily bring forth, hold her ne to stop her taking wind; and if that w dissolve madder, to the quantity of a pint of ale, and give it her warm. I cannot void her secundine, or after-bu 2 or 3 handfuls of fennel in running w put half a pint of that liquor into a m or into a pint of ale, with  $\frac{1}{2}$  part of salad ed together, and pour it lukewarm into trils, holding them close for some time. wife, give her green wheat, or rye, th which is best. If the mare has but lit boil as much as you can get from her leaves of lavender and spike, and bathe th with it warm, till the knobs and knots ar ved. She should now drink only white which is bran put into water; give her all mathes: and a month after foaling, let her math with some brimstone or favin in it.

(3.) MARE'S MILK, fermented, affords of nourishing vinous liquor; much used Tartars and Russians. See KOMISS.

(1.) MARENGO, or MARINGO, a dept. French republic, one of the six new one which the ci-devant principality of PAV was divided, by decree of the Conservati on the 11th Sept. 1801. It comprehends t district of the ALEXANDRINE, and sends 3 d to the Legislative Body at Paris.

(2.) MARENGO, a small town or village French republic, now the capital of the abe partment, seated on the Bormida; render morable by a most bloody battle fought nea the 14th June, 1800, between the Austrians Gen. Melas, and the French under Gen. parte, Berthier, Desaix, Kellerman, Victor, mont, Menier, and Murat; wherein the Fr after having been thrice repulsed and two of their army routed, by the reasonable arm the critical moment, of the grenadiers of the sular guard, and of the corps de reserve Gen. Desaix, obtained a most complete and five victory over the Austrians; or whom 2 9000 were killed or wounded, and 6000 taken oners. Among the latter were Gen. Zieg St Julian, several other generals, and almost the officers of the staff. Night scarcely put to the carnage and pursuit. The loss on the

in killed and wounded could not  
ing the former fell the brave Gen.  
lose valour and conduct, the victory  
btained. This victory decided the  
an armistice was next day agreed  
Gen. Melas and Bonaparte, which  
y for the general peace, in 1801-2.

ES, a sea port town of France, in  
lower Charente; 9 miles SSW. of  
ontaining about 5000 citizens. Its  
in salt.

IS, a lake in Egypt near Alexandria.  
hood was famous for wine; though  
e *Marcoticum vinum* grow in Epirus,  
part of Libya, called also *Marcotis*,

RESCHAL. *n. f.* [*marechal*, French,

*maréchal* from *mare*, the female of an  
inf commander of an army.—  
m, may thy arms advance,  
y lose Dinart next year,  
e *marechal* of France.

CHAL. See MARCHAL, § 2—8.

IO, an island on the W. coast of Si-  
in circumference, famous for a vic-  
by the Roman fleet over the Car-  
lies 15 miles W. of Trapani.

TS, John DE, a Pausian, one of the  
of the 17th century; but who be-  
visionary and a fanatic. He was a  
e of cardinal Richelieu, and used to  
er the fatigue of business, by his feca-  
tion. He was a member of the French  
its first erection. He wrote several  
es, and attempted an epic poem;  
ding several years about it, dropped  
write books of devotion. He like-  
nances; but not very virtuous ones.  
ught women atheistical principles,  
d not triumph over their virtue o-  
was a declared enemy of the Jan-  
s last years he wrote something a-  
's Satires.

s, Samuel DE, one of the most ce-  
es of the reformed church, was born  
1599. In 1620, he was settled in  
Laon; but in 1624, accepted a call  
an; in 1642, he obtained a profes-  
ningen; and, from that time to his  
d himself so much in the service of  
y, that it was reckoned one of the  
g in the Netherlands. He publish-  
*Divinity*, and a prodigious number  
s. He died in 1673.

, 2 towns of France: 1. in the dep.  
21 miles NW. of Périgueux; 2. in  
ndec, 5 miles N. of Luçon,

GARET, countess of Henneberg  
their is o. Florant IV. count of Hol-  
us on account of a ridiculous story  
many authors and compilers; viz.  
fused charity to a woman whom the  
time accused of adultery, she was  
l of 365 children. See LOOSDUYNEN.  
d men have endeavoured to trace  
ch could have given rise to a rela-  
rdinary. M. Struik fixed upon the  
e mother and son, and, in confor-

mity to the dates which they bear, he concluded  
that the countess was brought to bed of twins on  
Good Friday 1276, which was the 26th of March.  
Now, as the year then began on the 25th of  
March, there were only two days of the year e-  
lapsed when the countess was brought to bed, on  
which it was said *that she had brought into the  
world as many children as there were days in the  
year*. In fact only two children are mentioned in  
history, John and Elizabeth. The enigma thus  
explained is only a common event, wherein there  
is nothing of the marvellous. *Journal des Savans*,  
Feb. 1758.

(2.) MARGARET, countess of Richmond and  
Derby, the learned and pious mother of Henry  
VII. was born at Bethoe in Bedfordshire, in 1441;  
and was the sole heiress of John Beaufort duke of  
Somerset, grandson to John of Gaunt. Her mother  
was the heiress of Lord Beauchamp of Pow-  
ick. While very young, she was solicited by the  
king for his half-brother Edmund earl of Rich-  
mond, to whom she gave her hand. Henry VII.  
was the sole fruit of this marriage, his father dying  
when he was but 15 weeks old. Her 2d husband  
was Sir Henry Stafford, Kt. 2d son to the D. of  
Buckingham; by whom she had no issue. Soon  
after his death, in 1482, she married a 2d husb-  
and, Thomas Lord Stanley, who, was created earl of  
Derby by her son. He died in 1504, without issue,  
being then high constable of England. She died  
at Westminster in June 1509, aged 69, and was  
buried in Henry VII.'s chapel; on the S. side of  
which was erected to her memory an altar tomb  
of black marble, with her statue of brass. Bp.  
Hisher, her confessor, says, "the poet cited almost  
all things that were commendable in a woman,  
either in mind or body." She understood the  
French language perfectly, and had some know-  
ledge of the Latin. She was devout even to  
austerity, in humility romantic, profuse in the en-  
couragement of learning, and singularly chaste. Her  
life, from the turbulence of the times, and vicis-  
situde of her son's fortune, must have been subject  
to infinite disquiet, which however she is said to  
have supported with singular fortitude.—She  
wrote, 1. The mirroure of golke for the sinful  
soule; translated from the French. Lond. 4to.  
with cuts on vellum. 2. Translation of the 4th  
book of Dr Gerson's Imitation of our Saviour, 1504.  
3. A letter to the king; in Howard's collection.  
4. She also made the Orders for great estates of  
ladies and noble women, for their precedence,  
and wearing of habes at funerals, over the chin  
and under the same.

(3.) MARGARET, duchess of Newcastle, a lady  
famous for her voluminous writings, was born a-  
bout the end of K. James I's reign. She was the  
youngest sister of Lord Lucas, and married the  
D. of Newcastle abroad, in 1645. On their re-  
turn after the restoration, she wrote the life of  
her husband; with a great number of plays, poems,  
&c. amounting to about 12 vols folio. She died  
in 1673.

(4.) MARGARET, queen of Denmark, Norway  
and Sweden, was one of the greatest monarchs of  
the North. (See DENMARK, § 5, 6.) She form-  
ed the grand political design of a perpetual union,

of these 3 kingdoms, but accomplished it only during her own life. She died in 1412, aged 59.

(5.) MARGARET OF ANJOU, daughter of Regnier of Anjou, king of Naples, and wife of Henry VI. king of England; an ambitious, enterprising, courageous woman. Intrepid in the field, she figured herself by heading her troops in several battles against the house of York; and if she had not been the authoress of her husband's misfortunes, by putting to death the duke of Gloucester his uncle, her name would have been immortalized for the fortitude, activity, and policy with which she supported the rights of her husband and son, till the fatal defeat at Tewksbury; which put an end to all her enterprises. She died at Anjou in 1482. See ENGLAND, § 33, 34.

(6.) MARGARET, ST, a celebrated virgin, who is said to have suffered martyrdom at Antioch A. D. 275. The ancient martyrologists make no mention of her name, and she did not become famous till the 11th century. There is no more foundation for what is said concerning her relics and girdles, than for the stories which are told of her life. A festival, however, is still held in honour of her memory on the 20th of July. The Orientals pay reverence to her by the name of *Saint Pelagia*, or *Saint Marina*, and the western church by that of *Saint Geruma*, or *Saint Margares*.

(7.) MARGARET'S AT CLIFF, ST, a town on the coast of Kent, near S. Foreland; 5 miles NNE. of Dover.

(8.) MARGARET'S BAY, ST, a bay in the English Channel on the E. coast of Kent.

(1.) MARGARITA, the PEARL, in natural history. See MYA, N° 2. and PEARL.

(2.) MARGARITA, in geography, or PEARL ISLAND, an island of S. America, the middle of which is seated in Lon. 64. 2. W. Lat. 11. 30. N. It was discovered by Columbus, and is about 35 leagues in compass. The soil is very fertile in maize and fruits, and abounds in pasture and verdant groves; yet is totally destitute of fresh water, which the inhabitants are obliged to bring from the continent. The Spaniards were induced to take possession of it, on account of the valuable pearls found in the oysters abounding on its coast. They built a castle, called *Monpadre*, and employed prodigious numbers of negroes in the pearl fishery; cruelly forcing them to tear up the oysters from the rocks to which they stuck, although the coast abounds with sharks, which devoured many of them. In 1620, this island was invaded by the Dutch, who demolished the castle; since which time it has been almost abandoned by the Spaniards. It is now principally inhabited by the natives, to whom particular indulgences were granted by the court of Spain, on account of their ready submission to Columbus.

MARGARITARIA, MARGARITES, a genus of the octandria order, belonging to the dioecia class of plants.

\* MARGARITE. *n. f.* [*margarita*, Lat. *marginerite*, Fr.] A pearl.—Silver is the second metal, and signifies purity; among the planets it holdeth with luna, among precious stones with the *margarite* or pearl. *Peac'um*.

\* MARGARITES. *n. f.* [*bellis*.] An herb. *Ainswortb.*

MARGARITIM, a town of Turkey, in Epir.

MARGARITINI, glass ornaments, made at Venice, of small glass tubes of different colours, which are blown at Murano, and which the women of the lower class wear about their arms and necks. The largest sort are used for making rosaries. This work is performed with great dispatch, the artisan taking a whole handful of these tubes at once, and breaking them off one after another with an iron tool. These short cylinders are mixed with a kind of ashes, and put over the fire in an iron pan; and when the two ends begin to melt, by stirring them about with an iron wire, they are brought to a round figure; but care is taken not to leave them too long over the fire, lest the hole through which they are to be strung should be entirely closed by the melting of the glass. There are several streets at *Franco de Vigna* entirely inhabited by people, whose sole occupation is to make and bring these *margaritini*.

MARGATE, a sea-port town of Kent, on the N. side of the isle of Thanet, near the N. Foreland. It is noted for shipping vast quantities of corn, mostly the product of that island for London; and has a salt-water bath at the post-house, famous for curing nervous and paralytic disorders, and numbness of the limbs. It lies 14 miles from Dover, 12 from Canterbury, and 72 from London. In summer it is frequented for sea-bathing, chiefly by the people of London, and abounds with extensive prospects. Lon. 1. 30. E. Lat. 51. 24. N.

MARGEILLE, a town of France, in the dep. of Cote d'Or, 12 miles W. of Is sur Tille.

\* MARGE.

\* MARGENT. } *n. f.* [*margo*, Lat. *margin*, Fr.] 1. The border; the

\* MARGIN. } brink; the edge; the verge.

He drew his flaming sword, and struck  
At him so fiercely, that the upper *marge*  
Of his sevenfold shield away it took. *F. Quere*  
Never sincee

Met we on hill, in dale, forest, or mead,  
Or on the beathed *margin* of the sea. *Shel.*  
An airy crowd came rushing where he stood,  
Which fill'd the *margin* of the fatal flood.

2. The edge of a page left blank, or fill'd with a short note.—

As much love in rhyme,  
As would be cramm'd up in a sheet of paper  
Writ on both sides the leaf, *margin* and all. *Shel.*

—Reconcile those places, which both you and the *margins* of our Bibles acknowledge to be parallel. *Hammond.*—

He knows in law, nor text, nor *margin*. *Scop.*

3. The edge of a wound or sore.—All the advantage to be gathered from it is only from the crevices of its *margin*, the purpose will be as fully answered by keeping that under only. *Sharp.*

\* MARGINAL. *adj.* [*marginal*, French; *fron margin*.] Placed, or written on the margin.—We cannot better interpret the meaning of these words than pope Leo himself expoundeth them, whose speech concerning our Lord's ascension may be instead of a *marginal* gloss. *Hoeker.*—Went on

you find worthy of your riper observation, with a *marginal* star, as being worthy of cond year's review. *Watts.*

**MARGINATED.** *adj.* [*marginatus*, Latin, *margin.*] Having a margin.

**GOZZA**, a town and lake of the Italian c., in the dep. of Olona, and district (late of Milan; 40 miles NW. of Milan.

**GRABOWA**, a town of Prussian Lithuania by the *margrave* Albert, in memory interview with Sigismund Augustus K. of , in 1560; and the latter built Augustowa Polish frontiers, 30 miles distant. Near the Swedish and electoral troops defeated Tartars, and released prince Radzivil. It lies SE. of Königsberg.

\* **MARGRAVE.** *n. f.* [*marck* and *graff*, n.] A title of sovereignty in Germany; in its import, keeper of the marches or borders. **MARGRAVE**, is derived from *Marcke*, or *a frontier*; and *Graffe*, a *count*, or *governor*; *margraves* being originally governors of the frontiers of a state. This dignity is as to our Marquis. See **MARQUIS**.

**RGUENAT**, Anna Theresia DE, marchion-Courcelles, an elegant moral writer, was daughter of Stephen Marguenat lord of lles. In 1666 she married Henry de LAM-lieutenant-general of the army; and after-remained a widow with a son and a daughter she educated with great care. Her was a kind of academy, to which persons inguished abilities resorted. She died at 1733, aged 86. Her works, which are with much taste, judgment, and delicacy, ed in 2 vols. *The Advice of a mother to and daughter*, are particularly esteemed.

**RGUERITES**, a town of France, in the Gard; 4½ miles NE. of Nismes.

**RGUT**, a town of France, in the dep. of es; 13½ miles NW. of Sedan.

**RILAT** or **MERHAT**, an extensive country doostan, inhabited by the **MARHATTAS**, chending the greater part of the Paishwa's ons in the Deccan. (See **HINDOOSTAN**, The Mahratta dominions are governed by er of separate chiefs, all of whom acknowhe Ram Rajah as their sovereign; and all, one, own the Paishwa as his vicerent. untry immediately subject to the Paishwa, ng all the hereditary territories that were the rajah Sahou to the Ram Rajah, and hat have been acquired and added to them his name, extends along the coast near Goa to Cambay; on the S. it borders British possessions, late Tippoo's, E. on of the Nizam and of the Mahratta Ra-Berar, and towards the N. those of the ta chiefs Sindia and Holkar or their suc-

The whole of the dominion thus lately hed is of vast extent, stretching near 1200 long the ci-devant frontiers of the late Tipoo belonging to Britain) and the Nizam iE. direction, from Goa on the Malabar Balasore in Orissa, adjoining to Bengal; and hence NW. 1000 miles more, touching the s of the British and allied states, on the borthe Ganges and Jumna, to the territory

of the Siaks at Paniput, rendered famous in 1762 for the last memorable defeat sustained by the Marhattas, in their ambitious contest for empire with the united declining power of the Mahomedans. From this place, in a S. course, with great encroachment on the old eastern boundary of the Rajapoot country of Ajimere, it runs about 260 miles to the little Hindoo principality of Kotta, and thence SW. 540 miles further to the extreme point of the Soubah of Gujerat at Duarka, including the whole of that fertile province; whence along the sea-coasts of Cambay and Malabar to Goa, the distance may be reckoned 800 miles. Thus the overgrown empire of the Marhattas may be said to extend 19° Lon. E. near the parallel of 22° Lat. N. from the mouths of the Indus to those of the Ganges, and about 13° Lat. N. from the Kistnah to Paniput; comprehending at least an area of 400,000 square geographic miles, being considerably more than a 3d part of Hindostan, including the Deccan, and equal perhaps in dimensions to all the British and allied states in India, with those of Golconda and Myfore, taken together." (*Hist. and Polit. View of the Deccan.*) Such at least was the estimate of their extent before the late great addition to that of the British dominions in India, by the capture of Seringapatam, and the overthrow and death of Tippoc. See **INDIA**, § 29.

**MARHATTAS**, **MERHATTAS**, **MARATTAS**, or **MAHRATTAS**; a people of India, and by far the most considerable of the Hindoo powers. The Marhattas boast a very high antiquity; they profess the religion of Bramah; speak a dialect of the Sanscrit language, in which they have introduced all the technical terms of Moghul administration; use a character of their own writing, somewhat different from that of the surrounding tribes; and are divided into four casts or classes, with the various subdivisions of professional distinction in the rest of Hindostan, but with this remarkable difference, that among the Mahrattas every individual may, as in fact he occasionally does, follow the life of a soldier. They inhabited from time immemorial the country of **MARHAT**, but were completely subjugated, and afterwards for many centuries oppressed, first by the Patans, and then by the Moghul conquerors of Delhi. At length, towards the end of Aurengzeer's reign, they united, rebelled, and under the famous *Sevaje* or *Seva-je*, a leader of their own tribe, laid the foundations of their present vast empire, which has risen gradually on the ruins of the Mahometan power. This *Seva-je* claimed to be descended from the ancient Hindoo emperors. His father was lord of a small district, for which he paid tribute to the Mahometan king of Vizimpeur. This monarch having arrested and put him in jail, he died in confinement; whereupon *Sevva-je* took up arms to revenge his father's death, and being joined by great numbers, took several important places, with a large tract of territory; which, after the king's death, were ceded to him by his widow. After this *Sevva-je* became so formidable, that many of the Hindoo princes put themselves under his protection, and he at length ventured to make war upon the emperor Aurengzebe. Though at first unsuccessful, in so much that he was taken prisoner, yet having made his escape, he recommenced host-

ilities with such success, that at last Aurengzeb., now far advanced in life, made peace with him upon very advantageous terms. Seeva-jeer was succeeded by his son rajah Sahou, who considerably extended the Marhatta dominions. When rajah Sahou grew old and infirm, and the fatigues of government began to press heavy upon him, he appointed Bissonat Balajee, a Brahman born at Gokum, and leader of about 25,000 horse, to the office of Paishwa or vicegerent. Sahou died without issue, but left nephews by his brother. The courage and wisdom of Balajee had gained him, during the latter years of the old rajah, the affection and esteem of all the nation. But, under an appearance of modesty and self-denial, his prevailing passion was ambition; and the sentiments of gratitude and loyalty were absorbed in the desire to command. He made use of the influence he had acquired under his benefactor so firmly to establish his own power, that he not only retained the office of Paishwa during his life, but transmitted it to his posterity; and the descendants of rajah Sahou's nephews are still respected, though kept in a kind of captivity in the palace at Sattarah. The eldest is styled Ram Rajah, or sovereign; his name is on the seal and coin of the Marhatta state; but his person is unknown, except to those who immediately surround him. He resides in his splendid prison, encompassed with the appendages of eastern grandeur, but debarred of all power, and kept totally ignorant of business. The seat of government was transferred from the ancient royal residence of Sattarah to Poonah; and the usurper, as well as his successors, seem still to have acted under the supposed authority of the deposed prince, by their assuming no other title or character, than that of Paishwa or prime minister. From this change, the empire of the Ram Rajah has been distinguished only by the appellation of the *Rajshewaship*, or *Government of Poonah*, from the name of its present capital. Bissonat Balajee was succeeded as Paishwa by his eldest son Balajee Row (called also *Nana Sabeb* or *Nanah Row*), who left 3 sons, the eldest of whom Balajee Pundit, sometimes called Nanah Pundit, succeeded him. The two others were Rogobah or Rogonaut Row, and Shamsheer Row. Balajee Pundit left two sons; *Mahadava* or *Mada Row*, who was Paishwa 12 years; and Narrain Row, who succeeded him. During the latter part of the life of Mahadava Row, his uncle Rogobah, or Rogonaut, was confined to the palace at Poonah. Mahadava died without issue; and upon the accession of Narrain his brother, a youth of about 19 years of age, Rogobah applied to be released from his confinement; which some say was refused, while others affirm that he was liberated by his brother before his death. (See INDIA, § 22.) Be that as it may, it is certain, that he soon procured the assassination of his nephew Narrain Row, and his own election in his place. But the widow of Narrain being soon after discovered to be with child, the Marhatta chiefs fell off from their allegiance; and the murderers of Narrain being rewarded instead of being punished, Rogobah became so unpopular, that a council was held in Sattarah, the capital, by 9 of the chiefs who resolved to declare Narrain's child, yet unborn,

the legal successor; and the widow was sent for security to Poorendher, a strong fort, 25 miles from Poonah. Rogobah, upon hearing of this revelation, resolved to risk one battle with an army of the revolted commanded by Trimbec Row, in which the latter was slain; but though he obtained a victory, the strength of the confederates daily increased, and his own troops were diminished by continual desertions. He therefore found it necessary to apply for succour to the English, at Bombay, in which he was but too successful. His success in this application was the cause of two wars with the Marhattas, which, after much waste of blood and treasure, we were obliged to conclude by relinquishing his claim, and acknowledging as legal Paishwa the son of Narrain Row, who was born about 7 months after the death of his father. See INDIA, § 22, 26, 28.

MARLÆ ZELL, a town in Stiria, 12 miles N. of Pruc.

(1.) MARIA, or SANCTA MARIA, an island of the Indian Ocean, 5 miles E. of Madagascar. It is about 27 miles long and 5 broad; well watered, and surrounded by rocks. The air is very moist, for it rains almost every day. It is inhabited by 500 or 600 negroes.

(2.) MARIA, ST, a town of Hungary.

(3.) MARIA, ST, a town of Maritime Austria, in Istria; 4 miles N. of Montfalcone.

(4.) MARIA, ST, a town of S. America, in the audience of Panama, built by the Spaniards after they had discovered the gold mines near it, and soon after taken by the English. It is seated at the bottom of the Gulf of St Michael, at the mouth of a river of the same name; which is navigable, and the largest that falls into the gulf. The Spaniards come annually in the dry season, which continues 3 months, to gather the gull dust out of the sands of the neighbouring streams; and carry away great quantities. Lon. 148. 30. W. Lat. 0. N.

(5.) MARIA, ST, a town of Spain, in Andalusia with a small castle. It was taken by the English and Dutch in 1702, for the archduke of Austria. It is seated on the Guadaletta, at the mouth of which is a tower and a clove battery, 18 miles N. of Cadiz. Lon. 5. 33. W. Lat. 36. 35. N.

(6.) MARIA, ST, a town of Transylvania.

(7.) MARIA, ST DELLA GRATIA, a town of the Italian republic, in the dep. of the Mincio and district (late duchy) of Mantua: 5 miles W. of Mantua.

(8.) MARIA, ST, a town of Naples in Lower 37 miles W. of Naples. There are other 8 towns of this name, in Naples, distinguished as follows:

(9.) MARIA, ST, APOLSANO, in Capitanata:

(10.) MARIA, ST, DEL ALTO, in Otranto:

(11.) MARIA, ST, DEL DOTOLI, in Otranto:

(12.) MARIA, ST, DELLA GRATICE, in Calabria.

(13.) MARIA, ST, DELLA ISOLA, in Bari:

(14.) MARIA, ST, DELLA SERRA, in Calabria.

(15.) MARIA, ST, DI LEUCA, in Otranto: and

(16.) MARIA, ST, PALUMBO, in Otranto.

MARIAKIRCHEN, a town of Austria.

MARIAMNE, the daughter of Alexander grand-daughter of Hyrcanus II, and the second wife of Herod the Great; who, however, was

cred her and most of her relations. See ALFREDRA, N<sup>o</sup> 2; HEROD, N<sup>o</sup> 1; and JWS, § 10. **MARIAN**, or **LADRONE ISLANDS**. See LARONE.

(1.) **MARIANA**, John, a learned Spanish historian, born at Talavera in the diocese of Toledo. He entered among the Jesuits in 1554, at 17 years of age; and became one of the most learned men of his time. He was a great divine, a good humanist, and profoundly versed in civil and ecclesiastical history. He taught at Rome, in Sicily, at Paris, and in Spain; and died at Toledo in 1624. His principal works are, 1. A history of Spain in 50 books; which he wrote first in Latin, and afterwards in Spanish. 2. *Scholia*, or short notes on the Bible. 3. A treatise on the changes the species has undergone in Spain; for which he was imprisoned by the Spanish minister. 4. A treatise *De rege et regis institutione*, which made much noise, and was condemned by the parliament of Paris to be burnt by the hangman, for his asserting in it, that it is lawful to murder tyrants. 5. A work on the faults of the government of the society of Jesuits, which has been translated into Spanish, Latin, Italian, French, &c.

(2.) **MARIANA**, a town of the French republic, in the dep. and island of Corsica, 16 miles S. of Bastia.

**MARIANUS SCOTUS**, an Irish monk, who was related to the venerable Bede. He wrote a chronicle which is esteemed; and died in the abbey of Fuld in 1036, aged 58.

**MARIBONE**, or **St MARY LE BON**, or rather *Burn*, from the neighbouring brook, a parish of Middlesex, on the NW. side of London. The manor appears to have belonged anciently to the bishop of London. The houses are very numerous, comprising several extensive streets and squares, which are every year increasing. The Paddington road from Illington passes through this parish, which gives it communication with the E. part of London without passing through the streets. Here were three conduits erected about A. D. 1238, for supplying London with water; but in 1703, when it was plentifully served by the New River, the citizens let them out at 700l. a-year for 43 years. There were two for receiving its water at the NE. corner of the bridge on the river Tyburn, and over them stood the lord mayor's banqueting house, to which (the use of coaches being not then known) his lordship and the aldermen used to ride on horseback, as their ladies did in waggons. This banqueting house, after being many years neglected, was taken down in 1737, and the pillars arched over. This village is joined by new buildings to London. The old church, which was a mean edifice, was pulled down, and a new one erected in 1741. Besides which it has a great number of chapels of every sect and persuasion, and an extensive work-house for the poor.

**MARICA**. See FAUNA.

**MARICELLO**, a town of Naples, in Bari.

**MARKIDUNUM**, in ancient geography, a town of the Britons in Britain; now called *Great Marston*, or *CARSMARTHEN*, the capital of Carmarthensh.

(1.) **MARIE**, or **St MARIE**, the name of five towns of France: viz. 1. in the dep. of the Lower Pyrenees; 13 miles W. of Oleron;

(2.) **MARIE**, **St, AUX MINES**, in the dep. of Upper Rhine, and late prov. of Lorrain, near mines of silver and lead; 12 miles NW. of Colmar, and 25 of New Brisac. The Leber runs through it. Dr Brookes places it in the dep. of Vosges. Lon. 7. 24. E. Lat. 48. 16. N.

(3.) **MARIE**, **St, D'ARUCI**, in the dep. of Mont Blanc, (ci-devant Savoy), 15 m. NW. Chambery.

(4.) **MARIE**, **St, DE LA MER**, in the dep. of the Eastern Pyrenees, 9 miles ENE. of Perpignan:

(5.) **MARIE**, **St, DE MONT**, in the dep. of the Channel, 4½ miles N. of Carentan.

(1.) **MARIENBURG**, a town of France, in the dep. of Ardennes, 7 miles SE. of Philipville, and 10 SW. of Charlemont. Dr Brookes places it in the dep. of the North. Lon. 4. 28. E. Lat. 50. 2. N.

(2.) **MARIENBURG**, a town and palat. of Prussia.

(3.) **MARIENBURG**, a town of Saxony in Misnia.

**MARIE-HERDICKE**, a town of Westphalia.

**MARIENSTADT**, a town of Sweden, in W.

Getland, on lake Weener, 35 m. SE. of Carlskrd.

**MARJENWERDER**, a town of E. Prussia, with a castle on the Vistula. Lon. 19. 15. E. Lat. 53. 45. N.

**MARIES, THREE**, 3 islands near Mexico.

\* **MARIEFS**. *n. f.* [*cirole mariara*.] A kind of violet. *Dit.*

**MARIETTA**, a post town of the United States, in the North Western Territory, on the Ohio, at the mouth of the Muskingum; 460 miles W. by S. of Philadelphia.

**MARIGALANTE**, an island of North America, and one of the least of the Caribbees, 12 miles S. of Guadaloupe. The soil, produce, and climate, are much the same as the other Caribbees. Columbus discovered it in his 2d American voyage in 1483, and called it by the name of his ship *María Galanta*, or *Gallant Mary*. It is about 6 leagues long, and between 3 and 4 broad. Viewed at a distance from on board a ship, it appears like a floating island, because, as it is for the most part flat, the trees seem to swim; but a nearer prospect shows it to be intersected by some running grounds, which give a fine variety to the landscape. The French settled here in 1648; and it was taken by the English in 1691, but the French soon got possession of it again. It was again taken by the British in 1759, but restored at the peace in 1763. It was thought, on its first discovery, to want water; but a charming running stream has since been discovered, on the banks of which are some wealthy planters, and excellent plantations of sugar. A little village in a small bay is the capital of the island, and here the commandant resides. The whole island is very capable of improvement; the soil being almost all equally good, and the land rising no where too high. The coast affords many little bays, and safe anchorage and shelter to ships. Lon. 61. 5. W. Lat. 16. 32. N.

**MARIGNANO**, or **MELIGNANO**, a town of the Italian republic, in the dep. of Olona, district and ci-devant duchy of Milan. Near it Francis I. defeated the Sw. G. in 1515. It is situate on the Lambro, 11 miles SE. of Milan.

**MARIGNY**, 4 towns of France; viz. 1. in the dept. of Aube, 15 miles NW. of Troyes; 2. in that of the Channel, 6 miles W. of St Loo; 3. in

that of Indre and Loire, 1; miles SW. of Cluison: and 4. in that of Mont Blanc, (late Savoy,) 20 miles SSE. of Geneva.

(1.) \* MARIGOLD. *n. f.* [*Mary and gold; caltha*, Lat.] A yellow flower, devoted, I suppose, to the virgin.—The *marigold* hath a radiated discous flower; the petals of them are, for the most part, crenated, the seeds crooked and rough; those which are uppermost long, and those within short: the leaves are long, intire, and for the most part, succulent. *Miller*.—Your circle will teach you to draw truly all spherical bodies. The most of flowers; as, the rose and *marigold*. *Peacham*.—

The *marigold*, whose courtier's face  
Echoes the sun. *Cleveland*.

Fair is the *marigold*, for pottage meet. *Gay*.

(2.) MARIGOLD. See CALENDULA, N° 1.

(3.) MARIGOLD, AFRICAN. See TAGETES, N° 1.

(4.) MARIGOLD, CORN. See CHRYSANTHEMUM, N° 1.

(5.) MARIGOLD, FIG. See MESEMBRYANTHEMUM.

(6.) MARIGOLD, FRENCH. See TAGETES, N° 3.

(7.) MARIGOLD, MARSH. See CALTHA.

\* To MARINATE. *v. a.* [*mariner*, Fr.] To salt fish, and then preserve them in oil or vinegar.—

Why am I sty'd a cook, if I'm so loath

To *marinate* my fish, or season broth. *King*.

MARINDUGERA, one of the PHILIPPINE ISLANDS, 60 miles in circumference, and 30 NE. of Mindoro.

(1.) \* MARINE. *adj.* [*marinus*, Lat.] Belonging to the sea.—The king was desirous that the ordinances of England and France, touching *marine* affairs, might be reduced into one form. *Haysward*.—Vast multitudes of shells, and other *marine* bodies, are found lodged in all sorts of stone. *Woodw.*

No longer Circe could her flame disguise,

But to the suppliant God *marine* replies. *Ovid*.

(2.) \* MARINE. *n. f.* [*la marine*, French.] 1. Sea-affairs.—Nearchus, who commanded Alexander's fleet, and Queferates his intendant general of *marine*, have both left relations of the state of the Indies at that time. *Arabic*. 2. A soldier taken on shipboard to be employed in descents upon the land.

(3.) MARINE [*q. v.* 2, *d. f. l.*] is a general name for the navy of a kingdom or state: the whole economy of naval affairs; and whatever respects the building, rigging, arming, equipping, navigating, and fighting ships. It comprehends also the government of naval armaments, and the state of all the persons employed therein, whether civil or military. The history of the marine affairs of any one state is a very comprehensive subject. Those who wish to be fully informed of the maritime affairs of Great Britain, and the figure it has made at sea in all ages, may find abundance of curious matter in Selden's *Maræ Clugion*; and from his time to our's, may trace a series of facts in Lodi-att's and Banchet's Naval History; but above all in the *Campbell's Lives of the Admirals*.

(4.) MARINE ACID, or MURIATIC ACID, one of the component parts of sea salt. See ACID, MARIATIC. But the phlogistic hypothesis stated under that article is now entirely exploded. See CHEMISTRY, *Index*. An account of various methods of procuring this acid from common salt, of most

of its chemical properties, and of several uses may be put to in the arts, is given under the articles BLEACHING, CHEMISTRY, OXYGEN MAKING, &c. M. Chaptal observes, that the marine acid cannot be obtained by distilling salt powdered flints. He made the experiment mixing 10 lb. of flints with 2 lb. of sea salt, he obtained only a mass of the colour of litharge, the fumes were not perceptibly acid. Chaptal decompose this salt for once, but not in the highest degree if used a 2d time; which shows, that all probability the decomposition is owing to a portion of vitriolic acid contained in the salt. Under the article BLEACHING, Part II, we take notice of the properties of the dephlogisticated marine acid in whitening cloth. But great and important improvements have since been made in that art, as well as in the methods of procuring the oxygenated muriatic acid for that purpose. See MURIATIC ACID, and OXYGENATED MURIATIC ACID.

(5.) MARINE CHAIR, a machine invented by Mr Irwin for viewing the satellites of Jupiter at sea, and of course determining the longitude by the eclipses. An account of it is given in the *Journal Esfranger* for March 1760. An account of its accuracy was published in 1761 by M. de L'Isle, astronomer in the imperial academy of Petersburg; but notwithstanding the encomiums bestowed upon it by this gentleman, it hath never come into general use; and therefore we may conclude, that it is much inferior to the inventions of Mr Haffson for the same purpose. See HARRISON, N° 1; and LONGITUDE.

(6.) MARINE DISCIPLINE is the training up soldiers for sea-service, in such exercises as the various positions of the firelock and body, and teaching them every manœuvre that can be performed on board ships of war at sea. See EXERCISE, 61 and NAVY.

(7.) MARINE FORCES, or MARINES, a body of soldiers raised for the sea service, and trained to fight either in a naval engagement or in an action ashore. The great service of this useful corps was manifested frequently in the course of the German war, particularly at the siege of Belgrade, where they acquired a great character, although rarely raised and hardly exercised in military discipline. At sea they are incorporated with the ship's crew, of which they make a part; and many of them learn in a short time to be excellent seamen, to which their officers are ordered with admiralty to encourage them, although their duty is to order them to go aloft against their inclination. In a sea-fight their main arms are of great advantage in securing the decks of the enemy; and when they have been long enough to stand firm when the ship rocks, they make infinitely preferable to seamen if the troops will carry attempt to board, by raising a battle with their fixed bayonets to oppose them. The sole direction of the corps of marines is with the lords commissioners of the admiralty; and the admiralty is a distinct apartment of the royal palace. The secretary to the admiralty is also secretary to the marines, for which he receives of each a year; and has under him several officers for the management of this department.

marine forces of Great Britain in the time of peace are stationed in three divisions; one at Chatham, another at Portsmouth, and a 3d at Plymouth. By a late regulation, they are ordered to do duty at the several dock-yards of those ports, to prevent embezzlement of the king's stores, for which a captain's guard mounts every day; which certainly requires great vigilance, as so many abuses of this kind have been committed, that many of the inhabitants, who have been long used to an infamous traffic of this kind, expect these conveyances at certain periods as their due. The marine corps are under the command of their own field-officers, who discipline them, and regulate their different duties.—K. George II. in 1760 formed a new establishment of marine officers, entitled, *the general, lieutenant general, and three colonels of marines* (one for each division), to be taken from officers in the royal navy. The two first are always enjoyed by flag-officers, the last by post-captains only. This establishment was formed to reward such officers as distinguished themselves in the service of their country.

(8.) MARINE SURVEYOR, a machine contrived by Mr H. de Saunrez for measuring the way of a ship in the sea. This machine is in the form of the letter Y, and is made of iron or any other metal. At each end of the lines which constitute the angle or upper part of that letter, are two pallets, resembling the figure of the log; one of which falls in the same proportion as the other rises. The falling or pendant pallet, meeting a resistance from the water, as the ship moves, has thereby a circular motion under water, which is faster or slower according as the vessel moves. This motion is communicated to a dial within the ship, by a rope fastened to the tail of the Y, and carried to the dial. The motion being thus communicated to the dial, which has a bell in it, it strikes exactly the number of geometrical paces, miles, or leagues, which the ship has run. Thus the ship's distance is attained; and the forces of tides and currents may also be discovered by this instrument: which, however, has been very little used.

MARINELLA. Lucretia, a Venetian lady of the 17th century, who published, 1. *The Life of the Virgin Mary*; 2. *The Life of St Francis*; and, 3. A curious tract in which she maintains *the Superiority of the Female Sex over the Male*: with several other works.

(1.) \* MARINER. *n. s.* [from *mare*, Lat. *marinus*, Fr.] A seaman; a sailor.—

The merry *mariner* unto his word  
Soon hearken'd, and her painted boat straight-way

Turn'd to the shore. *Fairy Queen.*  
—We oft deceive ourselves, as did that *mariner*  
who, mistaking them for precious stones, brought  
home his ship fraught with common pebbles from  
the Indies. *Glaxville.*—

His busy *mariners* he hates,  
His shatter'd sails with rigging to restore. *Dryd.*  
What *mariner* is not afraid,  
To venture in a ship decay'd. *Swift.*

(2.) MARINER. See SAILOR, and SEAMEN.  
(3.) MARINER'S COMPASS. See COMPASS, N<sup>o</sup> V.

(4.) MARINERS, METHOD OF PRESERVING THE HEALTH OF. See SEAMEN.

(1.) MARINES. See MARINE, § 7.

(2.) MARINES, in geography, a town of France, in the dep. of the Seine and Oise; 7½ miles NW. of Pontoise, and 12 W. of Beaumont.

MARINGO. See MARLIGO, N<sup>o</sup> 1 & 2.

MARINGUES, a town of France, in the dep. of Puy de Dome; 13½ miles NW. of Clermont.

MARINHA, ST, a town of Portugal, in the province of Beira; 20 miles SE. of Oporto.

MARINI, a town of Spain, in New Castile.

(1.) MARINO, John Baptist, a celebrated Italian poet born at Naples in 1569. His father, who was an able civilian, obliged him to study the law; at which being disgusted, he left his parents, and retired to the house of Sieur Manzi, who was a friend to all men of genius. He at length became secretary to Matthew of Capua, great admiral of Naples, and contracted a friendship with Tasso. He went soon after to Rome, and entered into the service of Card. Aldobrandini, nephew to pope Clement VIII. who took him with him to Savoy. Marino was in great favour with the court of Turin; but afterwards created himself many enemies there, the most furious of whom was the poet Gaspard Murtola, who, attempting to shoot him with a pistol, wounded one of the duke of Savoy's favourites. Marino, being obliged to leave Turin, went to Paris at the desire of queen Mary de Medicis, and published there his poem on *Adonis*. He afterwards went to Rome, where he was made prince of the academy of the humoristi; and thence to Naples, where he died while he was preparing to return home. He had a very lively imagination, but little judgment. His works, which are numerous, have been often printed.

(2.) MARINO, a town and fort of Italy, in the Campagna; 15 miles SE. of Rome. Lon. 12. 40. E. Lat. 41. 54. N.

(3.) MARINO, ST, a native of Dalmatia, originally bred a mason, who flourished in the 5th century; and having turned hermit, retired to the mountain which still bears his name. His devotion and austerly soon procured him such a high reputation for sanctity, that the Italian princes, on whose property the mountain was situated, made him a present of it; whereupon great numbers of people out of veneration for the saint took up their residence upon it, and thus laid the foundation of the town and republic of Sr MARINO. (See N<sup>o</sup> 4 & 5.) He is venerated as the greatest of the saints, next to the virgin Mary, and to speak disrespectfully of him is punished as blasphemy.

(4.) MARINO, ST, a small republic of Italy, founded by the Saint, (N<sup>o</sup> 3.) consisting only of a mountain, a town and a few hills, about the bottom of it, about 6 miles in extent. The number of the inhabitants is about 6000. The mountain yields good wine, but they have only rain or snow water. In the whole territory there are only 3 castles, 3 convents, and 5 churches. The largest of the churches is dedicated to the saint, and contains his ashes and his statue. All that are capable of bearing arms are exercised, and ready at

a minute's call. In the ordinary course of government, the administration was in the hands of the council of 60, which, however consisted only of 40 members one half of whom are of noble families, and the other of plebeian. On extraordinary occasions, however, the *arengo*, or great council, in which every house has its representative, is called together. The two principal officers are the capitaneos, who are chosen every half year; next to them is the commillary, who judges in civil and criminal matters, and is joined in commission with the capitaneos. When an ambassador is sent to any foreign state, he is allowed about 1000 a-day. In the year 1700, the republic purchased the castle of *Pemarafla*, and in 1770, that of *Cajala*. About 1460, it assisted Pope Pius II, against Malatesta lord of Rimini; in return for which he made over to it the forts of Serravalle, Faetano, Mont Giardino, and Fiorentino. During all the late various revolutions of Italy, this republic preserved its liberty and independence; and upon the peace in 1802, the citizens new-modelled their constitution, by adding one fourth to the number of the little council, and increasing that of the great council to 300.

(5, 6.) **MARINO, ST.**, the capital of the above republic, seated on the top of the mountain above mentioned. It is well fortified and has only one road, by which it can be approached. It is 60 miles SE. of Bologna, and 125 N. of Rome. Lon. 12. 35. E. Lat. 43. 54. N.

(7.) **MARINO, ST.**, a town of Naples, in the province of Basilicata; 9 miles S. of Tuffi.

**MARINUS**, an engraver who flourished about 1670, and resided principally at Antwerp. His plates, Mr. Smith observes, are executed in a very fine style, with the most exact delineation of the most difficult parts, and exact over each plate, and engraved like a book, which is filled up with tiny little dots. His prints, though generally very good, want the force of the master in the delineation of the folds of the draperies and the outlines of the figures; and the extremities of which are heavy, and not marked with precision. Fine impressions from his cuts are not, however, much sought after by collectors; they especially after Rubens and Jordens are held in very high estimation.

**MARION**, a county of S. Carolina.

(1.) **MARIONIS**, in ancient geography, a town of Germany; now called *Helmstedt*, a famous trading city on the Elbe, in Lower Saxony, in the duchy of Helstern.

(2.) **MARIONIS**, another ancient town of Germany, now thought to be *Wilmars*, in the duchy of Mecklenburg.

(3.) \* **MARJORAM** *n. f.* [*marjorana*, Latin; *marjolain*, French.] A fragrant plant of many kind; the bastard kind only grows here.—The nymphs of the mountains would be drawn, upon their heads garlands of honey-suckles, woodbine, and sweet *marjoram*. *Psalm.*

(4.) **MARJORAM**, in botany. See **ORIGANUM**.

(5.) **MARJORAM**, Spanish, a species of **URTICA**.

**MARIOTTE**, Edmund, an eminent philosopher and mathematician, born in Burgundy. He was made a member of the academy of sciences. He

died in 1684. His works, which are much ed, were printed at Leyden in 1717, 1730.

**MARIQUITA**, or **ST SEBASTIAN DE** a town of S. America, in Popayan, with mines.

**MARISCH**, a town of Moravia, in Pr.

(1.) \* **MARISH**. *n. f.* [*marais*, Fr. *maerische*, Dutch.] A bog; a fen; a watery ground; a marsh; a morass; a bog. The flight was made towards Dalkeith way, by reason of the *marish*, the English were least able to pursue. *Hayward*.—We had avenged the blood of their brother turned again to the *marish* of Jordan. 142.—Lodronis, carried away with the in of the horsemen, was driven into a where, being fore wounded, and fast in it he had done the uttermost. *Koeller*.—

His limbs he coucheth in the cooler  
Oft, when heaven's burning eye the f  
vades,

To *marishes* resorts.

Gliding meteorous, as ev'ning mist  
Ris'n from a river, o'er the *marish* glide

(2.) \* **MARISH**. *adj.* Moorish; fenmy; swampy.—It hath been a great endang the health of some plantations, that th built along the sea and rivers, in *marish* whollose grounds. *Baron*.—

The fen and quagmire to *marish* by  
Are to be drained.

**MARITAGIUM**, in the feudal cust contradistinguished, from *matrimonium*, the power which the lord or guardian had of disposing of his infant ward in marriage while the infant was in ward, and had the power of tendering him or her a man without disparagement or dowry, which if the infants refused, they fell void at the marriage, *quod in maritagio* judgment; that is, so much as a jury would or any one would *bona fide* give to the father in an alliance; and if the infant themselves without the guardian's consent, it increased double the value, *duponiam maritagii*.

\* **MARITAL**. *adj.* [*maritalis*, Latin; French.] Pertaining to a husband; as a husband.—If any one retains a wife, been taken in the act of adultery, he is guilty of the crime of bawdry. But the punishment does consist in the name, and in the name charity, as well as *maritalis* induces a bond thereof, this is *maritalis* *dotis*.—It has been determined by some late professors of the law, that a husband create his *marital* authority so far, as to wife moderate correction. *Act of Tenor*.

\* **MARITATED**. *adj.* From *maritus*. Having a husband. *Dist.*

\* **MARITIMAL**. *adj.* [*maritimus*, Latin.] Pertaining to the sea; maritime.—I claim a *maritimal* charge and the power of distressment. *R. 1166*.—2. Referring to the coast; the maritime. *Ex. 1166*.—3. Referring to the sea; maritime. *Ex. 1166*.—4. Referring to the sea; maritime. *Ex. 1166*.

what been shrewdly touched. *Wotton*. 3. Bothering on the sea.—

The friend, the shores *maritimal*

Sought for his bed, and found a place upon  
which play'd

The murmuring billows.

*Chapman.*

Ereco, and the kifs *maritime* kings

Monbaza and Quilon.

*Milton.*

—Neptune upbraided them with their stupidity and ignorance, that a *maritime* town should neglect the patronage of him who was the god of the seas. *Addison*.

(2.) **MARITIME** signifies also bounded by the sea. A maritime province or country is one bounded by the sea; and a maritime kingdom is one that makes a considerable figure, or that is very powerful at sea. Hence, by **MARITIME POWERS** among the European states, are understood Great Britain and Holland.

(3.) **MARITIME ALPS**, that part of the Alps, which borders on the Gulf of Genoa. See **ALPS**.

(4.) **MARITIME ALPS**, a department of the French republic, formed out of the ci-devant county of Nice and principality of MONACO. Monaco and Nice are the chief towns.

(5.) **MARITIME AUSTRIA**, a new province of Italy, belonging to the house of Austria, comprehending the dominions ceded to the emperor, by the French republic, at the treaty of Campo Formio, on the 17th Oct. 1797, as a compensation for the loss of his hereditary dominions in the Netherlands; and since confirmed to him by the treaty of Lunéville, and the general treaty of peace in 1802. Its limits, as defined by the first of these treaties, commence on the W. side of lake Garda, on the confines of the Tirolse, with the rivulet which runs by Gardolo; and passing through the lake obliquely, extend on the E. to Lacize; hence across to Sr Giacomo; thence for 18,000 feet along the left bank of the Adige to Porto Legnano; thence to the left of the White Canal, the Tartaro, and the canal of Polifella, reaching to the Po, the left bank of which to the Adriatic completes the limits of the province. It is bounded on the N. by the Tirolse; NE. by Carinthia and Carniola; S. by the Adriatic, the Po, the Polifella, the White Canal, and the Tartaro; and on the W. by the ci-devant **CISALPINE**, now the **ITALIAN REPUBLIC**. Its superficial contents are 85 German square miles, 15 to a degree. It is situated between 28° 10' and 37° 8' Lon. E. and between 42° and 47° Lat. N. extending from NW. to SE. and "forming" (says Dr Oppenheim) "a golden seam of border to the Austrian monarchy." It comprehends the following provinces: 1. The city of Venice, with its Lagunes; 2. The Dogado; 3. The Paduano; 4. Rovigo; 5. Vicentino; 6. Trevisana; 7. Friuli; 8. Istria; 9. Dalmatia; 10. The four Isles of the Quarnero; 11. The 3 Dalmatian Islands; 12. Montachia; 13. Lower Dalmatia; and 14. Montenegro. The city of Verona, and the mountainous or northern part of the Veronese, also formed part of it by the treaty of Campo Formio; but they were taken by the French and annexed to the Cisalpine republic, in 1805, and now form a part of the Italian republic, and department of the Veneto. The total population of Maritime

Austria was estimated by Dr Oppenheim in 1798, at 3,110,000 souls; viz. 2,860,000, on the continent, and 250,000 in Albania, Dalmatia, and the islands; but from these must now be deducted 81,575 for the population of the Veronese. Of the above population 40,000 belong to religious orders, the Roman Catholic being the predominant religion. But "the system of toleration" (says the Dr) "is so firmly established, that no scope is given to accusations in religious matters, or to the abominable abuse of priestly power." The sciences, however, have made but little progress. The whole territory is fertile and the climate in general salubrious, and so mild that ice and snow are rarely seen. For other particulars, See **DALMATIA**, **FRIULI**, **QUARNARO**, **VENICE**, &c.

(6.) **MARITIME POWERS**. See 51.

(7.) **MARITIME STATE**, in British polity, one of the three general divisions of the laity: See **LAITY**. The state is nearly connected with the military; though much more agreeable to the principles of our free constitution. The royal navy of England hath ever been its greatest defence and ornament; it is its ancient and natural strength; the floating bulwark of the island; an army from which, however strong and powerful, no danger can ever be apprehended to liberty; and accordingly it has been assiduously cultivated from earliest ages. To so much perfection was our naval reputation arrived in the 12th century, that the code of maritime laws, which are called the *laws of Oleron*, and are received by all nations in Europe as the ground and substruction of all their marine constitutions, was confessedly compiled by K. Richard I. at the isle of Oleron on the coast of France, then part of the possessions of the crown of England. And yet so vastly inferior were the English of that age to the present in this respect, that even in the maritime reign of Q. Elizabeth, Sir Edward Coke boasts, that the royal navy of England then consisted of *three and thirty* ships. The present condition of marine is in great measure owing to the salutary provisions of the statutes called the *navigation acts*; whereby the constant increase of English shipping and seamen was not only encouraged, but rendered unavoidably necessary. By stat. 5 Rich. II. c. 3. in order to augment the navy of England, then greatly diminished, it was ordained, that none of the king's liege people should ship any merchandize out of or into the realm, but only in ships of the king's allegiance, on pain of forfeiture. In the next year, by statute 6 Rich. II. c. 8. this wise provision was enlarged, by only obliging the merchants to give English ships (if able and sufficient) the preference. But the most beneficial statute for the trade and commerce of these kingdoms is that navigation-act, the rudiments of which were first framed in 1650 with a narrow partial view; being intended to mortify our own sugar islands, which were dissected to the parliament, and still held out for Charles II. by stopping the gainful trade which they then carried on with the Dutch, and at the same time to cup the wings of these our opulent and aspiring neighbours. This prohibited all ships of foreign nations from trading with any English plantations, without licence

from the council of state. In 1651, the prohibition was extended also to the mother country; and no goods were suffered to be imported into England, or any of its dependencies, in any other than English bottoms; or in the ships of that European nation of which the merchandize imported was the genuine growth or manufacture. At the Restoration, the former provisions were continued, by stat. 22 Car. II. c. 12. with this very material improvement, that the master and three-fourths of the mariners shall also be English subjects.—Many laws have been made for the supply of the royal navy with seamen; for their regulation when on board; and to confer privileges and rewards on them during and after their service. 1. For their supply. The principal, but the most odious, though often necessary method for this purpose; is by impressing; see IMPRESSING. But there are other ways that tend to the increase of seamen, and manning the royal navy. Parishes may bind out poor boys apprentices to the masters of merchantmen, who shall be protected from impressing for the first three years; and if they are impressed afterwards, the masters shall be allowed their wages: great advantages in point of wages are given to volunteer seamen, in order to induce them to enter into his majesty's service: and every foreign seaman, who, during a war, shall serve two years in any man of war, merchantman, or privateer, is naturalized *ipso facto*. About the middle of king William's reign, a scheme was set on foot for a register of seamen to the number of 30,000, for a constant and regular supply of the king's fleet; with great privileges to the registered men; and, on the other hand, heavy penalties in case of their non-appearance when called for: but this registry, being judged to be rather a badge of slavery, was abolished by stat. 9 Ann. c. 21. 2. The Method of ordering seamen in the royal fleet, and keeping up a regular discipline there, is directed by certain express rules, articles, and orders, first enacted by the authority of parliament soon after the Restoration; but since new-modelled and altered, after the peace of Aix-la-Chapelle, to remedy some defects which were of fatal consequence in conducting the preceding war. In these articles of the navy almost every possible offence is set down, and the punishment thereof annexed: in which respect the seamen have much the advantage over their brethren in the land-service; whose articles of war are not enacted by parliament, but framed from time to time at the pleasure of the crown. Yet from whence this distinction arose, and why the executive power, which is limited so properly with regard to the navy, should be so extensive with regard to the army, it is hard to assign a reason; unless it proceeded from the perpetual establishment of the navy, which rendered a permanent law for their regulation expedient, and the temporary duration of the army, which subsisted only from year to year, and might therefore with less danger be subject to discretionary government. But, whatever was apprehended at the first formation of the mutiny act, the regular renewal of our standing force at the entrance of every year has made this distinction idle. For, if from experience past, we may judge of future events, the ar-

my is now lastingly ingrafted into the British constitution; with this singularly fortunate circumstance, that any branch of the legislature may annually put an end to its legal existence, by refusing to concur in its continuance. 3. The privileges conferred on sailors are much the same with those conferred on soldiers, with regard to relief, when maimed, wounded, or superannuated, either by countryrates, or the royal hospital at Greenwich; with regard also to the exercise of trades, and the power of making nuncupative testaments; and farther, no seaman aboard his majesty's ships can be arrested for any debt, unless the same be found to amount to at least £ 20; though by the annual mutiny acts, a soldier may be arrested for a debt which extends to half that value, but not to a less amount.

MARIVAUX, Peter Carlet DE, a French dramatic writer, born of a good family at Paris in 1688. A fine understanding, improved by education, distinguished him early. He met with the highest success in comic productions, which, with the merit of his other works, procured him a place in the French academy. "My only object (says he) is to make men more just and more humane; and he was as amiable in his life and conversation as in his writings. He died at Paris in 1763, aged 75. His works consist of, 1. *Précis de Théâtre*, 4 vols 12mo. 2. *Fiomere traæ. jii*, 1770. 3. *Le Spectateur François*, 2 vols 12mo. 4. *Le Pèlerin Indigent*, 12mo. 5. *Vie de Marianne*, 2 vols 12mo; one of the best romances in the French language. 6. *Le Poisson Parvenu*, 12mo. 7. *Précis de l'histoire*.

MARJUPOL, town of Russia, in the province of Ekaterinoflaw, on the coast of the sea of Asoph, W. of Kalmius; built for the Greeks who emigrated from the Crimea; 128 miles SE. of Ekaterinoflaw. Lon. 55. 30. E. of Ferro. Lat. 47. 0. N.

(1.) MARIUS, Caius, a famous Roman general, and 7 times consul, who saluted his great military reputation by savage barbarities. He was born at Arpinum, of obscure parents. He ingratiated himself under Scipio, at the siege of Numantia. The Roman general saw his courage and intrepidity, and foretold his future greatness. By his intrigues at Rome, while he exercised the inferior offices of the state, he rendered himself known; and his marriage with Julia, who was of the family of the Cæsars, contributed to raise him to consequence. He went to Africa as lieutenant to the consul Metellus against Jugurtha; and then ingratiated himself with the soldiers, and having raised enemies to his benefactor, he returned to Rome and canvassed for the consulship. By his extravagant promises to the people, and his insolent insinuations against Metellus, he proved successful. He was appointed to finish the war against Jugurtha, and showed his military talents by defeating Jugurtha. See JUGURTHA. The Roman provinces being suddenly invaded by an army of 300,000 barbarians, Marius was elected consul, and sent against the Teutones. The war being prolonged, Marius was a 3d and 4th time invested with the consulship. At last two engagements were fought, and not less than 200,000 of the forces of the Ambrones and Teutones were slain in the field of battle, and 90,000 more perished.

A. U. C. 650. In 651, the Cimbri, and a  
of barbarians were defeated; 140,000  
ere slaughtered by the Romans, and  
en prisoners. After these victories, Ma-  
nus colleague Catullus entered Rome in  
and Marius received the appellation of  
*leader of Rome*. He was elected consul  
; but his restless ambition began to  
ons, and to oppose the power of Sylla.  
he foundation of a civil war. Sylla re-  
liver up the command of his forces,  
he was empowered to prosecute the  
; war; and considered the demand as  
nd improper. He advanced to Rome,  
; was obliged to fly. Adverse winds  
him from seeking a retreat in Africa,  
left on the coast of Campania, where  
Sylla discovered him in a marsh, into  
had plunged himself, leaving only his  
ve the surface for respiration. He was  
the neighbouring town of Minturnæ;  
gistrates being in the interest of Sylla,  
ence of death on their illustrious pri-  
Saul was commanded to cut off his  
dungeon; but the stern countenance  
displayed the courage of the execu-  
l when he heard him say, *Tunc, homo,*  
*et Caium Marium?* the dagger dropped  
nd. Such an uncommon adventure  
compassion of the inhabitants of Min-  
ney liberated Marius, and favoured his  
frica, where he joined his son, who  
urming the princes of that country in  
Marius landed near the walls of Car-  
his retreat was soon known; and the  
f Africa, to conciliate the favour of  
elled Marius to fly to a neighbouring  
soon after learned that Cinna had em-  
cause at Rome, where the Roman se-  
ipped him of his consular dignity, and  
upon one of his enemies. Marius set  
his friend at the head of only 1000 men.  
however, was soon increased, and he  
me like a conqueror. His enemies  
nly sacrificed to his fury; Rome was  
lood, and he, who once had been cal-  
*her of his country*, marched through-  
tended by a number of assassins, who  
all those whose salutations were not  
their leader. When Marius and Cin-  
nately gratified their rage, they made  
consuls; but Marius, already worn out  
ze and infirmities, died 16 days after  
elected consul the 7th time, A. U. C.  
A. C. 86. Brought up in poverty,  
peasants, he always retained his native  
nd despised in others those polished  
nd education had denied him. Be-  
illiterate, he hated the conversation of  
; and his sobriety and temperance  
to the obscurity in which he had lived  
. His countenance was stern, his voice  
perious, and his disposition untract-  
as in his 70th year when he died;  
ejoiced at the fall of a man whose am-  
proved so fatal to many of her citi-  
only qualifications were those of a  
I; and these rendered him the most

powerful of the Romans, because he was the on-  
ly one whose ferocity seemed capable to oppose  
the barbarians.

(2.) MARIUS, Caius, the son of the preceding,  
was as cruel as his father, and shared his good and  
adverse fortune. He made himself consul in the  
25th year of his age, and murdered all the sena-  
tors who opposed his ambitious views. He was  
defeated by Sylla, and fled to Præneste, where he  
killed himself.

(3.) MARIUS, M. Aurelius, a native of Gaul;  
who, from being a blacksmith, became one of the  
generals of Gallienus, and at last caused himself  
to be saluted emperor. Three days after this ele-  
vation, a man who had shared his poverty with-  
out partaking of his prosperity, assassinated him,  
by a sword which Marius himself had made in his  
obscurity. Marius has been celebrated for his  
great strength; and it is reported that he could  
stop, with one finger only, the wheel of a chariot  
in its most rapid course.

(4.) MARIUS, Maximus, a Latin writer, who  
published an account of the Roman emperors  
from Trajan to Alexander, now lost. His com-  
positions were entertaining, and executed with  
great fidelity; but some say that they abounded  
with many fabulous stories.

(5.) MARIUS, an ancient British monarch, the  
son of king ARVIRAGUS, whom he succeeded  
A. D. 74. He conquered the Picts, and erected  
a stone upon Stanmere in memory of his victory.  
Dr Anderson says, he married a daughter of the  
celebrated queen BOADICEA. He died A. D. 125,  
after having reigned 51 years.

MARIZA, a river of Turkey, in Romana.

(I, i.) \* MARK. *n. f.* [*mare*, Welsh; *mare*, Sax.  
*mercke*, Dutch; *marque*, French.] 1. A token by  
which any thing is known.—Once was proclaimed  
throughout all Ireland, that all men should  
mark their cattle with an open ferveral *mark* upon  
their flanks or buttocks, so as if they happen to  
be stolen, they might appear whose they were.  
*Spenser*.—In the present form of the earth there  
are certain *marks* and indications of its first state;  
with which, if we compare those things that are  
recorded in sacred history, we may discover what  
the earth was in its first original. *Bacon*.—The  
urine is a lixivium of the salts in the human bod-  
dy, and the proper *mark* of the state and quan-  
tity of such salts; and therefore very certain in-  
dications for the choice of diet may be taken from  
the state of urine. *Arbutnot*. 2. A token; an im-  
pression.—

But cruel fate, and my more cruel wife,  
To Grecian swords betray'd by sleeping life:  
These are the monuments of Helen's love,  
The share I bear below, the *marks* I bore a-  
bove.

*Dryden*.  
'Twas then old soldiers cover'd o'er with  
tears,

The *marks* of Pyrrhus, or the Punic wars,  
Thought all past services rewarded well,  
If to their share at least two acres fell.

*Far.*  
—At present there are scarce any *marks* left of a  
subterraneous fire; for the earth is cold, and over-  
run with grass and shrubs. *Addis.* 3. A  
proof; an evidence.—As the confusion of tongues  
was a *mark* of separation, so the being of one

guage is a *mark* of union. *Bacon*.—The Argonauts sailed up the Danube, and from thence passed into the Adriatick, carrying their ship *Argo* upon their shoulders; a *mark* of great ignorance in geography among the writers of that time. *Arbuthnot*. 4. Notice taken.—

The laws  
Stand like the forfeits in a barber's shop,  
As much for mock as *mark*. *Shak.*  
5. Convenience of notice.—Upon the north sea bordereth Stow, so called, per eminentiam, as a place of great and good *mark* and scope. *Caresse's Storm of Cornwall*. 6. Any thing at which a missile weapon is directed.—France was a fairer *mark* to shoot at than Ireland, and could better reward the conqueror, *Davies on Ireland*.—

Be made the *mark*  
For all the people's hate, the prince's curses. *Denham*.  
7. The evidence of a horse's age.—At four years old cometh the *mark* of tooth in horses, which hath a hole as big as you may lay a pea within it; and weareth shorter and shorter every year, till at 8 years old the tooth is smooth. *Bacon's Nat. Hist.* 8. [*Marque*, Fr.] Licence of reprisals. 9. [*Marc*, Fr.] A sum of 10s. and 4d.—

We give thee for reward a thousand *marks*. *Shakefp.*  
—Thirty of these pence make a mancus, which some think to be all one with a *mark*, for that manca and mancus is translated, in ancient books, by marca. *Camden's Remains*.—Upon every writ for debt or damage, amounting to L.40 or more, a noble is paid to fine; and so for every 100 *marks* more a noble. *Bacon*. 10. A character made by those who cannot write their names.—

Here are maniere vows for signing;  
Set your *marks* that cannot write. *Dryden*.  
Lorenzo held the bargain with his *mark*. *Young*.  
(21.) **MARR** (M), *i. d. f.* is used among us for a money of account, and in some other countries for a coin. See **MONEY**. The Scottish mark is gold.  
(22.) **MARR**, or **MARCO**, denotes also a weight used in several states of Europe, and for several commodities, especially gold and silver. In France, before the revolution, the mark was divided into 8 ounces 24 drabms, 192 deniers or penny-weights, 160 sterlines, 300 mailles, 640 felines, or 2728 grains. In Holland, the mark weight was 240 called *Tropenlicht*, and is equal to that of France. When gold and silver are sold by the mark, it is divided into 27 carats.

(23.) **MARK**, ST. the Evangelist, was descended of the tribe of Levi. He is supposed to have been converted by St Peter, to whom he was a constant companion in all his travels, supplying the place of an amanuensis and interpreter. He was sent first into Egypt, fixing his chief residence at Alexandria, where he was so successful in his ministry, that he converted great multitudes. He afterwards removed southward toward Libya, preaching through Mauritania, Pentapontis, &c. where, notwithstanding the barbarity and idolatry of the inhabitants, he planted the gospel. Upon his return to Alexandria, he erected the church of that city, and there suffered martyrdom. About Easter, when the solemnities of *Exodus* were

celebrated, the idolatrous people beat St Mark, while he was performing duty, and, binding him with cords, dragged the streets, and thrust him into prison the night he had the comfort of a sleep. Next day they used him in the same worse, till he expired under their hands. It is added, that they burnt his body, and the Christians interred his bones and ashes near where he used to preach. This happened in the year 68. Some say, that his remains were translated from Alexandria to Venice, which has a rich and stately church erected in his memory, being the patron of the state.

(24.) **MARK**, ST. CANONS OF, a con-regular canons founded at Mantua by Spinola a priest, towards the end of the 17th century. Spinola made a rule for them, which was approved, corrected, and confirmed by succeeding popes. About the year 1743 reformed, and followed only the rule of the 1st. This congregation having flourished in the space of 400 years, declined by little and is now become extinct.

(25.) **MARK**, ST. GOSPEL OF, a canon of the New Testament, one of the 4 which St Mark wrote his gospel at Rome when he accompanied St Peter, A. D. 44. Tertullian asserts that St Mark was only amanuensis who dictated this gospel to him; others he wrote it after St Peter's death. Nor is it less divided as to the language it was composed in, some affirming that it was composed in Latin. Several of the ancient Fathers received only the gospel of St Mark; among the Catholics, rejected the rest of the New Testament. It is properly an abridgement of Matthew's.

(26.) **MARK**, ST. KNIGHTS OF, a military order in the late state of Venice, in honour of St Mark the evangelist. The members of the order wore gules, a lion passant guardant, on a shield. The word *mark* was never continued in the Italian language, some signal service to the Venetians.

(27.) **MARK**, ST. THE EVANGELIST, festival of the Christian church, celebrated the 25th of April.

(28.) **MARK**, ST. in geography, a province of Portugal, 24 miles S. of Port Fax. 21. M. Lat. 19. 18. N.

(29.) **MARK**, ST. a town and river in the north of the Christian church, situated at the head of Apalachy Bay in the province of St Augustine.

(30.) **TO MARK**, *gr. as. merken*, Dutch; Saxony; *marquer*, French; 1. To mark tokens or evidence.—

Will it not be said  
When we have *mark'd* with blood  
two

Of his own chamber, and used this word  
That they have denit?

—For our quiet possession of this world are naturally *marks* of where there is no *God*. 2. To notify as by a *mark*.—It was once the index to point out what *low mark* out that part of the water

of them resides. *Decay of Piety.* 3. To note; to take notice of.—

Alas, poor country!  
Where sighs, and groans, and shrieks, that rend the air,  
Are made, not mark'd. *Shak. Macbeth*  
—Mark them which cause divisions contrary to the doctrine which ye have learned, and avoid them. *Rom. xvi. 17.* 4. To heed; to regard as valid or important.—

Now swear, and call to witness  
Heav'n, hell, and earth, I mark it not from one  
That breathes beneath such complicated guilt. *Smith.*

(2.) \* To MARK. *v. n.* To note; to take notice.—Men mark when they hit, and never mark when they miss, as they do also of dreams. *Bacon's Essays.*—Mark a little why Virgil is so much concerned to make this marriage; it is to make way for the divorce which he intended afterwards. *Dryden.*

MARKAY, a town of Sweden, in Smaland.  
MARKED, *part. adj.* a kind of unmeaning expressive, or at best ambiguous superlative, very much used in modern metaphorical language, and even of late introduced into our parliamentary debates, by some celebrated popular orators. That eminent critic and philologist, however, the late Prof. J. H. BEATTIE, ranks this fashionable use of it among the many instances of "vulgarity, peevishness, and barbarism," with which our modern English is disgraced, and which he has humorously ridiculed in his *Dialogue in the Shades*, between Swift, a Bookfeller, and Mercury. After introducing the bookfeller as boasting that he was "of such marked regularity in his conduct, that no man could charge him with a single act of inobedience," &c. he makes Mercury give Swift the following among other instructions, "to make English of the *newest and best pattern*;"—"Instead of an authentic narrative, you must say a narrative marked with authenticity. Indeed the words *line, neat, marked, feel, go,* and some others, may be used on all occasions, whether they have meaning or not; as—He was received with marked applause, marked insult, marked contempt, marked admiration," &c. See LINE, § 5; To MEFET, &c.

\* MARKER. *n. f.* [*marqueur*, French, from *mark*.] 1. One that puts a mark on any thing. 2. One that notes, or takes notice.

MARKERSDORF, a town of Upper Saxony.  
(1.) \* MARKET. *n. f.* [anciently written *mercatus*, of *mercatus*, Latin.] 1. A publick time, and appointed place, of buying and selling.—It were good that the privilege of a market were given, to enable them to their defence; for there is nothing soth sooner cause civility than many market towns, by reason the people repairing often thither will learn civil manners. *Spenser.*

Mistress, know yourself, down on your knees,  
And thank Heav'n, fasting, for a good man's love:  
For I must tell you friendly in your ear,  
Sell when you can, you are not for all markets. *Shak.*

—They counted our life a passing, and our time were a market for gain. *Wisd. xv. 12.*—If one bushel of wheat and two of barley will, in the mar-

ket, be taken one for another, they are of equal worth. *Locke.* 2. Purchase and sale.—With another year's continuance of the war, there will hardly be money left in this kingdom to turn the common markets, or pay rents. *T. ple.*—

Pepper and Sabzan incense take,  
And with post-haste thy running market make;  
Be sure to turn the penny. *Dryden.*  
3. Rate; price. [*market*, French.]—

Was blood and life at a low market sold. *Dryden.*  
(2.) MARKET is also used for a privilege, either by grant or prescription, by which a town is enabled to hold a market.

(3.) The MARKET, COURT OF THE CLERK OF, an officer incident to every fair and market in England, to punish misdemeanors therein. A court of PLE-POUDRE is to determine all disputes relating to private or civil property. The object of this jurisdiction (see stat. 17. Car. II. cap. 19. 22 Car. II. cap. 8. 23 Car. II. cap. 12.) is principally the cognizance of weights and measures, to try, whether they be according to the true standard thereof or no: which standard was anciently committed to the custody of the bishop, who appointed some clerk under him to inspect the abuse of them more narrowly; and hence this officer, though now usually a layman, is called the clerk of the market.—If they be not according to the standard, then, beside the punishment of the party by fine, the weights and measures themselves ought to be burnt. This is the lowest court of criminal jurisdiction in England.

\* To MARKET. *v. n.* To deal at a market; to buy or sell; to make bargains.

\* MARKETABLE. *adj.* [from *market*.] 1. Such as may be sold; such for which a buyer may be found.—

A plain fish, and no doubt marketable. *Shak.*  
2. Current in the market.—The pretorian soldiers arrived to that impudence, that after the death of Pertinax they made open sale of the empire, as if it had been of common marketable wares. *Decay of Piety.*—The marketable value of any quantities of two commodities are equal, when they will exchange one for another. *Locke.*

\* MARKET-BELL. *n. f.* [*market and bell*.] The bell to give notice that trade may begin in the market.—

Enter, go in, the market-bell is rung. *Hen. VI.*  
MARKET-BOW-WORTH. See BOW-WORTH.

\* MARKET-CROSS. *n. f.* [*market and cross*.] A cross set up where the market is held.—

These things you have articulated,  
Proclaim'd at market-crosses, read in churches,  
To face the garment of rebellion  
With some fine colour. *Shak.*

\* MARKET-DAY. *n. f.* [*market and day*.] The day on which things are publickly bought and sold.—

Fool that I was, I thought imperial Rome,  
Like Mantua, where on market-days we come,  
And thither drive our lambs. *Dryden.*  
—He ordered all the Luquesse to be seized that were found on a market-day in one of his frontier towns. *Addison.*

MARKET-DEEPING. See DEEPING, N° 1.

MARKET-DRAYTON. See DRAYTON, N° 2.  
MARKET-END, a small town of Oxfordshire, near Ameriden.

\* MARKET-FOLKS. *n. f.* [*market* and *folks.*] People that come to the market.—

Poor *market-folks* that come to sell their corn. *Shak.*

MARKET-HARBOROUGH. See HARBOROUGH, N° 1.

MARKET-HILL, a post town of Ireland, in Armagh, Ulster; much celebrated in the poetical works of Dean Swift; being situated near Gosford Castle, the seat of his friend Sir Arthur Acheson.

MARKET-JEW. See MERAZION.

\* MARKET-MAN. *n. f.* [*market* and *man.*] One who goes to the market to sell or buy.—

Be wary how you place your words,

Talk like the vulgar sort of *market-men*,  
That come to gather money for their corn. *Shak.*  
—The *market-man* should act as if his master's whole estate ought to be applied to that servant's business. *Swift.*

\* MARKET-MAID. *n. f.* [*market* and *maid.*] A woman that goes to buy or sell.—

You are come

A *market-maid* to Rome, and have prevented  
The ostentation of our love. *Shak.*

MARKET-OVERTON. See OVERTON.

\* MARKET-PLACE. *n. f.* [*market* and *place.*] Place where the market is held.—The king, thinking he had put up his sword, because of the noise, never took leisure to hear his answer, but made him prisoner, meaning the next morning to put him to death in the *market-place.* *Sidney.*

The gates he ordered all to be unbarr'd,  
And from the *market-place* to draw the guard. *Dryden.*

Behold the *market-place* with poor o'erspread,  
The man of Rofs divides the weekly bread. *Pope.*

\* MARKET-PRICE. MARKET-RATE. *n. f.* [*market* and *price* or *rate.*] The price at which any thing is currently sold.—Money governs the world, and the *market-price* is the measure of the worth of men as well as of fishes. *L'Es/trange.*—He that wants a vessel rather than lose his market will not stick to have it at the *market-rate.* *Locke.*

MARKET-RAISIN, a town of Lincolnshire, with a market on Thursday; 16½ miles NNE. of Lincoln, and 151 N. of London.

\* MARKET-TOWN. *n. f.* A town that has the privilege of a stated market; not a village.—Nothing doth sooner cause civility in any country than *market-towns*, by reason that people repairing often thither will learn civil manners of the better sort. *Spenser.*—No, no, the pope's mitre my master Sir Roger seized, when they would have burnt him at our *market-town.* *Gay.*

MARKHAM, Gervase, an English author, the son of Robert Markham of Gotham, Esq. in Nottinghamshire. He bore a captain's commission under Charles I. in the civil wars, and was esteemed both a good soldier and a good scholar. He was master of the French, Italian, and Spanish. He wrote, 1. The tragedy of Herod and Antipater; printed in 1622. 2. Many volumes upon husbandry and horsemanship. 3. A tract on the

art of fowling. 4. The soldiers' accident and grammar.

MARKINCH, a parish of Fifeshire, 5½ miles long from N. to S. and about 5 broad, of an irregular form, comprehending 7,000 acres, almost all arable. It consists of 4 valleys, separated by gently swelling hills, and watered by the Orr and the LEVEN. The climate is mild and salubrious; the soil is partly strong clay, partly light loam, rich and fertile; but the greater part is wet and tilly. Oats, barley, bear, and *blanded bear* or *rammel*, are the chief crops; the barley having 2 rows of grain and the bear 6. The *blanded bear* is a kind of *Hybrid* plant, (See BOTANY, *Ind.*) produced by the two species being sown mixed, and the pollen of each falling on both. The population, in 1793, was 2790; increase 602, since 1755. Sheep were formerly numerous, but are now nearly banished, to make room for horses and black cattle which are reared in great numbers. The roads and bridges are good. Free-stone, shell marl, and coals abound. See BALBIRNIE, N° 1; and BALGONN, N° 1. The principal antiquity is Balgonie Castle. See BALGONIE, N° 4. There are 25 mills, of which 14 are for corn and barley; but millraces are still exacted. A considerable manufacture of lintseed oil is carried on; and great quantities of linen are whitened at the bleachfield. There are 7 villages and 7 schools in the parish; some of them patronised by Lady Balgonie, and all very flourishing. The well known taverns, called the *New Inn*, and the *Plasterers*, are in this parish.

(2.) MARKINCH, a village in the above parish, on the S. declivity of a small hill, surrounded by a marsh; from which *insular* situation, and *mark* or *merk*, the ancient value of the ground, the name is derived. It lies 4 miles S. of Falkland. Its chief manufactures are stockings, checks, and ticks.

MARKLAND, Jeremiah, one of the most learned scholars and penetrating critics of his age, was born in 1692, and educated in Christ's hospital. He became first publicly known by his *Epistole Criticae*, addressed to Bp. Hare. In this he gave many proofs of his extensive erudition. He afterwards published an edition of Statius, and some plays of Euripides; and assisted Dr Taylor in his editions of Lyfias and Demosthenes, by notes. He also elucidated some passages in the New Testament, which may be found in Mr Bowyer's edition of it; and was author of a very valuable volume of remarks on the epistles of Cicero to Brutus, and of an excellent treatise entitled *Magis Grammatica*. He died in 1775, at Milton, near Dorking in Surry; and was equally valued for his learning, goodness, and primitive simplicity of manners.

\* MARKMAN. } *n. f.* [*mark* and *man.*] A man

\* MARKSMAN. } skilful to hit a mark.—

In sadness, cousin, I do love a woman.

—I aim'd so near when I suppos'd you lov'd.

—A right good *marksman.* *Shak.*

This is the *mark/man*, safe and sure,

Who still is right, and prays to be so still. *Herber.*

—An ordinary *marksman* may know certainly when he shoots less wide at what he aims. *Dryden.*

(1.) \* MARK. *n. f.* [*mark*, Welsh; *merch*, Dutch.]

*marga*, Latin; *marle, marnes*, Fr. in Saxon, *merg*, is marrow, with an allusive signification, *marle* being the fatness of the earth.] *Marl* is a kind of clay, which is become fatter, and of a more enriching quality, by a better fermentation, and by its having lain so deep in the earth as not to have pent or weakened its fertilizing quality by any product. *Marl* is supposed to be much of the nature of chalk, and is believed to be fertile from its salt and oily quality. *Quincy*.—We understand by the term *marls* simple native earths, less heavy than the boles or clays, not soft and unctuous to the touch, nor ductile while moist, dry and crumbly between the fingers, and readily diffusible in water. *Hill*.—*Marl* is the best compost, as having most fatness, and not heating the ground too much. *Bacon's Nat. History*.—

Uneasy steps

Over the burning *mar'*, not like those steps

On heav'n's azure. *Milton*.

(2.) **MARL, or MARLE**, a kind of calcareous earth, very much used in agriculture as a manure. See RURAL OECONOMY. Marl is dug in many places of Great Britain and Ireland. In digging for it in Ireland, they meet with horns and other curious fossils. The marl always lies in the bottoms of low bog, and is found by boring with augers made for that purpose. It usually lies at 5, 7, or 9 feet deep. The obtaining it in many places is attended with very considerable expence in draining off the water. The manner of digging for it is this; six able labourers and a supernumerary, cut up a hole of 12 feet square, which is a pit that this number of men can manage in one day. Two men dig, two throw it up, and two throw it by, and the supernumerary man supplies defects on all occasions. For the first three feet they dig through a furzy earth, fit for making turf or fuel. Under this lies a stratum of gravel, of about half a foot; under this often, for 3 feet more, there is a more kindly moss, which would make better fuel. This lower stratum is always full of fossile wood, which is usually so soft that he spade cuts as easily through it as through the earth it lies in. Under this, for the thickness of about 3 inches, is found a series of leaves, principally of the oak. These appear very fair to the eye, but fall to pieces on being touched; and this stratum is sometimes interrupted by vast heaps of seed, of broom or furze. In some places there appear berries of different kinds, and in others several species of sea-plants; all lying in the same confused manner as the oak leaves. Under this vegetable stratum lies one of blue clay, half a foot thick, and usually full of sea shells. This blue clay is not so tough as common clay; but is thrown carefully up, and used as marl in some places. Under this always appears the true marl; the stratum of which is usually from 2 to 4 feet thick, and sometimes much more.—This marl looks like buried lime, and is full of shells, which are usually of a small size, and of the periwinkle kind; but there are several other sorts at times found among them. Among this marl, and often at the very bottom of it, are found great numbers of very large horns of the deer kind, vulgarly called *elk's horns*. These, where they join to the head, are thick and round; and at that joining

there grows out a branch, which is about a foot long, and seems to have but one joint just over the creature's eyes: it grows still round for about a foot above this; and then spreads out broad, and terminates in branches long and round, terminating with a small bend. The labourers are obliged to work in a hurry in all these pits, so that they seldom bring out the horns whole. There are also, at times, found the leg-bones and other parts of the skeletons of the same beasts; but this more rarely, only a few together, and but in few places. Dr Black is of opinion, that all kinds of marl derive their origin from the calcareous matter of shells and lithophyta. SHELL MARL, says he, is composed of the shells of aquatic animals, which are sometimes very entire, and often decayed or mixed down with other earthy substances. Examining this matter as occurring in different places, it may be distinguished into fresh water marl, and the marl of sea-shells. Of the first we have an example in the Meadow at Edinburgh. Wherever the soil is turned up to the depth of six inches, a quantity appears. It is composed of the shells of a small fresh-water snail or wick. This animal, when alive, is not easily discernible, the shell being much of the same obscure colour as the stones covered with the water. But we can observe a great number of them in all running brooks and other collections of fresh water; and as the animal dies, the shells are deposited where the water stagnates in very great quantity. That composed of sea shells, constitutes greater collections that are found in innumerable places now far removed from the sea. That most particularly described by Reaumur is a collection of this kind in a province of France, and at Turin. That part of the country where it is found is computed to contain 80 square miles of surface; and wherever they dig to a certain depth, they find this collection of shells: the country at present is 108 miles from the sea. They find the marl 8 or 9 feet below the surface, and they dig it to the depth of 20 feet. It is still deeper, but they find it too expensive to search for it. He supposes it to be only 18 feet deep; and even at this depth the quantity will appear enormous. It will amount to 140 millions of cubic fathoms of shells that are mostly decayed and broken into fragments, and mixed with other marine productions, as millipores, madripores, and other coralline bodies, which are all productions of the the sea.

(3.) **MARL, CALCINATION OF.** The qualities of marl have been proved by chemical analysis to be precisely the same with those of LIME. The similarity of the two has been still farther evinced by George Dempster, Esq. of Dunnichen, who constructed a kiln on a plan suggested by Dr Black for calcining marl; which, after calcination, makes a very strong cement. Dr Black, in a letter to Mr Dempster, dated 28th Nov. 1789, gave the following directions for constructing the kiln, and calcining the marl:—"In a country where the only fuel is peat, I have no hopes of success;—but in a kiln in which the masses of marl would be little disturbed, the operation will succeed. I would prepare the marl as the harder kinds of peat are prepared, by laying it, while soft, on a plot of grass, and forming it into a bed some inches

T t t t 2 thick;

thick; this, while drying, may be compacted, by beating it with the flat of the spade; and, before it be quite dry, it may be cut into pieces of the size of peats. The kiln for burning it should have nearly the shape of a draw kiln, or a much deeper cylindrical cavity than the vulgar lime-kilns: It may be from 20 to 30 feet deep, and from 8 to 9 feet in diameter; the top of it should be covered with a dome, or arch, having an opening at top, 3 feet diameter, to let out the smoke, &c. and a door in the side of this dome for introducing the materials: At the bottom, where the kiln is a little contracted, should be a grate 5 feet square, the bars of which, being loose, might be drawn out occasionally. In charging this kiln, lay first 18 inches depth of peats over the whole grate; then throw in prepared marl and peats intermixed, until the kiln is filled to the top; and at the top of all there should be some peats without any marl. Then shut up the door at the top with stones and mud, and throw in the kindling at the vent of the dome. The fire will be slowly communicated from the top to the bottom, so as to char the whole peats, and to expel the remains of humidity from the masses of marl; and this will be accompanied with very little consumption of the inflammable matter; but, when the whole is charred, it will begin to burn with abundance of heat, first at the bottom, and gradually upwards, until all the peats are completely consumed: Then by drawing the bars of the grate, the kiln may be drawn.—To know when the marl is thoroughly burnt, slake the lime with water, when fresh drawn from the kiln, and try if the slaked lime will dissolve in aqua-fortis, or spirit of salt, without effervescence." (Sir J. Sinclair's *Stat. Acc.* Vol. I. p. 426, 427.) This discovery must prove useful in situations where marl abounds, and where lime cannot be obtained but from a great distance.

(1.) \* To MARL. *v. a.* [from the noun.] To marlure with marl.—Improvements by *marling*, lining, and draining, have been since money was at five and six per cent. *Child.*—Sandy land *marled* will bear good pease. *Mortimer.*

(2.) \* To MARL. *v. a.* [from *marline*.] To fasten the sails with *marline*. *Ainsworth.*

(1.) MARLBOROUGH, an ancient town of Wiltshire, near the source of the Kennet, at the foot of a chalky hill; so named from its chalky soil, formerly called *marl*. It was a Roman station. In 1627, a parliament was held in the castle here, which made those laws called *Marlborough statutes*. There are still some remains of its walls and ditch. The town is an ancient borough by prescription, and sends 2 members to parliament. It is governed by a mayor, 2 justices, 12 aldermen, 24 burgesses, a town-clerk, &c. It consists chiefly of one broad street, with piazzas all along one side of it, two churches and several commodious inns, being the grand thoroughfare from London to Bath and Bristol. To the S. are some relics of a priory, and the site of a Roman Castrum, where Roman coins have been discovered. The ditch is still in some parts 20 feet wide; and towards the river, without the garden walls, one angle of the Castrum is very visible with the rampart and ditch entire. The mount at the W. end of the town, which was the main-guard of the

castle, is converted into a pretty spiral walk; at the top of which is an octagon summer-house. This town has often suffered by fire, particularly in 1690. It has markets on Wed. and Sat. and 5 fairs; with a charity school, erected in 1712, for 44 children. It lies 43 miles E. of Bristol, and 74 W. of London. Lon. 1. 26. W. Lat. 51. 28. N.

(2.) MARLBOROUGH, D. of. See CHURCHILL, N<sup>o</sup> 2.

(3.) MARLBOROUGH, a county of S. Carolina, in Cheraws district; bounded N. and NE. by N. Carolina, SE. by George-town district, and SW. by the Great Pedee. It is 25 m. long and 19 broad.

(4.) MARLBOROUGH, a town of Pennsylvania, 28 miles WSW. of Philadelphia.

(5.) MARLBOROUGH, a post town of New Hampshire, in Cheshire county, 428 miles N. by E. of Philadelphia.

(6.) MARLBOROUGH FORT, an English factory on the W. coast of Sumatra, in Asia; 3 miles W. of Bencoolen. Lon. 101. 12. W. Lat. 4. 21. S.

(7.) MARLBOROUGH, LOWER, a town of Maryland in Calvert County, on the E. bank of the Patuxent; 3 miles S. by W. of Annapolis.

(8.) MARLBOROUGH, UPPER, a town of Maryland, the capital of Prince George's county; 47 miles SSW. of Baltimore.

(1.) MARLE. See MARL.

(2.) MARLE, a town of France, in the dep. of the Aisne, 13½ miles S. of Laon.

MARLHEIM, a town of France, in the dep. of the Lower Rhine; 9 miles W. of Strasburg.

MARLHES, a town of France, in the dep. of Rhone and Loire; 10 miles S. of St Etienne.

MARLI. See MARLY, N<sup>o</sup> 1—5.

MARLIEUX, a town of France, in the dep. of Ain, 10½ miles SSW. of Bourg en Bresse.

(1.) \* MARLINE. *n. f.* [*marra*, *Skinner*.] Long wreaths of untwisted hemp dipped in pitch, with which the ends of cables are guarded against friction. —

Some the gall'd ropes with dawby *marline* bind,  
Or searcloth masts with strong tarpawling cunts.  
*Dryd.*

(2.) MARLINE also serves in artillery upon ropes used for rigging gins, usually put up in small parcels called *rains*.

\* MARLINESPIKE. *n. f.* A small piece of iron for fastening ropes together, or to open the bolt rope when the sail is to be sewed in it. *Beij.*

MARLOE, Christopher, an English dramatic author, who studied at Cambridge; but afterwards turning player, he trode the same stage with Shakspeare. He was accounted an excellent poet by Ben Jonson. He wrote six tragedies, one of which called *Luff's Dominion*, or the *Leicester's Quest* has been altered by Mrs Behn, and acted under the title of *Abdelazar*, or the *Moor's Revenge*. Some time before his death, he had made a considerable progress in an excellent poem entitled *Hero and Leander*; afterwards finished by George Chapman, who is said to have fallen short of the spirit and invention of Marloe. Mr Anthony Wood represents him as a free-thinker, in the worst sense of the word; and gives the following account of his death. Falling deeply in love with a low girl, and having for his rival a fellow as low-very, Marloe, imagining that his mistress granted

him favours, was fired with jealousy, and rushed upon him in order to stab him with his dagger; but the footman avoided the stroke, and, seizing his wrist, stabbed him with his own weapon; of which wound he died, in 1593.

**MARLOW**, a town of Buckinghamshire, under the Chiltern Hills, in a marly soil. It is a pretty large borough, and has a bridge over the Thames, near its conflux with Wycomb; a handsome church and town-hall, and a charity-school for 20 boys. It first sent members to Parliament in the reign of Edward II. Bone lace is its chief manufacture. The Thames brings goods hither from the neighbouring towns; great quantities of meal and malt from High Wycomb, and beech from several parts of the country. In the neighbourhood are frequent horse-races; and here are several corn and paper mills, particularly on the river Loddon, between this town and High-Wycomb. There are, besides, the Templemills, for making thimbles, and another for pressing oil from rape and flax seeds. Its market is on Sat. and fair Oct. 29. It is 17 miles S. of Aylesbury and 31 W. of London. Lon.  $0. 45. W.$  Lat.  $51. 35. N.$

\* **MARLPIT**. *n. f.* [*marl* and *pit*.] Pit out of which marl is dug.—Several others, of different figures, were found; part of them in a rivulet, the rest in a *marlpit* in a field. *Westward.*

(1.) **MARLY**, a town of France, in the dep. of Aisne; 6 miles E. of Guise, and 6 NW. of Ver- vins.

(2-5.) **MARLY**, or **MARLI**, a palace of France between Versailles and St Germain; seated in a valley, near a town and forest of the same name, in the dep. of Seine and Oise. It is noted for its fine gardens and water-works, there being a curious machine on the Seine, which not only supplies them with water, but also those of Versailles. It is 10 miles NW. of Paris. Lon.  $2. 11. E.$  Lat.  $48. 52. N.$

(6.) \* **MARLY**. *adj.* [from *marl*.] Abounding with marl.—The oak thrives best on the richest clay, and will penetrate strangely to come at a *marly* bottom. *Mortimer.*

**MARMAGNAC**, a town of France in the dep. of Cantal, 3 miles E. of Aurillac.

**MARMACNE**, a town of France, in the dep. of Cher, 4 1/2 miles W. of Bourges.

(1.) \* **MARMALADE**. **MARMALET**. *n. f.* [*marmalade*, Fr. *marmelo*, Portuguese, a quince.] *Marmalade* is the pulp of quinces boiled into a consistence with sugar: it is subsistingent, and grateful to the stomach. *Quincy.*

(2.) **MARMALADE** is a confecti<sup>o</sup>n of plums, apricots, quinces, &c. boiled up to a consistence with sugar. In this country, it is made of Seville oranges and sugar only.

**MARMANDE**, a town of France, in the dep. of Lot and Garonne, and ci-devant prov. of Guienne, and territory of Agenois. It carries on a great trade in corn and wine, and is seated on the Garonne. Lon.  $0. 16. E.$  Lat.  $38. 35. N.$

**MARMARDANS**, a people of Lycaonia, estimated by Alexander the Great. See **MACERON**, § 11.

**MARMARICA**, a country of Africa, anciently inhabited by the Libyans. It was bounded on the E. by Egypt, on the W. by Cyrenica, on the S. by Sarcis, or the desert of Libya Interior, and on

the N. by the Mediterranean; and was reckoned a part of Egypt. There is no distinct history of the country.

**MARMARUGLO**, a town of the Italian republic, in the dep. of the Mucio, district and late duchy of Mantua; 8 miles N. of Mantua.

**MARMION**, Snakerley, a dramatic writer, born in Northamptonshire, in 1602, and educated at Oxford. He wrote 4 comedies: viz. 1. Holland's League, 1632: 2. A Fine Companion; acted before the king at Whitehall: 3. The Antiquary; 1641: and The Soldier'd Citizen: all in 400. He died in 1659.

(1.) **MARMOR**. See **MARBLE**.

(2.) **MARMORE LUNENSE**. See **LUNENSE**.

(1.) **MARMORA**, the name of 4 islands of Asia, in the sea of the same name. The largest is about 30 miles in circumference; and the soil of them all produces corn, wine, and fruits.

(2.) **MARMORA**, THE SEA OF, a large gulph, which communicates both with the Archipelago and the Black Sea by that of Constantinople, being 120 miles long, and 50 broad. All ships must pass through it that sail to Constantinople from the Mediterranean. It was anciently called **PRO- PONTIS**.

\* **MARMORATION**. *n. f.* [*marmor*, Lat.] Incrustation with marble. *Dict.*

\* **MARMOREAN**. *adj.* [*marmoreus*, Latin.] Made of marble. *Dict.*

**MARMORICA**. See **MARMARICA**.

\* **MARMOSET**. *n. f.* [*marmoset*, French.] A small monkey.—

I will instruct thee how

To snare the nimble *marmoset*. *Slak.*

(1.) \* **MARMOT**. } *n. f.* [Italian.] The

(1.) \* **MARMOTTO**. } *marmotto*, or mus alpinus, as big or bigger than a rabbit, which abounds all winter, doth live upon its own fat. *Ray on Creation.*

(2.) **MARMOTTO**, **MARMOTA**, or **MARMOT**, a genus of quadrupeds of the class **Mammalia**, and order of **Glinex**, ranked by Linnæus under the Genus of **MUS**, or *Marine Quadrupeds*, but very properly separated and described as a distinct genus, under the name of **ARCTOMYS**, by Mr Pennant, Dr Gmelin and Mr Kerr. But as we are past that article in the order of the alphabet, and under it have only described a particular species from Chambers's *Cyclopaedia*, we must adhere to Linnæus's arrangement, and refer the reader for a description of the different species of the *Arctomys* or *Marmot*, to the article **MUS**.

**MARMOUTIER**, a town of France in the dep. of the Lower Rhine, 15 m. WNW. of Straßburg.

**MARNAY**, a town of France, in the dep. of the Upper Saône; 10 1/2 miles W. of Besançon.

(1.) **MARNE**, a town of Persia, in the prov. of Chorasan, 70 leagues N. of Herat.

(2.) **MARNE**, a town of Germany in Holfstein.

(3.) **MARNE**, a river of France, which rises in the dep. of Upper Marne, 3 miles E. of Langres, passes by Chaumont, St Dizier, Vitry Châlons, Epervay, Chateau Thierry, Meaux, and Lagny, and joins the Seine at Charenton.

(4.) **MARNE**, a department of France, comprehending part of the ci-devant prov. of **CHAMPAGNE**; bounded on the E. by the dep. of the

*Meuse.*

Meuse; S. by that of Aube; SW. by that of Upper Maine; W. by those of the Seine and Marne, and of the Aisne; and N. by those of Aisne and Ardennes. It is 60 miles long from E. to W. and 45 broad from N. to S. Chalons is the capital.

(5.) MARNE, UPPER, a department of France comprehending part of the late prov. of Champagne; bounded on the NE. by those of the Meuse and the Vosges; SE. by that of Upper Saone; S. and SW. by that of Cote d'Or; and W. by that of Aube. It is 70 miles long from NE. to SW. and from 22 to 35 broad. The chief city is Chaumont.

MARNHULL, a village in Dorsetshire, on the Stour 5 miles S. of Shaftesbury; remarkable for its lofty church, full of ancient inscriptions.

(1.) MARNOCII, a parish of Scotland, in Banffshire, on the N. bank of the Doveron, about 10 miles long, and from 4 to 5 broad. The surface is level; the soil partly rich loam, partly wet and stoney; but producing good crops of oats, barley, pease, potatoes, and turnips. Great quantities of grain, butter and cheese, are exported, as well as considerable numbers of cattle. There are several extensive and flourishing plantations of oak, fir, larch, pine, beech, elm, &c. The air is salubrious. The population, in 1791, was 1960; increase 66, since 1755. Alexander Gordon, Esq; of Auchentoule, who served under the czar, Peter I. of Russia, and showed great valour in the war against Charles XII, for which he was raised to the rank of major general, was a native of this parish, and wrote the *History of Peter the Great*.

(2.) MARNOCII, ST. See KILMARNOCK, N° 1.

(1, 2.) MARO, a town and village of the Ligurian republic, on the coast, in the late principality of Oneglia; 8 miles NW. of Oneglia, and 48 WSW. of Genoa. Lon. 7. 41. E. Lat. 44. 55. N.

(3, 4.) MARO. See MARONITES & VIRGILIUS.

MAROBUDUM, in ancient geography, the royal residence of Marobudus, king of the Marcomanni; and hence the appellation. Now thought to be *Prague*, the capital of Bohemia.

MAROGNA, a town of Turkey, in Romania.

MAROILLES, a town of France, in the dep. of the North; 3 miles NE. of Landrecy.

(1.) MAROLLES, Michael DE, born in 1600, was the son of Claude de Marolles, a French military hero. Michael, entered early into the ecclesiastical state, and by the interest of his father obtained two abbeys. From 1619, when he published a translation of Lucan, to 1681, the year of his death, he was constantly employed in writing and printing; but his translations of ancient Latin writers, especially of the poets, are deficient in taste and spirit. He was certainly, however, a man of great learning, and was one of the first who paid any attention to prints. He collected about 100,000, which made part of the ornaments of the late French king's cabinet; and are now in the National Museum. He wrote memoirs of his own life, which were published by the Abbe Goujet, 1755, in 3 vols.

(2.) MAROLLES, a town of France, in the dep. of Aube, 6 miles N. of Bar sur Seine.

(3.) MAROLLES, a town of France, in the dep. of Loire and Cher; 6 miles N. of Blois.

(4.) MAROLLES, a town of France, in the dep. of Sarthe, 7 miles S. of Mamers.

MARONITES, in ecclesiastical history, a sect of eastern Christians, who follow the Syrian rite, and are subject to the pope; their principal habitation being on mount Libanus. Mosheim says, that the doctrine of the MONOTHELITES, condemned by the council of Constantinople, was adopted by the *Mardaites*, a people who inhabited mounts Libanus and Antiubanus, and who, about the conclusion of the 7th century, were called *Maronites*, after *John Maro* their first bishop, who was originally a monk in the famous convent of St Maro, upon the banks of the Orontes. Tyrius and others, as well as the most authentic records, inform us, that the Maronites retained the opinions of the Monothelites until the 12th century, when, renouncing the doctrine of one will in Christ, they were re-admitted, in 1182, into the Roman church. Faustus Nairo, a Maronite settled at Rome, has published an apology for Maron and the rest of his nation. He says that they took their name from Maron, who lived about A. D. 400, and is mentioned by Chrysostom, Theodoret, and in the Menologium of the Greeks. He adds, that the disciples of this Maron spread themselves throughout all Syria; that they built several monasteries, and, among others, one that bore the name of their leader; that all the Syrians who were not tainted with heresy took refuge among them; and that for this reason the heretics of those times called them Maronites. Mosheim says, that the subjection of the Maronites to the spiritual jurisdiction of the Roman pontiff was agreed to, with this express condition, that the pope should not pretend to change or abolish any thing that related to their ancient rites, moral precepts, or religious opinions; so that in reality there is nothing among the Maronites that favours of popery, if we except their attachment to the Roman pontiff, who was very dear for their friendship. For, as the Maronites live in the utmost poverty, under the tyrannical yoke of the Mahometans, the pope is under the necessity of furnishing them with such subsidies as may appease their oppressors, procure a subsistence for their bishop and clergy, provide for the support of their churches, and the exercise of public worship, and contribute in general to lessen their misery. It is certain that there are Maronites in Syria, who still regard the church of Rome with the greatest abhorrence. One body of these non-conforming Maronites retired into the valleys of Piedmont, where they joined the Waldenses; another, above 600 in number, with a bishop and several ecclesiastics at their head, fled into Corsica, and implored the protection of the republic of Genoa against the violence of the inquisitors. The Maronites have a patriarch, who resides in the monastery of Cannubin, on mount Libanus, and assumes the title of patriarch of Antioch, and the name of *Peter*, as if he were the successor of that apostle. He is elected by the clergy and the people, but confirmed by the pope. He observes a perpetual celibacy, as well as the bishops his suffragans; but the rest of the

ecclesiastics are allowed to marry before ordination, though the monastic life is in great esteem among them. Their monks are of the order of St Anthony, and live in the most obscure places in the mountains. As to their faith, they agree in the main with the eastern church. Their priests do not say mass singly, but all together, standing round the altar. They communicate in unleavened bread; and the laity have hitherto partaken in both kinds, though the practice of communicating in one has of late been getting footing, having been introduced gradually. In Lent they eat nothing, after sun-rising; their other fastings are very numerous.

To MAROON, *v. a.* to put one or more sailors ashore upon a desolate island, under pretence of their having committed some great crime. This detestable expedient has been repeatedly practised by some inhuman commanders of merchant ships, particularly in the West Indies.

MAROSTICA, a town of Maritime Austria, in the Vicentino; 11 miles N. of Vicenza.

(1, 2.) MAROT, Clement, the best French poet of his time, was born at Cahors in 1495; and was the son of John Marot, valet de chambre to Francis I. and poet to Q. Anne of Brittany. He enjoyed his father's place, and in 1521, followed Francis I. into Italy, and was wounded and taken prisoner at the battle of Pavia. On his return to Paris he was accused of heresy, and imprisoned; but delivered by Francis I. He retired to Navarre and afterwards to Ferrara, and in 1536 returned to Paris; but declaring for the Calvinists, he was obliged to fly to Geneva; and retiring to Piedmont, died at Turin in 1544, aged 49. He translated part of the Psalms into verse, which were continued by Beza, and are still sung in the Protestant churches abroad.

(3.) MAROT, Michael, son of Clement, was also the author of some verses; but they are not comparable to those of his father and grandfather. The works of the three *Marots* were collected and printed together at the Hague in 1731, in 3 vols. 8vo, and in 6 vols. 12mo.

MAROTIER, a town of France, in the dep. of the Lower Rhine, and adjacent prov. of Alsace; 18 miles NW. of Straiburg. Lon. 7. 33. E. Lat. 48. 38. N.

MAROZZO, a town of Naples in Abruzzo.

(1.) MARPURG, or MARKBURG, a strong town of Germany, in Hesse-Cassel, with an university, a castle, a palace, a handsome square, and a magnificent town-house. It is seated on the Lahn, in a pleasant country, 15 miles S. of Waideck, and 7 SW. of Cassel. Lon. 8. 53. E. Lat. 52. 42. N.

(2.) MARPURG, a handsome town of Germany, in Lower Stiria, seated on the Drave, 25 miles W. of Grez, and 6 NE. of Laubach. Lon. 6. 10 E. Lat. 46. 42. N.

MARQUARD, Froher, an eminent German citizen, born at Augsburg in 1665. He studied at Bourges, under the learned Cujas; and acquired great skill in literature, and the laws. At his return to Germany, he became counsellor to the elector Palatine, and professor of law at Heidelberg; and was afterwards sent by the elector Frederic IV. as his minister, into Poland, to Mentz, and several

other courts. He died at Heidelberg in 1614. He wrote many works which are esteemed; the principal of which are, 1. *De re monetaria veterum Romanorum, et hiberni apud Germanos imperii.* 2. *Rerum Bohemicarum scriptores.* 3. *Rerum Germanicarum scriptores.* 4. *Corpus historię Franciæ,* &c.

MARQUAYS, a town of France, in the dep. of Dordogne; 5 miles NW. of Sarlat.

MARQUE, or LETTERS OF MARQUE, in military affairs, are letters of reprisal, granting the subjects of one prince or state liberty to make reprisals on those of another. They are so called from the German *marcke*, *i. e.* *limit, frontier*; as being *jus concessum in alterius principis marchas seu limitis transeundi, subinde jus faciendi*; as being a right of passing the limits or frontiers of another prince, and doing one's self justice. Letters of marque among us are extraordinary commissions granted by authority for reparation to merchants taken and despoiled by strangers at sea; and reprisals are only the retaking, or taking of one thing for another. (See PREROGATIVE.) The form in these cases is, the sufferer must first apply to the lord privy seal, and he shall make out letters of request under the privy seal; and if, after such request of satisfaction made, the party required do not, within convenient time, make due satisfaction or restitution to the party grieved, the lord chancellor shall make him out letters of marque under the great seal; and by virtue of these he may attack and seize the property of the aggressor nation, without hazard of being condemned as a robber or pirate.

MARQUESAS ISLANDS, the general name of 5 islands in the South Sea, distinguished by those of Magdalena, St Pedro, Dominica, Santa Christina, and Hood Island. All the natives of these islands are supposed to be of the same tribe. Those spots that are fit for culture are very populous; but as every island is very mountainous, and has many inaccessible and high rocks, it is doubted whether the whole population of this group amounts to 200,000 souls. The Spaniards, who first visited them, found the inhabitants gentle and inoffensive; but these qualities did not prevent those who landed from butchering several of the natives of Magdalena. The inhabitants of these islands, collectively, says Capt. Cook, are, without exception, the most fine of people in the South Sea. For symmetry of shape, and regular features, they perhaps surpass all other nations. Not a single deformed or ill-proportioned person was seen on the islands; all were strong, tall, well-limbed, and remarkably active. The men are from 5 feet 6, to 5 feet 12 inches high; their teeth are not so good, nor are their eyes so full and lively, as those of many other nations; their hair is of many colours, but none are red; some have it long, but the most general custom is to wear it short, except a bunch on each side of the crown, which they tie in a knot; the rest of their countenances are pleasing, open, and full of vivacity; their complexion is tawny, which is rendered almost black by punctures over the whole body. They were entirely naked, except a small piece of cloth round the waist and loins. The punctures were made

... centre of that, is another round piece of mother-of-pearl, about the size of half a crown; and before this another piece of perforated tortoise shell, the size of a shilling. Besides this decoration in front, some have it also on each side, but in small pieces; and all have fixed to them the tail feathers of cocks, or tropic birds, which, when the fillet is tied on, stand upright, so that the whole together makes a very sprightly ornament. They wear round the neck a kind of ruff or necklace made of light wood; the outward and upper sides covered with small pebbles, which are fixed on with gum; they also wear some bunches of human hair fastened to a string, and tied round the legs and arms. But all the above ornaments are seldom seen on the same person. All their ornaments, except the last, they freely parted with for trifles; but the human hair they valued very highly, tho' these bunches were the residence of many vermin. Perhaps these were worn in remembrance of their deceased relations, and therefore were looked upon with some veneration; or they may be the spoils of their enemies, worn as the honourable testimonies of victory. However, a large nail, or any thing that pleased them commonly got the better of their scruples. Their chief visited Capt. Cook; he was the only one seen completely dressed in this manner. Their ordinary ornaments are necklaces, and amulets made of shells, &c. They all had their ears pierced, though none were seen with ear-rings. The king had not much respect paid him by his attendants: he presented Capt. Cook with some fruit and hogs; and acquainted him that his name was *Houa*, and that he was *te-ka-ai*, which title seems to correspond with the *ara* of Otahitee, and *arake* of the Friendly Isles. Their dwellings are in the valleys,

... they could not pronounce the quadrupeds seen here were there were fowls, and several woods, whose notes were very inhabitants of the Marquesas ten, nor with their hands and ter meals, as those of the Soci they are very slovenly in preparation. Their diet is chiefly vegetable hogs and fowls, and catch in pure water, cocoa nuts being of them having shown an inclination. Cook put a stop to this but to be fired over their heads low, who had carried off a fir from the gangway, and swam was shot by a barbarous officer. Notwithstanding this murder, tured to traffic with the sailors bananas, plantains, and some chased for nails, knives, and iron natives became at length so far the sides of the ship in great numbers danced upon deck; much resembled those of Otah too was much the same. They lie between Lon. 138° and 140 Lat. 8' and 10' S.

(1.) \* MARQUIS. *n. f.* [*marquis*, French; *mar- chio*, Latin; *markgraves*, German.] 1. In England one of the second order of nobility, next in rank to a duke.—None may wear ermine but princes, and there is a certain number of ranks allowed to dukes, *marquesses*, and earls, which they must not exceed. *Puccian on Drawing*. 2. *Marquis* is used by *Siak-speure* for *markings*, [*marquise*, Fr.] You shall have

Two noble partners with you: the old duchess Of Norfolk, and the lady *marquiss* Dorset. *Shak.*

(2.) MARQUIS. The office of a marquis was to guard the frontiers and limits of the kingdom, which were called the *marches*, from the Teuto- tonick word *marcha*, a limit: as, in particular, were the marches of Wales and Scotland, before their union with England. The persons who had command there, were called *lords marches*, or *marquiss*; whose authority was abolished by stat. 27 Hen. VIII. c. 27. though the title had long before been made a mere design of honour, Robert Vere earl of Oxford being created marquis of Dublin by Richard II. in the 8th year of his reign. A marquis is created by patent; his mantle is double ermine, three doublings and a half; his title is *most honourable*; and his coronet has pearls and strawberry leaves intermixed round, of equal height.

\* MARQUISATE. *n. f.* [*marquifat*, Fr.] The seignery of a marquis.

MARR, that part of Aberdeenshire situated between the Dee and Don. See BRAE-MAR.

MARRACCI, Lewis, a very learned Italian, born at Lucera in 1612. He entered into the congregation of regular clerks of the mother of God, and distinguished himself early by his learning and merit. He taught rhetoric 7 years, and attained of himself the knowledge of the Greek, the Hebrew, the Syriac, the Chaldee, the Arabic; which last he taught at Rome. Pope innocent XI. chose him for his confessor, and would have promoted him, if Marracci had not opposed him. He died at Rome in 1700, aged 87. He was the author of several tracts in Italian; but the work which has made him deservedly famous, is his edition of the Koran, in the original, with a Latin version, notes, and confutation of his own. It was beautifully printed in 2 vols folio at Padua in 1698. His Latin version of it with notes, and a synopsis of the Mahometan religion, was published by Heinnecius at Leipzig, 1721, in 8vo. Marracci had also a hand in the *Bibliotheca Arabica*; Rome 1671, in 3 vols folio.

\* MARRER. *n. f.* [from *mar*. One who spoils or hunts any thing.—You be indeed makers, or *marrers*, of all men's manners within the realm. *Alcham's Schoolmaster*.

(1.) \* MARRIAGE. *n. f.* [*marriage*, Fr. *matrimonium*, low Latin, from *matrimonium*.] The act of uniting a married woman for life.—

The *marriage* with his brother's wife Has crept too near his conscience. *Hen. VIII.*  
If that thy bent of love be honourable,

To these whom death again did wed,  
 This grave's the second *marriage-bed*. *Craslow*.  
 There on his arms an once lov'd portrait lay,  
 Thither our fatal *marriage-bed* convey. *Denb.*  
 —Thou shalt come into the *marriage-chamber*.  
*Job*. vi. 16.—Neither her worthiness, which in  
 truth was great, nor his own suffering for her,  
 which is wont to endear affection, could fetter his  
 sickness; but, before the *marriage-day* appoint-  
 ed, he had taken to wife Baccha, of whom she  
 complained. *Sidney*.

Virgin awake! the *marriage-hour* is nigh. *Pope*.  
 Give me, to live and die,

A spotless maid, without the *marriage-tie*. *Dryd.*

(3.) MARRIAGE is a contract, both civil and religious, between a man and a woman, by which they engage to live together in mutual love and friendship or the ends of procreation, &c. See MORAL PHILOSOPHY. It is part of the law of nations, and is in use among all people. The Romanists account it a sacrament.—The woman, with all her moveable goods, immediately upon marriage, passes wholly “into the power and disposal of the husband.” See LAW, PART II, Chap. I. Sect. XV; and PART III. Chap. I. Sect. V.

(4.) MARRIAGE, [*Maritimus*] in law, signifies not only the lawful joining of man and wife, but also the right of bestowing a ward or a widow in marriage, as well as the land given in marriage.

(5.) MARRIAGE, ANCIENT LAWS AND CUSTOMS RESPECTING. The first inhabitants of Greece lived together without marriage. Cecrops, king of Athens, is said to have been the first author of this honourable institution among that people. After the commonwealths of Greece were settled, marriage was very much encouraged by their laws, and the abstaining from it was dis-

one of the parties bolts or gives out, that he or she is married to the other, whereby a common reputation of their matrimony may ensue. On his ground the party injured may libel the other in the spiritual court; and unless the defendant undertakes and makes out a proof of the actual marriage, he or she is enjoined perpetual silence in that head; which is the only remedy the ecclesiastical courts can give for this injury.

(10.) MARRIAGE, MODERN LAWS CONCERNING. Affinity, according to the modern canonists, renders marriage unlawful to the 4th generation, inclusive; but this is to be understood of direct affinity, and not of secondary or collateral. *Affinis est affinis, non est affinis meus.* This impediment of marriage not only follows an affinity contracted by lawful matrimony, but also that contracted by a criminal commerce; with this difference, that this last does not extend beyond the 2d generation; whereas the other reaches to the 4th. In Germany they have a kind of marriage called *moruanatic*, wherein a man of quality contracting with a woman of inferior rank, he gives her the left hand in lieu of the right; and stipulates in the contract that the wife shall continue in her former rank or condition; and that the children born of them shall be of the same, so that they become afterwards as to matters of inheritance, though they are legitimate in effect. They cannot bear the name or arms of the family. None but princes and great lords of Germany are allowed this kind of marriage. The universities of Leipsic and Jena have declared against the validity of such contracts; maintaining that they cannot prejudice the children, especially when the emperor's consent intervenes in the marriage. The Turks have 3 kinds of marriages, and 3 sorts of wives; *legitimate, concubine, and slaves.* They marry the first, hire the 2d, and buy the 3d. Among the savage nations, in Asia, Africa, or America, the wife is commonly bought by the husband from her father or those other relations who have an authority over her; and the conclusion of a bargain for this purpose, together with the payment of the price, has therefore become the usual form of solemnity in the celebration of their marriages. The Hebrews also purchased their wives by paying down a competent dowry for them; and Aristotle makes it one argument to prove that the ancient Grecians were an uncivilized people, because they used to buy their wives; and in proportion they laid aside their barbarous manners they got off this practice.

(11.) MARRIAGE, MODERN LAWS OF ENGLAND RESPECTING. The English law considers marriage in no other light than as a civil contract; the solemnity of the matrimonial state being left entirely to the ecclesiastical law, to which it pertains, to punish or annul incestuous or other unscriptural marriages. The law allows marriage to be valid, where the parties at the time of making it were willing and able to contract, and actually did contract, in the proper forms and solemnities required by law. The disabilities for contracting are of two sorts: first such as are canonical, and therefore sufficient by the ecclesiastical laws to void the marriage in the spiritual court; such as pre-contract, consanguinity, or relation by blood; and affinity,

or relation by marriage, and some particular corporal infirmities. But these disabilities do not make the marriage *ipso facto* void, but voidable only by sentence of separation; and marriages are esteemed valid to all civil purposes, unless such separation is actually made during the life of the parties. Thus when a man had married his first wife's sister, and after her death the bishop's court was proceeding to annul the marriage and bastardise the issue, the court of king's bench granted a prohibition *quoad hoc*; but permitted them to proceed to punish the husband for incest. By 32 Hen. VIII. c. 38. it is declared, that all persons may lawfully marry, but such as are prohibited by God's law, &c. See AFFINITY, § 3; and INCEST, § 2. By the civil law first cousins are allowed to marry; but by the canon law both first and second cousins are prohibited. Therefore when it is vulgarly said that first cousins may marry but second cousins cannot, this arose from confounding these two laws; for first cousins may marry by the civil law, and second cousins cannot by the canon law. On a promise of marriage, if mutual on both sides, damages may be recovered in case either party refuses to marry; and though no time for the marriage is agreed on, if the plaintiff avers that he offered to marry the defendant who refused it, an action is maintainable for the damages; but no action shall be brought upon any agreement except it is in writing, and signed by the party to be charged. The canonical hours for celebrating marriage are from 8 to 12 A. M. The other sort of disabilities are those which are created, or at least enforced, by the municipal laws. These civil disabilities make the contract void *ab initio*, by rendering the parties incapable of forming any contract at all. The first legal disability is a prior marriage, or having another husband or wife living; in which case, besides the penalties consequent upon it as a felony, the 2d marriage is to all intents and purposes void. See BIGAMY, and POLYGAMY. The next legal disability is want of age; therefore if a boy under 14, or a girl under 12 years of age, marries, when either of them comes to the age of consent, they may disagree and declare the marriage void without any divorce or sentence in the spiritual court. However, it is so far a marriage, that if at the age of consent they agree to continue together, they need not be married again. Another incapacity arises from want of consent of parents or guardians. And by the marriage act, viz. 26 Geo. II. c. 33. it is enacted, that all marriages celebrated by licence (for banns suppose notice), where either of the parties is under 21, not being a widow or widower, without the consent of the father, or if he be not living of the mother or guardians, shall be absolutely void. However, provision is made where the mother or guardian is *non compos*, beyond sea, or unreasonably froward, to dispense with such consent at the discretion of the lord chancellor; but no provision is made in case the father should labour under any mental or other incapacity. A 4th incapacity is want of reason. It is provided by 15 Geo. II. c. 30. that the marriage of lunatics and sons under phrensies, shall be totally void. Lastly, the parties must not only be willing and able to contract, but must actually

contract themselves in due form of law, to make it a good civil marriage. By 26 Geo. II. c. 33. Verbal contracts are now of no force to compel a marriage. Nor is any marriage valid that is not celebrated in some parish church, or public chapel, unless by dispensation from the Abp. of Canterbury. It must also be preceded by publication of banns or by licence from the spiritual judge. A marriage in pursuance of banns must be solemnized in one of the churches or chapels where the banns were published. No parson, vicar, &c. shall be obliged to publish banns, unless the persons to be married shall, seven days before the time required for the first publication, deliver to him a notice in writing of their true names, and of the house or houses of their respective abode within such parish, &c. The said banns shall be published upon 3 Sundays preceding the solemnization of marriage, during public service. If the parents or guardians, or either of the parties under the age of 21, shall declare, in the church or chapel where the banns shall be so published, at the time of such publication, their dissent, such publication of banns shall be void. And when the parties dwell in divers parishes, the curate of the one parish shall not solemnize matrimony betwixt them without a certificate of the banns being thrice asked from the curate of the other parish. A marriage in pursuance of a licence (except a special licence) must be solemnized in such church or chapel where the licence is granted; and no licence of marriage shall be granted by any archbishop, bishop, &c. to solemnize any marriage in any other church, &c. than in the parish church, &c. within which the usual place of abode of one of the parties shall have been for four weeks immediately before the granting such licence. All marriages shall be solemnized in the presence of two credible witnesses at the least, besides the minister, who shall sign their attestation thereof; and an entry shall be made in the parish register, expressing that the marriage was celebrated by banns or licence; and if both or either of the parties be under age, with consent of the parents or guardians, signed by the minister, and the parties married, and attested by the witnesses. It is also essential to a marriage, that it be performed by a person in orders; though the intervention of a priest to solemnize this contract is merely *juris positivum*, and not *juris naturalis aut divini*. No marriage by the temporal law is *ipso facto* void, that is celebrated by a person in orders; in a parish church, a public chapel, or elsewhere, by a special dispensation; in pursuing of banns or a licence; between single persons, consenting, of sound mind, and of the age of 21 years; or of the age of 14 in males and 12 in females, with consent of parents or guardians, or without it, in case of widowhood. And no marriage is voidable by the ecclesiastical law after the death of either of the parties; nor during their lives, unless for the canonical impediments of consanguinity, affinity, or corporal imbecillity subsisting previous to the marriage. By the same act, if any person shall solemnize matrimony in any other place than a church, &c. where banns have been usually published, unless by special licence, or without publication of banns, unless licence of marriage be

first obtained from some person having authority to grant the same, every such person knowingly so offending shall be guilty of felony, and transported for 14 years; the prosecution to be within 3 years. To make a false entry into a marriage register; to alter it when made; to forge or counterfeit such entry, or a marriage licence, or aid and abet such forgery; to utter the same as true, knowing it to be counterfeit; or to destroy or procure the destruction of any register in order to vacate any marriage, or subject any person to the penalties of this act; all these offences, knowingly and wilfully committed, subject the party to the guilt of felony without benefit of clergy. But this act doth not extend to the marriages of the royal family; nor to Scotland; nor to any marriages among the people called *Quakers*, or among persons professing the Jewish religion, where both the parties are *Quakers* or Jews respectively; nor to any marriages beyond the seas.

(12.) MARRIAGE, MODERN LAWS OF SCOTLAND RESPECTING. In Scotland, the parties living together as man and wife, or declaring themselves so before witnesses, makes a valid though informal marriage. See LAW, P. III, Ch. I. & V.

(13.) MARRIAGE, POLICY OF ENCOURAGING. Dr Halley observes, that the growth and increase of mankind is not so much stunted by anything in the nature of the species, as it is from the cautious diffidence most people make to adventure on the state of marriage, from the prospect of the trouble and charge of providing for a family; but are the poorer sort of people herein to be blamed, who, besides themselves and families, are obliged to work for the proprietors of the lands trusted them; and of such does the greater part of mankind consist. Were it not for this backwardness to marriage, there might be 4 times as many births as there are; for by computation, (see MORTALITY,) there are 15,000 persons above 16 and under 45, of whom at least 7000 are women capable of bearing children; yet there are only 1238, or little more than a 6th part of these, that breed yearly: whereas, were they all married, it is highly probable, that four of six would bear forth a child every year, the political consequences of which are evident. Therefore, as the strength and glory of a kingdom or state consist in the multitude of subjects, celibacy above all things ought to be discouraged, by extraordinary taxing or military service: and, on the contrary, those who have numerous families should be allowed certain privileges and immunities, like the *jus trium liberorum* among the Romans; and especially, by effectually providing for the subsistence of the poor.

(14.) MARRIAGE, SERVICE, OR DUTY OF, is a term used in some ancient customs, signifying an obligation on women to marry. Old laws had widows about 60 who held fees in body, or were charged with any personal or military duties, were anciently obliged to marry, to render the services to the lord by their husbands, or to indemnify the lord for what they could not do as a person. This was called *duty* or *service of marriage*.

(15.) MARRIAGE SETTLEMENT is a settlement made previous to marriage, whereby a jointure is reserved to the wife after the death of the husband.

These settlements seem to have been in use among the ancient Germans and Gauls. Of the former Tacitus gives us this account: *Dotem non uxori marito, sed uxori maritus offert: inter sunt parentis et propinqui, et manera probant* (De Mor. Germ. c. 18.) And Caes. de Bell. Gall. lib. vi. c. 18. has given us the terms of a marriage settlement among the Gauls, as nicely calculated as any modern jointure: *Viri, quantum pecunias ab uxoribus dotis nomine acceperunt, tantas ex suis bonis, æstimatione facta, cum dotibus communicant. Hujus omnis pecunie conjunctim ratio labetur, fructusque hæretur. Uter eorum vita superavit, ad eum pars utriusque cum fructibus supericorum temporum pertinet.* The dauphin's commentator supposes that this Gaulish custom was the ground of the new regulations made by Justinian, Nov. 97. with regard to the provision for widows among the Romans; but surely there is as much reason to suppose, says Judge Blackstone, that it gave the hint for our statutable jointures. Com. vol. ii. p. 138. See an excellent marriage settlement by Blackstone in the appendix to the 2d vol. of his Commentaries.

(16.) MARRIAGES, PRODUCE OF, ON AN AVERAGE. Marriages, one with another, do each produce about four births, both in England and other parts of Europe. Dr Price observes, that from comparing the births and weddings in countries and towns where registers of them have been kept, it appears, that in the former, marriages one with another seldom produce less than four children each; generally between 4 and 5, and sometimes above 5; but in towns seldom above 4, generally between 3 and 4, and sometimes under 3. Major Graunt, both from the London and country bills, computes, that there are in England 14 males born to 13 females; whence he justly infers, that the Christian religion, prohibiting polygamy, is more agreeable to the law of nature than Mahometanism and others that allow it. From this inequality between males and females born, it is evident that one man ought to have but one wife, and yet that every woman without polygamy may have a husband: this surplussage of males above females being spent in the supplies of war, the seas, &c. from which the women are exempt. According to Mr Kerneboom's observations, there are about 325 children born from 100 marriages.

(17.) MARRIAGES, PROPORTION OF, TO BIRTHS. For the proportions which marriages bear to births, and births to burials, in several parts of Europe, Mr Deham gives a table, which we think it hardly necessary to quote, as numberless tables of this kind may be found in Sir J. Sinclair's *Statistical Account of Scotland*. We shall therefore only mention, that Mr Deham states the proportion of births to marriages in London as 1 to 4; in England in general, as 1 to 4.63; in Ayrshire, Northamptonshire, as 1 to 6; in Bandedburg as 1 to 3.7; and in Paris as 1 to 4.7. Dr Price in a similar table makes the medium proportion of marriages to births, in Lincolnshire as 1 to 3.7; in Madaira, as 1 to 4.68; in Paris as 1 to 4.7; in A. Bardum as 1 to 1.9; in Copenhagen as 1 to 3.64; in Berlin as 1 to 3.9; and in the Vaud, as 1 to 3.9.

(18.) MARRIAGES, PROPORTION OF, TO DEATHS, &c. For an account of the numbers of married men and married women, and of widows and widowers, who died for a course of years at Vienna, Breslaw, Dresden, Leipzig, Ratibon, and some other towns in Germany, see *Phil. Trans. Aër.* Vol. VII. Part IV. p. 46, &c. The reader may find many curious calculations and remarks on this subject in Dr Price's excellent work entitled; *Observations on Reversionary Payments*. Mr Kerneboom informs us, that, during the course of 125 years in Holland, females have in all accidents of age lived about 3 or 4 years longer than the same number of males. In several towns of Germany, &c. it appears, that of 7270 married persons who had died, the proportion of married men who died to the married women was 3 to 2; and in Breslaw for 8 years, as 5 to 3. In Pomerania, during 9 years, from 1748 to 1756, this proportion was nearly 15 to 11. Among the ministers and professors in Scotland, 20 married men die to 12 married women, at a medium of 17 years, or in the proportion of 5 to 3; so that there is the chance of 3 to 2, and in some circumstances even a greater chance, that the woman shall be the survivor of a marriage, and not the man; and this difference cannot be accounted for merely by the difference of age between men and their wives, without admitting the greater mortality of males. In the district of Vaud in Switzerland, it appears, that half the females do not die till the age of 46 and upwards, though half the males die under 36. It is likewise an indisputable fact, that in the beginning of life, the rate of mortality among males is much greater than among females. From a table formed by Dr Price, from a register kept for 20 years at Grandborough, it appears, that of those who live to 50, the major part, in the proportion of 49 to 32, are females. Mr Deparcieux at Paris, and Mr Wargentin in Sweden, have farther observed, that not only women live longer than men, but that married women live longer than single women. From some registers examined by Mr Muret in Switzerland, it appears, that of equal numbers of single and married women between 15 and 25, more of the former died than of the latter, in the proportion of 2 to 1. With respect to the difference between the mortality of males and females, it is much less in country parishes and villages than in towns; and hence it is inferred, that the difference arises from adventitious causes, that take place in luxurious societies, especially in great towns. See farther on this subject under the articles, ANNUITIES, and SURVIVORSHIP.

\* MARRIAGEABLE. *adj.* [from *marriage*.] 1. Fit for wedlock; of age to be married.—Every wedding, one with another, produces four children, and that is the proportion of children which any marriageable man or woman may be presumed shall have. *Grant*.—I am the father of a young heiress, whom I begin to look upon as marriageable. *Sp. B.*—When the girls are 12 years old, which is the marriageable age, their parents take them home. *Swift*. 2. Capable of union.—

They led the vine  
To wed her elm; she spous'd about him twines  
Her marriageable vines.  
*Milton.*

\* MAK.

\* **MARRIED**, *adj.* [from *marry*.] Conjugal: consubial.—

Thus have you shun'd the *marry'd* state.

*Dryden.*

**MARRO**, a river of Naples in Calabria.

(1.) \* **MARROW**, *n. f.* [*mergh*, Saxon; *meirr*, Erse; *mergh*, Scottish.]—All the bones of the body which have any considerable thickness have either a large cavity, or they are spongy, and full of little cells; in both the one and the other there is an oleaginous substance called *marrow*, contained in proper vesicles or membranes, like the fat: in the larger bones this fine oil, by the gentle heat of the body is exhaled through the pores of its small bladders, and enters some narrow passages, which lead to some fine canals excavated in the substance of the bone, that the *marrow* may supply the fibres of the bones, and render them less apt to break. *Quincy*.—

Would he were wasted, *marrow*, bones, and all,

That from his loins no hopeful branch may spring.

*Shak.*

—The skull hath brains as a kind of *marrow* within it: the back bone hath one kind of *marrow*, and other bones of the body have another: the jaw bones have no *marrow* severed, but a little pulp of marrow diffused. *Bacon*.—

Famper'd and edify'd their zeal

With *marrow* puddings many a meal. *Hudibr.*

He bit the dart, and wrench'd the wood away,

The point still buried in the *marrow* lay. *Ovid.*

(2.) **MARROW**. See **ANATOMY**, *Index*.

(3.) \* **MARROW**, in the Scottish dialect, to this day, denotes a fellow, companion, or associate; as also equal match, *be met with his marrow*. [*marri*, husband, French].—

Though buying and selling doth wonderful well,

Yet chopping and changing I cannot commend  
With this for his *marrow* for fear of ill end.

*T. Asser.*

\* **MARROWBONE**, *n. f.* [*bone* and *marrow*.] 1. Bone boiled for the marrow. 2. In burlesque language the knees.—Upon this he fell down upon his *marrowbones*, and begged of Jupiter to give him a pair of horns. *L'Esfrange*.—Down on your *marrowbones*, upon your allegiance; and make an acknowledgment of your offences; for I will have ample satisfaction. *Dryden*.

\* **MARROWFAT**, *n. f.* A kind of pea.

\* **MARROWLESS**, *adj.* [from *marrow*.] Void of marrow.—

Thy bones are *marrowless*.

*Shak.*

**MARRUBIUM**, WHITE HOREHOUND; a genus of the gymnospermia order, belonging to the dicynania class of plants; and in the natural method ranking under the 42d order, *Ferticillate*. The calyx is salver-shaped, rigid, and ten-ribbed; the upper lip of the corolla bi-lobed, linear, and straight. There are 9 species, the most remarkable of which is the

**MARRUBIUM VULGARE**, a native of Britain, growing naturally in waste places, and by waysides near towns and villages, but not common. It has a strong and somewhat stinky smell, and bitter taste. It is reputed attenuant and resolvent; an infusion of the leaves in water, sweetened with

honey, is recommended in asthmatical and plethoric complaints, and most other diseases of the breast and lungs.

(1.) \* **To MARRY**, *v. n.* [*marier*, Fr. *marire*, Latin.] 1. To join a man and a woman; as performing the rite.—What! shall the curate controul me? Tell him, that he shall *marry* the couple himself. *Gay's* *Wit and* *Call it*. 2. To dispose of in marriage.—When Augustus consulted with Mecenas about the marriage of his daughter Julia, Mecenas took the liberty to tell him, that he must either *marry* his daughter to Agrippa, or take away his life: there was no third way he made him so great. *Bacon*. 3. To take for husband or wife.—

You'd think it strange if I should *marry* him.

*Shak.*

—As a mother shall she meet him, and receive him as a wife *married* of a virgin. *Beesley*, xv. 2.

(2.) \* **To MARRY**, *v. n.* To enter into the conjugal state.—

He hath my good will,

And none but he, to *marry* with Nan Page.

*Shak.*

—Let them *marry* to whom they think best. *Nam xxxvi. 6*.—Virgil concludes with the death of Turnus; for after that difficulty was removed, *Eneas* might *marry*, and establish the Trojans. *Dryden*.

(1.) **MARS**, in astronomy; one of the six planets, and of the four superior ones; its place being between the earth and Jupiter. See **ASTRONOMY**, *Index*.

(2.) **MARS**, in mythology, the god of war. He was, according to some; the son of Jupiter and Juno; while others say that he was the son of Jano alone, who, being displeas'd at Jupiter's having produced Minerva from his brain, without female aid, in revenge conceived without the assistance of the other sex, by touching a flower shown to her by Flora in the plains of Oenone, and became the mother of this formidable deity. The amours of Mars and Venus, and the manner in which Vulcan caught and expos'd them to the laughter of the other gods, have been described by several of the ancient poets. He is represented as having several wives and mistresses, and a considerable number of children. He was held in the highest veneration by the Romans, both from his being the reputed father of Romulus their founder, and from their inclination to conquest; and had magnificent temples erected to him at Rome. Mars is usually represented in a chariot, drawn by furious horses. He is completely armed, and extends his spear with the one hand, and grasps a sword, imbrued in blood, with the other. He has a fierce and savage aspect. Discord is represented preceding his car; and Clamour, Fear, and Terror, appear in his train. The victims sacrificed to him were the wolf, the horse, the wood-pecker, the vulture, and the cock.

(3.) **MARS**, among alchemists, denotes iron; that metal being supposed to be under the influence of the planet Mars.

(4.) **MARS**, in geography, or **MARS LA TOUR**, a town of France, in the dep. of Moselle, 11 miles W. of Metz.

**MARSA**, a town of Tunis, 10 m. NE. of Tunis. **MARSAC**.

MARSAC, a town of France, in the dep. of Puy de Dome; 6 miles S. of Ambert, and 30 N. of Puy.

MARSAL, a town of France, in the dep. of Lower Charente; 18 miles E. of Surgere.

MARSAIS, Cesar Cheneau DU, was born at Marseilles in 1576. He became a member of the congregation of the oratory, but soon left it; went to Paris, married, became advocate, and, in this new profession, met with great success. Disappointed, however, in his expectations of making a speedy fortune, he abandoned the law also. About this time the peevish humour of his wife, (perhaps of both,) occasioned a separation. He next became tutor in several genteel families; particularly in those of President de Maissions, the famous John Law, and the marquis of Beautremont. After this he kept a boarding academy, but fell into such adverse circumstances, that he was at last reduced to extreme indigence. In this situation he was found by the editors of the *Encyclopedie*, and made a partner in conducting that great work; for which he wrote the article *Grammar*, and several others. The Count of Lauraguais was so much affected with the discourse, and so much convinced of the merit of *Du Marsais*, that he procured him a pension of 1000 livres. Du Marsais died at Paris, June 11, 1756, in his 80th year, after he had received the sacrament. As he had professed to be a deist during his lifetime, the sincerity of his conversion on his death-bed has been doubted: But as Mr Bayle observes, "The faith of a great genius is not totally extinguished: It is like a spark under the ashes. Reflection and the prospect of danger call forth its exertions. There are certain situations in which *philosophers* are as full of anxiety and remorse as other men." Fontenelle expressed his character in few words, when he said, "that he was the most lively simpliciton, and as a man of wit the most simple he ever knew." He was a great enemy to every kind of affectation. His principal works are, 1. *Exposition de la doctrine de l'Eglise Gallicane par rapportaux principes de la Cour de Rome*, 12mo. This did not appear till after his death. 2. *Exposition d'une methode raisonnee pour apprendre la langue Latine*, 12mo, 1722, 3vo. 3. *Traite des troques*, 1750, 8vo; reprinted in 1771, 12mo. 4. *Les veritables Principes de la Grammaire raisonnee pour apprendre la langue Latine*, 1790, 4to. There was only the preface of this work published, in which he introduced the greatest part of his *Method raisonnee*. 5. *Judice de la fable du Pere Jacobini*, arranged after the manner of the original plan, 1731, 12mo. 6. *Logique, ou reflexions sur les operations de l'esprit*. It was reprinted at Paris, in two parts, together with the articles which he had written for the *Encyclopedie*, 1762. He also wrote some tracts of less merit, in favour of scepticism.

MARSAL, a town of France, in the dep. of the Meurthe, and late province of Lorraine, remarkable for its salt-works, seated in a marsh on the river Sille, of difficult access, which, together with the fortifications, render it an important place. Lon. 6. 41. E. Lat. 45. 46. N.

(1) MARSALA, an ancient and strong town of Sicily, in the valley of Mazara. It is well peopled,

and built on the ruins of the ancient LILYBEUM. Lon. 12. 37. E. Lat. 37. 52. N.

(2) MARSALA, a river of Sicily which runs into the sea about a mile S. of the town.

MARSAN, or MONT MARSAN, a town of France, in the dep. of Landes, and ci-devant province of Gascony. Late capital of a small territory so named, fertile in wine; seated on the Miduse. Lon. 6. 23. W. Lat. 43. 54. N.

MARSANDERAN, a province of Persia, on the Caspian Sea. Farabad is the capital.

MARSANNE, a town of France, in the dep. of the Drome; 9 miles SW. of Crest.

MARSAQUIVER, or MARSAQUIVER, a strong and ancient town of Africa, on the coast of Barbary, in the province of Beni-Arax, and kingdom of Tremeseu, with one of the best harbours in Africa. It was taken by the Spaniards in 1732. It is seated on a rock near a bay of the sea. Lon. 6. 10. W. Lat. 35. 40. N.

MARSCH, a river of Moravia and Austria, which runs into the Danube, 6 miles W. of Presburg.

MARSEILLAN, a town of France, in the dep. of Herault, 4 miles NE. of Agde, and 8 SE. of Pezenas.

MARSEILLE, a town of France, in the dep. of Oise; 104 miles NW. of Beauvais.

MARSEILLES, a strong and rich sea-port town of France, in the dep. of the Mouths of the Rhone, and late prov. of Provence. It has a good harbour, where the French galleys were formerly stationed; but it will not admit large men of war. The entrance of the harbour, which is extremely narrow and surrounded by lofty mountains, protects and shelters vessels during the most violent storms. The port itself forms a delightful walk even in the middle of winter, as it is open to the southern sun, and crowded with vast numbers of people, not only of all the European nations, but of Turks, Greeks, and natives of the coast of Barbary. The whole scene is one of the most agreeable that can be imagined. Martialis boys claim to the most remote antiquity; a colony of Phocian, in ages unknown, having founded it. It is divided into the Old and New Towns, which are separated by a street, bordered with trees on each side. The Old Town is one of the worst built of any in Europe. The New has sprung up since the commencement of the 12th century, and has all that regularity, elegance, and convenience, which distinguish the present times. It is said to contain 100,000 inhabitants, and is one of the most trading towns in France. Without the walls is the castle of Notre-Dame, which is very well fortified. It has an academy, and has been noted at all times for men of learning. In 1553, Lewis XIV. built the citadel and fort St. John to keep the inhabitants in awe, because they pretended to be free. The Jesuits had a very fine observatory, and in the arsenal there are arms for 20,000 men. In the House of Deputies they weave gold, silver, and silk brocades. Drugs are brought thither from all parts of the world. It is seated on the N. shore of the Mediterranean, in Lon. 4. 27. E. Lat. 43. 18. N.

(1) MARSH, Narcissus, a very learned and accomplished

completed prelate, born at Hannington in Wiltshire, in 1638. He was made principal of St Alban's hall, Oxford, in 1693; provost of Dublin college in 1678; bishop of Leighlin and Ferns in 1682; archbishop of Cashel in 1690; of Dublin in 1694, and of Armagh in 1703. He built a public library in Dublin, filled it with choice books and settled a provision for 2 librarians. He repaired, at his own expence, several decayed churches, besides buying in many impropriations, and presenting a great number of oriental MSS. to the Bodleian library. He was well versed in sacred and profane literature, in mathematics, natural philosophy, languages, especially the oriental, and music. He published, 1. *Institutiones logicae*. 2. *Manuductio ad logicam*, written by Philip de Trier; to which he added the Greek text of Aristotle, and some tables and schemes. 3. An introductory essay on the doctrine of sounds, &c. He died in 1713.

(1.) \* MARSH, MARK, MAS, are derived from the Saxon *marfe*, a fen, or fensty place. *Gibson*.

(2.) \* MARSH. *n. f.* *marfe*, Saxon. See MARISH. A fen; a bog; a swamp; a watry tract, of land.—

In their courses make that round,

In meadows and in *marshes* found. *Drayton*.  
—Worms for colour and shape, alter even as the ground out of which they are got; as the *marsh* worm and the flag worm. *Walton*.—We may see in more temperate climates greater variety in the people thereof; the up-lands in England yield strong, sinewy, hardy men; the *marsh*-lands, men, of large and high stature. *Hales*.—Your low meadows and *marsh*-lands you need not lay up till April, except the Spring be very wet, and your *marshes* very poachy. *Mortimer*.

(4.) MARSH signifies a piece of ground flooded with water, yet so that the grass and other vegetables rise above the surface of the water, and, by their decaying, give rise to putrid effluvia, which are very pernicious to health. See MOSS.

(1.) \* MARSHAL. *n. f.* *marſchal*, Fr. *marſchallus*, low Lat. from *marſchal*, old Fr. a word compounded of *mare*, which, old French, signified a horse, and *ſchal*, a sort of servant; one that has the charge of horses. 1. The chief officer of arms.—

The duke of Suffolk claims

To be high steward; next the duke of Norfolk  
To be earl *marshal*. *Shak.*

2. An officer who regulates combats in the lists.—

Unask'd the royal grant; no *marshal* by,

As kingly rites require, nor judge to try. *Dryd.*

3. Any one who regulates rank or order at a feast, or any other assembly.

Through the hall there walked to and fro

A jolly yeoman, *marshal* of the same,

Whose name was Appetite. *Fairy Queen*.

4. An harbiager; a pursuivant; one who goes before a prince to declare his coming, and provide entertainment.—Her face, when it was fair, fit, had been but as a *marshal* to lodge the love of her in his mind. *Sidney*.

(2.) MARSHAL, or MARESCAL, (*marſcallus*) primarily denotes an officer who has the care of the command of horses.—Nicoi derives the word

from *polemaribus* i. e. *maſter of the camp*; *Stethew Paris* from *Marſis ſeneſcallus*. In the old Gauliſh language, *marſch* ſignified *baſe*; whence *marſchal* might ſignify *ſub-ſecondo commando the cavalry*. Other derivations have been given by different authors; and the name itſelf has been applied to officers of very different employments.

(3.) MARSHAL OF ENGLAND, EARL, is the 2d great officer of ſtate. This office, until it was made hereditary, always paſſed by grant from the king, and never was held by tenure or ſerjeanty (by any ſubject) as the offices of lord high ſteward and lord high conſtable were ſometimes held. The title is perſonal, the office honorary and officary. They were formerly ſtyled *lord marshal* only, until king Richard II, June 20, 1397, granted letters patent to Thomas Mowbray, earl of Nottingham, and to the heirs male of his body lawfully begotten, by the name and ſtyle of *earl marshal*; and further, gave them power to bear in their hand a gold truncheon, enamelled with black at each end; having at the upper end of it the king's arms engraved thereon, and at the lower end his own arms. See CAVALRY.

(4.) MARSHAL OF FRANCE, was the highest & devout dignity of preference in the French armies, under the old monarchy. It was for this, though at its first institution it was otherwise.

(5.) MARSHAL OF SCOTLAND, EARL. His office was to command the cavalry, whereas the CONSTABLE commanded the whole army. They seem, however, to have had a sort of joint command, as of old all orders were addressed "to our constable and marſchal." The office of earl marſchal has never been out of the noble family of Keith. It was reserved at the union; and when the heritable jurisdictions were bought, it was in the crown, being forfeited by the rebellion of Geo. Keith, earl marſchal, in 1711.

(6.) MARSHAL OF THE EXCHEQUER, an officer mentioned by Fleta, to whom the court commits the custody of the king's debtors, &c.

(7.) MARSHAL OF THE KING'S BENCH, an officer who has custody of the prison called the *King's Bench* in Southwark.—He gives attendance upon the court, and takes into his custody all prisoners committed by the court; he is answerable for his absence, and non-attendance incurs a forfeiture of his office. The power of appointing the marshal of the king's bench is in the crown.

(8.) MARSHAL OF THE KING'S HOUSE, or KNIGHT MARSHAL, an English officer, whose business, according to Fleta, is to execute the commands and decrees of the lord steward, and to have the custody of prisoners committed by the court of verge. Under him are six marshal's men, who are properly the king's bailiffs, and attend in the verge of the court, when a warrant is backed by the board of green-cloth. The court when causes of this kind, between man and man, are tried, is called the *Marſhalſea*, and is under the knight marshal. See MARSHALSEA. This is so the name of the prison in Southwark; the reason of which may probably be, that the marshal of the king's house was wont to sit there in judgment, or keep his prison.
